This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

Communications.

THE ANNUAL CONGRESS OF HOMŒOPATHISTS.

The first Homœopathic Congress, which was held last year at Cheltenham, was attended by thirty medical men; that of the present year was held on the 23rd and 24th of July, and attended by more than sixty.

Drs. Russell, Stokes, Drysdale, Madden, Black, Sutherland, Boddy, Beilby, Prince, Norton, Hewitt, Ker, Fearon, Hale, Massy, Guinness, Marsden, W. F. Laurie, Ozanne, Stummes, Macdonald, Wilmot, Eylert (of Germany, from Southampton), and Messrs. Wardroper, Pope, Anderson, Spencer Hall, Sharp, Blake, Gray, Pearce, Joce, Phillips, Parsons, and another gentleman, whose name we cannot decipher, attended from different parts of England and Scotland; the metropolis contributed the following members, who attended the Congress: Drs. Kelsall, Dudgeon, Rogers, Laurie, Partridge, Viettinghoff, Hamilton, Chapman, Chepmell, Malan, Curie, Roth, Henriques, Cronin, Robert Hamilton, and Messrs. Engall, Hering, Millard, Frith, Reynolds, Wilson, Yeldham, M'Kechnie, Leadam, G. N. Epps, Metcalfe, and Professor Georgii.

Mr. Walker, of Conduit Street, Mr. Turner, of Manchester, and Mr. Capper, of Liverpool, homœopathic chemists, were also present at the Congress. There were also other visitors, among whom were the Honorary Secretaries of the Hahnemann, and the London Homœopathic Hospitals.

The first meeting was held on the evening of the 23rd instant.

It was moved by Mr. Hering, and seconded by Dr. Dudgeon, that Dr. Black should take the chair.

Dr. Russell then delivered the annual address, which was written in very elegant and eloquent language, and was spoken with great animation and effect, and was much applauded throughout.

It was proposed by Mr. Engall and seconded by Dr. Madden, that Dr. Russell be requested to publish his oration, which he promised to do, in the next number of the *British Journal of Homœopathy*. Dr. Ozanne read a portion of his paper on Medical Ethics, and concluded with certain resolutions, which were discussed on the following day, and were adopted in the following form.

Resolutions agreed to at the British Homœopathic Congress, held in London, 1851.

First. That the members of this Congress, being duly-qualified medical practitioners, have adopted the principle or law of homœopathy, and have applied it in practice, after a careful experimental examination of its truth.

Second. That being thus convinced of its practical value in the treatment of disease, they have felt it their duty to establish hospitals and dispensaries for the double purpose of relieving the sufferings of the poor, and of affording opportunities to the medical profession to observe the facts in support of the truth of this law, and of its beneficial operation, and they will continue these, and all other legitimate means of promoting its general adoption, notwithstanding the opposition manifested against it.

It may be observed that most of the gentlemen who had agreed to read papers, consented to withdraw them on the present occasion, in order to afford the Congress sufficient time to take into consideration the best means of meeting the aggressive measures of the Universities of Edinburgh and St Andrew's.

Dr. Russell then read the recommendation of a meeting lately held at York, for obtaining from Government the appointment of examiners for such medical students as intended to practise homœopathy, who by examination should test the knowledge of those students in the general medical subjects, and certify to their ability and attainments; and it was further recommended that a committee or council of homœopathic practitioners should be appointed by the Homœopathic Congress, to put themselves in communication with the Medical Homœopathic University of Philadelphia, for the purpose of obtaining their diploma for such certified students.

Dr. Russell moved and Dr. Madden seconded the recommendation that this course should be adopted.

Mr. Blake made some observations on

Hosted by Google

the necessity of first endeavouring to obtain a charter for the homœopathists, on the principle of the London University, and that in the event of failure they might then, he said, fall back on the measures recommended by the late meeting at York, and proposed to Congress by Dr. Russell.

Dr. CHAPMAN objected to the proposition of obtaining diplomas for the medical students, who intended to practise homœopathy, from an American university. He said that the homœopathists of Britain should have an university or college of their own, if it should appear that the medical universities and colleges of Great Britain and Ireland were determined all and each to withhold their diplomas from homœopathists. But he thought the London University, and the London College of Surgeons, would confer their diplomas on students up to the mark in their examinations, irrespective of any supposed tendency in the way of therapeutics. He said that the homœopathists, however, should be prepared to agitate for a charter. He earnestly entreated all the homœopathists to forget the past, and to be united for the future. This union was imperative in the present crisis. He moved, and it was seconded by Dr. OZANNE, that each practitioner subscribe a guinea, to further the objects of any committee or council that might be appointed by Congress.

Mr. MILLARD moved a form of petition for a charter, and was seconded by Mr. PHILLIPS.

Mr. BLAKE observed that a student could not get a diploma from the London University, except he had previously matriculated, and been a student at one of the colleges or schools attached to that University.

Mr. SPENCER HALL urged the necessity of obtaining a charter. He mentioned himself as an instance of one anxious to get a diploma, and yet unable to do so, from the hostility of the Scotch Universities.

Mr. WILSON insisted on the necessity of union for the purpose of obtaining a charter. He said that the apothecaries gained their charter without having any school, and that but few originally agitated for it. He recommended that the laws of the London University should be diligently considered by any who might be empowered to act for the Congress, as representing the whole body of homœopathists. He recommended that a petition should be presented to the Sovereign for a charter, specifically on the same grounds as those which were advanced and admitted for the charter of the London University.

Dr. NORTON moved for a provisional committee of twelve, to consider this question in all its bearings; to meet early in the morning, and to report to the Congress at their meeting of the next day; seconded by Dr. SUTHERLAND.

Dr. Norton's proposition was acceded to, with this difference, that Dr. DRYSDALE moved, and Mr. REYNOLDS seconded, that there should be only five members of the provisional committee, as five might work and twelve probably would not.

The following gentlemen were appointed: Dr. Russell, Dr. Macdonald, Dr. Norton, Mr. Wilson, and Mr. Leadam.

The Congress was then adjourned by the chairman to the following day—

July 24th. The Chair was taken by Dr. BLACK, at eleven o'clock. Dr. Stummes read a paper on the compatibility of using the water treatment in conjunction with homœopathy.

Dr. OZANNE's resolutions were then put, *seriatim*, and after some discussion were finally adopted as we have reported them.

Dr. DUDGEON read a portion of the bill introduced in the House of Commons by Mr. Jacob Bell, respecting pharmacy, which would have a very injurious effect on the homœopathic chemists. Dr. MADDEN moved, seconded by Dr. CHAPMAN, that a committee be appointed to take that portion of Mr. Jacob Bell's bill into consideration. The motion was agreed to, and Dr. Dudgeon and Messrs. Turner and Walker were appointed as that committee.

Dr. RUSSELL then read the report of the Provisional Committee, which had been appointed the night before to take into consideration the several propositions that had been brought before the Congress, as to the best mode of meeting the aggressive measures of some of the corporate bodies inimical to homœopathy.

The report was as follows:

"At a meeting held at 22, Brook Street, Grosvenor Square, this morning, July 24th, 1851, of the Provisional Committee appointed by the Homœopathic Congress of July 23rd, 1851, for the purpose of taking into consideration the several resolutions proposed to Congress, they unanimously recommend that an association of professional and non-professional homœopathists be formed at once, to take immediate steps for removing the obstacles which at present prevent properly-qualified candidates for degrees in medicine from receiving license to practise, on the plea of their showing any tendency towards the doctrines and system of homœopathy.

"The Provisional Committee further recommend the immediate publication and

Hosted by Google

extensive circulation of a pamphlet to instruct the public upon the grounds of the grievance of the homœopathic body, and the plan of proposed redress.

"The Provisional Committee also recommend the immediate preparation of a petition, to be presented to the Crown, to obtain the appointment of a board of medical examiners, duly qualified, to examine and certify as to the proper qualifications of candidates proposing to practise homœopathy; and in order to obtain as numerous signatures as possible, by those who are favourable to homœopathy, the Provisional Committee recommend the appointment of local committees in the different districts of the United Kingdom.

J. RUTHERFURD RUSSELL,
T. R. LEADAM,
DAVID WILSON,
W. MACDONALD, M.D.

It was stated by Mr. PEARCE and by Dr. CRONIN that the English Homœopathic Association was already such a body; and that it would be sufficient to refer this question to them. It was argued, on the other hand, that, without any disparagement to the English Association, there were some persons who would not become members of it, and that the present object was to aim at the union of all; and again, that the English Association was for general objects, whereas the association now proposed was for a specific purpose, and would cease as soon as its specific aims were accomplished; whereas the English Association might continue to exist for any length of time, as its objects were general.

The Report of the Provisional Committee was then agreed to; and it was determined that when the Congress should be declared to be at end by the Chairman, the members present should at once form themselves into an "Association for the Protection of Homœopathic Students and Practitioners."

On its being mentioned by several gentlemen that it had come to their knowledge that the homœopathic globules were sometimes spoiled in tropical regions, from deliquescing, the Congress recommended that the attention of the homœopathic chemists should be directed to this subject.

Dr. RUSSELL then presented preparations of the *Coluber Naja*, which had been made for him by Mr. Turner, and invited the members of Congress to *prove* it.

Dr. CHAPMAN proposed, seconded by Dr. CHEPMELL, that Leamington should be the place of meeting next year.

Dr. MACDONALD moved, seconded by Dr. DUDGEON, that Edinburgh should be the place of meeting. This amendment was adopted by a considerable majority. Drs. Russell and Wielobycki were appointed Secretaries, and Drs. Scott, Macdonald, and Beilby as a committee for the next annual Congress.

The Congress was then declared to be at an end.

Dr. HAMILTON was then elected to the chair; and the gentlemen present, on the motion of Dr. RUSSELL, seconded by Dr. MADDEN, formed themselves into an "Association for the Protection of Homœopathic Students and Practitioners."

After a great deal of discussion, the plans for carrying out the views of the Association were referred to a Committee, consisting of—Drs. Madden, Dudgeon, Black, Hamilton, Macdonald, Russell, Chapman, Drysdale, Fearon, Curie, Norton, Laurie, and Ozanne, and Messrs. Hering, Leadam, Yeldham, Wilson, and Blake, with power to add to their number.

A great number of the members of the Congress dined together, on the evening of the 24th, at Soyer's Symposium. There were at least sixty gentlemen present. The chair was very ably filled by Mr. SHARP, of Rugby, and grace was said by the Rev. W. J. CHEPMELL, Rector of St. Sampson's, Guernsey. On the removal of the cloth, the Chairman proposed the health of the Queen, with congratulations on the privilege they all enjoyed in living under so beneficent a Sovereign. The toast was received with cheers, and Professor M'DONALD took his colleagues by surprise, with a free-and-easy new reading of a stanza of *God save the Queen*, with a line of a foreign chaunt in it, doubtless the better to harmonize with the year 1851. The Chairman then proceeded: In conjunction with two other members of the Congress, he had, at the request of the meeting of the morning, prepared a paper in accordance with resolutions agreed to on that occasion. He had to place before the meeting two propositions embodying, as he thought, the five resolutions of Dr. Ozanne. (The Chairman then read the resolutions we have already inserted.) These, he thought, constituted their plain and solemn declaration that they, as homœopathic practitioners, had not adopted their plan of treatment on insufficient grounds; that they were not fairly to be regarded as knaves and fools, and that, while satisfied that the law of Hahnemann is a law of nature, they would adhere to it and practise it to the best of their ability. Difficult indeed was the subject, but if fairly investigated, a result might be come to, as free from all uncertainty and refutation as the undeniable law of gravitation, or of chemical equivalents. And he had faith that the day would come when, as the thanks of the world have already been given to Newton and to Dalton, so will they be awarded to Hahnemann for *his* great discovery.

Dr. MADDEN rose to propose the memory

Hosted by Google

of Hahnemann. He should not detain them long, as this toast had been so often spoken to before them, and had been illustrated by the burning eloquence of a northern, and the classical and etymological allusions of a southern colleague. Homœopathy, always well opposed, had lately experienced an opposition more than heretofore systematic and virulent; their opponents begun to think them hard to kill, and they were right. "Man is immortal," said the speaker, "till his work is done. We are contending for a law, not of a college, but a law of nature, a law of God. This law of nature said, *like shall be treated by like*, and none can alter that. How great is the debt due to Hahnemann! Let us pay it by assiduously working at the development of homœopathic practice, in the spirit of Hahnemann himself, whose law is progress, and whose practice was to the last in conformity with it. Let, then, our enemies' attack be but the trumpet-call to buckle on our armour, not for a petty paper war, but for fresh and more assiduous striving after the development of the great truth bequeathed to us by him whose memory we now thus honour."

Dr. CHAPMAN, in proposing the "Progress of Freedom," said that liberty was a subject that especially touched the interests of, and came home to, homœopathists; for their liberty of conscience was invaded by their opponents. As Dr. Madden had alluded to his (Dr. Chapman's) classical and etymological observations, on a former occasion, he might be excused for employing now a few similar illustrations. The word for freedom, in the most classical of languages, was *eleutheria;* if the first, and the two last letters were omitted, you have "Luther," the great reformer. But this word was of particular significance to medical men, for its root was Eleutho, being the primitive name for Lucina, the goddess of midwifery: the same word signifies to go. Lucina, then, delivering the human species from the darkness of the womb, bade those delivered to go into the world, and do their parts manfully. Hahnemann was the man-midwife of old allopathy. He had delivered from the dark womb of that old lady many goodly sons of the better Genius of medicine, and the present company were not bad examples of the species he had brought into the world. The room in which they were assembled was decorated by three paintings, one descriptive of Danae yielding to the gentle solicitations of Zeus, when he descended in the golden shower—she took the liberty to sin; another of Nell Gwyn, who also took the same liberty; and the third of Charles II., of the unfortunate race of Stuart, who took the same liberty. This was not the true liberty, for those who were slaves to sin were never free, in the true sense of the word. But his reign was at least memorable for the establishment of the Royal Society; and he hoped that the reign of her present Majesty would be memorable for the establishment of the Royal College of Homœopathists. Her name, Victoria, was of good omen for the homœopathists; they would achieve victory. Some were afraid of being accounted sectaries. All reformers were subject, of necessity, to that reproach; every successful creed was at first regarded as sectarian. Bishop Horsley had stated that orthodoxy was the *doxy* of the person who held this or that opinion, and that heterodoxy was the *doxy* of other persons from whom he dissented. The homœopathists might be well content to be accounted heterodox. True liberty was a thing of the mind. It was irrepressible. The progress of mental freedom, when men were determined to be free, could not be checked by tyranny of any kind. Galileo, for teaching that the earth moved round the sun, was shut up in the dungeons of the Inquisition. He sighed for air and the light of heaven, and agreed to recant his doctrine; but in the very act of signing his recantation, he said to the inquisitors—"My doctrine is true notwithstanding." But homœopathy could not be shut up. As free men we pursue, and will advance it. It had been his fortune to have been in slave countries, and he knew what physical slavery was. It was one of the paradoxes of the human character, that the nations most remarkable for freedom had been stained by having slaves among them. He need only allude to the Americans of the present day. Even in England, and in the present day, free men did not always concede liberty of action to others,—so the allopathists who made innovations often enough, did not concede to the homœopathists liberty in therapeutics. True freedom,—the spirit of freedom conceded to others the right of freedom. He entreated the homœopathists not to fall under the reproach to which their opponents were subject. None were altogether evil. Let them believe that their antagonists had their virtues as well as their vices. Let them try to win them over by conciliation, and by a tender consideration for them. Again, the homœopathists should be united, and be banded together. It would be well to let the past be buried in oblivion, and to begin a new course from the present day. Let there be no longer dissension and disunion; but let them support each other, as brethren should, according to the perfect "law of liberty." He regretted his poverty of language, but if he had the power of persuasion he would impress on them the necessity for this oblivion of the past, and for cordial co-operation now, and for the future. They all knew the struggles for liberty that had recently been enacted in different parts of continental Europe; but there was one country in which as Englishmen, whose literature and science were so much indebted to it, they must all take interest—Italy; in that beautiful region there was a gentleman present, Mr. Massen, who took the liveliest interest. He had written much and well in support of liberty, and was well entitled to speak on the subject of the "progress of freedom."

Mr. MASSEN, in replying to the toast, observed upon the moral nature of freedom, and the right of every one to be exempt from all opposition but a moral one. The relevancy of the toast to the present occasion was found in the fact that

Hosted by Google

no body of men had been more persecuted than the homœopathists. But the opposition was unfair. A university was at the present moment engaged in preventing even the examination of homœopathy by those desirous of testing its truth or falsehood. But such opposition would be ineffectual; the progress of freedom was certain, and the unselfish spirit of freedom, which laboured for the brotherhood of the human family, would at last girdle the world.

Dr. MARSDEN rose to propose the "Progress of Science and the Homœopathic Hospitals." He imagined the union of the subjects was a hint that we should not, while practising homœopathy, forget science. Diagnosis had been called the science of medicine. Though when the appointed time was come, when the silver cord must be loosened, and the bowl be broken at the fountain, our utmost science could avail nothing to save the patient, it would at least save the practitioner, not taken unawares, but calmly cognizant of the inevitable result. Towards the recognition of homœopathy, he regarded the hospitals now started as one end of the wedge. It had been so in Vienna. Dr. Marsden then referred to Dr. Chapman's recommendation of conciliatory bearing, and enforced it by the consideration that, after all, it was homœopathists who were the opponents of allopathists, and not the contrary. They must remember too, that though homœopathy was a medical truth, it was not the only medical truth.

The CHAIRMAN would make one remark. Dr. Marsden had designated homœopathy as "a truth, though not all truth;" it was, however, a truth that had but now been made known.

Mr. SANDOZ proposed the "Homœopathic Press." Beyond good wishes, and many obligations to it for instruction he had received, he had nothing to do with the press. Let us advocate homœopathy as a truth which we have not merely received but *tested*—you professional gentlemen scientifically, we laymen practically—by submitting ourselves and our families to the system. Only however abused, let us not abuse in return. This he would urge on those who have the command of the press, to banish from their own writing, and cut out from that of correspondents, every word of abuse and vituperation. He warmly recommended the homœopathic press to public support, deprecating the narrow feeling which prompted a man to insist on a work exactly reflecting his own views and notions, on pain of forfeiting his support. This is not the law of liberty. Much depended on the spirit of the press. While he heartily thanked the editors of their periodicals for what they had done, he would urge upon them more and more to conduct them in such a tone and spirit which would encourage and justify us in persuading all, friend or foe, homœopaths or allopaths, to read them. He would urge on medical men the importance of contributing the results of their experience and observation, facts and arguments. They had been charged with backwardness in this matter. Such a thing injured the Cause. Mr. Sandoz proceeded to urge the importance of union. Jealousies, prejudices, and personalities must cease and union come, or the union of opposition might conquer.

Dr. MARSDEN explained. He firmly believed homœopathy to be *a* truth, though not the *only* truth in medicine; for instance, he believed in the water-cure.

Dr. EPPS described the position of an editor as often a most provoking and difficult one, from the conceit of contributors, and the rudeness of correspondents. He amused the company with an instance of a communication not unlikely to be received, contemptible enough to a philosopher, though apt to make a sensitive man wince. He believed an editor must be a despot, and boldly pursue his course unregardful of public clamour. He thought we had a very good medical press. With reference to the backwardness of medical men in contributing, he believed much of it might be traced to the characteristic unwillingness of a first-class mind to view as of high significance what are but its every-day experience. The weekly periodicals he thought of paramount importance, affording opening to much that would never be written for periodicals of longer interval. After paying a compliment to the English Homœopathic Association, which he believed had done more to spread homœopathy than all other means put together, Dr. Epps spoke warmly on the wonders which might be achieved by a cheap press, in the form of tracts for instance. One province of the press he considered was to crush half-and-half homœopathy—and another so to accumulate evidence, as to bring our opponents to this condition, that they shall either conform to our views, or be driven to the admission that no amount of evidence whatever, that could be brought forward would convince them.

The CHAIRMAN being obliged to leave, Dr. CHAPMAN took his place.

Dr. RUSSELL gave "Homœopathic Union and Association." He need hardly recommend association there, beside the Crystal Palace, but he would remind his hearers that association made their opponents what they were. Even the St. Andrew's University, which loomed in the distance like a huge Myth, resolved itself, when analysed, into a certain Dr. Day; a St. Andrew's Day, more arbitrary and unreasonable than the Dey of Algiers, yet who, perhaps, if we had him here over a glass of wine, would turn out pretty much like one of ourselves. "Let us too," said the speaker, "have our association, and we may exchange our Jovian bolts with theirs.

Dr. FEARON said he could understand the best of men having antipathies, but he would wish to impress on them that while a man had a right to make or refuse any personal intimacies at his pleasure, likings and dislikings should never be allowed to prevent co-operation in promoting a great object.

There were several other toasts on the list; "Our Foreign Colleagues;" "The Provincial Members;" and "The Secretaries of the Congress," who had so excellently discharged their functions; but the lateness of the hour brought the very pleasant and friendly *symposium* to an end. All were pleased with the

Hosted by Google

dinner, with the music, with the speeches, which they cordially applauded, and, what is best of all, with each other.

The CHAIRMAN, in closing the proceedings, stated that the next Congress would be held in Edinburgh, and as they had preached up liberty, he hoped those who had voted for Edinburgh would not take the liberty of staying away.

The company then separated: many taking the opportunity of strolling through the unique establishment and grounds, the latter of which, with lamps sprinkled over the lawn, and hanging in clusters from the branches of the trees, looked, in the thick darkness, as if a dew of fire-flies and glowworms had fallen on them. During the evening there was a profusion of music and musicians, both of a decidedly foreign tone, in the opinion of some a little too much encroaching on the speeches. Mr. Sandoz, in noticing this, humorously remarked, that he had been puzzled to see the relevancy of the Marseillaise Hymn with the proceedings, until it had occurred to him that it alluded to the *total revolution* which they too were endeavouring to effect.

ALLOPATHY AND HOMŒOPATHY COMPARED.

BY A PROGRESSIST.

To the Editor of the Homœopathic Times.

SIR,—We believe the master-principle of your journal to be, the right of every opinion to its own free utterance. It is a fact, which will be confirmed by the observation of every man, that the *expressed opinion* of the day, as set forth in public discussions, in journals, or in books, does not represent the *actual opinion* as it exists in the convictions of the most elevated, the most active, and boldest intellects. The truly pregnant portion is suppressed, in deference to some political expediency, social routine, or mercenary prejudice. Before it attains expression, opinion is bated down to an average, and the country is debarred from enjoying the full force of the influences growing within it. You take the lead in opening the issue, by offering a free utterance to the most advanced opinion.

The specific principles which will guide me in these papers, will accord with that main principle. I shall endeavour to go straight to the heart of every question, shall declare my conviction in plain and unmistakable terms, depending on the opinion of your readers. I hold that such a course can be maintained in a spirit to win the confidence of all classes. I shall proceed in investigating these subjects less by destructive than constructive methods. "Revolutions are the violent rents made in the artificial crust of society by the unrecognised institutions growing beneath;" it is only by thorough freedom of opinion that homœopathy can proceed from the difficulties of the Past, through, we hope, a tranquil but energetic Present, to a more glorious Future.

It is the merit of all truly great and well-considered projects to social utility, that they include many advantages beside those which originally entered into the calculation and swayed the judgment of their founders. The originator of the uniform penny postage rate could scarcely have anticipated the numberless benefits that were to flow from the realization of his project. The inventor of the electric telegraph has not, in all probability, so much as dreamed of one tithe of the social blessings that in the ripeness of time shall result from the employment of electricity as the messenger of nations. In like manner, the men who conceived the idea of an Exhibition of Arts and Industry, and a friendly rivalry between the ingenious labourers, whose works are the results of the civilization of the world, were not aware of the vast number of collateral advantages that would spring from the original project. Every day some new benefit is shadowed forth, for which we shall have to be grateful to it, and, as the idea developes itself more completely, the people become more and more aware of the poetical grandeur of its conception, and more and more convinced of its practical utility. Among the many satisfactory results, either near or remote, which have already secured for it the extraordinary popularity which it enjoys, one of the most unexpected, but certainly not the least gratifying, is that of bringing together medical men from all countries to meet at the Congress to further the Cause of homœopathy. To draw those bold and conscientious men together that have followed in the steps of the immortal Hahnemann, who, like other great and good men, having introduced anything more than usually beneficial for mankind, received during his life insult upon insult, and persecution on persecution—to draw medical men to discuss the practical part of homœopathy, and to excite public interest in the Cause, is of itself a gain.

In submitting to the consideration of your readers the opposition of the medical profession to homœopathy, the task I have to perform is both difficult and painful—difficult, on account of the extent of the subject, painful, on account of the nature of the facts to which it is my duty to refer. I do not approach the subject without having carefully examined and weighed, as far as possible, every opinion and every fact

Hosted by Google

connected with it. I, therefore, presume to solicit a patient and attentive hearing.

"Homœopathy,"* it has been said, "is full of foolish pretensions and promises, humbug, or crazy bombast." And again—"Talk of reason! fiddlestick! The man who can waste his time with such nonsense and give it to print, must be a fool, or take the public for fools to believe such things; the inutility of some of the ordinary methods of cure might be caught up, not only by the fanatical apostles and disciples of the homœopathic and hydropathic heresies."†

The *Lancet*, of April 20, 1850, heads an article thus:—

"*The Fraternity of Quackery—Homœopathy, Mesmerism, and Hydropathy.* If we could set aside the profound regret that such intellects as those of Lord Robert Grosvenor and his friends should be debased at the miserable shrine of Hahnemann, the quack and impostor, and that the poor and humble should have their life and health consigned to the weak-minded dupes or cunning tricksters who practise the homœopathic deception, we should rejoice at the prospect of having two homœopathic hospitals in the metropolis, if those who are really sick of formidable diseases, and not merely those who are hipped, be admitted into these institutions."

Again:‡ "If an enthusiast takes it into his head to walk about with a farthing candle, and fancy it light from heaven, we are not to be allowed to smile at the delusion till we have climbed up an observatory designed for watching the very stars, and from so exalted a position take note of so ridiculous a phenomenon."

There would be little harm in such barefaced injustice, if it was one individual alone who said so, but there is great and monstrous harm in it if all, or nearly all, people are guilty of the same fault; for then it prevents all progress of the science. It is a fault to judge without reasoning, without examining; condemn as absurd or deceptive, without any real knowledge of the subject. It is this fault that has ever been the heaviest curse of mankind; that ridiculed, neglected, opposed such men as Columbus, Galileo, Hervey, Jenner, and all other individuals observing and reasoning a little more accurately than their fellow-men; it is this fault that defamed, tormented, reviled, and persecuted Hahnemann for fifty years. There are many people who find it much pleasanter and easier to laugh than to reason and inquire into the laws of Nature. It is a matter of serious regret when we see important questions laughed at, while ridiculous things are treated with gravity. For my own part, I desire to adhere to no party or practice, except the party and practice of truth and justice, and cannot but express indignation at the outrage thus offered to the natural feelings of humanity. Many a theory has been found false in practice. Many systems have been called theories, which were but a combination of errors. If we have not sense enough to discriminate mere names from matters-of-fact, we may always be at a loss to discern which is which. If we would stupidly and stubbornly tie the mental faculties down to mere plodding in practice, without reasoning and inquiring into the principles, we should have to discard the best part of our sciences, and our progress would have been less. For instance, if an astronomer informs you of the distance and size, etc., of the moon, would you give him the same reply, and say, Oh! a fig for your theorising, as long as you have not proved this by practice; that is to say, not travelled to the moon and measured its distance by the yard-stick.

In every branch of science which depends on the observations of years, it is of importance that its cultivators should review the state of knowledge, and inquire whether the foundation be secure, and if not, to supply the defects which previous ages have left. In entering into the subject of homœopathy with medical men, when one could be prevailed upon to listen and treat the subject seriously, particularly after he had said it was nonsense or humbug, I have heard them say, "Well, we do not mean to dispute, but one might hesitate to believe that there would be any effect produced by the administration of a thousandth part of a grain of *Opium*; or, "Well, there may be some truth in it after what you have stated, but I confess the practice staggers my belief." A homœopathist would say, "Come and see; you would do wrong to believe in it without reason, but you do no less to reject a thing before you take the trouble to inquire into it."

There was a time, within our memory, when everybody would laugh at the idea of running steam-carriages on iron roads for hundreds of miles, at the rate of twenty or forty miles an hour. Now this theory has been verified, and it is done now-a-days, however preposterous it may have appeared some time since. Medical men have seen cases that have been permanently cured by homœopathic and hydropathic measures, and all they can

* British and Foreign Review. † Ibid. ‡ Ibid.

Hosted by Google

say is, if they speak truth, that they are totally unacquainted with the science, and that the matter is beyond their judgment. We wonder why our great philosophers and the learned men of our profession have never devoted some portion of their time to the subject, since the benefit of the system may be proved to them so clearly, that it may be seen every day. The *Lancet* may now "rejoice;" there are "two homœopathic hospitals in the metropolis," and people that "are really sick of formidable diseases in them."

In homœopathy there are many details to be investigated to ascertain the practicability and usefulness of the subject, yet multiplied as may be its details, simple its principles, and great as its consequences must be for mankind, such is the spirit of the age, with all its vain boast of enlightening science, that not one single man comes forward as he ought, to give a fair and candid critique, or rather acknowledgment, on what cannot be denied, though the system has been before the public fifty years, and though the age cannot, with all its conceit, produce anything equal in importance, and equally desirable for people of every class, and for every human being. Silence and misrepresentation of the system by the learned, who boast to be promoters, instructors, or lovers of improvements, of science, of justice, and of truth, are belied by this stubborn fact. The exposition of this method of treating disease, with its ramifications, and objects attainable, stands as yet solitary, as if it were in a wilderness. It belies the opposition of any man who pretends to be an intelligent being, a lover of human progress, of justice and salutary truth, when he shuts his eyes to see, and his mouth to speak candidly on this matter. The darkest ages could hardly present a more disgraceful neglect, or baser misrepresentations than have been shown in this cause. The art of printing, with its rapid literary intercourse, are superior advantages of our age; but that seems to afford no advantage when it concerns the investigation and promulgation of truths of the greatest interest for human kind. When we consider how large a portion of mankind have perished by the hands of ignorant empirics, it surely cannot be a matter of indifference whether homœopathy is or is not a delusion. There is no subject which deserves a more thorough investigation. Some may be ready to exclaim, "None but God can produce so desirable a blessing as this necessary change in the management of all disorders, and the views of medical men;" but God works by human agency and human means. God could have produced such a change in the views of the British nation as to abolish the slave-trade, yet the event was only brought about by a long course of persevering and honourable exertions of benevolent men. God raised up powerful advocates, gave them the spirit of perseverance, and finally, crowned their efforts with success.

TREATISE ON THE ACTION OF IMPERCEPTIBLE AGENCIES UPON THE HUMAN BODY.*

By Professor R. Amador.

Communicated by Dr. Rosenstein.

Professor R. Amador commences this excellent essay with the assertion that each action or impression upon the human body must be vital or dynamical, *Aliments, Poisons, Contagia, Miasmata.*

Stimulants, etc., possess no other but a dynamical action. What has hitherto been attributed to absorption wants a foundation. These assertions require evidence, which may be derived from hygiene, physiology, and toxicology. The author, having shown that each function being strictly vital dynamical, further observes, when atoms have the power to generate whole beings, to which point can we fix its potency or impotency. When an atom has the power to give life, who will consider it impossible that it can change also its nature and being? When the *plus* exists, which is evident by Nature's events, why should the *minus* be considered impossible? Considering the facts of toxicology, the instantaneous death caused by a small quantity of *Acid. Hydrocyan., Aqua Toffana,* and other poisons of the animal and vegetable kingdom, the author draws the conclusion, that life which is the result of a dynamical action, may also be dissolved, destroyed by dynamical action, and everything that gives life is an immaterial, invisible, impalpable power; the invisible conduct everywhere the visible powers. The author cites the opinions of Buffon and Laplace on the internal powers of the human body, its invisible physiology (*Physiologie invisible, Laplace*), and the importance of its laws. He observes that the most formidable agencies in nature are incorporeal, which, like electricity, magnetism, heat, light, have neither smell, taste, colour, nor dimensions, being present everywhere, but invisible, penetrating everywhere, but themselves impenetrable. It is the same in relation to therapeutics.

* From the Bulletin de la Société de Médecine homœopathique de Paris.

Hosted by Google

There are many ways to relieve suffering, but foremost stands the vital dynamical therapeutic, which is the safest and most prompt, most agreeable to cure maladies, also the most rational and the most fruitful in practice.

If we cannot doubt the existence of a dynamical vital hygiene, physiology, toxicology, and pathology, it is evident that there must also be a corresponding therapeutic; still men, who ought to know better, have ridiculed instead of investigating the subject.

The author states that M. Lafarge introduced under the epidermis a five-hundredth, a thousandth, a two-thousandth part of a grain of *Opium*, and the results were the same.

The Principal of the Central Pharmacy at Paris observes that the new iron preparation *Valèts* possesses in very small doses by far greater medicinal powers than the ordinary iron preparations, which are usually administered in larger quantities. All this was accomplished, discussed, and made known by the same Academy which now confesses publicly that a medicine increases in quality in proportion as its quantity is diminished.

We may say this may be true, but it is against common sense. But common sense and daily experience cannot be contradictory; if reason cannot conceive the *rationale* of small doses, it must be set aright by daily experience. Sound reason believed for ages in the immobility of the earth; vaccination was declared to be against common sense: the progress of science and experience has established these truths. Why should we despise a therapeutic, which is but the application of one of our soundest axioms?

The Hahnemannian discovery we also consider to be still in its infancy; it will undoubtedly develope itself in the course of time, and stand as an indestructible monument for all future generations.

THE HOMŒOPATHIC TIMES.

SATURDAY, AUGUST 2ND, 1851.

We commence the first number of our third volume under the best of auspicious omens. A great number of our colleagues met together at the Annual Congress, held in the course of last week; and it was very pleasant to observe that a spirit of cordial union animated the assembly.

Most of the gentlemen who had agreed to read papers, withdrew them on account of the great importance of discussing amply the present state of homœopathy, and the bitter though stupid hostility to our school, unblushingly avowed by the University of St. Andrew's, and by the University and the Royal College of Physicians of Edinburgh.

We heartily congratulate all those who favour our Cause on the formation of an "Association for the Protection of Homœopathic Students and Practitioners." No better mode could be devised for meeting the aggressive measures of our opponents. Our countrymen love fair play, and the public at large will see that we have it. We trust that the Committee of the Association will not let the grass grow under their feet, and that they will be constant, in season and out of season, in carrying out the object of the Association.

It is well known to our readers that we have invariably advocated the agitation for a Charter. Some of our body have a morbid dread of being called what they are —medical sectarians. Every new reformed and reforming body is of course, and by the very necessity of the case, a sect, till it becomes orthodox by meeting with general acceptance.

The sectarian distinction only lasts while the sect is working its way. We must not be afraid of names. This is no time for being thin-skinned. Every man who practises homœopathy, must be prepared for abuse, misprision, and obloquy. It is the time for a cordial union of our own body: the "*disjecta membra*," the dissident and reluctant and self-severed members of the body should be re-joined, to form a harmonious whole.

We see no reason why there should not be one flock, even if there cannot be one fold, of our yet comparatively small body. We should take great delight in seeing the fusion into one of the two London Hospitals. The union would have an excellent effect on the homœopathic public. The few who are opposed to it, should

Hosted by Google

give way to the great number who are in favour of it.

Some sixty homœopathic practitioners have met in Congress, and have decided on a course of resolute action for the defence of the good Cause we all have at heart. Such a numerous meeting has never before occurred in this country. It is a good omen. The next annual Congress is to be held at Edinburgh. We think the friends of homœopathy should collect funds for the immediate establishment of a school and hospital *there*. It is always wise to take the bull by the horns. The time is clearly come for a large hospital at Edinburgh, and there is already an excellent nucleus for a school.

The non-medical supporters of homœopathy should be prepared to be liberal, each with a large "benevolence," for the support of a doctrine they believe to be true, and of a practice which they know from experience to be beneficial.

There is no such thing as standing still, we must advance or fall back. There can be surely no friend to homœopathy, who in this crisis would be content to fold his arms, and look on: there can be surely none so recreant as to fly from the battle-field, and show the craven heart. A gross injustice and a manifest injury have been perpetrated by several corporate and chartered bodies. The British mind revolts from such injustice, and is ever prompt to defend the injured. It should be the part of homœopathists to make known to the British public the injustice and the injury they have received. For this purpose there should be large issues of the admirable paper we have quoted from several times, and which is of sufficient importance to have called forth a long leader in the *Lancet*, we mean the New Test Act.* There should be large issues of short treatises on the subject of homœopathy. There should be frequent gatherings in all the cities and towns to discuss the subject. Eloquent men should give lectures; ready writers should publish rapid and forcible pamphlets. The medical men, who profess homœopathy, should stick by one another. Bygones should be bygones. Every one should throw all his heart into his work.

Through good report and ill report, under the most contrarious circumstances, with the aid and co-operation, and countenance and support of only a very small fraction of our colleagues, we have during two years fought the battle of homœopathy. The importance of such a paper as this is now being acknowledged. We assert that it is the duty of our colleagues to make use of this medium to act on the public mind. We hope that, in whatever way, all of them will do their duty at this time; that each will wear a bold front, and do his *devoir* manfully. *Carthago delenda est:* the stupid hostility of universities and colleges to a method of therapeutics, concerning which they are in a state of the most pitiable ignorance, must be beaten down and expunged. The war we have commenced cannot cease till we are allowed our rights. Seven bishops being unjustly put on trial, caused the loss of a crown to a king:—so many medical men put under the ban of an *ex-cathedra* anathema of the medical universities and colleges, without cause shown, most unjustly and injuriously and contumeliously, must issue in the shame and ignominy of the persecutors.

Professor Simpson makes no end of innovations in his special art, and glories in his *speculum*, and his *sound*, and his *chloroform:* and yet this same professor denies to us the right of acting up to our convictions, and he persecutes that innovation in therapeutics which in our conscience we believe to be necessary and very superior to the general mode of medicine. We are persuaded we should neglect our duty, and falsify our mission, if we did not practise it. "We of Edinburgh," says this portentous accoucheur, "have come to the determination of not meeting homœopathists in consultation," or to that effect.

* The New Test Act: a Recent Conspiracy against the Medical Practitioners of Homœopathy and the Public, by the College of Physicians and the Faculty of Medicine; considered in a Letter to the Patrons of the University of Edinburgh, by an Alumnus. Edinburgh: James Hogg, Nicholson Street.

Hosted by Google

Ex uno disce omnes: judge of all of our most worthy opponents from the conduct of this justly eminent man.

The time is come for a good stand-up fight: and we only wish that our opponents would select two or three champions to do battle, in a knightly and chivalrous way, with the same number of champions on our part. In the discussion of a scientific question there should be no bitterness and acrimony.

We fully expect that at the next annual Congress of homœopathists great progress will be reported; and that our position, both with the profession and the public, will be much improved. In the interval there must be an unceasing "agitation" for our undoubted rights as professional men, and as free-born Britons capable of appreciating freedom, and resolved to have that freedom of professional action which the laws guarantee to us, and which the Crown will uphold for us by charter, if existing chartered bodies turn their bye-laws and their privileges into the channel of an inquisitorial persecution of all such as they may suspect of medical heresy.

A THIRD volume of the *Homœopathic Times* is a slight symptom of progress. It will naturally be anticipated that we shall not allow the opportunity to pass unaccompanied by some observations on the present position and future prospects of the science which we have been deputed to advocate. Lukewarm should we indeed be in a cause which has associated with it the highest attributes of philosophy, did we not endeavour to bring prominently forward a knowledge of the success attending its early career. Few there are who have in reality appreciated the regenerating influence derived from the practice of our school of medicine, who will not be prepared to contend for its truth, and for the stable foundation upon which its principles rest, despite the malignant endeavours of opponents to falsify the fact of its existence.

That homœopathy has achieved an enormous success there can be no doubt. Neither can the public be longer kept in the dark concerning its utilitarian and moralizing tendencies. The experience of every-day life is fast throwing down the barriers which originally impeded the free circulation of information in this respect, and we regard ourselves as humble promoters of the system adopted, to give such information an extended currency. It is alone by popular means of this description that the professional and lay members of homœopathy will satisfactorily check the growth of the virulent opposition distinguishing the proceedings of the allopathic brotherhood, since the dissemination of properly-authenticated intelligence must eventually prove the best refutation of the scandalous falsehoods propagated regarding Hahnemann, his doctrines, and his disciples.

Under the circumstances which now stand identified with the steady movement homœopathy is making in all quarters, there never was a more favourable opportunity of attesting the strength and resources of its followers. Attacked and assailed from the strongholds of bigotry and preconceived perfection, it is essential that every one should contribute his or her mite of experience and information through channels such as we represent, in order to counterbalance and arrest the fearful amount of misrepresentation so zealously paraded against us. No better medium surely can exist than the homœopathic publications of the day. For them and for ourselves we again ask the necessary support. We ask an universal support thus ungrudgingly, because we would not wish to be supposed to be actuated by feelings other than those which ought to direct in so noble and elevating a mission.

It would be ridiculous to presume, in seeking subscriptions for the *Homœopathic Times*, to monopolise the whole of the reading community to ourselves. There are, in addition, two or three other worthy labourers in the field, whose share of patronage they have an equal right to claim. A prompt and generous assistance to encourage us in all our arduous undertakings is highly necessary, if the foes of homœo-

Hosted by Google

pathy are to be combated, and brought to a sense of their true situation.

THIS to our friends in America is sent with a hearty greeting. No more favoured allies are connected with homœopathy than our transatlantic neighbours. The rapid expansion of the philosophy of Hahnemann throughout the whole of the States, clearly shows that vigorous intellect and healthy appreciation have done more to propagate the blessings of the system in the new world, than in many other localities. But then it must be remembered that this does not solely arise from the circumstance of homœopathy having at first been cautiously received there, but rather in consequence of several of the choice students of our illustrious predecessor having made America their adopted home, and the grand sphere of their operations. An excellent and highly-gifted colleague, well-grounded in his medical education, and in the principles of homœopathy, who has spent a year at the European schools of medicine, sails in the mail-steamer, AFRICA, this day, for New York. Dr. Dunham carries back to the United States the esteem, and respect, and best wishes of his colleagues of Great Britain, France, and Germany. We confidently predict, if his life be spared, that his professional career will be a

"A glorious summer for the State of York."

America is now closely identified with homœopathy. The number of professional practitioners, the encouraging support they obtain, and the increase of hospitals and dispensaries on that continent, are startling proofs that what is real and substantial is seized upon with avidity by our Anglo-Saxon descendants, and that they can discern the progress of the revolution about to be effected in the practice and principles of the "healing art."

To render homœopathy alike successful in the two countries, viz. England and America, and thus bring into closer relationship the great humanizing sympathies of the one great race, destined to carry its name and influence throughout the whole habitable globe, we would seek for a more intimate connection between the leading spirits of this important system. As brothers by descent and ties of consanguinity, we would wish to reciprocate fellowship and information with those who on the other side of the Atlantic have adopted for themselves the motto of "*similia similibus curantur.*"

The Cause is worthy of the undivided exertions of all true and disinterested followers of Hahnemann, and no stone should be left unturned at the present juncture to assist and promote a popular investigation which shall carry conviction to the heart of every honest man, that homœopathy and Hahnemann do not deserve the opprobrium cast upon them by the allopathic press.

Ut sementem feceris ita et metes, said the ancient orator; and so shall homœopathists truly find the result, if they determine to persevere. A success awaits them under existing auspices which never could have been secured, had it not been for the almost superhuman efforts of those who have almost life-laboured to bring Hahnemann and his doctrines clearly and explicitly before the multitude.

First difficulties surmounted, popular prejudice in an essential degree overcome, and the large mass of the public anxious to investigate the foundation of a system that is held by numbers to be simple and efficacious, there can be no better time selected for commencing and maintaining this reciprocity. And the more unity is assured, the greater and more speedy will be our victory.

Let only the old medical school find this spirit actuating the two principal sections of homœopathists, and they will soon deem it convenient to set their own house in order. Never before were they reduced to such miserable exigencies to assume a position, which is hourly bringing upon them severe condemnation.

A Translation of the New London Pharmacopœia, including also the New Dublin and Edinburgh Pharmacopœias. By J. B. NEVINS, M.D., London Medical Officer to the West Derby Union Hospital, Lecturer on Botany in the Medical School, Liverpool, etc. Longman, 1851. 8vo pp. 780.

(Communicated by Dr. STRONG.)

THE Royal College of Physicians have immortalized this year* by the issue of their indescribable and incalculable periodical. Savouring in itself but little of the love of antiquity, of modern science, nor of cumulative experience, the text nevertheless gives occasion to commentaries and notes, abounding in these sources of knowledge. As it may be interesting at the present medical crisis to gather the tone and opinion of a less flippant chronicle than the *Lancet*, we give some extracts from the above allopathic work—probably the last of its race.

* The last Pharmacopœia was issued from the College in 1836.

Hosted by Google

"SACCHARUM LACTIS, D. *Sugar of Milk.* It is principally made in Switzerland, where it is prepared on a large scale from the residue of cheese manufacture. *Uses.* It has no medicinal properties, and is chiefly used by homœopathists for the preparation of their globules."

"CARBO ANIMALIS PURIFICATUS, D. E. *Purified Animal Charcoal. Uses.*—Charcoal is never administered internally, except by homœopathists."

"ACONITUM NAPELLUS. *Uses.*—It is used by homœopathists to relieve nervous headaches, and the feverishness of both infants and adults."

"ATROPA BELLADONNA.—Its continued use produces an eruption resembling that of scarlatina, said by German writers of credit to act as a *prophylactic against scarlatina;* it may be tried cautiously and cannot do much harm, if it do no good."

"STRYCHNOS NUX VOMICA.—In *pyrosis,* the late Dr. Belcombe, of York, employed the extract with success; and Mr. Mellon, of Manchester, has lately called attention to its good effects in the anæmial gastrodynia of that and other large towns."

[We have here acknowledged by Dr. Nevins, that homœopathy is a fact. This gentleman is a lecturer on botany, and no doubt knows much more of the properties of herbs and plants, than does the compiler of the New London Pharmacopœia.

Of the immense progress of homœopathy in the last three years there can be no doubt. The madness, the fury, the uncontrollable rage, of those who choose to make a party question of it, and the nuber of medical converts added weekly to our ranks, sufficiently attest this.

The senators of either House of Parliament must do their duty. They must avow their opinions on this subject. There are many about the person of the Sovereign who believe in homœopathy. It is their duty to express their conviction to that gracious Sovereign. It would be base and cowardly that eminent persons, who, either for themselves or for their families, have had recourse to the benefits of homœopathy, should shrink from an avowal of their faith. This cowardice would be so thoroughly un-English, that we cannot suppose it possible any would indulge in this low fear. It has been said that the House of Commons would sneer down any proposition in defence of the persecuted homœopathists, so much the worse for them, should that be the case. We do not believe it. The work, meanwhile, goes on to our hearts' content. What is the valorous University of St. Andrew's to do in Dr. Hale's case? We hope they will bring the question to the arbitrement of law. We fear not them nor all the medical colleges, and halls, and universities in the kingdom. We defy them to the battle.—ED.]

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—To non-professional homœopathists visiting India, few things cause them more anxiety than the impossibility they apprehend of being able to procure professional homœopathic advice. To such persons it will doubtless be a great relief to be informed, either through your Journal or by their medical friends, that Dr. Tonnerre, an accomplished physician, has been practising homœopathy at Calcutta during the last four or five years. Only a few days since I received a letter from him, describing in glowing terms the unexpected success he had met with: a success the more remarkable, on account of the all but impassable barriers of conservatism and exclusiveness which surround every institution, whether native or European, in India. In spite of a course of opposition from the orthodox practitioners, surpassing in virulence and bigotry anything of which even Halifax can boast, he has succeeded in introducing homœopathy into some of the first families of the place. Among the natives, especially the more wealthy and educated, it is preferred before any other system: as an instance of which I may state, that Dr. Tonnerre was appointed medical attendant to the Nepaulese Ambassador and his suite, during their stay at Calcutta *en route* to England.

Apropos to the remarks made at the Congress on Thursday evening, concerning the effects of hot climates upon homœopathic globules, Dr. Tonnerre observes, in speaking of some medicines he wishes to be sent out to him, "I desire the triturations and tinctures, because the globules melt very soon in this country."

I am, Sir,
Your obedient servant,
STEPHEN YELDHAM.

London, July 29th, 1851.

To the Editor of the Homœopathic Times.

Dunstable, Beds, July 22, 1851.

SIR,—I trust you will excuse a few suggestions I am desirous of throwing out, and which if carried into effect would I believe be of great advantage in introducing homœopathy into rural parts, where it is at present, I am sorry to say, a dead letter.

Having been in practice for fifteen years, and having frequently found how uncertain medicines were in their effects, some years since my attention was directed to the water-cure, more especially as by its means I succeeded in rescuing one of my children from a most dan-

Hosted by Google

gerous illness, when all the usual means had failed. Having performed several interesting cures by hydropathy, I visited Gräfenberg, and other continental establishments, with a view of personally inspecting and inquiring into its merits. I have since adopted it, and I am happy to say practised it with much success; finding subsequently that there were some cases which I could not cure by hydropathy alone, I had recourse to homœopathy occasionally, and took every means to test it, before satisfying myself, as I have now done, of its truth. But what I particularly wish to draw your attention to is, the persecution and obloquy I brought on myself by taking so independent a position as to think and act for myself. The surgeons to the different districts of the Union in which I held office clubbed together, and persuaded the guardians that I should introduce my water-cure practices, and other means unsanctioned by authority, into my district of the Union, and should thereby put the parishes to considerable expense and trouble. This was all done *sub rosâ*, so that I knew nothing of it, not even when I received an intimation from the Board of Guardians that I was no longer medical officer to the district I had previously held, though I certainly began to suspect how matters stood. Without any reason being assigned for my dismissal, I was informed that they had chosen another medical officer in my place, and this too, though contrary to the regulations of the Poor Law Commissioners, which do not permit two partners having separate districts of a Union, as was the case in this instance.

Though the loss of a district of a Union may, to persons not conversant with the subject, appear to be a matter of little importance, yet in the country it often has a very different effect, and particularly so in such a case as mine, as it led some of the guardians to form an unfavourable opinion of me, and consequently to cease to employ me as their medical attendant. Now, as regards attendance on the poor, the Editor of the *Lancet* has for years advocated that parochial attendance on paupers *ought* to be thrown open to all the medical men in the towns and neighbouring districts, who were willing to attend, instead of being confined to a single medical man in a town or district. Another argument used by this gentleman on the subject was that, instead of there being only one medical gentleman authorized to vaccinate the poor by the parish authorities, all would then be allowed to do so and be remunerated for so doing. We should not in this case have so many refusing to be vaccinated, and the prevalence of small-pox and neglect of vaccination would not be so extensively complained of, as has been the case during the last few years.

The advantages, as well as I can remember, contemplated by the before-mentioned gentleman were, that the poor ought to be as well attended as the rich, and that if they did not like, or derive benefit from one surgeon's treatment, they might have recourse to another. The plan, as far as I can recollect, to meet this view of the case, as at different times suggested in the *Lancet*, was to have tickets distributed every quarter to each of the parochial poor who had a claim for medical attendance, with the name of the medical practitioner inscribed on them, and the payment to be a fixed sum per case. Each person would then be able to select whatever surgeon he or she pleased for the ensuing quarter, and would have a card entitling him or her to the services of the medical man whose name was inscribed on it. Now, I have no particular desire to undertake a district of a Union, having as much to do as I can well attend to; but the circumstances I have just stated have led me to the conviction, that unless the homœopathic public can get a bill into parliament putting the homœopathic practitioners on an equal footing with the allopathic practioners in their attendance on the poor, very slow progress indeed will be made by homœopathy in country towns or districts. Many men, who would be rejoiced to introduce so good a system, will be debarred from doing so, for to practitioners of homœopathy in the country, as well as in large towns, attendance on a considerable number of poor people is indispensable to a thorough acquirement of this interesting science.

Again, it appears to me that it might be judicious, quietly and without reference to homœopathy at all, for some member of parliament to moot the question in the House of Commons, as to whether the poor should not have the advantage of choosing whatever surgeon they pleased, for it is notorious that even in allopathic treatment there are different degrees of excellence. Besides, the ignorance of guardians of Unions, in many cases, as to medical skill, and their incapacity in selecting medical officers, have been frequently alluded to, and led to the proposition of having a few salaried medical supervisors, under the Poor Law Commissioners, located in different parts of the country, to take cognizance of the medical department of the Unions generally.

I feel firmly convinced, that if the attendance on the poor were thrown open to the profession generally, it would prove a stimulus to the younger medical men to exert themselves, and strive to raise themselves to a superior position by the cures they would inevitably effect by well-selected homœopathic medicines. You must be aware, as well as I am, that the middling classes are naturally chary of having a new system of treatment tried upon them until they are convinced that the professors of it understand it fully, and how is this to be accomplished but by extensive practice among the poor?

I am, Sir,
Your obedient servant,
WILLIAM FORBES LAURIE, M.D.,
Member of the College of Surgeons,
Edinburgh, etc. etc.

ALLOPATHY AND HOMŒOPATHY COMPARED.

By a Progressist.

(*Continued from page* 8.)

Much prejudice and misapprehension, much apathy and indifference, on the part of both medical men and the public, has encumbered the subject of homœopathy. We are told by the former that it is "an innovation; "that their privileges are grossly infringed," and that the long and expensive education which persons intended for the medical profession are required to undergo, does not secure to them the advantages they have a right to expect; that the "medical corporations and all existing legislation fail to shield them from the aggressions and competition of the unqualified practitioner." Did it never occur to medical men, whilst recording such sentiments, how very similar in the respects alleged is the position of the medical practitioner to that of persons in almost every station in society, professional or otherwise? Whilst hesitating to enlarge on this point, I will, however, frankly admit my impression to have long been that, in the main, medical men are not sufficiently remunerated. "The truth is," says Mr. Erasmus Wilson, "they make a mystery of their art, which being incomprehensible to their patients, they regard it as supernatural and wonderful." This is the natural consequence of training people to believe that drugs are their cure, that they at last value the filthy stuff alone, and despise the judgment that directs it. Truly, indeed, do we deserve Napoleon's contemptuous sneer, that 'England is a nation of shopkeepers,' so long as we tolerate the mental attributes of the medical man only for the sake of enjoying his drugs, and pay *gladly* for the *drugs*, while we repudiate *any reward* as the harvest of a scientific education."

Of the main professed objects of the medical profession, it is impossible to speak in terms other than of high commendation. To see so strong an array of eminent medical men connected with the several branches of the medical profession—men of high moral and professional character—devoting their time and talents to the promotion of a good understanding throughout the respectable body to which they belong, becoming the disseminators of important scientific facts and statistical relations, aiming at honourable distinctions among their fellow-men, to deserve the approbation of the wise and good, and to secure that of the mass with whom they must necessarily come in contact, by the moral power as well as by the physical improvements of this age of discovery, cannot be otherwise than gratifying, and in the highest degree praiseworthy.

If objects like those above described were exclusively aimed at, well convinced are we all, not only would they not be blamed, but that persons of all ranks and classes must cordially assent to the terms of approbation thus feebly expressed. But if, on the contrary, it should appear that they make use of these high-sounding, honourable, and apparently disinterested positions as mere stepping-stones to the development and furtherance of really selfish principles, by which they may interfere with the interests of the public, then, indeed, must the meed of approbation be withheld, and the real motives of the parties laid bare; exposed to the expression of that condemnation to which such conduct must naturally give rise.

Hosted by Google

It may suit the purpose of medical men to argue, that the public are not capable of discriminating between the talented, the qualified, and the unqualified practitioner, and should therefore be secured against the acts of the mercenary and designing, by those who profess to make the public health an object of legislative care. We say, enlighten *the people* on subjects relating to health, and they will then be able to judge who shall be their physician. People of this country will not submit to too much interference with personal liberty and their general powers of discrimination. It has been too much the custom of the profession to decry as heretical everything that did not meet with their notions of orthodoxy. The confident manner in which medical men speak of their own opinions as being orthodox, reminds one of Selden's definition of orthodoxy, "which," says he, in his 'Table Talk,' "means a man's *own doxy*, while heterodoxy is the *doxy* of other people." I ask the candid reader if I am not warranted in what I say, when I call attention to the present rage for *Cod Liver Oil*. A patient may save himself the expense of a fee to a physician, by taking *Cod Liver Oil*, for so sure as he asks an opinion, so sure will this oil be prescribed; and yet none of them can tell the active principle of this fashionable medicine.

Dr. Kaye having witnessed a remarkable cure of rheumatism under its use, introduced it into the Manchester Infirmary, in 1776, and for thirty years the annual consumption of *Cod Liver Oil* at that institution averaged fifty or sixty gallons. But, notwithstanding the favourable result of so extensive a trial, it failed to come into general use as a therapeutic agent in this country. The remedial powers of *Cod Liver Oil* have been generally ascribed to the *Iodine* which exists in it, in some undetermined form of combination; but this opinion appears to be giving way, as the quantity is exceedingly small, and in many cases the oil has effected a cure after *Iodine* has failed. Dr. Pereira suggests that *Bromine* may be the active principle. Others attribute its efficacy to the *phosphoric* compounds contained in it. Dr. Williams thinks that its beneficial influence on the chylopoietic viscera is chiefly due to some biliary principle. Others regard these principles as too minute in quantity to produce any important effects, and consider the *oily matter* itself as the remedial agent; while Dr. De Jongh maintains that it is not to any separate principle, but to the combination of all, that we must look for an explanation of the various and remarkable curative effects of this remedy. Dr. J. C. B. Williams remarks, that it is a highly nutrient material; and it is admitted by all who have used it, that it possesses, in a remarkable degree, the property of fattening those who take it for any length of time. It is unnecessary and incompatible with the limits of this paper to detail the ingenious theories for explaining the *modus operandi* of *Cod Liver Oil*. We know, that, whether the active principle be iodine, bromine, phosphoric compounds, the oily matter, etc., the quantity at each dose must be exceedingly small. May we not inquire if these orthodox practitioners are not acting on homœopathic principles, without being aware of it?

Let us take another instance of the correctness of the orthodox school. Dr. Pereira, a physician to the London Hospital, in his Materia Medica, when speaking of *Opium*, says, "Several physicians, as Dr. John Murray and Dr. Anthony Tod Thomson, consider *Opium* to be primarily *stimulant*; some, as Drs. Cullen and Barbier, regard it as *sedative*. One, viz., Dr. Mayer, as *both*, that it is a *stimulant* to the nerves and circulatory system, but a *sedative* to the muscles and digestive organs; another, viz., Orfila, regards it as *neither*; while others, as Müller, call it *alterative*."

"Again," says Dr. Pereira, "*Mercury* is, by several writers, as Drs. Cullen, Young, Chapman, and Eberle, placed in the class of *sialogogues*; by many, as A. T. Thomson, Edwards, Vavasseur, Trousseau, and Pidoux, among *excitants*: by some, as Conradi, Bertele, and

Hosted by Google

Horn, it is considered to be a *sedative;* by one, Dr. Wilson Philip, to be *stimulant* in small doses, and *sedative* in large ones; by some, as Dr. John Murray, it is placed among *tonics;* by another, viz., Vogt, among the *resolventia alterantia;* by one, viz., Sundelin, among the *liquefacients;* by the followers of Broussais, as Begin, among *revulsives;* by the Italians, as Giaccomini, among *counter-stimulants*, or hyposthenics; by others, as Barbier, among the *incertæ sedes.*

I extract the following from Dr. Black's Treatise* to show there is an equal discrepancy of opinion among this orthodox body, with regard to the cause of disease.

"Let us open, for example, any monograph, and, upon the information therein given, attempt to treat the disease according to the varied opinions as to the nature of the disease. Treatises upon phthisis, gout, rheumatism, cholera, fever, etc., afford ample materials; we select delirium tremens.

"Armstrong regards it as a venous congestion in the brain and liver consequent upon the activity of the heart and arteries, increased by irritation; Klapp derives it from disorder of the digestive organs; Sandwith from abdominal venous congestion; Staugthon from gastritis; Playfair from a morbid state of the liver and intestinal secretions; Goeden finds the seat in the solar and cæliac plexus, and regards the affection of the brain as simply sympathetic; Günther admits a cerebral affection, in the one case idiopathic, caused by metastatic deposits, in the other sympathetic, provoked by gastric irritation; Toepken believes it to be a sympathetic irritation of the cerebral system, arising from the cæliac plexus; according to Perry, it consists in a febrile cerebral affection, inflammatory in a great measure; according to Sutton, in a peculiar irritation of the brain, approaching to frenzy; according to Andrea, Clutterbuck, and Bright, it is the consequence of inflammatory action in the arachnoid and pia mater; Hartes regards it as a superficial erysipelatous inflammation of the cerebrum; Blake as an indirect weakness of the nervous power consequent upon morbid activity of the brain and nerves; Hufeland believes that it is only a passive nervous delirium; Copland admits that it may sometimes be inflammatory irritation, but more generally that it is vital and nervous depression, increased by the morbid impressions, produced by accumulated secretions of a vitiated kind in the biliary system, and on the digestive mucous surface; Wasserfuhr admits that the alcohol is changed into blood, from which arises drunkenness, and from this results a continued affection of the brain, when the alcohol cannot be assimilated; according to Spath, the disease is the result of a rupture of the equilibrium between the brain and the nervous system of the abdomen; Stokes says there are two kinds, one consisting in diminished irritability, the other in increased excitement.

"What rational treatment can we adopt, if guided by such a heap of contradictory and fanciful views?"

For my own part, I make no doubt that homœopathy has been granted to us by Providence in merciful counteraction to this medical confusion. "The science of medicine," said Sir Astley Cooper, "is founded on conjecture and improved by murder." "There has been a great increase of medical men of late years, but, upon my life, diseases have increased in proportion," said Abernethy. "Medical doctrines are little better than stark-staring absurdities," said Dr. Gregory. "I have *wasted* more than twenty years in learning, teaching, and diligently scrutinising every part of medicine," said Dr. Brown. These extracts from eminent men of the orthodox school must convince every thinking person that no possible reliance can be placed upon the experience of any one out of twenty men, when it is found that the experience of each of the twenty is contradicted by the experience of all the others.

This condition of things is much to be

* A Treatise on the Principles and Practice of Homœopathy, p. 104.

Hosted by Google

regretted, when the progress of knowledge and inquiry is constantly developing new truths, and the time will come when homœopathy will need no voice to proclaim its triumphs or its truths; but, meanwhile, it becomes the serious duty of all to investigate its claims, and when convinced of its truth, to join hand and heart in the labour of love; the competent and the rich, with their influence, their talents, and their wealth; the poor, with their mite of good wishes and good words. Homœopathy belongs to the stubborn family of facts—a hardy breed, that will bear much ill-usage, and thrive under it.

It has been stated by the old school that homœopathy cannot be depended on in acute diseases. In my next paper I shall consider this point. I blame the allopathic profession for making these statements, since this orthodox treatment, though handed down for so many years, has proved so very generally unsuccessful. That profession which holds the lives of our fellow-citizens in its hand, it seems to me, is bound by every tie of honour to examine a system that will be likely to alleviate human suffering in any way; but no, they have not done it. They turn up their scientific noses, and pass it by as the "idle wind." Let them forget their science for a while and look at facts. Facts are stubborn things; and all the science in the world won't rub out one simple fact.

ELEGANT EXTRACTS FROM THE *LANCET*.

In a series of articles we have quoted at large from the *Lancet*, not only to show our thorough scorn and contempt for the contumelious and false charges brought against homœopathy and the homœopathists in that quintessence of coarseness and insolence, but to let those of our way of thinking see how we are assailed.

Mr. Turner, the eminent surgeon of Manchester, is gently reprimanded for speaking not unfavourably of homœopathy: as his words afford a striking contrast to the amiable invectives of the *Lancet*, we insert them:

"Look at extremes in practice! One set o men all mercury, another set of men all iodine another set of men all opiates, another set of men all bleeding, another set all blistering, another all purging. Now, this exclusive practice must be undignified, must tend to undignify the profession, and cause it to sink toward the pale of empiricism. Extremes have been especially carried out in the two systems of practice, homœopathy and hydropathy. Now, it is not consistent, nor is it policy, on the part of our profession, to pooh-pooh either the one or the other. There is no system which has not in it wheat as well as chaff, and the great duty which devolves upon us, is to endeavour to separate the one from the other."

We regret that Dr. Adrian Stokes resigned his membership of the Provincial Association. It is always best, we think, to let the onus of extrusion rest on the collective bodies, whether corporate or not, of our opponents. Resignation or withdrawal is considered to be an acknowledgment of defeat. We call the attention of our readers to the leader of last week's *Lancet*, which we give *in extenso*.

Here are unsupported charges brought against some of those who practise homœopathy: the back-stairs and sculleries are invaded by this pander to professional prejudice, and when information cannot be obtained in that way, we presume the Editor of the *Lancet* is *clairvoyant*. Some unmentioned homœopathist is compared to Mrs. Manning. The fatal termination of a case at Norwich is laid at the door of a homœopathist; whereas a few weeks ago, it was stated in the *Lancet* that the opponents of that practitioner had, happily, been called in, in time to save the patient. The coachman of some Lord A—— dies from the effects of over-drinking: this, too, is laid at the door of the homœopathist. Some woman, who dies after having been under homœopathic treatment, (the disease not specified,) expresses her regret in her last moments, and speaks of herself as having been "a sad fool" for having allowed herself to be so treated.

The catalogue of these cases, small as it is, is represented by the Editor of the *Lancet* as consisting of a series of horrors. Excepting the Norwich one, we know nothing of these cases. But the registry of deaths shows that people die who are not treated homœopathically; and we rather suspect that those who investigate the matter will find that most of the "horrors" that occur are not due to homœopathists. We promise our ungracious and "unlovely" contemporary to re-print all his choicest and fiercest bits of would-be eloquence against homœopathy. Let him go on: intellect is always an over-match for brute force. Let him write himself down, but, meanwhile, let

Hosted by Google

the friends of homœopathy see the manner in which the attack on us is managed by this journalist. The gentlemen of our profession, who are opposed to us, can have no sympathy with our assailant; on the contrary, their sense of what is gentlemanly will enlist their sympathies on our side; and some day even the obtuse Editor of the *Lancet* may discover that he has been *writing up* homœopathy instead of *writing it down*, as he no doubt flatters himself he is now doing. We beg leave to state that we take neither his reports of cases nor his testimony for any alleged facts against homœopathy. The very fact that people now consent to die, and their friends assent to their so dying, under the care of homœopathists, is a proof of the advance homœopathy has made. No medical man of any medical sect pretends to have a sovereign power over life. If the Editor of the *Lancet*, week after week, assails homœopathy, it is quite clear he knows that it has become a great *fact*. The very acrimony and bitterness betray a secret fear: the strong do not bluster, those conscious of right do not use such language.

"In a series of articles we have endeavoured to expose the folly and knavery of homœopathy, and to make evident the sordid motives of its professors. We turn now to show the painful effects of this fraud on society, and its deleterious influence on the morals as well as the interests of the medical profession. When these absurdities were in their infancy, it was safe, and perhaps wise, to treat them with derision and contempt; but when, through falsehood and chicanery, they have attained a dangerous elevation, and when it is clear they exercise a fatal influence upon public health, it becomes necessary to follow them through their tortuous proceedings to their last calamitous issues in tragedy and death. In doing this we shall, as far as possible, teach by example; as Sterne, when he would give an idea of the misfortune of captivity, sketched a single prisoner, whose portrait he drew, so we find no better method than the record of individual cases. Unfortunately we are seldom permitted to publish names as the vouchers of medical histories. The circumstances of these deep tragedies are too horribly painful for patient reflection on the part of those who have participated in them. It would be too cruel to gibbet them by an exposure to public indignation. We are, however, as professional men, debarred from any public use of the names given us, by the very manner in which they are conveyed. But should any of the practisers or encouragers of these iniquities recognise their own portraits in our pages, we shall not regret it, especially if it induce them to retire from a scandalous occupation, and atone for past crimes in humiliation and penitence. Abuse of trust, even a pecuniary one, is held not to be a crime in law; but surely, in the eye of reason and equity, and by men of honour, it must be held to be the greatest of all delinquencies. Of such faults, none is more debasing than the abuse of medical confidence—none owns a meaner motive—none is attended by consequences more immediate or so appalling—none, therefore, unmasks a harder heart or a fouler conscience.

"The last two numbers of this journal give striking illustrations of the truth of this. A poor man is seized with strangulated hernia. His anxious friends rush to the doctor, who is a homœopathist. Like most of his tribe, he has neither eyes, nor ears, nor thoughts, nor time, for any but the well-paying maladies of the rich. This poor man is globulized; the fears of friends are calmed by intrepid assurances of his speedy restoration to health; his agonies increase; other and more competent advisers are sought; an operation is too late, though skilfully performed, and the patient sinks and dies amidst the terrors and affliction of his family. He lived in a civilized land, with all the appliances and means of surgical skill ready at hand; but a pitiful quack dared to stand between him and safety. At the inquest on his body, the homœopathic doctor evinced not a feeling of regret. Full of self-approbation and impudence, he excused every part of his conduct. Mrs. Manning, who would have shot a man as she would a cat on a wall, was not more indifferent to her crime than he was to the consequences of his treatment, or rather, no treatment. These men must have hearts harder than the nether millstone, and consciences seared with guilt, to be able to persevere in a life of such infamy and horror.

"Our last week's journal contained the melancholy conclusion of the Norwich case, which affords a good example of the recklessness of homœopathic practitioners. They refuse the aid of the ordinary and rational proceedings of physic, and adopt modes of treatment now opprobriously rejected by medical men on account of their unreasonableness and risk. Conscious of their own falsehood, practising an admitted lie, without compassion and without remorse, they would yet filch unacknowledged credit, and in their ignorance and awkwardness they blunder into crime.

"We have been made aware of the circumstances which occurred in the person of the coachman of Lord A——. He attended his master at one of her Majesty's drawing-rooms on a very hot day in summer, and, while waiting, drank rather freely. He, next day, complained of headache, and was persuaded by the family to place himself under the care of a favourite homœopathist. He was willing enough, as it implied only the swallowing of a globule. The headache increased, and the treatment was continued until the man became delirious. In this case, too, we regret to say that a medical man sanctioned the proceedings. At length an eminent physician was sent for, but too late, as it proved, to save the unlucky patient, who died, leaving a large family in indigence and suffering.

"Some months ago a physician of our acquaint-

Hosted by Google

ance was sent for, to visit a dying woman. He was addressed by the patient in these sad and solemn words, for the truth of which we can vouch:—"Ah, doctor, I am afraid you come too late to do me any good. I have been a sad fool. I know it now." It was indeed too late. She died in a few hours. The trembling homœopath had fled with affected indignation, when he learned that a respectable practitioner had been called to the case, but he did not fail, like the ordinary knaves of his calling, to proclaim that the event would have been different had the patient continued to trust in him and his infinitesimals.

"Yet notwithstanding the existence of such horrors, not in one case, but in dozens, we have before us, at this moment, the account of a wife of a wealthy baronet, who is about to leave town for the season, furnished with an ample supply of globules. This woman, besides consulting more than one homœopathist, has, we regret to say, for her medical attendant, a physician who occupies a most respected station in his profession. He listens to her babble, not only without reproof, but with indulgence amounting to encouragement, and thus she goes into the country to spread mischief all around her. Armed with such dictatorial power, her neighbours scarcely venture to oppose her, and a great portion of the clergy, ready to eat humble-pie at her table, do her bidding, and propagate her poisonous advice, while few of the medical practitioners in her neighbourhood, though all are deeply injured by her folly, dare assail it. But we tell our country friends, and particularly her family surgeon, that if they would relieve themselves from oppression, and check an injurious encroachment, they must learn to speak out. We have done our duty, and shall continue to do so. But our hands would be much strengthened were the strong will of the profession heard in that deep earnest voice of conviction which awakens sleepers, detects offenders, and rallies scattered friends. The dull and ridiculous spirit of resistance rife in our inert and foolish colleges, will and must give way before general indignation. Censors and Examiners, Elects and Councillors, and Fellows, will show the requisite alacrity to meet the desires of their professions, when these are emphatically and unmistakably pronounced. We shall then no longer be affronted by the spectacle of quacks appointed to be public orators, and insulted at every corner of the street, and in every newspaper, by the open exhibition of the degraded offices of the profession. Chevalier Bunsen, the patron and dupe of every variety of quackery, will not again adjourn himself from the meetings of the Homœopathic Hospital to the meetings of the College of Physicians, nor be invited by president and fellows to meet our declared enemies, and the enemies of the medical profession. These things achieved, it will be difficult for a conceited and fashionable physician to whisper away the interests and honour of the profession in the ears of a few vain and silly titled women."—*Lancet*, August 2, 1851.

THE
HOMŒOPATHIC TIMES.

SATURDAY, AUGUST 9TH, 1851.

WE invite the attention of our readers to a powerful and liberal article from the *British Banner*, which we have inserted in this week's impression. When such a writer for such a journal takes this view of our Cause, we have, indeed, reason to be hopeful.

Thought is free as the air of heaven. Lord Rosse, by the means of his telescope, discovers starry firmaments in the far-off infinite space,—firmaments assuming the most grotesque shapes. Lord Rosse is not ridiculed. We apply to the healing of disease instruments as beautifully adapted to their purposes: sciolists admire Lord Rosse, but laugh at us, or endeavour to persecute us. Sublime as are the discoveries made by the telescope, more wonderful still are those made by the microscope.

We deal with the molecules, the atoms, the infinite congeries of which make up the sum of the human body. All true and sound philosophy bears out our views. Yet men are to be found who profess to have scientific knowledge, that affect to scorn this beautiful philosophy of Hahnemann.

Much as we venerate that great genius, we doubt if he was himself aware of the full grandeur of his magnificent conceptions, and of their ultimate result on the destinies of the human race.

Had the family of the *Medici* been under homœopathic treatment, the probability is that it would not have become extinct. A congeries of atoms make up the mountain. The human body is made up of atoms. We deal with these.

The ordinary method of medical treatment acts on specified parts of the body through the mass of that body. Homœopathy acts specifically on parts, it may be atoms, and from parts on the whole.

We go ahead, as our brother Jonathan

Hosted by Google

says. Our philosophy, reduced to practice, is coming home to the business and the practical life of our fellow-citizens. Let the *Lancet* rave; let the mythical St. Andrew's fancy itself to be a power; let imperial Edinburgh disgrace itself through its Medical Faculty; let dominions and powers, as unsubstantial as the shadows on the walls of their places of assembly, play the part of tyrants, we laugh at them, we hold them effete, ridiculous phantoms of a barbaric age. We prefer a living *clientelle* to the dead images of Pompeii.

ENGLISH HOMŒOPATHIC ASSOCIATION.

The Annual Meeting of this Association will take place on Tuesday next, the 12th instant, at the Freemasons' Tavern, Great Queen Street, Lincoln's Inn Fields. The chair will be taken at half-past seven o'clock p.m.

This Association has already done so much for homœopathy, and is capable of being turned to such excellent account for the defence, advancement, and establishment of our true medical reform, that we cannot too urgently press its claims on the attention of our medical colleagues, and on the homœopathic public. We should be glad to know that every individual, who favours homœopathy in these realms, was enrolled as a member of this Association.

It is by the demonstration of numbers that we can best influence the public. We know how multitudinous is the host of those who are on our side, but the public does not sufficiently know it.

The Hahnemann Hospital is already deeply indebted to this Association; and we trust that its Medical Staff, and the members of its Medical Council, will be present at the Meeting on Tuesday next. We shall be glad to see there *all* the metropolitan practitioners of homœopathy, and as many of the gentlemen practising in the country as can possibly attend.

The Meeting of last year was a splendid one; let this be more splendid still.

There is much work to be done. A portion of the medical press is most bitter in its hostility: some of the medical corporate bodies have unblushingly avowed their intention to stifle homœopathy, if they can, by refusing their diplomas to any suspected of any leaning thereto: a conspiracy is a-foot to disparage, vilipend, and hold up to contempt and hatred those who are called homœopathists. The attitude of a medical sect was not assumed by us, but has been forced on us. Like some sea-Pharos, we have to bide the violence of angry surges, and the roar of waters in a state of furious ebullition. We require concert, and co-ordinate action on our part—the wisdom of a council, the enthusiasm of a public assembly. We want the clear notes of the trumpet of Fame to declare our struggles and doings during the present time—our hopes forthe future.

Powerful tracts, *conciones ad populum*, should be issued every week.

In all directions, in which we look for the wherewithal to defend our position, and to advance our outposts, and to introduce our *battalia* into new fields of action, the English Association is capable of doing vast good to our Cause.

The following statement, extracted from the *Times*, of July 22, displays in such a remarkable manner the value of homœopathy as a remedial agent, and so clearly demonstrates the truth of the Hahnemannian law, *similia similibus curantur*, as to make it peculiarly fitting for record in the *Homœopathic Times*. The conclusive evidence that is here afforded of the efficaciousness of the homœopathic method of treatment is the best refutation to the charges of quackery and fraud, so unsparingly heaped upon the professors of homœopathy by its opponents, whilst it will also tend to show, even to the most sceptical, that a science which can furnish such indubitable proofs of the soundness of its principles demands a thorough investigation ere it can be pronounced as erroneous. Nor will such cases as these fail to have their due influence on the popular mind, if properly represented.

Hosted by Google

The circumstances here stated must have come under the cognizance of a large number of persons, and have become a subject of general interest, consequently presenting a favourable opportunity for showing the benefits derivable from such a mode of treatment. It is only by such indisputable facts as the following, that any impression can be hoped to be made on that portion of the community which it is so desirable should be convinced of the truth of our law of healing; for so tenaciously do they cling to old opinions, that it is a work of difficulty to engage their attention to any novel system which interferes with this settled belief, unless its direct practical advantages can be made evident to them, and then their incredulity gives place to an earnest faith, the sincerity of which they evince, by becoming the warmest and most strenuous advocates of their newly-adopted opinions. We trust, then, that by such means homœopathy may be extensively promulgated, and therefore it is that such communications as the following will always be received with pleasure.

To the Editor of the Homœopathic Times.

SIR,—Enclosed is an account of a person at Sunderland who, in the late storm, was struck by lightning, and at once deprived of speech and hearing. The homœopathic application of *galvanism* afforded prompt relief and probably recovery.

Yours, etc., G. STRONG.

The Chase, July 24th.

"THUNDERSTORM AT SUNDERLAND.—On Friday evening last, about half-past six o'clock, the town of Sunderland was visited by a destructive thunderstorm. A large ball of fire, having a blue appearance, and being tinged with red, was seen to descend and fall upon the lower part of the town; this was immediately followed by a tremendous peal of thunder. The sky for several moments was completely illumined with sheet lightning, which was followed immediately by a heavy shower of rain. The electric fluid struck the chimney of a house in Burleigh-street, which was shattered to pieces, and the bricks strewn in all directions. The electric fluid passed down the chimney; several pieces of wood and iron were thrown about in the attic; it then passed down to a room in the third story, stripped the plaster from the wall, tore up the hearthstone, and broke all the windows. In the second story there was a cast metal stove which seemed to have attracted the electric fluid, for a large stone chimney-piece was thrown out of the wall on to the floor, and a door shattered. A boy, named Baily, was struck with lightning; he was taken up in a state of insensibility, and expired the same evening, at nine o'clock. In a neighbouring house in the same street, as Mrs. Woodcock, a married woman, was sitting at needlework in an upper room, the electric fluid struck the needle and thimble on her finger, and she received a powerful shock which threw her on the floor; when taken up she was found to have completely lost her speech and hearing. She was immediately attended by Mr. Dickson, surgeon, and recourse was had to galvanism. The apparatus was brought, and a gentle current of the electric fluid was passed through her frame for about a quarter of an hour, and she again received her speech and hearing; although extremely weak, she is likely to recover. During the whole evening the street was crowded by a dense mass of people, and the greatest excitement prevailed among the inhabitants of that part of the town, which is principally occupied by the poorer part of the population."

THE WAR OF THE DOCTORS.

THE ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH AND THE HOMŒOPATHISTS.

To the British People.

THE essential principle of Popery, up to the present hour, to a most woeful extent prevails in the high places of medicine. Our corporate medical bodies are the inveterate foes of the grand principle of Protestantism—the right of private judgment. An ignorant and infatuated world has been, time immemorial, deeply in love with art and mystery, of which it has had its fill, and most deeply has it paid for the luxury. It has been unwittingly amused with sounding names and dazzled by splendid pretensions. It has had the science, art, and mystery of government,—of divinity, of law, and of medicine; and the professors of these several sciences, arts, and mysteries have, as their indefeasible right, laid claim to the privilege of acting wholly without any consultation with, or control by, the parties interested in their respective operations. They have, to a vast extent, drank deep into the cup of Popery; they have demanded implicit confidence from mankind. To doubt, was to be condemned as contumacious, and subjected to appointed penalties. Thus the interests and the concerns of liberty, property, physical health, and eternal life, were to be left to the sole and exclusive care of those various corporations! Such was the ancient state of things, and such, to a large extent, it is now in our "most enlightened age." There is, upon the whole, but little abatement either on the side of the privileged or of the multitude. The arrogant and outrageous pretensions of the potentates are but little lowered, and the great majority of a foolish world are well pleased to have it so. Hitherto, but a small portion of mankind have understood the right and duty of exercising private judgment in this matter; they much prefer taking

Hosted by Google

everything upon trust. There are, nevertheless, specialities; the position of the various objects to which we have referred is not everywhere alike. In various countries, but more especially in our own, there is a considerable measure of emancipation as to the science of government; men in large numbers think and speak with tolerable freedom concerning the character and the conduct both of the legislative and the executive powers. In regard to the "science of religion," it is the same, especially in the portion of society called Nonconformist, or Dissenting. As to law, it is not so; things there stand much the same as they did generations back; the bulk of men are wholly ignorant of the necessity, the value, beauty, and glory of just law, and the wrongs and miseries to which a portion of them have, from time to time, been subjected by unjust, oppressive, and cruel enactments, and by the iniquities which have blended with the administration of them. But it is worst of all in the matter of physic. There, system gives place to system, and school to school, and yet the advocates of each system, and the professors of each school, for the time being, lay claim to a monopoly of medical wisdom, and treat with summary vengeance, to the extent of their ability, all those who attempt innovation!

On a former occasion, we were induced to take up the subject of homœopathy, as coming legitimately within the province of humanity, a chief department of our official labours. We were then prevented from completing what we had to say on behalf of the public, by the Papal invasion and the commencement of Parliament, which absorbed both our space and our thoughts, and we have now been led to return to it sooner than we intended, by the extraordinary course pursued by the Scotch Universities, which have commenced a deadly war against the homœopathic practitioners. The Royal College of Physicians of Edinburgh has determined to give diplomas to no man, whatever his talents or acquirements, who has the slightest sympathy with the homœopathic system, and to withdraw such diplomas from all its Fellows who may fall into the heresy. Now, it will be allowed, that this is a very extraordinary measure, and such as the public cannot witness altogether unconcerned. The doctors exist for the public, not the public for the doctors, and therefore this is a matter in which the public, having the chief, if not the sole stake, are entitled and required to exercise a judgment. This right, for them and ourselves, we now assert, and act upon it as the great principle of Protestantism, which applies not less to medicine than to theology. It may be that these Scottish Universities are acting a part which entitles them to the universal thanks of the nation, or it may be that they are acting a part which ought to subject them to universal condemnation; we hold, therefore, that this is a point which ought to be determined. Now we are not going to enter into the matter medically; this is not our business; but the great question is one with which we hold ourselves competent to deal. Is it demonstrated by experience that homœopathy cures, at the very least, *one-third* more patients than the old school? So say the homœopathists. Is it true that the Government of Vienna, probably impelled by the allopathists, at first denounced the introduction and practice of homœopathy, and that they were subsequently prevailed upon by one of the Austrian nobility, to permit the establishment of an hospital—by way of experiment—and that, in the said hospital, which was opened, about the time of the cholera invasion, for cholera patients, and that the Government medical officers, themselves the opponents of homœopathy, reported that while *two-thirds* of those treated homœopathically recovered, *two-thirds* of those treated by the ordinary methods in the other hospitals, perished? Is this true? Is it true that the Government reports of this extraordinary result led Count Kolowrath, Minister of the Interior, to repeal the law interdicting the practice of homœopathy? Is it true that Dr. Wylde, the Government reporter, and opponent of the homœopathic principle, reported to the Government that "the statistics show that the mortality is much less there (in the homœopathic hospital) than in the other hospitals of the city?" Is it true that Knoly, the Austrian Proto-Medicus, published reports in 1838, which exhibited a mortality of but *five or six per cent.* in the homœopathic hospital, while three similar institutions, on the allopathic plan, show a mortality as high as from *eight to ten per cent.?*"

It is stated by the advocates of the allopathic system, and the opponents of homœopathy, that the latter system may succeed in concealing its imposture in the sluggish stream of chronic maladies, but that in acute diseases, which demand immediate remedies, it is impotent. Now is it so? It is just, if report may be credited, the very reverse! From tables before us, prepared by Professor Henderson, of the Edinburgh University, it is shown that in 909 cases of inflammation of the lungs, treated upon the established system, no fewer than 212 died—that is, nearly *one* out of every *four*,—whereas in 299 cases treated on the homœopathic system, only 19 died, or *one* out of every *fifteen* cases. In 111 cases of pleuritis, treated upon the established plan, 14 deaths ensued, or about *one* in *eight;* whereas out of 224 cases of the same malady, treated homœopathically, there were but *three* deaths, or little more than *one* in *a hundred* cases! Again, in 21 cases actually occurring in the Edinburgh Infirmary, upon the established plan, there were *six* deaths, or more than *one* in *four;* whereas, in 105 cases of the same malady, treated homœopathically, there were but *five* deaths, or *one* in *twenty-five* cases!

Now, we ask the Royal College of Physicians, if these things are so? It will surely be allowed that there is, at least, a case made out here for inquiry. These statistics are facts, or they are falsehoods, let their falsehood be arrived at; if facts, let the Royal College of Physicians explain, and vindicate the course they have pursued.

We now proceed with a case in point.

We inserted a paragraph last week to the effect, that the Senatus of the University of St. Andrew's had threatened to withdraw a di-

Hosted by Google

ploma from Dr. Hale, of Norwich, because he had avowedly adopted homœopathic principles, and expressed our disbelief in the allegation. We now, however, begin to entertain fears that it may, after all, have been true; for, from a letter which we have since received, we find that a like course has been adopted by the Royal College of Physicians, Edinburgh. This letter originated in the issuing of a series of resolutions by that distinguished body relative to all practitioners of homœopathy, constituting Fellows of their College. These resolutions were passed May 9, 1851, at a meeting expressly convened for that purpose, and with entire unanimity. (See *Homœopathic Times*, No. 97, in which they were given.)

This manifesto was left to exercise its own effect on the minds of the Fellows of the College; they are to understand this as a significant hint either to recant or withdraw, and that, failing of this, they will be expelled. Such Fellows, then, may do one of three things—they may renounce their homœopathic principles, or, at least, desist from acting on them; or they may wait in silence their expulsion; or they may defend themselves by protest or otherwise. Dr. Macleod has preferred the last course-and, to crown his reasons for so doing, is the, object of this very able, copious, and temperate pamphlet. The Doctor lost no time in doing what he has done, although he apologizes that it was not done earlier. The resolutions were passed on the 9th of May, and the pamphlet bears date the 28th of June, and is addressed to Professor Simpson, President of the Royal College of Physicians. A copy of the resolutions, it seems, was sent to Dr. Macleod, among the other gentlemen who had fallen into the homœopathic heresy. At first, he was disposed to disregard the denunciation, and to deny the authority of the requisition; but it seems such a use has been made of the resolutions, as to compel him to speak out; in consequence of that document, "disreputable imputations" regarding every one who has embraced a new theory have been recklessly made. The author, in proceeding with his defence, gives the history of his own studies, which is certainly such as few can boast; at any rate, not many have had more extensive opportunities of study. He commenced his career in Edinburgh, where for years he devoted six hours a day mainly to the business of the dissecting-room for nine months in the year, and laboured with zeal in the Royal Infirmary for upwards of three years, performing nearly all the weights and measures made there during that period. He went the round of the hospitals, when the physicians were not there regularly, for several years, watching and examining for himself every case of interest; he assisted in the examination of almost all the bodies of those who died in the hospital. In a word, he did all that was deemed necessary or practicable thoroughly to master the science of medicine as it is taught in that far-famed school; yet so unsatisfactory was it, in many respects, that be determined to renounce drug or allopathic practice, and to devote his energies to the study and teaching of anatomy and physiology. Circumstances arose to call his attention to homœopathic practice: having, nevertheless, his doubts about its law, he determined to proceed to Vienna, that he might examine the subject at the homœopathic hospital in that capital, and this he did for four months, studying at the same time the negative practice pursued by Dr. Skoda and the allopathists under one of his colleagues; and, after carefully comparing the results during that time of these several modes of treatment, he was forced to the belief, that the homœopathic was the most efficient, the negative or do-nothing the next, and the allopathic not only the least so, but the most dangerous, and that even in the most skilful hands. While at Vienna, the Doctor, full of zeal and insatiable in his thirst after knowledge, met with some persons who called his attention to the subject of hydropathy, from which they had received personal benefit. Determined to sift this matter to the bottom, he set off to Grafenberg, and spent the autumn and the winter with the renowned Preissnitz. Having thus extended his views of men and things, he returned again to Scotland, a believer in the efficacy of minute doses, when properly administered, in the cure of many diseases, and also satisfied that water, for divers maladies, was a powerful medical agent. Declining several situations which offered, he accepted the office of physician to the establishment of Benrhydding, where, he says, "I have spent some five happy years in discharge of the duties of my office, and have enjoyed the privilege of treating no fewer than 6,000 cases." Dr. Macleod goes on to complain of those men in the profession, who have chosen to take part in this controversy; insinuations of the most unworthy description have been, and still are being lavishly scattered, with a view to damage, at all hazards, the repute and authority of the objects of their displeasure. He then proceeds, with an elaborate argument, into the character and merits of which we cannot enter, since it lies beyond the scope of our present article; it is, moreover, of a nature somewhat technical. Passing over this then, we proceed to that which concerns us, and with us,—all mankind. Our present object is to remark on the closing, and, as they may be designated, the practical portions of the pamphlet. The author tells the President that he considers such a display on the part of the College, as eminently hazardous to its future reputation, unjustifiable in its present position, and by no means calculated to exert any beneficial influence, in furtherance of the public safety. Dr. Macleod has shown that whatever unanimity there may be among the physicians as to the truth of homœopathy, and its practitioners, there is very little as to their own medical practice. Not satisfied with defeding himself and his brethren, he becomes, in his turn, assailant, and he here displays a capability, if he chooses to exert it, of carrying on the war with no feeble hand. The Royal College issued a ukase, stamped with authority; Dr. Macleod meets it by the calm statement of a few facts—facts of a nature the most damaging to anything like science or consistency. The following

Hosted by Google

will speak for itself. (See *Homœopathic Times*, No. 104, in which the extract referred to appeared.)

Such was the practice in what long claimed to be the first medical school in Europe! Such is the system which demands the homage of mankind, and which pours the bitterest scorn upon men who venture to think it unsatisfactory, and long for something better. But we must leave the three physicians, and turn to the Doctor's account of the two professors, which runs thus;—(See *Homœopathic Times*, No. 104.)

Now, it is to be remembered, that such was the teaching of the College in the experience of Dr. Macleod. Is it marvellous, therefore, if the effect was what he represents it to have been? and is it strange, that he should resent the conduct of the Royal College towards himself and his homœopathic brethren? Was it possible, that such teaching could command the respect of young men of intelligence and reflection, who were anxious to ascertain what is the truth—who are averse to walking in the dark, while performing deeds connected with death and life, and whose honourable spirits revolted at the thought of practising on the credulity of mankind? Dr. Macleod next inquires of the President of the Royal College of Physicians, what is likely to be the effect of the ukase on the country, and on this point he sets forth a series of thoughts which are worthy the attention of all whom the matter concerns;—

"In the first place, what effect can follow from the resolutions, on minds already favourably disposed towards the denounced doctrines? Let us notice how homœopathy now stands, and the nature of its hold on opinion. Has it been accepted only by the ignorant? Is it professed only by quacks and impostors? Let not the College be deceived. Our leaders should not shut their eyes to the fact, that the system in question is assented to by thinkers as enlightened and acute as any in this age, and that its disciples are not of the multitude. Is a man like Bunsen, for instance, or Archbishop Whately, or indeed any one who can probe more than skin-deep, likely to be deceived by the superficial but meaningless unanimity of that ballot-box? The list of its professional cultivators, too, notoriously contains the names of as reputable and instructed physicians as any in Europe. Not one solitary practitioner, I believe, will that unhappy decree turn from his course; nor will it shake the faith of a single patient who has tested the system by experience.—Then again, as to the general public? Is it not the most probable result of a simple authoritative decree like the one we are considering, that it will rather rouse prejudice against it? Those tales of futile and frequent exactions of this sort, in former times, are rife enough to reach and fill the general ear; and, on the face of present circumstances, there is nothing peculiar, nothing to satisfy any one that the old blunder has not been repeated. The decree, I have said, is simple and unattended. It is an utterance from authority regarding certain matters still under inquiry; and it is nothing more. It is unaccompanied by any effort at persuasion, or by the faintest promise of service in the way of clearing up existing difficulties. One great, one inestimable service the College might have rendered; nor is it yet too late. It is a service, likewise, in perfect harmony with our English idiosyncrasy, which, as I have said, is averse to generalization. I refer to the establishment of a great hospital, wherein the operations of the new system of cure might be seen and examined by all; furnishing alike to the student and advanced practitioners the only true means of reaching correct judgment on a matter of paramount professional as well as public concern.

Here it comes out—the facts were known before—that his Excellency Chevalier Bunsen and Archbishop Whately have embraced the homœopathic doctrine, and in them we have two of the most enlightened men of the age—the one of the church, the other of the world—the avowed disciples of the system which has been denounced by the Royal College of Physicians of Edinburgh.

Nor is this all; there can be adduced the names of 3,000 practitioners, very many of them of the first mark in Europe, and not a few chief professors of the universities, and physicians in the courts of kings. But a Bunsen and a Whately in our own country are but types of a numerous class of educated men who entertain similar views. Amongst that class will be found the Duke of Hamilton, the Earl of Wilton, Lord Robert Grosvenor, Principal Scott, of Owen's College, Manchester; the Marquis of Anglesea, and Richard Cobden. What Dr. Macleod calls the "Decree" is, in our judgment, not simply idle,—it is foolish. No men of sense would think the less of the system, and the multitude will think of it all the more. Persecution is always patronage amongst Englishmen. We reiterate our oft-repeated suggestion—a point to which we are happy to find Dr. Macleod referring—that the question is not to be settled by mere authority. The professors of the new system appeal to facts, and on the ground of fact they must be met. We have said we laugh at the globule, but we are rendered serious by the contemplation of the facts, numerous and well-attested, which are, from time to time, coming before us. On this point we have been alike amused and pleased to find that most able man and distinguished physician, the late Dr. Combe, as quoted, using the very words used by ourselves in former articles: his high science and our mere common sense conducted us respectively to the same conclusion. The homœopathists are in earnest; they clearly believe their own doctrine, and they are rapidly placing themselves in a position which will bring matters to an issue. They have already, in London, two hospitals, both in full operation, which are open to the visitation of the general public and the whole medical faculty; while from period to period the results are being published to the wide world. It is, we contend, but just to give them a fair hearing. In the face of England they stand forth in the Capital, and say, "Send us patients labouring under every malady known to human nature, and we undertake to deal with them on homœopathic princi-

Hosted by Google

ples, and to produce effects more satisfactory, and, for mankind, far more beneficial than have hitherto been realized from allopathic practice." Can anything be more rational, more candid, more decisive? But we must give the closing paragraph of the letter, which constitutes a personal appeal to the President of the College of Physicians, who appears to have been one of Dr. Macleod's college companions and early friends.

"Concerning your own action in these recent deliberations I know positively nothing; but I shall not question the sympathy of one who has never been blamed for resisting novelties himself; who has perhaps introduced more serious and startling courses of practice than any other cotemporary British physician; who is certainly not bound by formulæ of colleges, but, on the contrary, who has ventured, on the strength of his own will and resources, to walk all but singly along a most perilous path. Recollections of former times also reassure me. Were I to arrange and compute the value of their influences, I know not—if I have erred—how far I might not plead in palliation *Te Duce*. You have not forgotten that small room, approached by the long passage, where our lamented friend, Dr. John Reid, once lived and studied. Free speech was there, free thoughts, and criticism unchecked. Youth passes, and with it many dreams and impulses. We think, when we begin, that we are to storm the world, but alas! the world too often storms us. Many find it safest to capitulate, and permit themselves to be sold. Still, all these early impulses are not foolish. For myself, I would cherish, as before, fair hopes of success and auspicious fortune; but, foremost, that old and firm resolve, to remain, whatever betide, by honesty and intellectual independence."

These solemn words form a meet conclusion to this very able epistle, by which the College of Physicians, of the orthodox system, have gained nothing—Dr. Macleod and the homœopaths a great deal. The pamphlet will prove a valuable advertisement to both,—and we vouch for it no man, with a fair portion of intelligence, can read the letter with care and candour, without forming a favourable opinion both of the writer and of his subject, and without concluding that he has made out a sufficient case for further inquiry. Let this be granted, and we ask no more; for we repeat, in conclusion, that all we ask is justice, and that we, the British people, have the deepest interest in the question; and we have every reason to be dissatisfied by the conduct of the established practitioners in attempting by mere authority to suppress the new system. We shall return to the subject.—*British Banner*, July 30th.

DR. HALE AND THE UNIVERSITY OF ST. ANDREW'S.

To the Editor of the Provincial Medical and Surgical Journal.

SIR,—On the principle of *audi alteram partem*, and as fellow-sinner with my friend Dr. Hale, whose recent "gross deception" you have so energetically exposed, permit me to offer a few remarks illustrative of my ideas on the subject.

The charge against Dr. Hale, as I understand it, is this:—That when he was examined at St. Andrew's touching his knowledge of the practice of physic, he answered the questions, not according to his own judgment, but in the way he imagined his examiners would best approve of.

But first, as regards the heading of the examination paper. If this was designed to prevent a believer in what is called homœopathy from passing an examination, a gross act of dishonesty was attempted to be perpetrated by the University? On it certain powers have been conferred, to be exercised for a certain definite object. This object is, that candidates who are possessed of a sufficient amount of qualification and medical knowledge shall be empowered to exercise it, in virtue of a diploma received from the University. If a candidate who possesses this amount of knowledge is refused a diploma, the University is guilty of an act of dishonesty towards the practitioner, and of deception on the public. His being possessed of a *greater* amount of knowledge than they require, that is to say, his having acquired a knowledge of the use of a number of remedies of which the examiners know nothing, cannot disqualify him. In all fairness and reason, it ought to be left to *him* to decide whether he shall communicate this *extra* knowledge to his examiners. If he chooses to do so, it is a work of supererogation. If a set of men can be found so blinded by prejudice to a sense of their duty, as to punish a man because he knows *all* that they do, and *something more*, any reasonable amount of "deception" is justifiable, when the object to be attained is a laudable and necessary one, and when, through their dishonesty, it cannot be obtained without it. If you were to be tried by a judge who always managed to obtain the conviction of every prisoner who had red hair, surely if you were so unfortunate as to be of the number, it would be a pardonable deception for you to dye your hair black.

As long as so great an uncertainty appertains to the practice of medicine, the "deception" practised by Dr. Hale is more or less practised by every candidate for a diploma, who has any practical knowledge of his profession. Do you not yourself remember, Mr. Editor, when you were preparing for your examination at "the Hall," that it was again and again inculcated on you, that if Mr. A. asked you a particular question, you were to answer it one way; whereas if Mr. B. asked you the same question, you were to answer it in another? Was it not the same at the "College?" And would you have imperilled yourself by departing one jot from the indicated track?

Suppose a disciple of Broussais were to be examined by a staunch Brunonian (for even such still exist), is it reasonable to suppose that he would contend for all the dogmas of his master? Suppose a hoary-headed disciple of "Young Physic," whose long experience has taught him the dangers of the heroic practice,

Hosted by Google

and that it is much more easy to do harm than good; for example (*vide* Forbes's Review, vol. xxii, p. 243), suppose such an one to be examined by the dauntless hero who presides over the Edinburgh College of Physicians, fulminates anathemas against homœopathy, glories on slitting up the os uteri on the smallest provocation, leaves a sponge tent for days in the womb, physics *ad libitum*, what chance would he have, if, when asked how he would treat disease A, he should answer "do nothing;" disease B, "amuse the patient;" disease C, "give cold water;" disease D, "bread-crumb pills," &c. It would be manifestly impossible for any one so circumstanced ever to obtain a diploma; and such there are in our profession, who probably have been the examiners of the examiners. I might extend these examples to an indefinite length, but I spare you further details; I only ask which of these should cast the first stone at Dr. Hale?

In sooth, Mr. Editor, you are treading on dangerous ground. You are exposing the nakedness of your own kith and kin. You know as well as I do, that if you were ill, and were to consult on the same morning any six practitioners, no two of them would recommend the same treatment. You know that there is no such thing as an approximation to an uniform treatment of disease, and that if a dozen really thinking and practical men were to be examined by the same examiner, and were conscientiously to found their answers on their individual experience, and the examiner was to reward them according to his idea of their merits, no two of them would pass. Such a thing never has and never will be done, as long as medicine remains in its present state. Ninety-nine candidates out of a hundred give a certain orthodox routine practice, which they have gathered either from authors or lecturers who, in practice, would probably be the first to repudiate their own teaching.

One word as regards homœopathy. The practitioners, in many instances, have based their conviction of its truth on large experience. There was a time when they were as sceptical as yourself. Have you, Sir, any really practical knowledge of the system you denounce? If so, for the benefit of the profession, and the confusion of the homœopaths, inform the world of it. Have you ever (as is the case with the humble individual who now addresses you) patiently persevered for months with experiments with the homœopathic medicines? If not, let me recommend you to set about it, or at all events to urge on your readers to undertake the task. I will give a prize of twenty guineas for the best series of experiments illustrative of the *failure* of the homœopathic medicines, if you will give a similar prize for the best series of successful cases; your readers would then be able to decide on facts, not on empty words. Of one thing you may be certain, that the believers in homœopathy laugh to scorn all the attempts at petty persecution and bitter invective founded on ignorance. If their system is true, you might as well attempt to fetter the waves with a thread, as to extinguish the smallest spark of truth which it contains. When their system is *proved* to be false, they, of all others, will most rejoice to aid you in its destruction.

I am, Sir, yours obediently,

GEORGE HILBERS,
M.D., University of St. Andrew's, M.R.C.S.E., and L.A.C.

19, South Bedford Street, Liverpool,
June 23, 1851.

[We extract this letter from a late number of the *Provincial Medical and Surgical Journal*. Once a Dr. always a Dr. The University of St. Andrew's cannot *undoctor* Dr. Hale. What is that Faculty about? They threatened Dr. Hale with a series of "horrors." Has their valour evaporated?—ED.]

Correspondence.

To the Editor of the Homœopathic Times.

DEAR SIR,—The enclosed case is at your service, if suitable for your pages. I do not send it as a model of treatment, for you will perceive I erred in the selection of the first medicine, but it is of interest from its similarity to, if not identity with, true Asiatic cholera.

W. K——, aged sixty-two, 6th July, 1851. Temperate habits; dined yesterday on gooseberry pie, and had had a pint of ale for supper; was quite well when he went to bed last night. Awoke about seven this morning, with desire for stool; on walking across the room fainted, and remained insensible about a quarter of an hour. His face was of a livid colour, covered with profuse cold perspiration, and he passed urine involuntarily; about an hour afterwards had a copious liquid stool, and fainted again. He was carried to bed, and on attempting to sit up fainted a third time, and his bowels were moved involuntarily. Vomited twice, the first time apparently the food taken the previous evening, next a watery fluid. He has been very cold; hot bottles have been applied, without warming him. Has had since ten a. m., severe attacks of cramp, first in his feet, and then in legs and thighs. First seen at one p. m.; restless, will not lie with bedclothes on; thinks he is dying. Surface very cold; covered with profuse, cold, clammy perspiration; great thirst. Pulse scarcely perceptible; merely occasional fluttering in the right arm, quite imperceptible in the left. Face cold; features much sharpened; eyes sunk, surrounded with a livid circle; livid colour, especially of the nose and upper lip. Tongue cold, clammy, covered with thick yellowish-brown fur. Great thirst. Voice low and hoarse; disinclination to speak. No vomiting for the last half-hour. Stools passed as he lies, in jerks, at intervals of a few minutes; lurid, nearly colourless, liquid, producing no stain on bed-linen; no urine since that passed involuntarily in the morning, between seven and eight. Cramps severe in legs and thighs; the toes are drawn backwards during the cramps; feet very cold; toe-nails blue; hands cold, but not livid.

Hosted by Google

Hot bottles to be applied round him. *Tinct. Verat.* 3 ; one-fourth of a drop half-hourly.

Three p. m. No change, except the pulse quite imperceptible.

Continue.

Four p.m. General state of stools as before. Complains of burning heat in right hypochondrium, with crampy pain at epigastrium, and intense thirst. No urine. Since half-past three p. m. no cramps in legs, but arms and hands severely cramped; nails blue; skin of the points of the fingers puckered.

Tinct. Arsen. 3 ; one-fourth of a drop at intervals of twenty minutes.

Half-past nine, p. m. Cramps ceased. Skin still cold, but less perspiration. Tongue moist, cold, cleaner. He thinks there is less discharge from the bowels. Pulse 108, very feeble; thirst. No urine.

Continue.

Half-past ten p. m. Discharge from bowels leaving a pale yellow stain. Skin not so cold; no cramp; pulse firmer. No urine.

Continue *Arsen.* half-hourly.

July 7th, half-past eight, a. m. Slept at intervals. No cramp; skin of nearly natural temperature. Pulse ninety-six, pretty firm. Tongue still cool, and furred. Stools frequent, liquid, leaving stain as reported last night; no urine. Thirst; voice hoarse and low. Troublesome cough, causing pain at umbilicus; no pain or pressure either there or at hypogastrium.

Continue *Arsen.* hourly.

One p. m. Voice stronger. Stools liquid, and still passed involuntarily; no urine. Skin warm; pulse ninety-six. Tongue cool, with thick yellow fur. Frontal headache; eyes suffused.

Continue.

Eight p. m. As at last report. No urine.

July 8th, eleven a. m. Slept at intervals; feels better. No stool nor urine. Pulse eighty-four; good strength. Voice stronger. Complains of hunger.

Continue *Arsen.* bi-hourly. To have a tablespoonful of thin gruel bi-hourly, between the doses of medicine.

Evening. Passed urine three times; no stool. Free from pain. Complains much of hunger.

Omit medicine. A tea-cupful of gruel for supper.

9th. Slept well. Passed urine three times. Pulse eighty-four, natural. Tongue cleaner.

No medicine. Gruel for breakfast and supper; a little plain boiled rice for dinner.

10th. Frequent ineffectual desire for stool and urine, though a good deal of urine passed. Pulse ninety-six; skin dry. Frontal headache and giddiness on attempting to sit up.

Nux 3 ; at bedtime. Continue diet.

11th. One liquid bilious motion; passing urine freely.

Omit medicine. Continue diet.

12th. A formed, rather costive, motion; in other respects better. He was allowed animal food on the 13th. Has continued gradually to improve, and to-day has been out. The secretions from the bowels and of urine *natural.*

Believe me, dear Sir, yours very faithfully,

Hull, 56, Prospect-street, G. ATKIN.

July 16, 1851.

Miscellaneous.

THE DUNDEE HOMŒOPATHIC DISPENSARY was opened June 15, 1849, for the purpose of affording gratuitous advice and medicine to the poor; Dr. Cockburn attends from two to three p.m., on Mondays, Wednesdays, and Fridays. It has just issued its First Report, from which we extract the following:—

During the 1st half-year		156	Patients were	admitted.
During the 2d	do.	132	do.	do.
During the 3d	do.	139	do.	do.
During the 4th	do.	552	do.	do.
During the two years		979		

The above statement shows a large increase in the number of patients attending the Institution, and gives the best evidence of its great value to the sick poor. This increase has been brought about entirely by such patients as have been either entirely cured or benefited — these having circulated the result of the treatment among their neighbours. By far the greater number of cases were of a chronic character, not a few of these of many years' standing, and some who had been dismissed from the ordinary Medical Institutions as incurable. Almost all the patients have appreciated the value of the treatment, and expressed their gratitude for the benefit derived from it.

CHESTER HOMŒOPATHIC DISPENSARY.—The above Institution was opened on the 31st of March, of the present year, under the direction of a committee of management. Since which time to the 30th June, 207 patients have been admitted.

ALLOPATHIC CANDOUR. — "We have received," writes the *Lancet*, in its notice to correspondents of July 19, "two or three communications respecting the appointment of Mr. Newman, a homœopath, to the Glastonbury district of the Wells Union. Can it be that this is the Mr. Newman who was dismissed some years since from the same Union, in consequence of his being a homœopathic practitioner? We are informed that he is, and that the Poor-law Commissioners have ratified the appointment made by the board of guardians! The excuse is, that no other *qualified* man in the district tendered for the appointment. Can this be true? We have heard also that not one of the three other surgeons of the Union has protested against the election of Mr. Newman. NO WONDER AT THE PROGRESS MADE BY (HOMŒOPATHY) quackery when such appointmeets are made by boards of guardians, and silently tolerated by medical men immediately interested in them."

No. 107. Vol. III. | SATURDAY, AUGUST 16, 1851. | Stamped 4d. Unstamped 3d.

ANNUAL MEETING OF THE ENGLISH HOMŒOPATHIC ASSOCIATION.

On Tuesday evening was held the Annual Meeting of the above Association, at the Freemasons' Tavern. The company at first assembled in the smaller room, but this being immediately crowded to excess, they adjourned, before commencing proceedings, to the large and handsome hall of the building.

Sir John Kennaway, Bart., was unanimously invited to take the chair, and opened the proceedings thus:—In taking the chair, a stranger among you, I do so with regret for my own sake and yours, that the place is not filled by the noble President of this Institution, with whom I have the honour to be personally acquainted, and whose presidentship, all who are acquainted with his public or private character must know, cannot but be productive of advantage and honour. He is not, however, in town, and I take the chair he would have better filled. There are, however, some circumstances to render me not altogether unfit to preside over a meeting of homœopathists. It is said that our medical creed is one hastily taken up and as hastily abandoned. Certainly, to me this remark does not apply; most of those around me are, probably, newer to the subject than myself. This claim, therefore, I have on your attention, that I have given the question a long consideration, judging it as a layman can, as one not called on to attempt any technical or scientific knowledge of the matter, but certainly to make *some* inquiries and obtain *some* knowledge of it. Such knowledge I may claim to have had for twenty years, from experience connected with my own family; for so long ago is it that two relatives derived so much good from the treatment of Dr. Belluomini, that I could not but conclude the system had great claims to attention. From that time all things have concurred to convince me that homœopathy is founded on truth. And now nothing is more clear, than that we can afford to take high ground, and wait with patient confidence the progress which everything shows homœopathy is making. It is not the character of the English to take up with novelties, but rather to receive them slowly and by degrees, and therefore, I am the more struck with the progress the system has made in this country. There are many signs of this. In the towns I have been surprised to see so many shops in which homœopathic articles are sold. In the country I believe it enjoys twenty times the notoriety it ever did. What would it be then, could all who have been benefited by it speak out. For I am persuaded that there is much homœopathy privately appealed to; that many a man turns from his regular adviser and consults, unknown to him, the homœopathic practitioner. And thus the practice is spreading, so that no antagonism, no virulence, can put it down. And when we behold the virulent opposition it has met with in various parts of the country, it is encouraging to know that this is the best proof that we are advancing. Were we doing nothing, nothing would be said. In this contest, all we ask is, a fair field and no favour; and, indeed, speaking as a layman, as one of the public so vitally interested, I demand as a *right*, some means by which we may recognise the educated practitioner from him who buys a few books, and then commences practice. These are the men against whom we want protection, and, no doubt, we shall soon get it. (Cheers.) It would, among other things, remove this difficulty—that if some test could be had, conferring, as in justice it ought, the same rights as in the recognised schools, there would no longer be the heart-burnings, and jealousies, and acts of oppression which are now rife; because if a man discovered that he had been in error, and that homœopathy was a truth, he would lose no privilege, nor sacrifice anything by joining the ranks of its professors. One point has always struck me as most important and worthy of the most striking display, viz., the wonderful extent to which homœopathy simplifies the course to be pursued by a medical man. Under allopathy, there may be no doubt as to the disease, but the difficulty is, how and with what to treat it; but it is not claiming too much for homœopathy, to say that no such difficulty can exist in it; but let the disease be once clearly distinguished and recognised, and the treatment follows. In this discrimination of diseases, in this diagnosis, as it is called, many advantages may at present be on the side of the allopaths; but how mighty the gain to them and the public could we to their skill in diagnosis unite our certainty of treatment. (Hear, hear.)

Mr. Pearce, the Honorary Secretary of the Association, read letters from the Rev. W. Brock and James Wilson, Esq., M.P., regretting unavoidable absence; after which the following Report was read:—

The English Homœopathic Association, the first homœopathic association established in this country, was founded in consequence of an attack on Dr. Curie by the coroner for Middlesex.

The Association originated in the determination to protect the interests of the public, by preserving intact the rights of homœopathic practitioners and students, the ministerers to the medical wants of the public.

Hosted by Google

In the carrying out this determination, it offered its services to Mr. Blake, surgeon, at Taunton; it defended with success Mr. Pearce; it effectually sympathised with Mr. Newman, who was dismissed from his office as surgeon to the Poor-law Union of Glastonbury, because he practised homœopathically; and it has now put itself in communication with the Dean of the Medical Faculty in the University of Edinburgh, in relation to the case of Mr. Pope, with the view of ascertaining what legal steps can be taken to try the question of the assumed right of the Medical Faculty to exclude Mr. Pope from the obtainment of his diploma on the ground that he will not promise not to practise homœopathy. It sought parliamentary information on the case of Mr. Holland, of Honiton, who was allowed to retain his office as Poor-law medical officer, although a homœopathist.

The English Homœopathic Association has issued several publications: "Homœopathy, its Principle, Theory, and Practice," by Mr. M. B. Sampson. The edition issued by the Association is exhausted.

"The Progress of Homœopathy;" this edition is exhausted.

"Homœopathy and its Principles Explained," by John Epps, M.D.

Besides these large works, it has issued other publications; one on "The Prevention and Treatment of Asiatic Cholera," was forwarded to all the members when the cholera was raging.

The committee of the English Homœopathic Association, in calling together the members and the friends on the present occasion, offer to them now assembled the subjoined statement of the proceedings of the Association since the last annual meeting.

This statement, the committee believe, will be of peculiar interest at the present moment, not only as a record of important facts, but also as establishing that the Association is an instrument which may be of the greatest service now, when homœopathy is subject to the grossest attacks, and when it is attempted to hunt down homœopathists.

The English Homœopathic Association was founded for several objects.

The defence of homœopathy against attacks, conceived in an unfair spirit, and carried out by unrighteous means, was one object.

In relation to this, the Association felt it to be their duty to publish a statement of the case of Mr. C. T. Pearce, their honorary secretary. A copy of this statement was transmitted to each member of the Houses of Commons and of Lords; subsequently a petition in relation to the same case was presented to the Commons by the respected president, Lord Robert Grosvenor, and to the Lords by the noble lord's brother, the Earl of Wilton.

The discussion on the petition, when presented to the Commons, had the effect of bringing the case prominently before the House and the country.

Another object of the Association is to publish works explanatory of homœopathy. They refer with pleasure to the work last issued, written by one of the members, namely, "Homœopathy and its Principles Explained," by John Epps, M.D.; a work, for the publication of which the public press has congratulated the Association.

Each member of the Association for 1849 was supplied with a copy of the work, and members for the year 1850, renewing their subscription this year, will be supplied, if not already supplied, with a copy of the work referred to. The committee have further resolved that any new member shall be supplied on the payment of one shilling in addition to his registration fee.

A third object for which the Association was founded, was the establishment of an hospital.

A ladies' committee, in connection with the English Homœopathic Association, had been active in collecting funds, which, with the consent of the subscribers, have been transferred to the Hahnemann Hospital, in behalf of which hospital the committee invite the benevolent activity of the members of the Association.

A fourth object of the Association was to have meetings of the members.

The present meeting is in fulfilment of such object, and the committee would be glad if the funds of the Association allowed of the recurrence of these meetings more frequently, the utility of which cannot be doubted.

All these matters done have caused the Association to incur much expense, and the committee appeal to the members of the Association not only to continue their aid in carrying out the objects of the Association, but to induce all persons zealous of homœopathy to join the Association, and thus augment its strength, and thus enable it to carry out more effectually its objects.

The balance-sheet will show the expenditure and the receipts, and will justify the inquiry, that, as so much has been done with so few means, what will be done when means more numerous, and funds greater in amount, are afforded.

The committee concur in the suggestions of the *Homœopathic Times*. "The attitude of a medical sect was not assumed by us, but has been forced on us. Like some sea-Pharos, we have to bide the violence of angry surges, and the roar of waters in a state of furious ebullition. We require concert, and co-ordinate action on our part—the wisdom of a council, the enthusiasm of a public assembly. We want the clear notes of the trumpet of Fame to declare our struggles and doings during the present time—our hopes for the future.

"Powerful tracts, *conciones ad populum*, should be issued every week.

"In all directions in which we look for the wherewithal to defend our positions and to advance our outposts, and to introduce our *battalia* into new fields of action, the English Association is capable of doing vast good to our cause."

In presenting the Treasurer's Report for the past year, the committee congratulate the members on the increase of donations and subscriptions over the two preceding years. The increase of 1850 as compared with 1848 is £14 1s. 6d.; and as compared with 1849 the increase is found to be £18 14s. 8d. Although the present year has not been so prolific in donations and subscriptions at present—in consequence, as it is believed, of many zealous homœopathists having an erroneous opinion that the primary object of the Association was the establishment of an hospital, and that being accomplished the Association should cease—the committee hope that every member will acknowledge that there is even a greater necessity for its existence and operations than ever; and it is hoped that when those who are in arrears have handed in their subscriptions the Association will, before the close of the year, be in a still more flourishing condition.

In addition to the number of volumes of the work the Association last issued, presented to each member, upwards of 250 copies have been sold to the public.

ANDREW STEINMITZ, Esq., moved the first resolution—

"That the Report be adopted, and the Committee authorized to take such means for its distribution as they might deem best."

He said:—It is, I may say, with feelings of gratitude, that I rise to move the adoption of this Report—gratitude for the most signal benefit received from homœopathy. It so happened, that on a certain occasion, the muscles of the left side of my face became paralysed, my general health remaining as usual. This continuing longer than convenient, I called in a doctor, one of the old school, and an old-school recipe he gave me, viz., apply six leeches, put on a blister, and swallow a black draught immediately. Now, thought I, circumstances have made me somewhat acquainted with diseases, and I know I have not had a paralytic shock; still, such a thing may be impending, and, therefore, though not altogether agreeing with this treatment, I will act as the doctor bids. So I lost a pint of blood, I suffered the blister, and swallowed the draught. "My dear

Hosted by Google

sir," said the doctor at the next visit, "if you had not taken this in time, you would have been struck down." And struck down I was; for from pain and weakness I was unable to move; on which he pronounced me better. (Laughter.) Better! why the day before I had been in good health,—ate well and slept well. I was desired to continue the treatment, and accordingly I got weaker and weaker, and could scarcely speak. He came again, and *cupped* me of a pint, and then once more pronounced me better, on which I declined further treatment. I told him I was sure he was wrong,—that it was a muscular affection, and not a nervous one, and that I should at once attempt to get up my strength by eating, after being almost starved. He took some pains, and succeeded at last, in inducing me to consult a medical man of Norwich, and to him I candidly put the question, "What is the matter with me? is it apoplexy; and would you have applied these violent means?" "Sir," said he, "it was merely rheumatic paralysis, perhaps caused by a chill, and would probably have gone off of itself, or at most by the application of galvanism." Yet here had been a practitioner within an ace of bringing *serous* apoplexy upon me! (Hear, hear.) Now then, said I, for some rational system of physic; for, rather than be sent out of the world by the doctors, I will go out of it by natural means. I read Hahnemann's great work, and this enabled me to recognise in myself so clearly the symptoms of coffee, that I abandoned that beverage at once and for ever for the unmedicinal chocolate, and with the best results; and so becoming more and more acquainted with the subject, I have had the happiness of effecting cures, both of myself and others. Now, there are many who, seeing our little globules, and accustomed to their 10 to 20 grains of calomel, cannot conceive the action of such minute particles; but this arises from too gross a conception of the wonderfully delicate tissues and fibres of the frame. Talk of infinitesimal doses not acting! Why, the disease itself must in its origin be infinitesimal, implicated as it is with fibres too small for the eye to see. Talk of the system being nonsense! you may say so of the most demonstrable fact, because it does not square with first appearances; you may say it of the earth's motion, you may say it of the most sacred truths. (Applause.)

The motion was seconded by THOMAS MILO, Esq., and carried unanimously.

W. SHAEN, Esq., M.A., moved the next resolution.

"That this meeting deeply sympathises with the feeling of Dr. Hale and Mr. Pope, under what they consider to be the unfair course pursued towards them by the Medical Faculties of the College of St. Andrew's and the University of Edinburgh respectively, and will be happy to aid in testing the legality of the proceedings of those corporate bodies."

He then continued:—I stand here a living proof of the truth and value of homœopathy. Eight or nine years ago I was pretty nearly annually in the doctors' hands. Now I have tested homœopathy, and find it wonderfully satisfactory to my health, my pocket, and my family. (Hear.) As the Edinburgh University has lately made itself a subject of much angry remark, allow me to mention what took place there some time back, connected with myself. About ten or twelve years ago, I wanted to pursue a university course of education, and I turned my thoughts to our great universities. But unfortunately I was a Dissenter. The walls of Oxford were therefore closed to me, unless I signed my name to certain theological doctrines, and although Cambridge would not refuse me, yet she would prevent my contending for the honours I aimed at. I therefore went to Edinburgh, and all my associations with it, its professors, its students, its society are of a most pleasing character; so that, although I did not eventually take my degree there, I have ever looked to it with affection as my *alma mater*. It is therefore with the deeper regret that I have heard of the late proceedings, and assuredly, as I could praise her when right, the more warmly will I denounce her when wrong. I have to call your attention to proceedings emanating from three establishments,—the University of St. Andrew's, the University of Edinburgh, and the College of Physicians of Edinburgh; and I call on you not only for sympathy, but for assistance in testing the legality of those proceeedings. The first case is that of Dr. Hale. That gentleman passed his examination satisfactorily and obtained his degree. Subsequently the heads of the University learnt that he practised homœopathy. On their wanting to know if this were really the case, he replied yes, and that he considered himself justified in using that process, which, in his own opinion, was most efficacious in curing disease. (Applause.) Extraordinary as it may appear, the heads of the University thought otherwise. Finding that he continued to practise homœopathy, they called on him to give up his diploma, and this, I am happy to say, he has not thought fit to do. (Hear.) Now for Edinburgh. During last year, Mr. Pope, a student, applied for the usual diploma. He was examined by the professors, who were all apparently well satisfied. After the examination, one of them said, as if making a casual remark, that he had heard Mr. Pope intended practising homœopathy. Mr. Pope replied that he had not made up his mind to practise it, but that certainly he intended to examine it. (Hear.) Then finding that he did not choose, then and there, to declare infinitesimal doses an illusion, they discovered that he was rather "rusty," as they said, in his surgery. I believe we may, without uncharitableness, come to the conclusion, that the only cause of his rejection was his non-rejection of homœopathy. There seems to have been a good deal of friendly feeling towards Mr. Pope on the part of the professors, some of whom let the cat out of the bag, by giving his friends to understand that the examination had been a good one, and the surgical examiner had no doubt, if by the next examination Mr. Pope had come to a conclusion as to globules, his examination would be satisfactory. There is another circumstance. It is usual for the examiners to lay their heads together, and in case of agreeing that a candidate then before them

Hosted by Google

shall not pass, they quietly tell him that he must try again on another examination; but in Mr. Pope's case they did what is usual with candidates, who it is understood are successful, though the official declaration is delayed till the morrow—that is, they politely bowed him out. As one does not see the relevancy to anatomy and surgery of a question as to what a practitioner would consider a *dose of Nux vomica*, it is not extraordinary that an extraordinary meeting of the authorities was held, and the decision was that Mr. Pope must come up again in six months. The third case is worse than all. The College of Physicians of Edinburgh have been exceedingly aggrieved by the leaking in of homœopathy even into their own ranks. In their own body they number several distinguished homœopaths. I hold certain resolutions passed at what is very properly called an *extraordinary* meeting.

"I. That the Royal College of Physicians of Edinburgh did, several years ago, publicly express its opinion of Homœopathy and Homœopathic Practitioners, by peremptorily declining to admit into its body a candidate for its Fellowship who belonged to that denomination; and, consequently, that no Fellow of the College can possibly be ignorant of the light in which all those who practise Homœopathy are regarded by the College."

Now I do not see that every one should be expected to know all the foolish resolutions and stupid acts of a corporate body, nor are we to be called upon for respect and deference to what was long ago done. This is just what we should expect from a chartered set of old-fashioned bigots, but not what we should look for from Modern Athens.

"II. The College regrets that, notwithstanding this decided expression of its opinion, more than one of its Fellows, after being admitted in a different character, have endangered the reputation of the College by becoming Homœopathic Practitioners; and the College expresses an earnest hope that these Fellows, seeing they have thus virtually separated themselves from the College, will spontaneously sever their further connection with an Institution which repudiates them, and from which they can derive, as merely nominal Fellows, nothing else than a false position and a spurious credit."

"III. The College feels the more bound thus to express its opinion, seeing that those Fellows who have become Homœopathists, and any other Medical Practitioners who follow Homœopathy, must necessarily be aliens to the other Fellows, and to the profession at large; inasmuch as no Fellow of this College, or any other physician can, by any possibility, without derogating from his own honour, and from the honour of the profession, meet Practitioners of Homœopathy in consultation, or co-operate with them in the other common duties of professional life."

Such a resolution stamps with indelible disgrace the body passing it.

"IV. That although the College has not thought it expedient hitherto to take any active steps for disclaiming those Fellows who have become Homœopathic Practitioners subsequently to their admission to the College, nevertheless, since it has the power of dealing summarily with those who act in a manner so unbecoming the character of a Physician, it reserves its right to exercise that power when it shall be so advised."

As a homœopathist, I should say the sooner they are so advised, the better. (Loud cheers.) The body of men they attack, are men who have come forward in such a way as to make many begin to doubt the wisdom of that extraordinary meeting. Dr. M'Leod has addressed to the President, an old fellow-student of his, a letter, crushing as an answer to the resolutions, and striking for the intellectual power displayed. There is another view of the matter, extremely important to the subject, and I would call attention to it. In the third resolution these words occur: "Inasmuch as no Fellow of this College, or any other Physician can, by any possibility, without derogating from his own honour, and from the honour of the profession, meet practitioners of homœopathy in consultation, or co-operate with them in the other common duties of professional life." This is not only absurd, but immoral. (Hear, hear.) Dr. M'Leod has shown its absurdity, and asks pertinently, how gentlemen with the same education, under the same professors, having earned the same honours as others, should merely by adopting some peculiar notice, chiefly as to a dose, fall far beneath them in pathology, diagnosis, etc. This is a matter affecting the public most. If we have been inveigled by homœopathic practitioners to be treated, and it becomes advisable or necessary, for the safety of our lives, to have the advice of an allopath peculiarly skilled in a particular disease, is it to be borne that the allopath shall say that the usual relations between the suffering patient and the medical man are at an end, and that they are entitled to revenge themselves thus on the homœopath, and consign us to the grave for no fault even of their own showing, except that we have been deluded victims? Truly is this not only absurd, but immoral. To the next question. Ought this to be submitted to? Is it true that these privileged bodies have acted thus shamefully and betrayed their charge, and if so, what ought we to do? Are these establishments standing up as advocates for finality? Assuredly, as soon as a chartered body cease to be pioneers, they have forfeited their right to the privileges conferred on them. There are several ways in which we may do good service. 1st. We want a fair field and no favour; we want publicity; and all can do something in publishing and denouncing this injustice. 2nd. We can do much in supporting the victims of this oppression, by testing the legality of the measures. Here the University of Edinburgh stands peculiarly open. Pardon me for bringing forward a law book. A lawyer is nothing without his *case*, like a doctor. (Hear, hear.) In this book I find that a tendency to play tricks with examinations has already been tested by the highest court in Scotland, the Court of Session, 1829. The heads of the University wished to exclude a certain professorship, but so far from being irresponsible, they found themselves controlled by the municipality; the provost and town council turned out to be the ruling heads of the University, and they said *This shall be so.* And when the professors still said "no," the town council made a "visitation," and decided that no degree should be granted without examination in the particular study in question. So they went to law, and the municipality gained the cause. It was re-argued; when the whole court decided that professors were

Hosted by Google

wrong and laymen were right. (Hear, hear.) Professors may make rules, said one Judge, but all such rules are revisible by the magistrates. And another took occasion to remark, that universities had been notorious as some of the greatest literary tyrants the world ever saw. I sum up then by saying, that these proceedings are inquisitorial and unjust. That we can assail them by spreading a knowledge of facts, by upholding any who require it, and the assistance of the English Homœopathic Association, testing the legality of past proceedings.

The motion was seconded by W. H. ASHURST, Esq., who said:—My learned friend has left me, as junior counsel, nothing to do. As laymen it is for us to publish abroad this atrocious attempt to make us, whether we will or no, subjects for allopathy; to give the doctor a vested interest in us; to declare that we shall not consider for ourselves, but shall be bled, and blistered, and scoured. Now I am a friend to little pills. I have been myself bled, and blistered, and scoured, and on the point of dying—I recovered. But about ten years ago I thought my time was come; my doctor, however, in the meanwhile had died, and my friends, for I was too far gone to do anything, called in a homœopath, and here I stand, with good health ever since. You would not be likely to see at an allopathic meeting, three speakers in succession rising and speaking with joy and gratitude of what allopathic treatment had done for them. These doctors consider if you take away the physic you take away the bill, but, for us, this is an escape from blistering and scouring, of which I cannot think without a shudder, I have had so much of it. Let me tell you a little anecdote about lawyers. An old gentleman was asked what was the law on some particular point. He replied, that he must send for his junior partner when he wished to know the law of the present day, unless he could resolve to set out afresh on his studies. Now, take the parallel case of physic. Suppose a new light to break in on a man, and see what tasks it imposes—new books to be consulted, new trains of thought to be followed, new labours to be performed, labours, suited only to his passed youth. When, then, we see men actually doing all this, what admiration do they deserve! what gratitude we owe them! How could you stand up to be laughed at—despised; to be told that it was a derogation to meet you; that your fellow-workman or your brother student, according to your rank, shuns you, because, forsooth, you have adopted some peculiar mode of working. It is a matter for the public to see that such men are not hunted down. We have been in existence as an Association now five years, purposely starting at almost a nominal subscription, to come down to the pockets of the public. Then came the prosecution of Mr. Pearce; he was tried, and it was to the attention drawn to the case, and the good advice we got, that we had the declaration of a judge that the prosecution was most disgraceful. Fathers and mothers, knowing what it is to labour for your children, fancy a man thrown back at a point of his life just when you believe he is about to reward you for all your exertions. To the public this is all-important. I, as a layman, am ready to come forward with double what I have ever done; but, as an old clergyman used to say, "if you can't come to the text, come to the Amen." (Hear, hear.) Do not be backward because you are only one—you can never be two; without an audience there will be no speaker; therefore come forward—assist, encourage—even a cheer may do good. All can do something; those who cannot give their tongues may give their presence. Consider how many youths may now he preparing for Edinburgh, condemned to consider how to evade a tyrannical restriction, when they ought to be free to choose according to judgment. It has now, however, occurred, even to Chartists themselves, that moral force is the best for all questions,—this every one is seeing; the public is the true judge; and, looking at the many fathers and mothers here assembled, I say, let us unite in removing an iniquitous restriction, and establishing freedom in all things.

Dr. EPPS moved the next resolution:

"That considering the immense value to society of a diffusion of homœopathy, this meeting recommends its friends to concentrate their zeal by uniting with the English Homœopathic Association, and thus to enable the council to diffuse information on the subject of homœopathy through the medium of tracts, publications, and otherwise."

He said:—Many have asked the use of the Association. I think its use may be seen in this meeting, for it would deserve well had it done nothing more than give rise to the statements and revelations made this evening. The present is a question decidedly for the public. It may be very well for medical men to say, what have the public to do with physic but to be physicked. I say, without their permission, they are liable to be pillaged. It is not as with your butter or your tea, in case of a bad article you can go to another tradesman; but in the case of physic, by the time you have discovered that your article is bad, you are dying, or your child is dead, and it is too late to have recourse to other advice. It is true you are not to interfere with your doctor any more than with your schoolmaster, but you take care to select well at first, and know something of the system he pursues. (Hear, hear.) All profess to relieve, and no doubt even the old system must relieve, or it could not have lived as it has. But there are various ways of relieving: you may relieve yourself of unpleasant inmates of a house (I need not name them), by burning down the house, and a man may have been cured of cholera in such a way that he has never had good health since. So a woman may have had skin disease, and was cured, her skin may have been made beautifully clear and smooth; but she used to run up stairs, when there were pimples on her face, without inconvenience, and now she puffs in all the agonies of asthma. There is an hospital for treatment of fistula: they talk of cures, but they don't tell you how many of the cured die, within five years after, of consumption. They have only changed the disease, that is, they have driven the disease to another part. So in consumption hospitals, they show you so many

Hosted by Google

cures, but they do not tell you how many are sent away before death to die under the parish surgeon. It would be just to science if the committee would follow these cases and see the final result. "Peace, peace, where there is no peace," is as old as the Bible—putting off the evil day—shifting from lung to leg, or leg to lung. This is no cure. Now I think our true position is the aggressive—not in abuse, but as gentlemen with gentlemen. But the public must come forward, as indeed they have done, yet not for any personal predilection, but for a principle which you have well examined. Now, then, we find there is a legal ground on which we can stand, and I should be glad to go down as one of a committee to Edinburgh and appeal to the municipality to exercise their privilege of returning members to the town council to test the proceedings of the Senatus Academicus. (Great applause.) Now, we have proof that homœopathic mortality is less than allopathic, and so it must be if homœopathy is truth, and God is good. In the case of inflammation of the lungs, Dr. Henderson has shown that out of 909 patients treated allopathically no less than 200 died, i. e. more than one in five, while not more than one in fifteen died of those treated homœopathically. Is not this a comfort? It is enough to make one ill to see the state of medical practice and the utter want of certainty in the treatment. All who know anything of the human mind, know that you cannot assist a patient more towards cure than by giving him confidence. The most extraordinary thing, however, is this. In America, cholera raged in Cincinnati: 2410 patients were treated homœopathically, and eighty-five died; while the deaths under allopaths were one in two. This was established by evidence brought before the Board of Health, in Cincinnati. Now let us glance at the progress the science is making. Everywhere I see homœopathic institutions. Here in London have been established two hospitals, one of which I see, by the statistical return, has in nine months received more than 3000 patients. Within the last fifteen years half a million of patients have been treated homœopathically in this country. In Bristol there is a homœopathic dispensary which was opened in September, 1850. In that month the number of patients was 48. The numbers increased each month, and in June, 1851, I find the number of patients admitted that month amounted to 160. These facts, Sir, I maintain, should be brought before the public. The English Homœopathic Association presents an agency suited for this diffusion. It *will* effect this diffusion if aided. The committee call on the homœopathic public for aid. Even with their present means they offer to each new member of the Association, for the sum of his registration fee (half-a-crown), and the addition thereto of one shilling, a copy of the large work issued by the Association. I appeal, therefore, to this meeting to support the resolution which I have the honour to propose, and which will be seconded by a gentlemen, who has the power to embody thought in terse sentences, and to express in the clearest phraseology the results of his mind's working.

E. MIALL, Esq., rose and said:—I cannot say that I am acquainted with the external history of homœopathy in this country, or have much intimacy with the particulars of its condition. I may, however, venture to recommend, as generally wise, union. But I may say, that if a disciple of homœopathy, I am but a neophyte, and perhaps could not agree to all its doctrines. I have certainly employed homœopathy exclusively for eight or nine years, and even were I on the verge of eternity, I believe I should place myself in its hands in preference. My convictions are in favour of the law *similia similibus curantur;* but I cannot say, that I have sufficiently studied the question to say that I believe in its universal applicability. I believe in the power of infinitesimal doses, and when taxed with holding an absurd doctrine, I reply that my opponents believe it as much as I do, but they will not confess it. *They* believe in infinitesimal doses. It was a general belief that some invisible, intangible, imponderable miasm caused the breaking out of the deadly cholera in the human system: what an infinitesimal dose must have been absorbed, and yet how terrible a power: knocking a man down and sending him into eternity in an hour or two. Is it incredible that similarly small doses may affect the system to cure, as well as to kill? (Hear, hear.) Nay more, they believe in infinitesimal doses in vaccination, for the portion absorbed, and by absorption preventing a virulent disease, must be indeed imperceptible. I was going to say that I am one of many not exactly prepared to believe in homœopathy on every point, but inclined to examine with candour: and I find everywhere my friends becoming homœopaths, at least, as far as myself. Now, I wish medical men would put themselves into the position of this large portion of the public, and ask, how shall we put an end to homœopathy? Never by authority. (Hear, hear.) You may have privileges, and respect from those who always respect honours bestowed by a learned body; but in a question, a judgment upon which is little more than a matter of observation, we are not to be put down by its being called a matter of science. Neither by abuse. It is not decent of men professing to have received a high education to treat the common sense of the people as if it were not to be exercised at all. We may not be able to go into the science of the thing, but we can judge which of you reasons like a quack or a knave. Again, we are not to be deterred by simple evasions. Perhaps they cannot deny the facts, but only deny that results are traced to their true origin. They say, here is a cure. True, but it is by diet. Now, if they do *not* believe this, what shall we say for their honesty? if they *do* believe it, why then do they drug us as they do (Hear). Again, it is imagination, but this will take in a large class of cases not possible to be fairly so classed. Even in my own family, there was not only no belief, but actual unbelief. In a child six months old, a globule of *Aconite* produced an effect as sure as on the most imaginative person in the universe. It may explain some, but not all cases, and it is most unphilosophical,

Hosted by Google

to say the least, to attempt to palm off as reason what cannot satisfy your own minds. (Hear hear.) Others say it is sheer chicanery; well then let them prove it, and we shall be as ready as any to allow it. But to do this, they must be prepared to meet on fair grounds those who are so acting, according to their representations. For we are not all blockheads surely; all we want is that the two systems shall be fairly brought together. Do anything that is fair and reasonable. You may persecute men, take away M.D.'s, stain reputations, but remember you did so to Harvey and to Jenner. We who do not believe in the infallibility of corporate bodies, desire to use our own judgment, and if you wish to sway that, you must come down to the usual and proper modes of appealing to it. (Applause.)

THOMAS DICK, Esq., rose and said:—An easy and agreeable duty devolves on me. I have to move the following resolution:—

"That the thanks of the meeting be given to the committee and to the treasurer (T. H. Johnston, Esq.) for the last year."

It is no business of mine to vindicate homœopathy, that has been done by abler men. But I cannot refrain from saying thus much, that I do not make this resolution merely *pro forma*. I have a belief of my own, a warm, fervent belief, that he who in any way assists in spreading homœopathy is a benefactor to mankind.

— MOORE, Esq, seconded the resolution. At this late hour much cannot be said, but ungrateful should I be if altogether silent, invited as I have been by one to whom I owe my life. For I, too, have to thank homœopathy for being able to stand here this night. With much pleasure would I relate, did time permit, the many cases of rescue from the grave which I, in a very brief acquaintance with homœopathy, have witnessed. Mr. Moore then related a circumstance connected with a life assurance, which bore on it much suspicious appearance of a persecuting spirit against homœopathy. "But," said the speaker, "of this persecution we must expect much, and I hail it as what will eventually be of good service to us."

Dr. CHAPMAN said, that the resolution he had to propose was, that "The thanks of this Meeting be given to the President, Lord Robert Grosvenor, M.P., for bringing the petition of the Association, in reference to the conduct of the Deputy-Coroner of Middlesex, before the attention of Parliament." Of true honour it might be said as of mercy, that its quality was not strained, that it was twice blessed, and that it at once graced those that paid and those that received the tribute of respect due to an honourable course of action. Lord Robert Grosvenor reflected honour on homœopathy, from his consistent and persistent advocacy of it, but he no less received honour. (Hear, hear.) When the names of those whose likenesses were on those walls (here the speaker pointed at them) were forgotten, Lord Robert Grosvenor's name would be imperishably associated with the struggles and with the establishment of homœopathy in these realms. There was a duty, however, incurred by men of Lord Robert Grosvenor's rank and his social advantages, in the matter of homœopathy. It had been remarked in a weekly medical journal, that the Chevalier Bunsen and Lord Robert proceeded from meetings for support of allopathic hospitals to those in support of homœopathic institutions. Now, something more than even this kind of support was necessary. Persons of their importance should strive to bring to the test the comparative advantages of the two modes of practice. Let them propose, as an equitable test, that at least one ward should be given in each allopathic hospital which they supported, to the homœopathists, to make trial of their practice. The strength of no truth and of no principle can be known till it is fully tried. The homœopathists only demanded a fair and full trial. On his part, he thought nothing was so contemptible as the pitiful vanity, the exaggerated self-esteem, which would shrink from every external manifestation of a position that we have no right to be ashamed of. This was the first meeting of the English Homœopathic Association he had attended. His object was to promote brotherly union among the medical practitioners. The want of this union was the real deficiency in the present state of homœopathy. (Hear, hear.) He hoped that a cordial union might be effected. Dr. Epps had stated that the number of persons who had received homœopathic treatment was at least half a million. He (Dr. Chapman) had every reason to believe that this amount was much understated. (Hear.) He believed that at least one million of the present inhabitants of the British isles had received or were receiving homœopathic treatment. (Hear, hear.) With such a number, it was idle to suppose that homœopathy would be kept from making further progress, or could receive any real check or be proscribed. Some of the allopathic opponents abused the homœopathists, and lauded themselves. It might be said to each of these, *Sus sui, canis cani, bos bovi, et asinus asino, pulcherrimus videtur*— the swine to the swine, the hound to the hound, the steer to the steer, the ass to the ass, appeared the most beautiful being in the world. But they must not forget that among the allopathic opponents of homœopathy there were very many men of science and of the highest moral worth. Their prejudices should be taken into lenient account. Among the topics and allusions of the eloquent speakers who had preceded him, he had noticed one omission. The ladies had not been mentioned. One who had been called the prince of poets, Virgil, had said of woman—

"Varium et mutabile fœmina semper."
That woman was aye fickle and changeful.

No true poet he, in this judgment at least, of woman. The homœopathists, at all events, had every reason to know that the *dictum* of the poet was not true. No more staunch friends had they than the ladies. Their influence should be exerted, and should be courted. When a man wanted a seat in the House of Commons, he canvassed the wives and daughters of the electors. The homœopathists should follow this good example. In reverting to the resolution

Hosted by Google

he had the honour to propose, he reiterated his opinion that the noble President received as much honour as he gave; and he trusted that in the recess of Parliament, the friends of homœopathy would not lose sight of the good Cause, but would agitate for such measures as might redound to its advantage. It would be quite as mad in the opponents to doubt of its being established, as to doubt that there was a sun in the heavens. (Applause.)

Dr. CRONIN seconded the resolution: he agreed with the preceding speaker that the noble President of the Association received as well as conferred honour from having promoted the cause of homœopathy to the best of his ability.

Dr. EPPS would beg, as the hour was late, to embody two resolutions in one. He then moved the following:

"That the committee of last year be re-elected, with the addition of S. R. Bardouleau, Esq.; and that W. Arnum, Esq., be elected honorary secretary; and that the thanks of the meeting be given to C. T. Pearce, Esq., for his services as honorary secretary."

Mr. Pearce had had the honour to testify to the truth within the prison walls, for which he thought him one of the most honoured of men. He had done the duties of secretary most admirably, and now that he had passed his examination, and was an M.R.C.S, he had settled in Northampton, and the Association had done themselves the honour of presenting him with the inkstand which the Chairman would have the kindness to place in his hands.

The CHAIRMAN, rising, and with many complimentary expressions, amid much applause, presented Mr. Pearce with a beautiful inkstand, on which was an appropriate inscription.

Mr. PEARCE, with much feeling, acknowledged the compliment thus paid him. It was his duty and heartfelt pleasure to thank them for their handsome present—a present bestowed in recognition of services, which he could truly say were never prompted by any view to personal good, but to universal. In leaving the metropolis, and thus necessarily resigning his post, he hoped that he should find a fair field for labour, and he was gratified to say that already, in three months, he had treated 300 patients. He could truly say he felt more nervous in standing there to accept this present, than when he stood at the bar of Newgate.

W. ARNUM, Esq., rose not to second but to approve. He had seen Mr. Pearce's assiduity, and seen it such, that he at first took him for a paid agent; willing he certainly was, and unpaid he found him to be. The voluntary principle certainly worked well in him. He (Mr. Arnum) had also been an eye-witness of his sufferings. He must say, if it was a privilege to look through the bars of Newgate, he did not covet it. In conclusion, he would say, may this Society long prosper, till truth shall spread to earth's remotest bounds.

Mr. ASHURST would beg pardon for a liberty he had taken with all there assembled. He held a resolution, moved by Mr. Ashurst, and seconded by the whole meeting, that cordial thanks be given to the Chairman for his ability and kindness in the chair.

The CHAIRMAN, in returning thanks, prayed consideration for a country actor treading the London boards. He could not refrain, he said, from expressing the satisfaction with which he had heard it stated that one chartered body, the Royal College of Surgeons of London, had pursued a course alike honourable to themselves and beneficial to society. (Hear, hear.)

The meeting was altogether of the most pleasing character. The speeches interesting, and not too long or too many, and the audience thoroughly interested to the end, which did not take place till considerably after eleven o'clock.

THE
HOMŒOPATHIC TIMES.

SATURDAY, AUGUST 16TH, 1851.

THE homœopathic public must be up and stirring. At the present moment agitation is of the most vital importance. It is not merely press agitation that will suffice, but it must be personal and individual agitation to boot. The cause is worthy of the exertions of all who are identified with it, and progress cannot be achieved unless the most vigorous endeavours are made to secure its principles a fair and impartial examination.

Our allopathic opponents, well aware of the success attending the promulgation of the doctrines of Samuel Hahnemann, find themselves in a position to attack us in every quarter. And how does this come about? Because they have matured for themselves a press ready to do their behests in whatever manner they may dictate, and because also their professional gains will afford an expenditure to perpetuate their system, if they can only satisfy the public that they are right.

But the public will not be so easily managed. The great mass of the people, whether high or low, are not willingly led by the nose as in days of yore. The public of the nineteenth century are a reading public, and not only a reading public but likewise a thinking public. This is a fact patent to everybody in the least manner associated with journalism. Therefore is it that we recommend all disciples of homœopathy to encourage the circulation of homœopathic literature, and to aid

Hosted by Google

and disseminate in the freest possible manner every scrap of information through our columns, or those of our homœopathic cotemporaries, that they may find themselves possessed of.

Give us in every respect the assistance we deserve. If not permanent subscriptions, send all the intelligence available. Years have brought together, for allopathy and its fallacies, a band of supporters, who not alone maintain their press with writing, but also with a patronage worthy of a higher object. A tithe of such resources would, were it immediately at the command of homœopathy, carry us triumphantly over the present period of struggle with a portion of the medical press, and with some of the medical corporate bodies.

We are as yet, however, in this period. We must, under these circumstances, be content to walk forward amidst our persecutors with a firm and erect bearing. But at the same time we shall be able to appreciate the indignities shown us by the few virulent writers of the allopathic brotherhood. *Homo fervidus et diligens ad omnia est paratus.* Nothing can gainsay the truth of our position.

Were we the deluded wretches described in the *Lancet* and the *Provincial Medical and Surgical Journal*, it would be well to extinguish us in the off-hand manner desired. This summary method of dealing with our theory and our principles it is, however, discovered does not answer the anticipations at first entertained. Believing that we have right on our side, we are prepared to wait for might until the real season arrives. Gathering strength in our onward course, we cannot fail of reaching the goal, the acknowledged establishment of homœopathy.

The world wags merrily with us. The antagonism of the *Lancet* is very refreshing to us. He is a far better friend to us than most of our medical colleagues—for he furnishes us with matter. May his shadow never grow less! May his unloveliness never grow unlovelier!

But to pass from this "nobody" to more pleasant themes, we must notice, first, the gratifying fact that the English Homœopathic Association still carries on the peaceful war. We refer our readers to the report of the annual meeting held this week. The progress of our Reform, and the courage and confidence of those engaged in defending and advancing it, are conspicuous. Those who run may read the significant signs of our progress.

Two years ago it was declared that homœopathy was extinct in the metropolis. Our readers now know that the Editor of the *Lancet* does not think so.

We shall soon know if any other of the fourteen corporate bodies, which confer diplomas and the license to practise medicine in these kingdoms, will follow the example of stupid intolerance and audacious bigotry set by the mythical St. Andrew's, and by historical Edinburgh. If the example is not followed, and the other bodies are wiser in their generation, we shall be satisfied with keeping our line of defence;—if the example is followed, we must enter into what will be then the enemy's country. We do not wish to consider even these corporate bodies as enemies. The choice rests with them. But we are strong enough to do battle with them. If they are foolish enough to provoke the war, they must take the consequences.

The attempt to prevent liberty of conscience in the choice of therapeutics is one of the most monstrous absurdities that was ever made known. It is an invasion of the liberty of the subject: it is what no despot in Europe dare do. It is worthy of the King of Dahomey, with his army of Amazons, and his mud-hut for a palace.

The opponents of our medical Reform do not count the cost of the warfare they provoke. They are ignorant of what is taking place around them: good, easy people, they think the world stands still. They do not see that the drug-system is doomed, that it is even now about to pass into the region of forgotten things. Jacob Bell is wiser in his generation—for he brings in a bill to perpetuate druggists: but Jacob forgets that when nobody takes drugs, there will be no place for druggists. An Act of Parliament to perpetuate drug-selling! Restore the heptarchy! Bring back the Druids! Make Westminster again an island! Let fetish be performed

Hosted by Google

in our high places! The thing is too ridiculous even for laughter.

We commend to the attention of our readers the following extract. What Hermogenes was, are most of the medical practitioners throughout the world now—they worship unknown genii of medicine—they have altars to unknown powers—and they will not learn of Hahnemann that there is one law of healing, and that cures shall be attempted through the instrumentality of means that act in accordance with that law. The Royal Colleges and the Halls are now among the obsolete antiquities of medicine. Let them discover it in time—and become young again under the influence of homœopathy.

"ANTIQUITIES.—Some workmen employed by Mr. Evans, in digging a cellar near the Exchange at Chester, last week, exposed several large blocks of stone at the depth of eight feet, and among them one with an ancient inscription. It turned out to be a portion of an altar, with a legend in Greek characters, which described it as having been dedicated to certain genii and preservers of man, by one Hermogenes, a physician, who seems to have exercised his profession in the Roman army at Chester, as there were several tiles near it, stamped with the well-known mark of the 20th Legion, L. XX. VV."

WE have perused with much interest and satisfaction the "Fourth Annual Announcement of the Homœopathic Medical College of Pennsylvania, Session of 1851-52," and we think this a most appropriate time to place before our colleagues and readers generally a full abstract of the progress made by our transatlantic brethren anent the subject of teaching homœopathy, concerning which we ourselves are now much interested, and as to the best mode of securing which there seems to be amongst us a diversity of opinions. Some of our brethren have a tenacious hankering for allopathic institutions in which *they* have been educated—a very excusable attachment, were not principles involved, which we look upon as highly detrimental and obstructive to the advancement of true homœopathy. Strange yet gratifying is it to find that our sentiments some time since expressed, should be re-echoed from Pennsylvania.

"Homœopathy is an essential element of practical medicine, and that it unites all the different parts into an harmonious whole. This position being assumed, it follows that the study of medicine in any other connection, with a view to practice, would, at least, be a useless expenditure of time. An expense which cannot be afforded from a period so limited, as to be no more than sufficient to acquire the knowledge absolutely demanded of the candidate for a medical degree. The plan, therefore, pursued by some gentlemen, of attending a course of lectures in an allopathic college and completing their studies in one in which homœopathy is taught, while it has nothing in it to be recommended, has much to be condemned. To the efforts made by allopathic teachers to prejudice the minds of their hearers against homœopathy, no importance is attached; such means, if in the least operative, having a tendency to provoke rather than to paralyse inquiry. All things necessary to be known are as fully and, it is believed, as well taught in homœopathic as in allopathic colleges; the chief difference, and it is of vital import, being found only in the practical teachings. In allopathic institutions a large portion of time is consumed in the study of flimsy hypotheses and of their mischievous and disastrous practical results. In homœopathic institutions this same time is given to explain a law which constitutes the only philosophical basis of practical medicine, to teach its mode of application, and to display its gratifying results."

To the list of subjects taught in the Pennsylvania College we would add something more, which would, we trust, convince "Alumnus," the writer of the very clever pamphlet entitled "The New Test Act," that we had no intention of being "tempted to lower the standard of education." We have no fear either of being "put out of communion," or of being "by external pressure, condensed into a distinct sect, having no intercourse with the rest of the profession." We believe the external pressure will shortly settle the whole question—the public voice and public judgment will, ere long, shelve old allopathy and all her vicious champions, provided we conscientiously supply efficient aid. Whence does allopathy derive her power and influence, now fast tottering? Simply from the fact that her institutions, from the want of others, have educated young men and scattered them over the world crammed with "flimsy hypotheses." The public, too, until the present "war of the doctors," have for centuries, to their bodily suffering and cost, been slumbering in an unsuspecting confidence. The public, also, now begin to see that this

Hosted by Google

"war of the doctors" embraces questions of the most vital interest, and, with this point gained, we need not have any fear of the future. Our business is to supply the public with well-qualified homœopathic practitioners, and one of the most beneficent reforms will so be secured to suffering mankind.

We cannot quite understand the conflicting views and diversified tones of advocacy supported by some of our brethren; in truth, it seems to us nothing more nor less than blowing hot and cold. On the one hand we are told "let the practitioners of homœopathy continue mixed with the general body of physicians (not a word about surgeons and general practitioners), and if the system be false, the stronger truth which the others hold will ere long supplant and exterminate it." The above extract from the "New Test Act" meets with the unqualified approval of the Editor of the *Monthly Journal of Homœopathy*. While, on the other hand, we are in receipt of a pamphlet just issued by the English Homœopathic Association, entitled "Homœopathy and its Opponents," extracted also from the *Monthly Journal of Homœopathy* for July, 1851, wherein the following reasoning occurs:—"One of the medical periodicals, it is reported, forbids allopathic practitioners to consult with homœopathic practitioners. The recommendation not to meet homœopathists in consultation is perfectly futile. Homœopathists do not seek consultations with allopathists; homœopathists know quite as much of disease as allopathists, and they know infinitely better *how* to cure disease. What need then have they to seek consultations? The strong to seek the weak is perfectly ridiculous."

We heartily wish that these recommendations were acted on by our homœopathic brethren, which we unfortunately know not to be the case in a vast majority of cases which are neither surgical nor obstetric, but purely medical; and it is this unfaithful conduct of one to another, and the petty jealousies in our ranks, that give our allopathic libellers such hold over us. The homœopathic profession is blind to itself, in not seeing that it has within its own ranks men equal to each department of medical science, and that there does not exist the least necessity of a homœopath meeting with a degrading rebuff from an allopath, however high in reputation, or the letting slip into his hands cases, through a want of open, honest, and manly courage. Why, then, shall we longer desire to be united with a body of men who have acted as our opponents have done, and who deport themselves in the most ungentlemanly and unscientific as well as libellous tone towards us, who are so much in advance of them? We earnestly hope that one and all of our body will become aroused to a true sense of their proper dignity, and that the onward energy of our American colleagues will prove to us a stimulus—an example worth following. Why shall we not have our own charter? We court inquiry, and shall be happy to listen to arguments. We deny that there exists a single institution or examining board in Great Britain qualified to examine for a homœopathic license to practise; and we maintain that, in the present growth and spread of homœopathy, the public ought to have some guarantee that those who profess to practise that system have undergone a thorough sifting as to their knowledge of its principles and practice. Our colleagues will do well to ponder over this matter. The first point of action would seem to be the securing of as large a number of signatures as possible to petitions praying for a charter. A million or half a million of signatures would be no mean manifestation of the strength and public attitude of homœopathy. We trust the new "Association for the Protection of Homœopathic Students and Practitioners" will speedily turn their attention to what seems to us the most effective course of action.

It is perfectly clear, unless we can secure our own charter, we cannot become legalised to practise homœopathic medicine in this country, although we may resort to Pennsylvania for a degree, which we observe two of our English colleagues have

Hosted by Google

recently done. We shall be glad to have the opinions of our brethren on this subject; and trust that the English Homœopathic Association and other homœopathic societies will direct their deliberations actively and efficiently to the furtherance of our object—a charter first and school next. Our American colleagues have erected a school before a hospital.

We have now much pleasure in appending for the perusal of our readers a very full abstract of the Pennsylvania College.

"A more full and complete course of instruction is given in this Institution than is usual in other medical colleges. The endeavour will be made by the teachers to present the different objects of study in a manner to sustain attention; and this is the more easily accomplished, in consequence of the highly philosophical and comprehensive law of homœopathy imparting a stimulus to more minute and scientific research. This deeper interest is elicited not only from witnessing the effects of minute doses of medicinal atoms upon the animal economy, but from the fact that many of the recent developments in various branches of science reveal phenomena as the results of causes either very attenuate or even inappreciable, excepting in their effects.

"The law of *simile* leading to a closer approximation of the causes of phenomena, and their more rigid observation, and thence to their more ready solution, infuses into the teachings of all the branches of medicine an extraordinary interest.

"The Professor of Biology and Pathology, therefore, will, in addition to a general description of healthy and diseased function, demonstrate the minute structure of organs and tissues, their peculiarities as exhibited in health and in disease, and explain those differences of sensation which are expressive not only of the nature of the morbid action but of the kind of structure affected; thereby obtaining the indications for the remedial measures to be adopted.

"From the Chair of Anatomy, instructions will be given both of a general and special nature—those parts will be particularly dwelt upon, an accurate knowledge of which is necessary for a successful surgical practice. When upon the distinctive characters of structure—for example, upon the tissues or cerebro-spinal system—opportunities will be afforded for remark upon phenomena connected with an abnormal condition of such parts and their specific therapeutical indications.

"Throughout the course of lectures upon Materia Medica and Therapeutics, there will be pointed out the relative value of medicinal symptoms, as well as such as are characteristic; likewise, those diagnostic qualities by which to select, from numerous medicinal symptoms apparently corresponding with those presented in disease, the properly adapted medicine. All the facts necessary to be known in the history of plants in their connection with medicinal properties, the parts used, the cautions to be observed, and the means to be employed in their preparation, will be fully explained. Similar instruction will be given in relation to the articles obtained from the animal and mineral kingdoms.

"It will be the duty of the Chair of Homœopathic Institutes and Practice of Medicine to expound the law of *similia similibus curantur*; to divest it of all hypothetical embarrassment, and present it in its simple, and therefore in its most forcible, aspect as a great law of nature. To explain, also, the rules of its application; and in further confirmation of its truth, show how it adapts itself to every modification of morbid action. The histories of disease will be succinctly given; but to their symptoms, diagnosis, and prognosis, and especially to their treatment, the most minute directions will be bestowed.

"It will be the province of the Clinical Instructor to teach the proper mode of examining patients, with a view to the most correct appreciation of their condition, and to designate the appropriate means of relief. An important part of these examinations, in a very great number of cases, is auscultation; the knowledge of which is indispensable to correct diagnosis, prognosis, and treatment. To this chair belong likewise instructions in regimen, clothing, ventilation, and such other circumstances which not only aid Nature in her restorative efforts, but are absolutely necessary to the favourable action of medical agents.

"The course of Chemistry and Toxicology will be full and complete. This branch of science, when studied specially as an aid to medical practice, is invested with additional interest to the homœopathic student. In which relation much greater nicety and precision are required in the preparation of medicinal agents. The interest is likewise increased, from the striking analogous facts which this science furnishes in support of the law of *similia* in the minute divisions of atoms as detected by chemical tests, and in the wonderful phenomena effected by agents which are possessed of neither weight, volume, nor colour, viz. light, heat, and electricity.

"The teachings of the Chair of Surgery will be in accordance with the great reform which the homœopathic principle has wrought in all other branches of medical science. By its influence the field of medico-surgery is completely reformed and enlarged, and the surgeon is enabled to relieve, without resort to painful operations, many diseases which were formerly surrendered to the knife. But as all operations performed may again be necessary, and as many of the subjects of accident or disease can be relieved only by surgical contrivances or operations, they will be taught in all their minutiæ by this Chair. The most approved methods of operating will be shown upon the subject, or illustrated by models, etc., and when opportunity offers, on the patients before the class.

Hosted by Google

"The female sex is subject to many and varied ailments. Whilst the peculiarity of her organization renders her more obnoxious to disease, it for the same reason causes a greater susceptibility to medicinal action. In no branch of medicine is the power of homœopathy more frequently and strikingly witnessed than throughout the entire range of the diseases of females. The period of utero-gestation, which under allopathic management may, with truth, be regarded as a pathological condition, under homœopathic guidance is what Nature designed, a physiological process. In the diseases of the puerperal state, as well as those occurring during lactation, homœopathy exhibits its incomparable superiority. Upon the instrumental part of obstetrics, the most minute instructions will be given. To the Chair of Midwifery belongs also the diseases of children; to a consideration of the most serious of their complaints a portion of the course will be devoted.

"The remaining Chair to be noticed is that of Botany and Medical Jurisprudence. As a necessary adjuvant to Materia Medica, the necessity of a knowledge of the former of these subjects is obvious. A large portion of our remedial agents is obtained from the vegetable kingdom, and from the same source we expect to receive hereafter many important acquisitions. In addition to the regular winter course of lectures, a summer course, given by the Botan.cal Professor, affords students, in rambles over the country, a favourable opportunity to acquire a practical knowledge of this subject. To Medical Jurisprudence, in most colleges, little if any attention is given; and yet upon its possession may rest not only the individual reputation of the physician for a proper knowledge of his profession, but upon the amount of such knowledge may depend also the reputation, property, or even lives of individuals, who, whether innocent or guilty, are arraigned before the tribunals of justice. The vast importance of the law of *simile* in times long past, had it been known, would afford, were this the proper occasion, a curious as well as interesting subject for consideration.

"In addition to the regular lectures, clinical instructions are given at stated times by the different Professors in the College, and from the numerous patients applying to the Dispensary for medical aid an extensive range of disease presents for study. A physician is in daily attendance also, at the Dispensary, which latter is located within the College building, from whose examinations of patients and prescriptions the students of the Institution will have abundant opportunity to acquire practical information.

"To render the course of instruction of this College complete, nothing more was wanting than the establishment of a hospital, which desideratum will soon be realized. A charter has been granted—funds are collecting, and under the administration of its present board of energetic managers, efforts are making for placing the charity shortly in operation. The suggestion of a hospital having emanated in the College, the present board, with a just regard to that circumstance, have associated the medical officers, most of whom are Professors in the College, in their deliberations, and exhibit a willingness to concur with such suggestions as will make the arrangements of the charity subserve the objects of clinical instruction. Fortunately such arrangements are those best suited to the interests of the patients. Before the commencement of the course of lectures now announced, it is confidently believed that the hospital will be serving the causes both of humanity and science."

Correspondence.

ASSOCIATION FOR THE PROTECTION OF HOMŒOPATHIC STUDENTS AND PRACTITIONERS.

To the Editor of the Homœopathic Times.

SIR,—A circular headed as above was placed in my hands a few days ago, but anxious and ardent as I have ever been for the advancement of the noble science of homœopathy to its proper social and legal position in this country, I hesitated a little before proceeding to carry out the resolutions of the London committee, in my provincial district, in order to have an opportunity of referring again to what passed at the late Homœopathic Congress, as it is reported in this periodical. Upon a careful perusal of that report, it appears to me, Sir, that the moment for an agitation such as is projected in Resolutions 1, 2 and 6 has not yet arrived. Shrewd calculating heads, both in England and Scotland, will scrutinise the subject as it may *affect themselves;* and the result will be, I fear, that the public generally will *not* feel that their interests are mortally assaulted by the crude determination of the Colleges of Edinburgh and of St. Andrew's to withhold degrees from homœopathic students. This is, no doubt, a gross moral and intellectual affront to a large section of the medical profession, but the popular view will not be narrowed down to such a consideration. Not one person perhaps in a hundred of the reading public can discriminate between a degree and a diploma; the latter indeed they are apt to consider the essential part of the business. They will ask, are there no other Colleges where a certificate of qualification can be obtained? Have we sufficient reason to believe that Mr. Pope or Mr. Spencer Hall would be refused at Dublin, at Aberdeen, at Glasgow, or even at the Edinburgh College of Surgeons? In truth, taking into the account Oxford and Cambridge, and the Worshipful Company of Apothecaries, the number of licensing bodies in these realms may be estimated at fourteen, of whom two only as yet have assumed a decidedly hostile attitude. Some remarks of a peculiarly sound and moderate character, which were let fall at the Congress, seem to have been too much disregarded by the committee. The speaker (Dr. Chapman) said "That the homœopathists of Britain should hav

Hosted by Google

an university or college of their own, if it should appear that the medical universities and colleges of Great Britain and Ireland were determined, all and each, to withhold their diplomas from homœopaths. But he thought the London University and the London College of Surgeons would confer their diplomas on students up to the mark in their examinations, irrespective of any supposed tendency in the way of therapeutics." He said "that the homœopathists, however, should be prepared to agitate for a charter." I do not therefore think that the committee have succeeded in making out any such case of grievance, as will warrant a systematic agitation of the question as proposed.

In the present state of homœopathy, what is most urgently required for the protection of its votaries is a school where the Materia Medica Pura and its application to diseases may be taught by able professors; and, as is the practice in Germany, a further examination on this branch of therapeutics, for all those who are desirous of being admitted as licentiates in homœopathy.

Your obedient servant, GEORGE STRONG.
Ross, August 8, 1851.

[We do not believe the committee of the Association for the Protection of Homœopathic Students and Practitioners have proposed anything more at present than to obtain the enrolment of the greatest attainable number of members; so that the Association may carry with it the weight of influence due to the well-known moral worth, intellectual capacity, and rank of some, to the unimpeachable character of all, and to the number that may so proclaim faith in homœopathy. There is as yet no definite course of action—and no doubt means will be taken to obtain the sense of the Association, when it is fully formed. The first case, in point of importance, is that of Mr. Pope. We hope our esteemed correspondent will use his influence to obtain numerous signatures of adhesion to this very important Association.—ED.]

Miscellaneous.

CHESTER HOMŒOPATHIC DISPENSARY.—*Tic Douloureux.*—April 18th, Mrs. —, aged 44, of a dark complexion, and healthy look, has had neuralgic attacks for thirty years; is a widow, and has had two children, and is a strong, powerful woman. Her mother suffered from a similar complaint. She describes the attacks as a violent pain over one eyebrow, shooting behind the ear to the back of the head; it occurs at irregular intervals of two, three, or four weeks, and always continues exactly a night and a day. A curious circumstance connected with the pain is, that it has always affected alternate sides of the head and face. During its continuance she is deadly sick, but never vomits nor ever makes efforts to vomit. With the exception of a dry and red spot at the point of the tongue, she is in unexceptionable health. Her pulse, however, is 84, *strong, full, and hard.* Ordered *Aconitum* 30, a pilule night and morning. 24th. Has had no pain yet; continue the medicine. May 1st. Had an attack of pain yesterday, during which she took the *Aconite* every hour, and the pain subsided in a shorter time than it had ever done before. Ordered *Rhus* 30, one pilule, night and morning. 17th. No return of headache; says she feels very well. *Sulphur* 30, night and morning. 27th. Had a neuralgic attack yesterday, for which she took *Aconitum* 3, a pilule every hour until it went off, which it did in a few hours. *Carbo veg.* 30, a pilule every night. July 7th. Says she is quite well; no return of the headache; has grown stouter, healthier, and stronger-looking than she was. Her pulse has become moderate in size, strength, and frequency.

Observations.—*Aconite* was prescribed in this case on account of the great vascular action. The pulse, when she first applied, was unnaturally powerful. Soon after taking the *Aconite*, it became softer and smaller. The *Rhus*, *Carbo*, and *Sulphur* ordered, were of no perceptible advantage, and would have been better left out.

BATH AND BRISTOL BRANCH OF THE PROVINCIAL MEDICAL ASSOCIATION.—The annual meeting of the above association was held on Thursday, at the Medical Library, Orchard-street. Dr. Symmonds, president for the year, having been called to the chair, he read a highly interesting retrospective address, in the course of which he enumerated the valuable acquisitions to professional knowledge made during the past ten years. He then referred to the heresies which have sprung up of late years. To hydropathy, unless when used as a specific to the exclusion of all other means of treatment, little objection need be made, for the employment of cold water was, and always had been, considered a most useful adjunct to treatment; but of homœopathy it was impossible to speak, save in terms of derision and of pity. Those who could leave the august temple of medicine for the baseless tent of a mere speculative empiric were undeserving even of our pity; those who *can* conscientiously practise homœopathy pure must be devoid of ordinary intelligence and of reasoning faculties, for the practice is wholly without principle or reason. But what shall we say of those who, under the the guise of homœopathy, commit a double apostasy, by forsaking even their adopted theory, and, as is often the case, administer *Castor Oil, Cod Liver Oil,* enemata, blisters, leeches, etc.? Leaving, however, this unpleasant subject, the Doctor spoke in glowing terms of the holy duties of the medical man, and of the reverential consistency with which he should perform them, and concluded his eloquent address, which was listened to with marked attention, and gave great satisfaction, amid much applause.—*Bristol Times,* June 28.

HAHNEMANNIAN ESSAYS.

No. XXII.

The present circumstances of homœopathy claim serious attention. Two out of some fourteen bodies that confer diplomas of medicine and surgery have declared war against the Medical Reform. The language of the writers in the *Lancet* and the *Provincial Medical and Surgical Journal* is uncourteous, rude, and coarse in reference to those who are called homœopathists. A great effort is being made by the opponents to crush homœopathy. We who have adopted it on conviction know that this is a vain effort, that truth and true wisdom are never far separate, and believing homœopathy to be true, we think it wise as well as honest to declare our convictions.

It may be that the other corporate bodies, armed with the authority of conferring medical and surgical diplomas, may be drawn into the wake of the two Scottish Universities. It may be that the timid, whether of practitioners or of the public, may be frightened from their propriety, and fly from the contest in dismay. An unjust tyranny on the part of the persecutors, and a senseless fear on the part of the persecuted, may have some influence at this time; but no true reform ever sailed on smooth seas during the first part of the voyage. We shall learn who are the true Reformers; and we must snatch victory from the very circumstances that might to the timid appear most adverse.

In very truth there is nothing in this outbreak of persecution but what is most hopeful for our Cause. If its maintainers prosecute their aims and endeavours with a firm and unshrinking courage, and are cordially united, the victory will be speedy as well as certain. The disunion of the professed champions of any cause is the chief hindrance to its progress.

There is nothing like an earnest faith. Those who believe in the law of homœopathy must be in earnest, and express their convictions peremptorily. The honesty of a true believer will be always acknowledged, because it is readily perceived whether he is in earnest or not.

While the virulent among our opponents exhaust the terms of vituperation afforded them by our language, we must not forget that there is a multitude of excellent men opposed to our doctrine, who do not so abuse us. We should return good for evil; we should be courteous to all men, and shame our abusive adversaries by a contrasted tone of gentleness and the attitude of champions who fear no mortal foes. The most gentle of demeanour are evermore found in action to be the most truly brave. The heroic spirit is defective, if there is not the element of gentleness mixed up with it.

There can be no excuse for abuse and vituperation, whether the offender be of this sect or of that. There may be manly oppugnancy without degrading personalities. A scientific question should be argued temperately: and, when the health of the human race is concerned, the subject should be handled reverently. We have some misgivings of the moral health of any man who can conduct an autopsy with a light and irreverent tone or manner. The human body is while it lives, and *has been* when it has ceased to live, the temple of an immortal spirit. The medical controversy which relates to so august a temple should be conducted decently. We have no sympathy with those of our sect—for we are a

Hosted by Google

medical sect, and why should we mince the matter?—who reciprocate terms of abuse with our virulent opponents. Is Liebig less Liebig—less one of the two great chemists of the day—because in his one-sidedness he has called homœopathy "humbug?" Is Faraday less Faraday—the philosopher, one of the primest of Nature's nobles—because he has no faith in homœopathy? Have Williams and Bright—and the best of them all—Billing, no brains because they laugh at homœopathy? We must take men as we find them. We cannot make circumstances; but we can avail ourselves of them.

We hold allopathy to have been rational, while there was no reason for believing there was something far more rational: but believing that homœopathy is that something far more rational, we advocate it, and we desire its progress and advancement.

The assertion that homœopathists are dishonest, of necessity dishonest, because they practise homœopathy, is too childish for any grave comment. One writer, Dr. Cormack, has assumed that men practise homœopathy because they have large families, and need to find them support. Many of our homœopathists—and the first of them all in point of time, and one of the first, every way—are bachelors—old bachelors, if you please, but not the less free from the *impedimenta*, the burden and the care of families. This sort of random assertion is a monstrous absurdity. It is a vulgar clap-trap that no educated gentleman should indulge in. The same writer has assumed, as a mark of dishonesty, that some homœopathists recommend the water-cure, and mesmerism, and divers other non-drugging means. Why should they not, if they can do so conscientiously? Do none of the allopaths recommend water-treatment? do none recommend mesmerism? We could mention men of mark by scores, who do so. The same writer, who expresses most bitter things in the most gentle terms, accuses homœopathists of dishonesty because some few of the number occasionally recommend allopathic doses of medicines, *Aloetic paste* and *Castor oil*. Wherefore dishonest, most learned Theban? If it be done openly, where is the dishonesty? Let it be fully admitted that such persons are very imperfect homœopathists, that they have neither comprehended the philosophy of Hahnemann, nor followed his precepts—that they are babes in homœopathy. But is the baby in his mother's arms dishonest because he cannot chew and digest venison?

This milk-and-water antagonism can do us no harm. We can afford to laugh at it. Those who know us, know that we are not needy adventurers—constrained to take up the first quackery that presents itself, to get bread for our wives and children.

What is the simple fact touching our professed knowledge of medicine? It is simply this—we profess, according to the measure of our opportunities and abilities, to know fully as much as those of the allopathists who have had similar opportunities, and have the same amount of abilities; and that we have, *in addition*, what puts the meanest of us in advance of the foremost of the allopathists, a far better knowledge than they have of the properties of medicines, and a law of general applicability whereby we regulate our choice of those medicines. Is this nothing? The working out of a practical Reform is not an affair of white gloves and orange flowers—not of whispered sweetness long drawn out and of gentle sighings. It is a hard work, and requires all the pith of a resolute nature. Erasmus was too elegant and refined to play the part of Luther, and contented himself with writing epigrammatic sentences—and doing nothing. We want men like Wicliffe, and Huss, and Jerome of Prague, and Luther and Melancthon, and Knox and Melville,—men of indomitable spirit, to do battle for the right,—men who, keeping their consciences clear, are not afraid of any amount of abuse that may be heaped on them. There is a widespread conspiracy among the allopathic practitioners against homœopathy. Their object is, at present, to frighten the authorities of the Medical Colleges and Halls.

We preach up union among the homœopathists. Why in the world should not the English Homœopathic Association go on its way rejoicing, and co-operate with the Association for the Protection of Homœopathic Students and Practitioners? Why should not the members of the British Homœopathic and the Hahnemann Societies think, speak, and act as brotherly colleagues—the champions and defenders of the great medical truth of the day—a doctrine that must of necessity influence the practice of medicine for all succeeding ages?

A great cause may be put back, but can never be quenched. If there be a hero or heroes among us, let them show proofs of their heroical nature, and let the rest of us pay homage to such. It is very pleasant to know that a spirit of harmony is now rising in our body; such a spirit is needful for the struggle with the fierce demon of persecution that has been set loose against us.

The homœopathists constitute at present a medical sect. All the words in the

Hosted by Google

world would not do away with the fact. Is any one ashamed of the imputation? Let him forbear our camp, let him withdraw from our body. Earnest faith is the thing wanted—we repeat it: and earnest faith does wonders, walks barefoot over burning ploughshares, and will support with equanimity and patience the rebuffs of uncivil men and the language of uncourteous writers.

Let "Union" be the cry: let union be accomplished. Let the nice and the fastidious remember that practical reforms must be worked out on, through, and by the *mass*: that though the pitchfork is an unseemly thing, and is used in husbandry for the distribution of unsweet substances, it has its uses as well as the silver fork, and as the golden ring that is put on the finger of the beautiful virgin made hopeful wife. We cannot afford to be finical just now. We have to win our battle. It must be won—it will be won; but whether by this generation or some future one, depends very much on the temperate spirit, good sense, and co-ordinate action of ourselves. Face sharpens face—spirit speaks to spirit: let these friendly words from one of the least worthy of the Medical Reformers find their way to the hearts and consciences of all who are engaged in this good, and, because good, this holy work.

ALLOPATHY AND HOMŒOPATHY COMPARED.

A FEW WORDS AGAINST BLEEDING.

By a Progressist.

(*Continued from page* 18.)

There can, I apprehend, be little doubt in the opinion of all connected with or interested in the system of homœopathy, that it is not so fully or so adequately supported as it ought to be. If there is any one department of science, any one national advantage to which, more than another, the place of honour, in all the meanings of the phrase, ought to be assigned, it is the system for the cure of disease introduced by that profound thinker Hahnemann. The "old school" have discovered that these doctrines are not the growth of a day—that they are practical, not theoretical. We know that they are the result of deep thinking, of patient experience, and an instance of unequalled industry and perseverance. Hahnemann's doctrine became slowly and gradually known: as it became appreciated by the public, opposition commenced; with its success, persecution—the bitter sneers and the contemptuous ignorance of professional opponents assailed it. Had such men as Sydenham, John Hunter, etc., introduced it, it might have met with less opposition, and it is strange it never entered into their minds—it is strange, I say, that such men as these should have faled to have seen this improvement in therapeutics. In the history of physic, no system has been introduced that should occupy a more conspicuous place in the minds of enlightened men. That it has from the commencement of the nineteenth century done much, the most prejudiced medical owl cannot deny. It has had its season of gloom, let us anticipate its season of brightness. Let us hope it will grow with the progress of popular enlightenment. Its difficulties are somewhat set aside. The last two years have marked the formation of two homœopathic hospitals in the metropolis, for whose support the friends of the Cause have flocked with liberal contributions. Among the contributors, too, we find not a few physicians, eminent men, distinguished by the highest reputation, and conspicuous for high and lofty talent. All this combined force must ultimately shake the prejudices of the old school, and draw the veil from the mysteries of their established colleges, that seem determined to adhere to the dark times of old, when men hoarded their knowledge as the miserable miser hoards his gold; they are unwilling that the world should learn the ingenuity of Hahnemann had excelled their own. The College of Physicians of Edinburgh passed a resolution that they will not grant a diploma if the candidate confesses himself favourable to homœopathy. So pitiful is this narrow view of the subject, that it might have been passed by, and I should have been disposed to have left those dissentient voices unnoticed, did not their eminence give their decision a weight, the more dangerous and to be guarded against, from the *animus* with which it has been given.

"Truth," says Lord Bacon, "is a naked and open daylight, that doth not show masks and mummeries and triumphs of the old world half so stately and daintily as candlelights. Truth may come to the price of a pearl, that showeth best by day." Thus it is with the system of homœopathy with reference to allopathy. In theory, of course, nothing can be more beautiful than the golden mean. If you hear a man say, "I have looked into homœopathy, have examined it thoroughly, and found it sheer

Hosted by Google

nonsense," depend on it, that man went not beyond the golden theory, and the examination no further than this—"Will it prove personally advantageous to me? Will it augment my practice?" He answers, "I know nothing about it; therefore it is my *interest* to *oppose* it." "A hundred weight of error," Baron Liebig remarks, "will not form one grain of truth."

In my last paper I concluded by saying, "all the science in the world will not rub out one simple fact." Facts are what people want. Let the facts of homœopathy be set side by side with those of allopathy, and I will risk the judgment that will be decreed by the public. It is a maxim among builders to clear away the rubbish of the old before they begin to build the new structure. We will take an acute case, "pneumonia," or inflammation of the lungs, as treated by the "old school."

I cannot find a better illustration of this system of treatment than by copying an extract from Mr. Yeldham's book.* "The following is extracted from a lecture on the treatment of pleuro-pneumonia, or inflammation of the lungs with pleurisy, written by Mr. Guthrie, and reported in the *Medical Times* of February 19, 1848.

"'In the year 1801, I found myself, not seventeen years of age, in charge of a regiment of infantry, on the top of the Berry Head, the outermost point of Torbay. The men were soon attacked by pneumonia. I had been taught the practice of physic in London; had followed, among other avocations, the late Drs. Rowley and Hooper for three years, and, in consonance with their views, bled my patients three or four times in the first forty-eight hours. I first drew sixteen ounces, then fourteen, then twelve, then abstracted, as the complaint continued, eight ounces; gave *Tartar Emetic*, so as to keep up nausea; then *Calomel*, *Antimony*, and *Opium*; and lost my patients. Discomfited by my failures, I reconsidered every case, and saw that, however systematically I had acted, the disease had not been arrested in any one of them. *In fact, enough had not been done.* Recollecting what I had been told of northern constitutions, and of country practice, I determined that in future they should die of the bleeding, and not from excess of inflammation. I then took away, on each occasion, as much more blood; my sixteen ounces became from twenty to thirty. It would not do. I arrested the rapid course of the disease, but did not effectively subdue it. It was evident that, to succeed, I must place no limit to the abstraction of blood in the first instance, but the decided incapability of bearing its further loss.'"

I will quote another paragraph from Mr. Yeldham (p. 2). "Let us suppose the case of a patient labouring under inflammation of the lungs, or pleura. We find him complaining of severe pain in the side, and difficulty of breathing: this is his chief, probably his only source of suffering—we find him moving, walking, and performing any other action not requiring much bodily exertion. Do we hear him complain of weakness? Certainly not! Observe this same patient after the lapse of only a few hours—the change startles you! He is already reduced to the lowest point of physical depression—he can scarcely speak above a whisper, move without being supported, or drink unless the cup is held to his lips. Whence this sudden alteration? Assuredly not from the progress of the disorder. There is no inflammatory complaint, however severe, which, even if left to itself, will in so short a space of time produce such powerful effects upon the vital energies. Nothing can afford a stronger proof of this than the condition in which we often find cases of the most dangerous character, which have existed for several days, unchecked by the use of any remedial measures whatever. In these instances we have, as might be expected, sufficient evidence of the inroads of disease upon the constitution, but certainly nothing at all approximating to that state of exhaustion which has just been described as dependent upon the loss of blood. The alternative is unavoidable; it is to the *remedy*, and not to the disease, that we must look for a solution of the question. The explanation is but too palpable:—he has been bled till he fainted; till his cheek was blanched, his eye dim, and his pulse scarcely perceptible. Reaction manifesting itself, the operation was repeated, and the system brought down to its former level. This is done again and again, till it can be borne no longer: then only does the destroyer arrest his progress. But though the victory of the lancet is complete, let not the reader imagine that the struggle has terminated: subdued, but not annihilated, the eradication of the disease is committed to the leech, the cupping-glass, the blister, nauseants, purgatives, and salivation; these, after the bleeding has done its work, even if they be not employed simultaneously with that operation, are brought to bear upon the exhausted patient."

Homœopathy observes a different course, and patients labouring under inflammatory diseases are cured without losing a single

* Homœopathy in Acute Diseases, by Stephen Yeldham, p. 3.

Hosted by Google

drop of blood. "Bloodletting is objectionable," says Dr. Black,* "on the ground that it is unsuccessful and dangerous, as compared with the employment of specific remedies. It is an indirect and only palliative mode of treatment, in so far as it only relieves the urgency of the symptoms, but does not effect a radical cure." Again: "It is defective as a means, for although its primary effect is to reduce suddenly the action of the heart, its secondary, and one which soon follows, is a state of reaction, a great increase of vascular action; this must necessarily be combated by some other means, or, as is too often, mistaken for the natural progress of disease. The want of permanent success which follows bloodletting is seen in the every-day case of individuals being bled for a 'tendency of blood to the head;' the immediately disagreeable symptoms are relieved, but the so-called tendency soon returns. The individual is bled periodically, but with only temporary relief, for the cause of the disease has never been attacked. It is in such a case as this that the superiority of the homœopathic treatment is shown to that of only palliative."

Of all the therapeutic methods employed since the most remote antiquity, "bleeding" is that which has produced the greatest diversity of confidence in the opinion of medical men. The power of this method of reducing disease, the rapid influence upon the organs and functions, its visible advantages, and not less incontestable inconveniences, the good and the evil which it produces at once, or in a short time, in a word, the deep perturbations which it excites in the system, will sufficiently account for the variety of opinions physicians entertain respecting it. Whilst with some its merits are exalted beyond the bourne of truth, by others it is equally deprecated. It is regarded by some as a system which tends rapidly to the destruction of vitality in the heart; others consider its application no less dangerous, as it is a system which in its exhaustion of the blood tends to retard life; it is, in truth, a theory believed to have no definite system which may pronounce for its continuance. It is, at best, very difficult to determine, with precision, the number of bleedings that will be necessary, the quantity of blood to be evacuated—as quantity must necessarily often vary considerably in giving to the disease its check — the constitution, the age of the patient, all of which must be considered to complete the solution of the problem. What conclusion is arrived at? Generally, the success does not realize the expectations of benefit believed to be obtained on the progress of the malady. The system is weakened to an indefinite prolongation of nervous debility, and the inevitable result is, that subsequent maladies are formed. If we read the medical registers, we shall observe multitudes of instances in which bleeding has been pronounced advantageous; but if it were possible for us to follow one by one those individuals comprised in these registers, we should doubtless be induced to acknowledge the disadvantages of bleeding, when we should discover, in a lapse of time, more or less prolonged chronic diseases, engendered from the imprudent recourse to this system. It often happens that these ejections of blood are encouraged at the risk of bringing on at some future time serious consequences, but which are scarcely ever foreseen by the practitioner. What more *easy*, in fact, than to diminish the vital action, and, consequently, all pain and inflammatory action, when one does not fear a considerable depletion of the blood? But, again,—what more *difficult* than to reproduce the patient's *original strength*, *vigour*, and *habitual tone?* Several examples may be quoted where a single bleeding (used *mal à propos*) has left for the remainder of a person's life irremediable weakness and a decided decrease of vital energy. It is impossible to deny that the effect, in a most direct manner, is to weaken and enervate the system, and that to a degree that it is impossible to calculate on. How often do we see after prolonged bleeding, external pallor, the pulse lowered, a difficulty in breathing, coldness of the extremities, swooning, sometimes followed by convulsions, and always more or less by a feeling of decided feebleness, which extends throughout the whole body. The skin becomes in general discoloured and pale, the cellular texture of which, towards the lower extremities, is charged with a watery matter; the digestive organs, particularly those of the stomach and bowels, are enfeebled; the muscular strength is sometimes rapidly diminished, and the sufferer becomes almost powerless. It is these disastrous effects which render the convalescence of a patient so interminable, and which usually follow serious illnesses; and it must be added, that this weakness singularly predisposes persons to a number of diseases, particularly those that result from infection. It must be observed that a number of individuals suffer from the effects of bleeding promptly and intensely; these are children, old men, and the greater number of women: in fact, three-fourths of

* Treatise on the Principles and Practice of Homœopathy, p. 3.

Hosted by Google

society. Children are bled and lose a considerable quantity of blood by the application of leeches, and to what sad results are they not subjected? Pelletier mentions the case of a child six years old, who died from hemorrhage occasioned by six leeches applied to the chest. Pereira says:* "Some years since, the application of a leech was ordered to the chest of a person labouring under pneumonia; it was at the same time mentioned that the bleeding should be encouraged. The directions were literally fulfilled; the discharge of blood was assiduously promoted, until so large a quantity had been lost, that death was the result. In another instance, two leeches were ordered for a child, aged about eighteen months, suffering with pneumonia in consequence of measles; the following day the poor little creature was found in a fainting or rather dying state, with face and lips completely blanched. On inquiry, it appeared that the leech-bites were still bleeding, and no attempt had been made to stop the discharge; the mother thinking it would be beneficial, more especially as the pneumonic symptoms had considerably abated; as predicted, the little sufferer died within twenty-four hours." Mr. Wilson, quoted by Mr. Wardrop, has related the case of a child, where one leech had nearly caused death by a serious hemorrhage.

It is much the same with old men, whose hard pulse is often mistaken for a plethoric habit, which is only imaginary; this class of persons cannot lose blood. Nervous persons, now so numerous from civilization being carried to so great an extent, may be ranged in the category of those where the economy cannot submit with impunity to ejections of blood; and if we would seek the cause of these melancholy results, of which we have only here given a feeble sketch, it would not be difficult to recognise it.

Those who are decidedly against bleeding have said, "that blood being the source of life, bleeding is the commencement of assassination." These bleedings take from the blood a great proportion of fibres and globules (certain essential elements of this fluid), thereby rendering a patient liable to serous plethora, which is an infallible sign of organic weakness. Let us separate, for instance, the fibrous and coloured matter from the blood, or that part which contains the principle especially and immediately concerned in the support of health and strength. Is it not taking away its vitality? Dr. Billing's theory is, that all diseases are caused by impressions made on the nervous centres or their nerves, by which the nervous influence (whatever it may be) is exhausted or morbidly diminished. Now, if all diseases have exhausted nervous influence for their cause, is it not palpable that bleeding may be the most prompt and direct means of disorganizing the entire system, by depriving each particular organ of its original amount of blood, heat, nutrition, and vital strength that should return to it?

Homœopathy has so far operated beneficially—there are practitioners who have received a lesson, and who have recourse to bleeding with considerable hesitation; although it is to be lamented there are others who are prodigal of blood, without calculating the disastrous results, immediate or future, arising from this truly murderous practice.

A recent London medical periodical makes the following declaration: "There never lived that conqueror who, with sword or lance, slew one quarter the myriads that have died of lancet and leech."

"Blood-letting," says Dr. Nicholls, "is continually resorted to, and the health of thousands is undermined, and thousands of lives are sacrificed."

"Less slaughter." says Dr. Reid, "I am convinced, has been effected by the sword than by the lancet."

"The history of medicine proves that persons have been correct in saying that millions of men have fallen under the blows of the physicians. The means which are employed at the present time, and which become more numerous from day to day, are a sure guarantee that in time the number of victims will be incalculable" (Bergk).

These passages have emanated from allopathic physicians, and are quite sufficient to show there is no uniformity in the orthodox school. Let the reader contrast this complicated and unsettled system recommended and practised by the allopathic school, with the simple, rational, and successful treatment of homœopathy.

The following are two cases of pleurisy, or inflammation of the pleura, treated homœopathically, and without the loss of blood.

CASE I.

J. P., aged 19. On the 20th of April (Easter Sunday) complained of violent pain in the side, increased on the slightest pressure, by taking a long inspiration, by coughing, or moving in bed; considerable expectoration of froth and mucus, mixed with blood; pulse 120; tongue furred and clammy; burning heat of skin; great restlessness; shiverings, with trembling;

* Concise View of Homœopathy, vol. ii. p. 106, 1832.

Hosted by Google

intense thirst; oppressed breathing. He was directed to take half a drop of the *Tincture of Aconite* every hour, for the first four doses, and then every two hours.

April 21st. Slept at intervals during the night; pain in the side continues; had two violent fits of coughing; expectoration increased, still deeply coloured with blood; pulse 103; tongue moist, and covered with fur. Half a drop of *Tincture of Aconite* and *Bryonia*, alternately, every three hours.

April 22nd. Slept well; better in every respect; quite free from pain; cough and expectoration less; pulse 86.

April 24th. Complains of headache and nausea; pulse 90; skin hot; great thirst; cough more troublesome. *Tincture of Pulsatilla*, alternately with *Aconite*, instead of *Bryonia*.

April 25th. Better; quite easy this morning.

April 26th (Saturday). Feels so well that he wishes to get up; went down stairs into the parlour, and continued very comfortable the whole of the day.

April 27th. Pain in the side, and cough returned; skin hot, pulse quick; thirst and some shivering. All this yielded to *Aconite*, *Bryonia*, and *Pulsatilla*. On the 30th of April was quite well, and had he not imprudently gone down stairs on the 26th of April, in all probability he would have had no return on the 27th.

Case II.

A. B., about twelve or thirteen years old, of a sanguine temperament, was attacked on the 5th of June with vomiting of a bilious fluid, which continued during the night. On the 6th of June, I visited him at seven o'clock in the morning, and found him with considerable fever, shivering, and heats; cold sweats on the forehead; flushed face; headache; thirst; burning heat, afterwards copious sweats; pain in the side; quick, hurried breathing; cough, increased by taking a deep inspiration; expectoration trifling; pulse 130, and irregular; unquiet sleep, with muttering. I ordered half a drop of *Tincture of Aconite* every hour, until I saw him again. I then gave *Bryonia* and *Pulsatilla*, alternately with *Aconite*, as in Case 1. On the 14th of June my little patient was well.

This case was attended with some anxiety. The father of the lad had derived great benefit from a course of homœopathic medicine, and is a warm and zealous supporter of the system; but his mother knew nothing of it—her tearful eye, her anxious looks and inquiries for her only boy, fully portrayed the workings that were rife within. She bore it magnanimously. Most sincerely do I hope it has been the means of establishing in her mind the superiority of this system of treating inflammatory diseases without loss of blood.

The principles of homœopathy are truths which have been clearly and fully ascertained, and confirmed by fifty years' experience. All the relevant anatomical, physiological, and psychological evidence of human nature certifies their truth. It pleased the Almighty Protector of us all to raise up that wise and good man Hahnemann, and he has demonstrated how fatal is the system of blood-letting. Had God wholly withdrawn His merciful providence, and left us to the destructive treatment of the "old school," this fatal delusion might have continued. Let us, then, in obedience to these teachings of Providence, of human experience, for ever abandon the carnage of this system of bleeding. Pure reason is on our side, and the inflexible laws of nature inexorably demand that all of us, as intelligent and responsible beings, should come together in these communings, that we may better understand and obey the requisitions of Heaven upon us, in order to fulfil the purpose of Divine benevolence in the furtherance of homœopathy, as of the highest good to man.

(To be continued.)

ALLOPATHIC AND HOMŒOPATHIC QUACKERY.

By Dr. Rosenstein.

Salus publica suprema lex esto.

There is in this country of freedom too much liberty given to those whose main task is to prey upon the credulity of the public, and fabricate *pills*, *ointments*, *mixtures*, etc., "for all the ills that flesh is heir to," and who thereby live in ease and affluence. Government winks at it, and the editors of newspapers get a good deal of money out of these parasites, and are very glad to puff their nostrums. The chemists and druggists sell those patent medicines, and are not ashamed to make a show of them in their windows, with this kind of advertisement, "*Patent Medicines, and prescriptions carefully prepared.*"

Why does government allow this? Why do the editors of the *Lancet* and the *Times* not cry out against these abuses? All their vituperations are heaped upon the homœopathists. Why so? There is nothing wrong in the principle or practice of homœopathy when correctly and skilfully employed.

A medical man has much to contend with in England. Some say they have no confidence in doctoring. They leave every-

Hosted by Google

thing to Nature, and think "*to do nothing is the best policy.*" Such extreme confidence in Nature's sanative powers is a folly. Nature's powers are great, no doubt; who doubts it? but Nature wants aid in very many instances, as the hungry man wants food, and the sick man wants medicine, certainly not in excessive quantity; a single drop is sufficient, if properly used. We do not advocate the highly attenuated doses exclusively, but a lower dilution may often be requisite; still the medicine should be prescribed according to the homœopathic principle.

I am attending at present a case of lumbago of twenty years' standing. A high attenuation did not produce the least effect; a lower attenuation of the same remedy acted most favourably.*

Others say, we have no confidence in the old practice; but they are advocates of quack medicines, such as *Morison's pills*, etc.; they use them on all occasions. The mischief arising from such a practice is very palpable.

I was called a few weeks ago to a child, eleven years old, suffering from chronic disease of the mesentery. The child was emaciated to a skeleton; the abdomen extremely distended, very hard to the touch; constant vomiting. Morison's pills were the only remedy that had been used during six months. The father of the child said, he had great confidence in that nostrum; he said he would take 200 for a dose; he thinks they can do no harm, but are sure to do good. I had very little hope to benefit such a case; however, her sufferings were soon relieved by the use of *Ars.*, *Pulsatilla*, *Nux Vomica*, *Calcarea*, etc. The vomiting has ceased, and the child is improving in every respect.

I will now say a few words on homœopathic quackery. The many domestic books on homœopathy have opened the way to charlatanism; such are the works of Ruoff, Haase, Jahr, etc. They are the guides of those who figure as doctors, and are too lazy to study. A lady called upon me a few days ago, who suffered from a cold, constant sneezing, running of the nose, of the eyes, etc. She consulted a homœopathic chemist, who gave her a small bottle of *Euphrasia*. Was the remedy indicated? I ordered *Ars.* and *Sulphur*, which soon cured her.

What right has the allopathic or homœopathic chemist to prescribe? He knows nothing of anatomy, physiology, or pathology. If the allopathic apothecary mixes drugs, which he has been in the habit of doing for ages, we will not dispute with him; but those who are advocates of the homœopathic principle ought to know better. It is more than enough to be content with a shilling for a little bottle with medicated globules.

Why is quackery not tolerated in Germany? The chemist and druggist in Germany is liable to severe fines in case of administration of drugs without the permission of a medical man. Why not carry out the same principle in England? We hear often of poisoning certainly, by mistake of the chemist, and what is the penalty? He pays a little money, and all is right again; and does this bring the unfortunate man back from the grave?

It is surprising, that whilst so much attention is paid in this country to every department of science, medicine should remain in *statu quo*. Medical police (*medicinische policy*) is in England much neglected, and deserves more attention.

* Dr. Rosenstein would be serving his brethren and the cause by publishing in our Journal the most *minute* particulars of the above case, as well as the case of chronic mesenteric disease.—Ed.

THE
HOMŒOPATHIC TIMES.

SATURDAY, AUGUST 23RD, 1851.

DR. SYMONDS ON ORTHODOX MEDICINE AND THE HERESIES OF THE DAY.

We beg to call the attention of our readers to an address on Orthodox Medicine, delivered by Dr. Symonds to the Bristol and Bath Provincial Medical Association. It is worthy of perusal as being an unwilling testimony to the progress of homœopathy, and illustrates the fact that when passions are roused and pride wounded, reason and courtesy are alike disregarded. Dr. Symonds commences his address with a notice of the present state of medicine; he briefly alludes to the *vis medicatrix*, but he is coy of offending his audience with much on that subject—one so painful to the heroic practitioner. He then makes some remarks on the opinion the public form of physic, and feels sadly disappointed that the public tide ebbs so fast from orthodoxy. "Two notable heresies have sprung up of late, and have succeeded in obtaining not a few victims from the laity, and some con-

Hosted by Google

verts or perverts from our own body. We cannot blame the public. Ignorance is an object of pity, not of reprehension." He then, after this tale of defalcation, indulges his audience with a little *sauce piquante* anent Drs. Aquaticus and Minimus, in order to whet their appetites for the solid part of the entertainment, where the unhappy Dr. Minimus is roasted and served up in the true mock heroic fashion.

"For them we have no qualification or mitigation of our sentence. On them the science of medicine pronounces its distinctest and deepest-toned anathema. But, setting medicine aside, common sense derides them, humanity reproaches them, and reason sets upon them the ineffaceable brand of *impostor* or *simpleton*. Is this harsh or intolerant language? It is not. Are we intolerant? No. We extend our Christian charity to the utmost over the motives of the poor perverts."

A Daniel come to judgment, yea a Daniel! What a mockery of the brightest and greatest of heavenly graces! We now learn that it is consistent with Christian charity to pronounce deepest-toned anathemas, to call thousands of regularly-educated medical men *impostors, marauders, simpletons*—whereas we had ever thought that Christ says, "Love your neighbour as yourself; whosoever shall say thou fool, is in danger of hell fire;" and we had fondly imagined that the basis of all charity was founded on that commandment, "Thou shalt not bear false witness against thy neighbour."

Alas, for the rarity
Of Christian charity
Under the sun.

"Reason sets upon them the ineffaceable brand of impostor or simpleton." The Christian charity of Dr. Symonds instigates him thus to brand, but reason scorns the task. She proclaims in clear trumpet notes liberty of thought and action founded on that thought; she invites to calm investigation—she indulges in no invective—she speaks of truth and error, but never descends to epithet—she justly complains that an unhappy constitution of the human mind admits a tincture of the will and passion, which generate their own conclusions, but she disowns as her offspring these hasty prejudiced opinions. Reason holds no part with those who, without experiment, dismiss as absurd what professes to be founded solely on observation and experiment.

Of what earthly value are "the distinctest and deepest-toned anathemas of the profession?" Are they mere smoke of burning straw, causing a temporary cloud, obscuring the heavens solely to those who apply the torch, or are they the real thunderbolts of some infallible power? What says history? What has been the fruit of the most rancorous and disgraceful anathemas against Harvey? Does the blood flow as he said it did, or does it flow in obedience to the anathema? When *Peruvian Bark* was first introduced, so fierce was the anathema of the profession against it, that they allowed Oliver Cromwell to die of intermittent fever rather than give it to him. Do the profession now, in obedience to that anathema, abstain from giving *Bark* and *Quinine?*

The profession anathematized inoculation with the virus of small-pox; was not their bigoted sentence reversed by the enthusiasm of Lady Mary W. Montague? Did not the profession anathematize Jenner, abusing him in the foulest language? Has the anathema deprived the public of the blessings of vaccination? *Antimony* has had a hard struggle, after many a contest. The Faculty of Paris anathematized it, and by Act of Parliament its use was forbidden in 1566; and in 1609, Paulmier was expelled the Faculty for administering it. Still it was given secretly, and gave rise to much disputation; at last, on the 29th of March, 1666, it was formally admitted into the French codex. And will it be believed that one who disposes of medical facts by anathemas should, in spite of anathemas most distinct and very deep-toned, write A.D. 1847, "It is unquestionable, that some twenty years ago even acute phlegmasiæ were often treated with needless severity, and that blood was squandered most pro-

Hosted by Google

fligately by those who fastened their faith to the lancet only. But we have outlived those sanguinary days. Thanks to the help of those grand adjuvantia *Calomel, Opium,* and ANTIMONY, it is very long since we have seen a case requiring the repeated venesections common to the time of our noviciate."* Such has been and ever will be the fate of all such anathemas, bellowed let them be with the lungs of a Hercules. Truth ever will prevail. As for the undignified abuse that accompanies the anathema, why it marks how homœopathy is extending; and with the public the conviction becomes irresistible, that indulging in foul names denotes pride and interest wounded, and a total want of power to bring forward any sound or conclusive argument against the system.

Dr. Symonds disposes of the to him uncomfortable fact of lay support to homœopathy in the following happy manner: "Even the laymen of great powers of mind that have adopted homœopathic treatment for themselves or their families should go for nothing. They are not led by reasoning, but by what they fancy to be experience, which is indeed only empiricism." And why not believe in such experience as they possess? Do the patients of Dr. Symonds and of the Association he addresses employ them, "after studying physiology, and learning some rudiments of pathology, sufficient to assure them of the rational basis of medicine, and that their true safety depends upon it?" Or is it not with them as with others, "whereas I was blind, now I see?" Were patients to wait until, with rigid reasoning, backed by a course of physiology and rudimentary pathology, they had proved the value of medical theories and medical inconsistencies, we fear that the Bristol and Bath Medical Association might be long without a patient. If the profession are often so opposed in their views of disease and its treatment, what rational treatment can be adopted by the public when their guides display such contradictory statements? Mrs. A might be sadly puzzled to reconcile the tonics strongly recommended at Bath, with their equally strong condemnation by another Esculapius at Bristol. Mr. B might be sorely perplexed when his son has fever, he calls in Dr. X, who recommends depleting measures; but Mr. B has read that fevers are attended with lowness of the vital powers. Dr. X's opinion is therefore opposed to his; he sends for Dr. Y, who insists on stimulants, but friends recommend Dr. Z being summoned. Dr. Z is one who has seen much practice, and his verdict is throw physic to the dogs; carefully nurse your son, and he will do very well. Again, Mr. D is verging on delirium tremens, and in his sober hours he has consulted various authors on the pathology of this disease. Now a cloud of confused and innumerable theories cross his mind, and what with conflicting ideas and a brain fast verging on delirium, he begs a friend to read, and on that reading to determine what is to be done. The friend begins with all earnestness his rudimentary pathological studies. He reads in one author that it arises from inflammation of the brain; in another, from a peculiar irritation of the brain but not inflammatory; in a third, he finds that it arises from vital and nervous depression, increased by the morbid impressions produced by accumulated secretions of a vitiated kind in the biliary system, and on the digestive mucous surfaces, and so with half a dozen authors. But his difficulties do not end here; for as different as are the theories, equally conflicting are the treatments. A insists on wine and *Opium;* B calls out for *Tartar Emetic;* and, strangely annoying, W states that if the *Opium* produces sleep before the time in which the patient would sleep were the disease left alone, it is that sleep which knows no waking. Unhappy friend of D, he closes the works with great misgivings of so-called pathology, even a rudimentary study of it; and these misgivings turn to horror when he stumbles on the opinion of an eminent disciple of the ultra-pathological school. "I am sometimes disposed to doubt," says this disciple,

* Brit. and For. Med. Rev., No. 46, p. 602, Letter by Dr. Symonds.

Hosted by Google

"whether the untoward event of a disease (which his science had enabled him to predict, and which he had assiduously endeavoured to avert with all the resources of his art) is not productive of *more real satisfaction*, as it *certainly is more creditable* to the philosophic practitioner, than the recovery of a patient of the nature of whose disease he is ignorant."

If the profession indulge in such heaps of contradictory views,—and who can deny the fact that they do?—what a chaos for lay students in rudimentary pathology. Lay believers do not adopt homœopathy on mere blind experience; theirs is a rational experience, so gained as to satisfy their judgment that it is not fallacious. For example: A has suffered long, and tried various modes of treatment; friend B, who has been cured of a similar disorder by homœopathic means, recommends it to A. A tries it, and derives relief; and he in turn urges it on C, and with the same result. Surely, the joint experience of A, B, and C is of value, and becomes still more certain, when they find their children advantageously treated in various acute disorders by similar remedies. They detail their experience to D, and D, being a thoughtful man, argues in this way: I was told by my previous medical advisers that the chances were ten to one against my disease being cured in a year; now as that favourable termination did occur within that time under homœepathic treatment, it is plain that the chances are equal in favour of the result having been obtained by the remedies. Now as friend A's exactly similar case terminated also within the allotted time, then the chances are ten to one against the termination having been spontaneous or accidental; and B's similar case gives 100 to 1, and my friend C's the enormous probability of 10,000 to 1 in favour of the means employed having been instrumental to the end attained.

If the public can form an opinion as to the results of ordinary practice, why can they not of homœopathic? It is a begging of the whole question, for Dr. Symonds to assume that "the wise have adopted homœopathy because they have not been wise in all things!" Surely such minds as Whately, Bunsen, Radetsky, Metternich, Richter, Arnold, Miall, and many others, all great in their various missions, would not embrace a mere phantom, whose failure, if such, should have taken place in less time than half a century. Such men, and the public in general, back their experience by the circumstance of the homœopathic principle being founded on many facts, and they judge that the history of homœopathy adds much to the value of their experience. They know that it is not a thing of yesterday, that the principle has been at the root of much of the best ordinary treatment. They know that now more than half a century hes elapsed since Hahnemann gave such importance to this law, and insisted that experiments to discover the action of drugs should be made on the healthy and not on the sick. However calumniated he has been, they consider that man to be no quack who has so unceasingly demanded impartial investigation; who has made no concealment of his means, but urgently pressed their examination by all. They rejoice to know that he was a man skilled in the sciences collateral to medicine, and well versed in literature. They heed little the abuse heaped on him when men of cosmopolitan reputation, such as Richter, Hufeland, Broussais, Brera, Valentine Mott, Forbes, Liston, and Combe, bear noble testimony to the mind of Hahnemann. They know that the system has progressed, in spite of the most bitter and uncompromising opposition. They know that the Austrian government, instigated by the ordinary profession, denounced the practice of homœopathy. They remember that the government medical officers, opponents of homœopathy, reported that during the epidemic of cholera in Vienna, while two-thirds recovered under homœopathic treatment, two-thirds perished under the ordinary; and that such brilliant results led Count Kolowarth, Minister of the Interior, to repeal the law interdicting the practice of homœopathy. They know that similar returns were gained in various parts

Hosted by Google

of Europe, and that during the last epidemic of this scourge in Great Britain, excellent results were gained, and these on no loosely drawn-up tables, but from actually published individual cases, which, to the disgrace of the profession, were never regarded, notwithstanding the admitted difficulties as to the treatment of this fearful malady. They make all allowance for the fallacy of statistics, yet still find that such results confirm their own experience.

While they rejoice at the advance of homœopathy in Europe, they are equally strengthened in their belief of its rapid progress in America. They know that in North America, its practitioners can be counted by hundreds, and that a chartered college has been established in Pennsylvania for the study of homœopathy, and granting of degrees. They have also cause for congratulation on its spread in South America, where very lately it has proved so efficient in the yellow fever raging in Brazil; nor are they shaken in their belief when these results are said to be owing to imagination, to diet, and to Nature. That it cannot be diet and imagination, they have positive evidence in the treatment of infants, and the lower animals; and if Nature, then may they justly say, give us Nature. Why, if Nature cures every curable disease so pleasantly and so quickly, why do you, gentlemen, who estimate Natur so highly, so constantly disregard her? when your assistance is asked, why physic your patients, if Nature will cure them?

We now come to the last quotation that our space permits us to make.

"I strongly advise my brethren to take an uncompromising part, not only by refusing to co-operate, even in the most indirect manner, with homœopathic practitioners, but also to show the public in what light we regard these marauders. I need not tell you that the *only really remunerative cases* to the general practitioner (except in the feeling of satisfaction in the discharge of an arduous duty, in the achievement of success in a difficult act, and in the thought of having saved a life, or assuaged pain and distress) are those in which his duty consists mainly in standing by the bedside of the patient, ready to interpose, if in his judgment any emergency arises; *though they are cases to the cure of which Nature alone is usually adequate.* Nothing can really compensate him for the anxiety incident to the life and death encounters in grave cases, to say nothing of fatiguing days and broken nights. If, therefore, his attendance is sought by a family in such cases only (and the instinct of the patient or his friends will generally lead them away from homœopathists on such occasions), he is justified in requiring that *his reward* should be very different from what it is when he has all kinds of cases submitted to him."

It has been our fate to read many an attack on homœopathy, but we have never met with one so ludicrous in its pathos, so mercenary in its conclusion. Murder will out, and in this choice paragraph we have the burden of the whole song. Homœopathy has sadly pulled the purse-strings of allopathy, and Dr. Symonds, like a desperate chancellor of the exchequer, proposes a poll-tax to be levied on every man, woman, and child who, having once submitted to the tender mercies of homœopathy, with "returning instinct" rushes back to allopathy. How unkind the reception; no rejoicing over the return of an apostate—nothing mercenary—nothing. Dreading the charge of such conduct being considered mercenary, Dr. Symonds compares the homœopathist to the soldier who has merely "garrison duty, and the light routine of parade ground," and the ordinary medical man, to those "who fight pitch battles and lead forlorn hopes." Unhappy simile—imagine the hard-working soldier to demand extra pay ere he engages in his pitch battle, and leads the forlorn hope. Nothing mercenary; but vividly reminding us of old Jack Falstaff, who preferred good sack and a well-filled purse to honour: "What need I be so forward with him, that calls not on me? Well, 'tis no matter;

Hosted by Google

honour pricks me on. Yea, but how if honour prick me off when I come on; how then? Can honour set-to a leg? No. Or an arm? No. Or take away the grief of a wound? No. Honour hath no skill in surgery, then? No. What is honour? A word. What is in that word honour? What is that honour? Air. A trim reckoning! Therefore, I'll none of it. Honour is a mere scutcheon: and so ends my catechism."

Members of the Bath and Bristol Medical Asssociation, you have unanimously agreed to resolutions in accordance with those of the Edinburgh College of Physicians, wherein you denounce homœopathy, and refuse all intercourse with all those who practise it. We place before you resolutions as unanimously adopted at a large Congress of British homœopathic practitioners, lately held in London. We appeal to you, we appeal to the public, which resolutions become most the sincere well-wisher for the progress of the healing art.

First. "That the members of this Congress, being duly-qualified medical practitioners, have adopted the principle or law of homœopathy, and have applied it in practice, after a careful experimental examination of its truth."

Second. "That being thus convinced of its practical value in the treatment of disease, they have felt it their duty to establish hospitals and dispensaries, for the double purpose of relieving the sufferings of the poor, and of affording opportunities to the medical profession to observe the facts in support of the truth of this law, and of its beneficial operation, and they will continue these and all other legitimate means of promoting its general adoption, notwithstanding the opposition manifested against it."

We appeal to a tribunal to which, with your desire to promote the healing art, you can have no objections—we appeal to experience. You must test the truth of homœopathy by careful and extensive experiments; you have tried other means to uproot homœopathy, and these have signally failed. Pursue, then, a more dignified and a more scientific course—examine experimentally; you will then gain the power of giving a direct and authoritative answer to our statements. If your results accord with ours, then will you have acquired a rich addition to your therapeutics; if they are negative to us, then you can show that our course has been a wrong one, and then, and only then, can you put the public on their guard, with more chance of being listened to. We confidently commit the question to Time and to Experience, and abide by their verdict. "It must soon be utter night with a Lie, or glorious sunshine with a Truth."

Every day firmly convinces us that homœopathy is destined to achieve a glorious career. Its success already illustrates the proselyting progress of its disciples. No marvel, then, that allopaths should stand and look aghast at the increasing popularity of a system which, if fostered in a manner its high philosophy deserves, cannot fail to rank it among the greatest reforms of the age.

Whether we look to the right or to the left, on either hand we discover unmistakable evidence of the influence it is exercising upon the public. When associations spring up identified with the Cause, when we discern that the lay as well as the professional members of homœopathy are actively engaged in promoting what they deem an essential change in the principles and practice followed out in connection with medical art, it is fair to presume that there is something deeper at the bottom of all this energy than mere antagonism of opinion or party prejudice.

Nothing can more strongly demonstrate this fact, than that when a convert is made, it is not upon the old principle of getting benefit personally, and leaving others to find out the source of relief, but at once the convert becomes what he ought to be in reality, an ardent student of the subject, and he goes forward fearlessly proclaiming the enlightened views he has received.

In this way there is, doubtless, much good effected. The allopaths feel it, and hence their virulent animosity. Who ever

Hosted by Google

heard of any private individual canvassing the merits of the allopathic system in the same spirit or in the same manner as homœopathy is canvassed? The comparison is truly ludicrous. To advocate the perpetuation of blistering, bleeding, and purging would indeed be monstrous. But to advocate a system which entirely refuses them recognition, is a measure of sound wisdom and of practical humanity.

We are so persuaded of the uniform benefit to be derived from an extensive lay agitation, that we shall take every opportunity of enforcing it upon the notice of our readers. The professional disciple will find his way much smoother, if this kind of introduction be encouraged. Sympathy extended through a pre-knowledge of the operating principles which guide him in his arduous pursuits, will prepare the patient for the ordeal, whatever it may prove, and assist both parties in attaining the desired results. All things which tend to produce so desirable a position of affairs should have a firm and warm support, and the wider such a circle of sympathy can be extended, the better it will be for every one interested in homœopathy and its progress.

ONLY two years ago, it was declared that homœopathy was extinct in the metropolis, and all but extinct in the provinces. During this year the Universities of St Andrew's and Edinburgh, and the College of Physicians of Edinburgh, have declared against this system of therapeutics. The Provincial Medical and Surgical Association has now formally pronounced against it. At the anniversary meeting of this Association, held at Brighton last week, there was this explosion.

"At the opening of the proceedings this day, Dr. Cormack brought up the Report of the committee appointed to investigate the measures to be put in force in order to discountenance irregular and illegal practice. The committee recommended that three classes of persons ought to be deemed ineligible to belong to the Association:—1st. Those who practise homœopathy; 2nd, those who practise it in combination with hydropathy and mesmerism; and 3rdly, those who hold professional consultations with persons entertaining opinions opposed to legitimate practice, or who hold professional intercourse with such as practise homœopathy. Dr. Cormack made some pertinent observations on the conduct of certain recusant professors of Glasgow and Edinburgh, and the active promulgation of homœopathic doctrines by the clergy in many places; and especially on the unfitness of certain passages in a sermon of the Rev. Mr. Everest, lately preached in London, some quotations from which he read, though, as he emphatically remarked to the President, 'Sir, this is almost too blasphemous to read.' (Hear, hear.) As an instance of the absurdity of some of this reverend preacher's views, passages were quoted, showing that he considered the leprosy of Scripture to be no other than the psora of Hahnemann, the mystic. (A member of the Association here ejaculated, 'That shows his knowledge was only skin-deep.') Even socialism was considered by the clerical dermatologist 'of psoric origin!' And it was insinuated in one of his passages, that until Hahnemann arose even redemption had not been effectual! Such were the props of this glaring system of inanity and mischief. Dr. Cormack went on to say, that he thought the report of the committee did not affect any individual member of the Association at present; but the Report asked for a committee of five members, to be appointed to frame stringent rules on the matter, to be laid before the next anniversary meeting. It proposed that thanks should be given to the College of Physicians and Surgeons at Edinburgh for their opposition to the homœopathic heresy; also to the University of Edinburgh and St. Andrew's; but that disapproval should be expressed of any school of medicine which retained professors who practise homœopathy. The committee proposed that the resolutions of the meeting on these subjects should be forwarded to all the corporate medical bodies, and advertised in the principal daily and the medical journals. Dr. Cormack remarked, that any feeble and uncertain sound from the Association on this subject would be worse than useless.

"Dr. Malden proposed that the Report before the Association be adopted.

"Dr. C. B. Williams, in seconding the proposition, said that if the matter were not taken up actively by such an Association as their own, nowhere could we look for an expression of the opinions of the profession. While the examining boards, who ought to be the guardians of the profession, remained sunk in apathy, it is incumbent upon all bodies of professional men, however constituted, to stand forward in the matter. He then entered into some statements, showing the utter absurdity of infinitesimal doses, and deplored that the wealth and influence of the rich and the lives of the poor were sacrificed to uphold a monstrous fraud, the prevalence of which had made it so notorious.

"Dr. Edwards Crisp agreed fully with the Report, but thought that the Edinburgh College of Physicians deserved little thanks, their edict against homœopathic practice having been forced upon them, and not spontaneous.

"After some conversation of several speakers relative to the alleged expulsion of Professor Henderson from the University of Edinburgh,

Hosted by Google

Dr. Cormack explained that the Faculty of Medicine had not the power to expel Dr. Henderson from his chair for promulgating the doctrines of homœopathy, that power belonged only to proprietors of the University; but they had prohibited him from putting that system into practice in the infirmary where they had power, though they could not help his still retaining the chair of pathology.

"Dr. Cowan (of Reading), in an eloquent and enthusiastic address, which was greatly applauded, announced that he looked upon homœopathy as only a part of a certain influence which characterised the age in which we live—an age full of moral and intellectual dangers—and which influence manifested itself in other sciences—not alone in medicine. A homœopathist ought always to be distrusted as to his judgment. (Loud applause.) The Association ought to feel deeply and strongly on the point; and, as a body, ought to hold no intercourse with those whose principles are so diametrically opposed to the experience of ages.

"The motion that the Report be adopted was carried unanimously. The reporting committee, Drs. Cormack, Tunstall, and Ranking, with Drs. Malden, C. J. B. Williams, and Cowan, and Sir C. Hastings, were appointed a committee to frame the rules for adoption on the subject. Dr. Tunstall moved, that the Report which had been read *'on irregular and unprofessional practice'* be printed and circulated amongst the members; and we afterwards learned that it would be ready for distribution before the Association separated."

Advertisement of the Provincial Medical and Surgical Journal, in the Times.

"PROVINCIAL MEDICAL AND SURGICAL ASSOCIATION.—*Report on Irregular Practice.*

"The following Report was brought up and unanimously agreed to.

"Your committee have, after consultation with numerous members of the Association, maturely considered the subject referred to them, and beg respectfully to suggest the adoption of the following resolutions:—

"1. That it is the opinion of this Association, that homœopathy as propounded by Hahnemann and practised by his followers is so utterly opposed to science and common sense, as well as so completely at variance with the experience of the medical profession, that it ought to be in no way or degree practised or countenanced by any regularly educated medical practitioner.

"2. That homœopathic practitioners, through the press, the platform, and the pulpit, have endeavoured to heap contempt upon the practice of medicine and surgery as followed by members of this Association and by the profession at large.

"3. That for these reasons it is derogatory to the honour of members of this Association to hold any kind of professional intercourse with homœopathic practitioners.

"4. That there are three classes of practitioners who ought not to be members of this Association, viz.:—1st, real homœopathic practitioners; 2nd, those who practise homœopathy in combination with other systems of treatment; and 3rd, those who, under various pretences, meet in consultation or hold professional intercourse with those who practise homœopathy.

"5. That a committee of seven be appointed to frame laws in accordance with these resolutions, to be submitted to the next annual meeting of the Association.

"6. That the thanks of the Association are eminently due, and are hereby given, to the Presidents and Fellows of the Royal College of Physicians and Surgeons of Edinburgh for their determined stand against homœopathic delusions and impostures.

"7. That the thanks of the Association are also due, and are hereby given, to the Universities of Edinburgh and St. Andrew's for their resolution to refuse their diplomas to practitioners of homœopathy, but the Association feel imperatively called on to express its disapproval of any school of medicine which retains among its teachers any one who holds homœopathic opinions.

"8. That these resolutions be printed and transmitted to all the medical licensing bodies and medical schools in the United Kingdom, and that they likewise be inserted in the *Times*, newspaper, the *Morning Post*, the *North British Advertiser*, *Saunders's News Letter*, all the British and Irish medical periodicals, and in such other journals as the council may sanction upon the recommendation of the branch Associations.

"In proposing these resolutions for the adoption of the Association, your committee are anxious to state that they are actuated by a strong sense of the importance of the subject in its relation both to humanity and morals. They most conscientiously believe that the countenance afforded to the form of charlatanry herein alluded to is detrimental to the true interests of the public, as it is subversive of that strict integrity which ought to characterise practitioners of medicine, and which has ever distinguished the profession in these kingdoms.

"JOHN ROSE CORMACK, M.D. Edin., Fellow Royal Coll. Phys. Edin., of Putney.
"JAMES TUNSTALL, M.D. Edin., of Bath.
"H. H. RANKING, M.D. Cantab., of Norwich.

"It was moved by Dr. Malden of Worcester, and seconded by Dr. Charles J. B. Williams of London, that this Report be adopted.

"The motion was put from the chair and unanimously agreed to.

"The following committee were then appointed in terms of the fifth resolution:—Dr. Cormack, of Putney; Dr. Tunstall, of Bath; Dr. Ranking, of Norwich; Dr. Malden, of Worcester; Dr. Charles J. B. Williams, of London; Sir Charles Hastings, M.D., of Worcester; and Dr. Cowan, of Reading. Dr. Cormack to be Convener.

"On the motion of Dr. Tunstall, it was unanimously resolved, that the proceedings in reference to this subject be printed and circulated among the members.

"G. S. JENKS, President.
"J. P. SHEPPARD, Secretary.
"Pavilion, Brighton, Aug. 14, 1851."

Hosted by Google

How homœopathists practise *irregularly* or *illegally* there is no attempt at explanation. It is simply asserted that they do so. Professor Simpson and others come under the lash in the above quotation, for Professor Simpson encourages and practises mesmerism. Dr. Symonds, of Bristol, recommends the water treatment: and these are, two of the anti-homœopathists! The fury of our adversaries has got the better of their common sense. They show their sense of the importance of our real medical reform, and they encourage each other in a vain and silly attempt to put down by brute force what they cannot do by argument. The public will naturally ask, why these zealous, and erudite, and pains-taking persons do not put homœopathy to the test by actual experiments? Why not? let them answer. They do not, however, seem at all conscious that they are giving the homœopathists a great advantage. It is very easy to call practitioners possessed of *the same* medical qualifications as themselves "illegal and irregular" practitioners. But how will they prove them to be such? Not one word of argument has been advanced in support of the assertion. We show how little we care for these outbreaks of faction, by reproducing them. We are satisfied that such one-sided partisans damage their own cause, and advance ours. Why should they be in such a rage? Do they think the public will give them credit for disinterestedness in the course they pursue? We are very sorry for them, and would willingly see them enter into a calm, and philosophical, and experimental investigation of the claims of homœopathy. They have begun a course of persecution, of obloquy, of injury—let them beware. They *recover* none from our ranks; we daily win recruits from theirs. Let them persuade Colleges and Halls to refuse us their diplomas—we believe they would utterly fail in this attempt,—and we will have Colleges and Halls of our own. It is cheering to know that they mightily magnify our importance by these hostile demonstrations, and that in forcing us to acquiesce in the denomination of a medical sect, they are laying the axe to the root of their own tree?

Review.

Letter to the Patrons of the University of Edinburgh on the late Resolutions of the Medical Faculty. By WILLIAM HENDERSON, M.D., Professor of General Pathology in the University of Edinburgh. London: Hamilton, Adams, & Co.

PROFESSOR HENDERSON is not a man to be snubbed, or treated with indignity. He casts off the petty malice of his assailants, the mean jealousies, the undignified censures, "like dewdrops from the lion's mane." This letter is written in a calm tone, and shows that the Professor has justly measured his own strength and position as compared with those of his unworthy antagonists.

We recommend a careful perusal of the letter to our readers. After giving the resolutions pointed at himself, the Professor thus writes:

"Why the Faculty should have determined on the extraordinary course which has met with so severe a check from their colleagues, I may hazard a conjecture in the sequel. That it has been somewhat suddenly conceived, admits of indisputable proof. In the June Number of the Journal conducted by the very members of the Faculty with whom this persecution originated, they exonerate themselves from the charges of being lukewarm on the subject of homœopathy, and of tolerating a colleague who professes a belief in that system, in the following words:—'As to the Professorship of General Pathology, the Medical Faculty have no power in the way of appointment or dismissal; but we have no doubt that if it ever came to their knowledge that Dr. Henderson was making his lectures from this chair the vehicle of homœopathic doctrines, they would petition the patrons for his removal. The testimony of students who have attended this course assures us there has hitherto been no ground for any such complaint; *and so long as this is the case, we do not see how the Medical Faculty can take cognizance of the principles upon which their colleague chooses to conduct his private practice.*' A month did not elapse, however, before they altered their opinion, and fancied they could make out some pretext for molesting their colleague, on account of those very principles 'upon which he chooses to conduct his private practice.' And what makes this rapid change all the more remarkable is, that it is singularly inconsistent with their conduct during the previous seven years that their colleague has been known over the three kingdoms as a believer in homœopathy. Thus, the Professor of Clinical Surgery, who took the lead in this proceeding of the Faculty, was the mover, in the College of Surgeons a short time previously, of a resolution which bore, that meeting in consultation with those who practise homœopathy, is to countenance the system, yet he himself has repeatedly given such countenance to it in this city. Lest he may have forgotten the occasions, I may remind him of two that fell within my own knowledge. The one occurred a few days before he set out to take possession of his London appointment, the other a few days after his return from that enterprise. The Professor of Midwifery has still more frequently countenanced it in the same way: and several others are in the like predicament; while one professor, who was present at the meeting and concurred in the Resolutions of the Faculty,

Hosted by Google

requested me by a letter under his own hand to attend his only child during an attack of scarlet fever, a little service which was as freely rendered as it was frankly asked, and has now (shall I add?) been handsomely requited!"

Ler our readers weigh well the weight of testimony and the force of argument in the following extract:

"If the Medical Faculty would act wisely and fairly in reference to homœopathy, and to candidates for their degree, they should test experimentally the claims of the system they repudiate before they venture to condemn it. It will not do to sneer at it as a mere system of infinitesimal doses, for should any one affirm it to be so, I am entitled to tell him that, if he do so without having studied the subject, he speaks in ignorance, let him pronounce his opinion with what pretentious pomp he may; and that if he do so after having studied the subject, he says what he must know to be untrue. While we maintain that no College or Faculty in existence is in a condition to decide what may be the smallest quantity of a medicine that is capable of acting on the sick, and that doses very much smaller than our Colleges and Faculties have any conception of actually do operate as remedies, the whole question of doses is left open to the discretion and experience of the physician, who may be as strictly a homœopathist as Hahnemann himself, though he should give his medicines in the ordinary form, simply if he select them according to their homœopathic fitness. This alone is homœopathy, and it has been studied, or the study of it recommended, by men quite as considerable in social and scientific rank as any member of the Faculty. Our late townsman, Dr. Andrew Combe, was a good specimen of the more philosophic physicians, and he wrote of homœopathy thus:—'I am not, and for a long time have not been, *hostile* to homœopathy. I have long thought that the homœopathists have made out a case for *serious inquiry*, and on that ground urged our medical nephews to avail themselves of the opportunities presented to them to investigate its claims, and verify them in practical observation. If I were to continue in my profession, I should consider it a duty to *test* these claims.'

"Brera, the Professor of Practice of Physic, and Clinical Medicine in the University of Padua, one of the most eminent examples of the practical physician, wrote of homœopathy in these terms:—'Homœopathy, though it may appear vain to some, singular to others, and extravagant to a great number, does actually reign in the scientific world just like any other school; for it has its Chairs, its Books, its Journals, its Hospitals, its Cliniques, its Professors who teach, and its Public who listen....Such being the case, it can no longer be treated with contempt; it merits that calm examination, that severity of judgment which have been applied to all systems of medicine successively,' etc. etc.

"The late Mr. Liston, Professor of Clinical Surgery in the University College, London, was the finest example of the practical surgeon this country ever produced, and his opinion of homœopathy appears in the following extract from his Lectures. After detailing the particulars of the cure of cases of erysipelas, which he had treated with homœopathic remedies, that great surgeon thus addressed his pupils: 'Of course we cannot pretend to say positively in what way this effect is produced, but it seems almost to act by magic; however, so long as we benefit our patients by the treatment we pursue, we have no right to condemn the principles upon which this treatment is recommended and pursued. You know that this medicine (*Belladonna*) is recommended by homœopathists in this affection, because it produces on the skin a fiery eruption or efflorescence, accompanied by inflammatory fever. *Similia similibus curantur*, say they . . . I believe in the homœopathic doctrines to a certain extent, but I cannot as yet, from inexperience on the subject, go the length its advocates would wish, in so far as regards the very minute doses of some of their medicines. The medicines in the above cases were certainly given in much smaller doses than have hitherto ever been prescribed. The beneficial effects, as you witnessed, are unquestionable. I have, however, seen similar good effects of the *Belladonna*, prepared according to the Homœopathic Pharmacopœia, in a case of very severe erysipelas of the head and face, under the care of my friend Dr. Quin. The inflammatory symptoms and local signs disappeared with very great rapidity. Without adopting the theory of this medical sect, you ought not to reject its doctrines without due examination and inquiry.'

"The Faculty may decline to follow the advice or example of these distinguished men, but it is far from being likely that the students in our schools will read with indifference those deliberate statements from men who stood among the foremost in their several departments, or that they shall be insensible to the suggestions of curiosity when aroused by such weighty testimony. To oppose penalties and regulations to the beliefs or purposes of their pupils, will soon be found a vain expedient for cutting off the supply of qualified and licensed practitioners to the ranks of the rising system, and we hope to be spared the annual recurrence of scenes which place this city, that was wont to take a first place in great intellectual and scientific movements, not only behind other seats of learning in free countries, but actually behind such dens of despotism as Vienna and St. Petersburg. In both these cities the young science which struggles in Britain for bare toleration, under the ban of Colleges and threatenings of pains and penalties, is sanctioned by the authority and protected by the strong arm of the State. The *Odium Medicum* can be more tyrannical than the employers of Haynau, and more intolerant than the imperial jailor of Siberia."

The truth of the matter is, that the Universities of mythical St. Andrew's and historical Edinburgh have got themselves into a mess. They have a very awkward customer to deal with in Professor Hen-

Hosted by Google

derson. A pathologist second to none in these kingdoms—a professor of the great Medical University of Great Britain, a man of the most vigorous intellect, and of the most satisfactory attainments, not only in his special subject, but in every department of medical science—looked up to with respect and admiration by the students of Edinburgh—with a very large private practice—a conscientious upholder of what he believes to be true—one of Carlyle's men, a man of earnest faith in what he professes to believe—how can such a man fail to give a heavy fall to those who have prejudice to oppose to his faith—"resolutions" to oppose to his practical experience—the tyrant's edict of "it shall be so" to his firm assertion "it is so"?

We do verily believe that if we had half a dozen earnest men, sufficiently gifted with oratory, and with their heart in their work, to go about delivering lectures on homœopathy in the cities, towns, and villages of the British Isles, we should have the said homœopathy the rule, and not the exception, of medical practice throughout these realms in less than ten years.

OUR RELATIONS WITH HOMŒOPATHY.

To the Editor of the Provincial Medical and Surgical Journal.

Putney, July 29, 1851.

SIR,—While, with you, I recognise the greatness of the benefit conferred on legitimate medicine by the recent acts of the Scottish Colleges, I cannot help feeling that we ought to do more than, as individuals, yield to them our concurrence and applause. We ought not, I think, to allow our annual meeting at Brighton to pass without issuing a deliverance upon the subject of homœopathy, as explicit as those which have come to us from beyond the Tweed; and there is one point upon which it appears to me that even more plainness of expression is required.

To adopt resolutions setting forth that the homœopathic dogma and the doctrine of infinitesimal doses have no truthful basis, and are, in fact, mere nonsensical delusions, may be quite proper, inasmuch as some honest but weak and undisciplined minds have been seduced by the hardy assertions and false reasoning by which these errors have been supported. But something more is required, if it be true, as I think it is, that this fashionable quackery is so susceptible of adaptation to the most contradictory prejudices of shallow men and women, as to have become a sort of Protean deceit, able to lure lucre by every imaginable wile from the sick and the silly. The worst part of homœopathy is, in my opinion, the DISHONESTY of the majority of those who live by it. When patients are once secured, they are, I think, very rarely treated in accordance with the principles of Hahnemann; but are retained by the combination of every current medical novelty which may at the time be most in favour with the moneyed throng of quack fanciers. I have not been able to hear of any one who honestly relies on homœopathy for the cure of disease; but I can point to many calling themselves homœopathic practitioners, who attempt to relieve the symptoms of disease by the same means which we would adopt, and to others, who retain their *clientelle* fully as much by practising hydropathy, mesmerism, and miscellaneous tricks, as by giving the globules. If homœopathy were honestly practised, it might be amicably dealt with; but as it is truly a combination of any and every available charlatanic trick, it cannot be effectively opposed as a distinct medical heresy, and therefore all that remains for us, as men of science and men of integrity, is to give notice, that we exclude from all professional intercourse practitioners who are in any way engaged in using or upholding a system which we think bears upon its very face fraud as well as absurdity.

I have heard it urged in extenuation of the fall of some medical men, that they had large starving families, and that they had met with distressing pecuniary reverses. It has often been said to me that if they treated disease to the best of their ability, there was no great crime in their sailing so far with the fashionable current as to call themselves homœopathic, and to give globules as placebos. From my heart I compassionate these persons; for I know that want has distorted and destroyed the moral sense even in good men; but, while in some cases we pardon the transgressors, let us not be tolerant of the transgression. It behoves us, quickly and decidedly, to draw a broad line between medicine and homœopathy, so as to encourage and strengthen the hands of many in our impoverished and overstocked profession, who, though tempted have not yet bartered principle for pelf.

The Provincial Medical and Surgical Association has now the power, and the near opportunity, of drawing this much-needed line of demarcation:—*Let the Association declare that the names of homœopathic practitioners and of those who hold professional intercourse with them, cannot be on its list of members.* The promulgation of this law would enlighten the public. It would also deter some too-facile consulting physicians from meeting the homœopathic quacks "simply for diagnosis;" and it would make it impossible for operating surgeons to say they did not mean to insult the profession, "that they only went to give a surgical opinion" or "perform an operation." When it is known that such unworthy proceedings are of daily occurrence in London; and when we see Fellows of our metropolitan colleges eagerly seeking as the patrons of their hospitals Lord Carlisle, Lord Robert Grosvenor, and other noblemen who are notorious abettors of homœopathic charities, is it wonderful that the public mind has become poisoned, and un-

Hosted by Google

able to discriminate between legitimate medicine and fraudulent practice? When we see Fellows of both London Colleges so demeaning themselves, how can the Colleges serve the cause of truth? In these circumstances it is doubly the duty of our great Association to come forward; and when we meet at Brighton, let us make the fact of membership be a more distinctive test of professional morality than any now existing out of Scotland.

I am, Sir, your obedient servant,
JOHN ROSE CORMACK.

LETTER FROM DR. HILBERS ON HIS DEFENCE OF HOMŒOPATHY.

To the Editor of the Provincial Medical and Surgical Journal.

SIR,—Having been absent from home for a few days, the number of the *Provincial Journal*, containing your strictures on my letter, only fell into my hands a day or two ago. As you have impugned my conscientiousness, I trust you will not deny me a place in an early number of the *Journal*, in order that I may point out the error in your article to which, as I conceive, your remarks are mainly attributable.

The "sophisms" which you are pleased to call mine, are of your own manufacture. My "sophisms" are quite different, and are not touched by your article. You say,—"he admits, in fact, that equivocation is justifiable when it is necessary to obtain a certain end." I say,—"If a set of men can be found so blinded by prejudice to a sense of their duty, as to punish a man because he knows all that they do, and something more, any reasonable amount of deception is justifiable, when the object to be attained is a laudable and a necessary one, and *when, through their dishonesty,* it cannot be obtained without it." I would suggest that there is some slight difference between the qualified and the unqualified assertion; about as much as if you were accused of justifying assault and battery in the abstract, because you had said that if a man assaulted you, and tried to take away your coat, you would feel yourself justified in knocking him down. Methinks it seems passing strange, and somewhat inconsistent, for so stern a moralist to fall into such an error and consequent injustice, for I presume it is not a part of your moral creed that it is unnecessary for "a Christian and a gentleman" to act fairly and honestly to a heretic.

If you desire fairly to put the question to your clerical adviser it would run thus:—I am in want of a distinction which the State has empowered a University to bestow on all candidates who comply with certain conditions. I *have* complied with those conditions, and consequently consider myself legally and equitably entitled to the distinction. But some members of this University, in order to gratify a blind prejudice, based on ignorance, have illegally and arbitrarily appended certain other conditions, never contemplated by the State, and diametrically opposed to the genius of our institutions and the spirit of the age. Am I justified in answering in the third person (the sum and substance, be it remembered, of Dr. Hale's delinquency, and of my justification) instead of the first, in order to evade these conditions? Despite your taunt as to my want of conscientiousness, I still think that such an act of "deception," if deception it can be called, is justifiable, exactly as I should consider the unfortunate red-haired prisoner, mentioned in my former letter, justified in going into court with his hair dyed black. The old English proverb, "what is sauce for the goose, is sauce for the gander," holds good here. If it is imperative on the homœopath to answer purely conscientiously, it is imperative on every other candidate to do so too. Considering the diversity of opinions which exist in the treatment of disease, any examination on such terms would be impossible. Every man would naturally contend for the correctness of his own views; the examination-room would speedily be transformed into a bear-garden, and the police-office, or the riot act, would be the *finale* of every examination. The examination always has been, and always must be, a test of a man's knowledge, and not of his creed. If he is found to possess a competent share of the former, he ought to be presumed capable of correctly determining the latter.

As to the members of the University deciding that homœopathy is a mischievous fallacy, it is not surprising, when it is remembered that it is something new, and that they are quite ignorant about it. Granting for a moment that the system is as true as its warmest advocates assert it to be, how is it possible that either you or they can ever be convinced of its truth so long as you refuse to test it, or to believe a word spoken in its favour by those who have tested it? To talk in a grandiloquent style about its not being worth testing, and of its having been refuted over and over again, is simply absurd. There are plenty of writers in your own school who would deny such assertions. Dr. Andrew Combe, for instance, says (*British and Foreign Medical Review*, vol. xxi. page 521): "If I were now in practice, I should hold myself bound, without further delay, to test its truth by careful and extensive experiments." Again, to compare it with Morrison or Holloway is worse than absurd; for surely no useful analogy can be drawn between a system which is supported by thousands of competent authorities (educated medical men), and a single medicine which rests for support on the testimony of one or two interested persons. Read the fine philosophic views in the paper of Combe's above quoted, and then see whether such reasoning is applicable to homœopathy.

Depend upon it, Sir, that whether homœopathy is true or false, the course pursued by the periodical medical press is alike impolitic and injurious to the respectability of the profession. The public are beginning to inquire into the matter, and it will be hard for the profession to come well out of the scrutiny. If you really believe homœopathy to be a "mischievous fallacy," you ought to urge on your readers to set to work to expose it without delay, by experi-

Hosted by Google

menting honestly with their medicines, and publishing their failures. You should tell them that what has heretofore been called refutation (in other words, abuse and calumny) has been tried for sixty years, and has most signally failed;—that homœopathy to-day is more rampant than ever;—that, therefore, the further reliance on these weapons is hopeless;—that nothing can be expected from persecution;—that that also has been tried and found wanting;—and that if despotic Austria was obliged to abandon it, it is scarcely probable that the miserable efforts of the Scotch Universities in the same direction will answer better. Wonderful to say, however, the unwillingness of the profession to enter on our destruction in the way which (if we are wrong) would ensure success, is only equalled by *our* eagerness to court this destruction. We open hospitals, we put every facility in the way of medical men attending them, we say to our bitterest enemies—come, and welcome. On the present occasion I have tried to bribe the profession to expose us, by offering a twenty guinea prize (I will make it forty, if you please) for the best series of cases illustrative of the failure of the treatment, but all to no purpose. You fall back on the old tactics, and solemnly pronounce your deliberate conviction, that out of two or three thousand medical men, not one has ordinary conscientiousness and intelligence combined. And you say this, although many of these men have made the greatest possible sacrifices, personal and professional, in embracing homœopathy; and though they have enlisted on their side such men as the scientific Chevalier Bunsen, the logical Archbishop Whately, and the hard-headed statistician Wilson. Verily, Sir, the extreme of scepticism is the quintessence of credulity.

I am, Sir, yours obediently,
GEORGE HILBERS.

19, South Bedford Street,
July 29, 1851.

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—Will you permit me space to draw the attention of the "Association for the Protection of Homœopathic Students and Practitioners" to the manifesto of the "Provincial Medical and Surgical Association," advertised in the several morning papers, besides the *Times* of last Saturday?

A more wicked and fruitless attempt to stifle the progress of truth could scarcely be found. Nevertheless, it seems to me that it would be unwise to treat such a slanderous proceeding with the silence of contempt. We ought to be up and doing, and lose not a moment in exposing the shallow resolutions of our opponents, some of whom look upon our doings as "awful." One speaker, a Dr. C. J. Blasius Williams, of Holles Street, Cavendish Square, who, like Dr. Rose Cormack, a general practitioner in Putney, is the "*son of a clergyman*," *blazed* away, while Cormack *rose* to the eloquence of a hungry lion. Poor Blasius felt keenly, because we, the homœopaths, were entrapping the *rich* and the wise. Good soul, Williams, was deeply affected. "Yes, indeed, awful!" was his concern for the "properties of the victims" whom he has attempted to recall as wanderers from his fold, by an affectionate threat that if "victims" will continue in their common-sense path of obtaining health, and will stubbornly refuse to listen to his warning voice, "the fate of their body and soul" is in danger. Noisy Cormack, who also affected much sanctity, equally declared his *animus*, and but for his slanderous statements, which formed the basis of the resolutions since advertised as a manifesto, I would not have troubled myself to send you this communication.

Dr. Cormack, in a letter published in the *Provincial Medical and Surgical Journal*, which has been reprinted in the form of a sixpenny pamphlet, and largely distributed, in order that he may have an opportunity of advertising a few complimentary notes addressed to him by a patient or patients, as a placebo for his grief and chagrin at their desertion from him to the growing tide of homœopathy, writes:—"I have not been able to hear of any practitioner who honestly relies on homœopathy for the cure of disease." This outrageous slander ought to be challenged at once.

I would propose that the Honorary Secretary of the "Association for the Protection of Homœopathic Students and Practitioners" do at once summon a meeting of the committee, in order that a brief yet comprehensive set of pungent resolutions, cautioning the public against the ignorance and wiles of our opponents, may be framed and published in the various morning papers. Allow me to inform the Honorary Secretary of the Association, that our generous chemist, Mr. Headland, to whom the matter was represented, at once, in consideration of the Association funds being young, empowered me to hold him responsible for the insertion of such resolutions in the morning papers.

I trust not one moment will be lost. I enclose my card, and am, Sir, your faithful servant,
A MEMBER OF THE COMMITTEE OF THE ASSOCIATION FOR THE PROTECTION OF HOMŒOPATHIC STUDENTS AND PRACTITIONERS.

[We highly approve of our correspondent's idea, and with him trust the Honorary Secretary will call such meeting as advised.—ED.]

To the Editor of the Homœopathic Times.

SIR,—I find that some of the most thoughtful of our body fear that this movement for an Association has been precipitate and premature. Sympathising as I do in the fullest way with their desire for peaceful seclusion from the strife of tongues attendant on political agitation, yet I feel assured that our only hope of peace in this life is by boldly repelling the aggression on our liberties. The question for us to resolve is, whether shall we encounter the foe at the frontier or at the gate of our citadel? The Professors of Edinburgh have now admitted the charge of interrogating a student as

Hosted by Google

to whether he intended to practise homœopathically, and condemning him because he wavered. No one can read their account of the transaction, without coming to the conclusion that Mr. Pope's adhesion to homœopathy was the head and front of his offending. Now, let it not be supposed that our University is unusually bigoted, and did this of its own accord. Quite the reverse. Many of the professors are very liberal; but as a body it is timid, and cannot despise the threats of the *Lancet*. The *Lancet* lives by the support of the mass of ordinary practitioners. Till their feelings towards homœopathy change, the tone of their organ towards us will not change. So long as the *plebs medica* grumbles, the Tribune *Lancet* will roar; so long as the *Lancet* commands, the schools obey. If Edinburgh sets the example, is there any security that the others shall not follow? They have crossed the Rubicon. Let us beware of divisions in the senate.

Yours, &c.,

J. Rutherfurd Russell.

Edinburgh, August 18th.

To the Editor of the Homœopathic Times.

Sir,—We are now commencing a third volume of the *Homœopathic Times*, and it would appear that a great struggle is at hand, one which should render the pages of this journal very important, as it must be used in a popular sense to arouse the energies of the dormant, to defend the oppressed, and maintain the invaluable doctrines of Hahnemann unflinchingly through evil and good report. On the medical practitioners much depends, and their unremitting attention to every case presented is of more moment than may at first sight appear, for if they fail, each failure marks one against them; this should never be forgotten. Cure Well—Cure Quickly, must be the motto. Theorising is of no avail, bring it to the test; the public have no time to study individual theories. Every man to his business. If I am ill, who can make me well? This is the question, and the answering this question, in fact, will bid defiance to the slander of our enemies, if enemies they must be called; you can bring no stronger evidence than the fact *I am cured*. This is the ground I have ever maintained while advocating the principles of homœopathy. Seven years ago, wherever I mentioned the word, I almost invariably met with the reply, "Ah, sir, I know, it's the water-cure; I never could take much water, it does not agree with me." But when I came to an explanation, and opened my wonderful magic box with its tiny globules, the attention was aroused (occurrences like these frequently happened in railway carriages), several heads would be bobbing to hear the simple law of Hahnemann expounded. As we proceeded farther, the subject became better known; here and there, a reply would be made, such as "My doctor says it is the diet; there is nothing in those little things to cure disease." "Well then," say I, "you shall not change your diet, only abstain from coffee, and we will prove to you that the diet alone does not play the all-important part. Next came the argument that homœopathic globules ccontained the most powerful poisons and have killed several persons. "What! the dose kill? you see this arsenic (showing a bottle of *Arsenicum*), I will now swallow several doses, and, if you wish me, the contents of this small bottle; thus proving it impossible." In this manner I have proceeded, and administered the first globule to some hundreds of persons. How does the matter stand now? Homœopathy is known to almost all: the virulence of the doctors, the bitterness manifested, the loss of temper shown by many of them when the horrid word has been pronounced, have done more real good than harm to the Cause.

About twelve months ago I called upon a lady of my acquaintance, whom I was surprised to see with her arm in a sling, she was evidently suffering much pain. On inquiry, I found she had been under medical treatment nearly six weeks, and her sufferings at night were almost unbearable; she told me she had passed the previous night without five minutes' rest. I was bold enough to promise a good night, if she would take some globules; after consulting her husband she consented. I dissolved six globules of *Veratrum* 30, for six doses; a third dose was administered at bedtime that night. On the following day she stated she had slept well until five o'clock that morning; the pain had left her, but the arm felt as if wrenched out of the socket, or as though it did not belong to her. I left her one dose of *Sulphur* 30, to be taken at the expiration of a week, and she has had no return of the pain. Now, Sir, this is all very well, her medical attendant could say nothing; his patient was cured in less than forty-eight hours, by a system of which he is totally ignorant. Many such cases may be recorded; but I do not see that so much benefit can be derived from this source as by a record of unsuccessful cases. If homœopathic practitioners would meet together and candidly lay down, each, their individual experience, more good would result from the consideration of those cases in which they fail to cure.

A friend of mine spoke to me, about fifteen months ago, respecting an eruption on the head of her little girl, a species of porrigo. I recommended homœopathy, and the child was placed under the care of a medical gentleman who had been converted, but had previously practised allopathy several years in the town in which they resided. He appeared to pay great attention to the case, and worked very hard at it, probably too hard, for he did not make any favourable impression on the disease in six months; indeed, the child was worse rather than better at the expiration of that period; and, to my great annoyance, was removed from under his care, and subjected to allopathic treatment, when *Mercury* and *Sarsaparilla* set the disease aside for a time; it, however, subsequently reappeared in a modified form, and was ultimately cured by a herbalist. Now it seems to me essential for the safe progress of the homœopathic system, that such cases should be recorded, for unfortunately I have another nearly the same as that just related, though in an opposite part of the country,

Hosted by Google

which shared the same fate. Failure under homœopathy should be studied, and the result of any particular treatment made known. It may be unpleasant for medical men to publish their failures, but surely the attainment of knowledge and a more certain mode of cure would amply repay them for a little sacrifice of feeling under circumstances of such vital importance. There is another point requiring some attention at the present moment—the refusal of general practitioners to meet in consultation those who profess the doctrines of Hahnemann.

Now the public are the greatest sufferers from this unfriendly sectarianism. I will suppose that my wife is taken dangerously ill. Is it or is it not my duty to try every reasonable means likely to save life? I am of opinion that it is; therefore, after having expended all that legitimate allopathy can do, I should, even as an indifferent person, feel justified in consulting homœopathy. But how would the matter stand? The homœopath must take up the case with all its responsibility, single-handed, at the eleventh hour; left not only to combat the disease, but the effects of coarse drugs which have perhaps tended to exhaust the few remaining energies of his dying patient. Is this fair? would it not be more satisfactory to my mind, that he who had watched the case from the commencement should still remain at his post, anxious to see the result of a system which is unknown to him but in its name? can it be a disadvantage to know too much—to have a twofold power? Oh, no, this is not the case. An allopath, who a short time since listened to my argument in favour of homœopathy, replied, "What you say I believe to be true; but it won't do—it's against the shop." Yes, it is against the shop, and many persons are not willing to pay their money, unless they have quantity, or plenty of physic for it. Time and patience will overcome all this. The crisis has commenced, and it would seem urgently to call for a charter of protection. But I charge you, be not too hasty on this point; there is not much to fear, and an undue precipitancy may retard the attainment of this object some years, a circumstance we should all regret. Let homœopathy go on progressing in an honest straightforward course. Bring all the force to bear, and we shall soon enlist such power in this cause of truth as to withstand all opposition, and ultimately arrive in the haven of safety.

H. B.

Miscellaneous.

THE CENSUS FOR IRELAND, 1841-51.—Ireland,—the exception to almost every rule. in religion, in politics, and in social economics,—true to her character, is also an exception as to the rule applying to the General Census for 1851. The enumeration for Great Britain yields a result of increase of population to the extent of 2¼ millions, while Ireland shows a decrease of more than a million and a half in a population of eight millions, as follows:—

		1841.		1851.
Houses:	Inhabited	1,328,839	..	1,047,735
	Uninhabited, built	52,208	..	65,159
	building	3,313	..	2,113
	Total	1,384,360	..	1,115.007
Families		1,472,287	..	1,207,002
Persons:	Males	4,019,576	..	3,176,727
	Females	4,155,548	..	3,339,067
	Total	8,175,124	..	6,515,794
Population in 1841		8,175,124		
,, 1851		6,515.794		
Decrease		1,659,330		

Or, at the rate of 20 per cent.

Population in 1821	6,801,827
,, 1831	7,767,401
,, 1841	8,175,124
,, 1851	6,515,795

Now since the Legislature has not "repealed the Union," neither shall we, and so, adding the Census of Ireland to the general results for England and Wales, we find that the whole decennial increase of population in the United Kingdom amounts to only 604,220.—*Medical Times.*

MENTAL EXCITEMENT.—Bad news weakens the action of the heart, oppresses the lungs, destroys the appetite, stops digestion, and partially suspends all the functions of the system. An emotion of shame flushes the face; fear blanches it; joy illuminates it; and an instant thrill electrifies a million of nerves. Surprise spurs the pulse into a gallop. Delirium infuses great energy. Volition commands, and hundreds of muscles spring to execute. Powerful emotion often kills the body at a stroke; Chilo, Diagoras, and Sophocles died of joy at the Grecian games. The news of a defeat killed Philip V. The doorkeeper of Congress expired upon hearing of the surrender of Cornwallis. Eminent public speakers have often died in the midst of an impassioned burst of eloquence, or when the deep emotion that produced it suddenly subsided. Largrave, the young Parisian, died when he heard that the musical prize for which he had competed was adjudged to another.

OMNIPRESENCE OF GOD.—The same Being, whose eye is abroad over the whole universe, gives vegetation to every blade of grass, and motion to every particle of blood which circulates through the veins of the minutest animal. He takes in his comprehensive grasp immensity, and all its wonders. Yet is each individual known to him, as if he were the object of his undivided attention. He marks all our thoughts, and gives birth to every feeling within us; and with a power which we can neither describe nor comprehend, the same God who sits in the highest heaven, and reigns over the glories of the firmament, is at our right hand, gives us every breath we draw, and every comfort which we enjoy.—*Chalmers.*

No. 109. Vol. III. | SATURDAY, AUGUST 30, 1851. | Stamped 4d. Unstamped 3d.

Communications.

UNVEILING OF HAHNEMANN'S STATUE AT LEIPZIG.

The 10th of August, at Leipzig, was one of the most brilliant and cloudless days of the year, and, being a holiday, the good Leipzigers had donned their best attire, and were assembled in great crowds to witness the ceremony of unveiling the statue of that great man who, thirty years before, had been ignominiously expelled their city.

A large number of homœopathic practitioners had assembled from every part of Germany, and from many distant countries, from Italy, Spain, Denmark, England, Scotland, to assist in this work of respect for the memory of their master, and these being joined by a large number of the lay friends of the Cause, at twelve o'clock, marched in procession through the eager crowd, from the Hôtel de Pologne to the place where the veiled statue stood. A large space had been railed off round the statue, and tastefully decorated with garlands of flowers. The procession, having arrived on the ground, formed a circle round the statue, and a chorus sung an anthem. After this, Dr. Melicher, the president of the Congress, delivered an oration in honour of the Founder of Homœopathy, and at a signal from him, the canvas that shrouded it fell and revealed the statue, amid the plaudits of the assembled multitude and a flourish of trumpets. The chorus then sung an ode composed for the occasion, after which Dr. Melicher, addressing the chief magistrate and town council, who were present on the ground, solemnly delivered over the statue to them. The chief magistrate made a suitable reply, and commended the statue to the care of the citizens of Leipzig. Dr. Stapf now advanced, and laid a laurel and wreath at the foot of the statue of his late Friend and Master, and the procession then reformed, and marched back to the hotel, where an excellent dinner awaited them, to which upwards of 160 ladies and gentlemen sat down. Appropriate toasts and songs enlivened the entertainment, which was effectively presided over by Dr. Melicher. The festivities terminated by a ball in the evening, which was kept up with great spirit by the young folk.

CHOICE OF DILUTIONS AND REPETITIONS OF MEDICAMENTS.

By Dr. J. Perry.*

Communicated by Dr. Rosenstein.

If homœopathic physicians have adopted incontestably Hahnemann's principle, *similia similibus curantur*, because it has been confirmed a thousand times, it has not been the same with the quantity and the repetition of the doses; with reference to this subject the contradictions are very decided. The cause of this divergency of opinion is easily understood. The principle of homœopathy is based upon an acknowledged law, whilst the manner of dividing and administering the medicaments necessarily varies according to the opinions of different practitioners. Each school calls to its aid its individual experience, because it is now proved that the most varied powers, weak and strong doses, single and often repeated doses, cure diseases homœopathically, provided the remedy be well chosen. It is important

* This memoir was long since addressed to the Parisian Homœopathic Congress, in answer to the following questions: "At what degree of dynamization are the homœopathic medicaments possessed of the greatest efficacy in the treatment of acute and chronic maladies? To fix the characters of the morbid states, indicating the use of a given dynamization, in preference to all other dynamizations? What is to be thought of the repetition of homœopathic doses?"

Hosted by Google

to inquire which, compared with the others render most service. In fact, it is more difficult to establish a comparison between the things which are relatively good, than to distinguish the good from the bad. We should investigate if there exists a sufficient reason to accord the preference to the higher or lower powers. If in acting so, we should not be justified in giving the preference to the entire series of powers, we should then, examine if in certain circumstances the higher powers have not the advantage over the lower, and *vice versâ*; what these circumstances are; and finally, if these depend upon the particular character of the medicaments or of the diseases, if they proceed simultaneously from the one and from the other. An intimate relation exists between the degree of power and the repetition, for that reason these two terms are included in the question put for competition by the Society. Although the choice of the remedy is always the first and the most important condition in the cure of diseases, the dose and the repetition of it should nevertheless be treated in the second place, because the success often depends on the dilution.

1. The *term* used to indicate the preparation of the medicament. Some pretend that the name is of no import; but this is a grave error, because each word carries along in its train accessory ideas which influence the mind of the inquirer. Some employ the words *dynamization* and *power*; others *dilution* or *attenuation*. These are two opposite views: one is dynamic, the other material. The proposition to abandon provisionally this point of litigation, and to distinguish the preparations only by numbers, has hitherto not been generally admitted.

Hahnemann has chosen the word power, which recalls to mind arithmetical relations; the term used in the system of Brown to designate the influences which act upon our excitability and which modify it,—influences under which we must range also our medicaments; whereas in the investigation of such an important question, we must as much as possible guard ourselves from all preconceived opinions. I shall maintain in this memoir the term employed by Hahnemann, which by its double signification favours this tendency, and which is generally used in homœopathic literature.

The other series of terms, which is the result of material intuition of the phenomena, finds also its justification, because it is impossible to deny a progressive diminution of medicinal particles. In fact, microscopic researches have proved in the case of metals, that their diminution may be seen until the twelfth trituration; we are by no means justified in denying this progressive division in the higher developed powers because the imperfection of our instruments do not permit us to perceive them.

We may explain the series of phenomena which take place during the trituration and succussion of the remedies as follows. In proportion as the cohesion of the particles lessens they extend progressively. It is also possible that the latent powers develope themselves simultaneously; but it must be proved that this development increases at the same time with the progressive division of the medicinal substance. As long as this fact is unexplained, and a divergency of opinion exists on this subject, the partisans of dynamism will continue to develope more and more the medicine, in order to increase its latent power; the materialists, on the contrary, will fear to diminish the effect of the medicine in pushing too far the attenuation.

2. The views on the *nature of the disease* have certainly been taken into consideration in the review of the question. We meet here two principal opinions. Hahnemann calls disease a change of state; he admits consequently, as the cause of it, a change which has been effected in the vitality of the organism. Others, who look upon disease as a parasite, treat it consequently as an independent being. The organism is, according to their views, the soil where it takes root, grows and dies. Some have in vie w to regulate the abnormal vital powers, and consequently a limited quantity of a weak medicinal power is sufficient; others wish to destroy promptly the supposed parasite, and therefore a stronger dose is requisite. Hahnemann has shown himself to be a good observer in this, as in other points, in administering in the treatment of *psora* higher powers, although, according to his theory, he should have recommended the lower.

3. It is through a deplorable abuse of language that the terms have been considered as identical, and have been confounded. *Strong doses and low powers, weak doses and high powers.* It is also in making no distinction between the words *volume* and *force* that recourse is ordinarily had to strong doses when an energetic action is to be produced. This confusion is in two ways injurious: the word *dose*, in a limited sense, should be applied to the form and to the quantity (one globule or a few drops); the term *power*, on the contrary, designates

Hosted by Google

a mixture of a medicine with an unmedicinal vehicle, (such as sugar of milk or alcohol,) prepared according to the rules of homœopathy. Hahnemann, in diluting the substances, thought to separate the medicaments from injurious principles, but he soon perceived that this was not the way to weaken their curative virtues. It is very difficult to renounce prejudices, even when we think we are free from them, as we often commit the same error which we wish to avoid; so, likewise, do we grossly err in considering as identical the expressions largeness and force, because these two properties of a remedy exist conjointly. Those no less err who consider the higher powers weak, because the substance is diminished; the term dilution gave rise to this mistake.

4. We must also consider as an obstacle the moral disposition of the observer. The physician who proceeds with calmness and firmness, after having prescribed what seems to him the most appropriate on the present occasion, will wait in order to judge of the result. The too zealous or the too timid practitioner will order stronger and too often repeated doses, when the disease follows an unusual course. For which reason, we see many physicians who usually employ higher powers, often having recourse to the repetition of lower powers, in diseases, the course of which is rapid and grave. The mind of the observer is tormented by the fear of injuring the patient by refraining from acting; and by doing too much, mischief is done. The reflecting and cool practitioner will always obtain in such cases the most satisfactory results, because in the art of healing more injury is done by doing too much, than by doing too little.

5. We fear generally—and that is another prejudice—that exterior influences or a digression in diet, may counteract the action of the higher potencies; but experience teaches us that this is not the fact.

6. Another great obstacle, which is a hindrance to arriving at the discovery of truth, is the too great confidence which is generally accorded to some individual observations. Nothing is more prejudicial to the progress of truth than a blind faith in authority.

(To be continued.)

ELEGANT EXTRACTS FROM THE *LANCET*.

Our unfriendly friend, who with the worst possible intentions to homœopathy is doing the homœopathists the best possible service—the would-be *Thug*, who has not the skill nor the success of his oriental prototype—is very rich in a recent number.

He exhibits the brute temper of the gladiator in the worst ages of imperial Rome, unredeemed by one trait of intellect, unillumined by one ray of true philosophy, a mere animal with the animal propensity of destructiveness—but only, after all, a harmless brute. The hook is in the nostrils of this very unwieldy, "unlovely," ungraceful, ridiculous and fantastic Leviathan—of sprats. We suspect he will be sooner tired of out-pouring the slaver of his innocuous wrath, which he fancies is venom, than we shall be of holding him up to ridicule for his impotent imitation of the character of a medical dynast.

Let us whisper in his ear: he praises the Medical Faculty of the University of Edinburgh for refusing their diploma to Mr. Pope: five or six of the graduates of Edinburgh of Mr. Pope's year—led to investigate the subject by the unrighteous, unmanly, and unwise tyranny exercised by the medical corporation of Edinburgh, at the expense of a meritorious student—have engaged themselves to study homœopathy, in consequence of that very persecution. Another whisper for him: the President and Council of the Royal College of Surgeons of England will assuredly *snub* the whining remonstrance of Dr. Hall.

First we give his attack on Mr. Kingdon. That gentleman has said he is not prepared to go the whole way with the homœopathists. He and Dr. Uwins were the two first of the allopathic body, after the introduction of homœopathy into England by Drs. Quin, Belluomini, and Romano, to recommend the study of it to the profession. But he has never entirely and thoroughly adopted it. We speak with all tenderness and respect of Mr. Kingdon, who has made no inconsiderable sacrifice in maintaining his convictions,—so far as he has gone; but those, like himself, who sometimes prescribe homœopathic remedies, and sometimes drugs *in gross*, must expect the sort of lashing the Editor of the *Lancet* has given Mr. Kingdon. We can only express our regret that he, and other worthy and honourable men like him, practise in this half-and-half way. The liberty of conscience we exercise ourselves in therapeutics compels us to respect that of these "borderers." We should rejoice that the whole truth of the Hahnemannian philosophy was received by them—and that they would enter fearlessly on the wide field of homœopathic practice. We do not justify their course; but it is competent to them to exercise their conscience, and to do what they believe to be best for their patients. Their practice is open—and, therefore, there is nothing dishonourable in it, though

Hosted by Google

it is damaging to themselves and in some manner to homœopathy, which they advocate only *in degree*. We think it right to state that though the Editor of the *Lancet* has so worded it, as to make it appear that Mr. Headland furnished both the prescription for the homœopathic medicine and that for the allopathic compounds, that chemist is innocent of sending from his shop, now or at any time, such compounds.

"Determined to do our utmost to separate the impostures and idiocies of globulism from legitimate practice, and to eject those from our ranks who degrade themselves by its quackeries, we this week publish another instance of a man, pretending to a respectable position amongst regular members of the profession, yet mixing himself up with the practices of the homœopathic quacks. The individual we refer to is Mr. William Kingdon, of No. 2, New Bank Buildings, City. On a former occasion, Mr. Kingdon betrayed symptoms of perversion from the regular paths of the profession; but his friends had diligently excused them as a passing matter, and respectable men were glad to believe in the truth of the apology.

"We need not enter into further particulars of the charge we make against Mr. Kingdon, than to publish two of his recent prescriptions, *verbatim et literatim*. It will be seen that they are both recent, and they were both given to the same patient, for the same malady, within seven days of each other.

"These prescriptions afford evidence, not only of Mr. Kingdon's perversion to globulism, but of a far worse state of things. We have before now received assurances that the globulists, whenever they fall into any difficulty, forsake their shams, and resort to the real resources of regular physic. Here is, as it appears, a speaking instance of it. On the 7th of June, Mr. Kingdon orders his patient globules of infinitesimal sugar and belladonna, made into powders; on the 14th of June, Mr. Kingdon prescribes full doses of bark and mercurial, just one week after his homœopathic trash. Can anything be more treasonable or bad, in everything relating to faith and morality, on the part of a medical practitioner? The only other explanation which the case admits of is, that Mr. Kingdon, being sent for as a regular medical man, and receiving payment as such, did nevertheless impose the globules upon his patient, without his patient's knowledge. But this supposition is, if possible, more damaging than the first.

"We see that Mr. Kingdon is one of the honorary fellows of the College of Surgeons of 1843. Surely he cannot be permitted to hold this diploma. Common honesty should suggest to him the propriety of returning it. We observe, also, that he is consulting-surgeon to the Stamford Hill and Stoke-Newington Dispensary. Can this continue? Will the physicians and surgeons consent to hold office in his company? Can Drs. Conquest, Dueshury, and Sieveking, the physicians, or Messrs. Reynolds and Toulmin, the surgeons, consent to act with Mr. Kingdon as consulting-surgeon?

"Our attention was formerly directed to the circumstance that a portrait of Mr. Kingdon was suspended in the meeting-room of the Medical Society of London, and which, we are informed, still continues. We believe Dr. Tyler Smith, in the course of last year, drew the attention of the Council to the impropriety of allowing the likeness of a person suspected of homœopathy to remain in such situation. This was disregarded by the Council at the time, but we trust it may now be amended. We must at all points separate the true from the false—the real from the sham—and legitimate medicine from this worst form of quackery."

In the next extract our dear friend thus expresses himself: "But we tell our professional brethren the time is now ripe; let them be firm and vigilant, and the doom of quackery and fraud is pronounced; the *advent* of science is at hand. Yet a little while and the sun of philosophy now struggling up the empyrean of pure and pellucid knowledge, will light with meridian blaze every corner of the realm of physic." Indeed!—so there has been no science, heretofore, in allopathic medicine; it has been deep night, and the sun of allopathy is now rising for the first time! "Save us from our friends," might the allopaths exclaim. What an admission! Yet this absurd writer denounces as quacks and impostors Hahnemann and his followers, who have stated that there is a natural law of healing, as there is a law of gravitation, and a law of chemical equivalents, and have declared that before the promulgation of this law, medicine was

Hosted by Google

guess-work—the very admission the Editor of the *Lancet* has made for himself and his fellows. Mark the pitiful tone of the conclusion of the second extract, which we translate for the benefit of the Editor of the *Lancet*, as we doubt his knowledge of the meaning of the passage. "If you show yourself a lazy dog, and don't hurl down the sinners, Castor and Pollux, good bruisers though they were, can't save you, call on them as you will."

"Lord Fitzwilliam lately informed the House of Lords, that in the contest with the Court of Rome he expected nothing from the aristocracy. We regret also to have to inform our readers that in our struggle with quackery we expect little or nothing from the heads of the medical profession. They have too much reason to be well satisfied with things as they are, and view with ill-concealed dislike every commotion which disturbs the well-arranged circumstances that minister so beautifully to their comfort and well-being. This selfishness deserves no respect, and we shall give it no quarter.

"It is otherwise with the great body of the profession. Except in some remote rural districts, where, as related in our last number, a country practitioner encounters the conceit and quackery of a baronet's meddling wife, the great body of the medical profession is not only sound and honest, but quite willing to resist the enemies of science. A better proof of this could scarcely be given than that afforded by the late meeting of the Gloucestershire Medical Association. In vain the globulist bullied, and declared he would survive all remarks; in vain the chairman higgled and dodged; the meeting insisted on the expulsion of the unworthy member, and a letter of resignation, ready cut and dried for the purpose, was produced when expulsion was inevitable. The homœopath was indignantly cast forth from the profession. The conduct of the president was most reprehensible. We tell our medical brethren that it will be ever thus. The pleasant circumstance of 'being called in' rules the mind of the conspicuous individual who presides at public meetings. Such favours are of frequent occurrence, between the fashionable quack who ministers to the trifling disorders of pampered individuals, and the physician in vogue. They must be carefully watched. But we do not recommend quarrels. With the profession awake and aroused, there need be no fear of the leading physicians. They must always depend more upon the suffrages of the profession than on the patronage of two or three individuals, however great their names and extensive their possessions. But if there be obstinacy in error, let the time-serving physician or surgeon be set aside, and others brought forward in his stead; and let the quacks be ignominiously ejected from every provincial medical association in England. The 'rogues' march' is the only tune they will understand and fear."

"But we tell our professional brethren the time is now ripe; let them be firm and vigilant, and the doom of quackery and fraud is pronounced; the advent of science is at hand. Yet a little while, and the sun of philosophy now struggling up the empyrean of pure and pellucid knowledge, will light with meridian blaze every corner of the realm of physic. The foreign impostors who have been encouraged by great and scandalous carelessness, will seek in the dreary and benighted regions of their own lands fresh fields for their cupidity, and their wretched abettors amongst ourselves will have to find in the swell-mobs of other occupations less understood means of dishonest existence."

"The great body of the profession must now, however, step forward. Its serried ranks must appear, and overcome the pale inertia of the Colleges. Let there be no anger, no abuse; let all be calm and temperate as becomes a great profession. The exertion must be made. Si te secordiæ et ignavæ tradideris, nequicquam deos implores; irati infaustique sunt."

The Editor of the *Lancet* will find that the accomplished surgeon who presides over the College of Surgeons will not join in the hue and cry against homœopathy, and we suspect that the majority of the Council will agree with their President, that it is their true policy to leave the conscience of their members and fellows free in the matter of therapeutics.

"There is some hope that the Council of the College of Surgeons will take stringent steps with reference to the homœopathic quacks who disgrace their lists. We know that the Council have for some time past been frequently appealed to, and that individual members of the Council have promised their assistance in the matter. Dr. Hall's letter is a further step in the right direction, and must be followed by other, and, if possible, collective remonstrances, until the Council do their duty.

"An admirable letter, to which we shall take occasion to refer, appears this week, from Dr. Cormack, in the *Provincial Medical and Surgical Journal*, calling upon the great Association of which that periodical is the organ, to declare, at the coming meeting at Brighton, 'that the names of homœopathic practitioners, and of those who hold professional intercourse with them, cannot be on its lists of members.' The Association could not be more worthily employed than in such an honest deliverance of its unanimous opinion. If this pestilent quackery be strongly dealt with, then indeed will the Brighton meeting be memorable in the annals of the Association. We have every hope and expectation that the meeting will be large beyond precedent: and we trust we shall have to record that it has not been without fruit in the cause of legitimate medicine, as against the quackeries which now infest her very bosom."

One bit more, and we have done with this exquisite *Lancet* for this week. We presume the title of *Lancet*, now that the

Hosted by Google

use of the lancet is nearly gone by, is kept on the principle of *lucus a non lucendo*. Why does not the proprietor change his name, and call himself anti-homœopath?

"THE MEDICAL DIRECTORY AND THE HOMŒOPATHIC QUACKS.

"*To the Editor of the Lancet.*

"SIR,—In the circular at present being sent to the members of the profession from the editors of the *Medical Directory*, is a question touching the continued publication or not of the list of the homœopathic practitioners. I have (perhaps to the surprise of those equally abhorrent of homœopathy as myself) given my assent to their names still being inserted, and I have given also my reason, which I will take the liberty of transcribing:—

"'For though it may confer upon them great notoriety, it will serve to point them out to the honourable portion of the profession, who will not therefore be in danger of committing mistakes after the manner of Dr. Murphy.'

"I am not, however, certain that some peculiarity may not attach to my views on this head, and I should therefore be very glad to be set right, if I shall be proved to be in error; for I would that my feeble assistance towards crushing the monstrous abortion of legitimate medicine should co-operate in the right direction.

"Your obedient servant,

"J. E. N.

"August, 1851.

*** "The names of the quacks should be wholly excldued from the *Directory*.

"If not, the *Directory* itself should be excluded from the house of every qualified regular practitioner.—ED. L."

ELEGANT EXTRACTS FROM THE MEDICAL TIMES.

THIS paper has not, for some time, written bitter things against homœopathy; but we suppose the conductors feel it to be necessary to bid against the *Lancet*, and the *Provincial Medical and Surgical Journal*, for favour with the allopathic practitioners. Let it not be forgotten that a year or two ago the Editor of the *Medical Times* asserted that homœopathy was extinct in the metropolis, and fitfully blazing in divers parts of the provinces, to go out suddenly. It is found, however, that homœopathy has too much vitality to be expunged by a sneer, and to be *burked* by a band of conspirators.

We give the elegant extracts, with our comments.

"Legitimate practitioners will also, we are sure, at the same time, record their desire that the names of those who practise homœopathy should be altogether omitted from the list of medical men."

This is pitiful enough; but who asked the Editors of the *Medical Directory* to insert those names? Did the homœopathists? We trow not. That, when applied to, they sent their qualifications and addresses, is palpable; but that any sought the notoriety of being advertised as homœopathists, we do not, for one instant, believe.

In the answers to correspondents we have these exquisite *morceaux*.

"The Provincial Association deserves the utmost praise. The example set by its members should be followed by every practitioner in the profession. No regularly qualified man should meet a homœopath in consultation."

We remark on this, that the homœopathic practitioners are as regularly qualified, as the Editor of the *Medical Times* knows very well, as any of their allopathic brethren. He should have worded his paragraph, "no regularly qualified man should meet any other regularly qualified man, if he practises homœopathy. The very fact of his being a homœopathist should put a ban on him: he is more accursed than the veriest villain in the world, from the mere fact of his being a homœopathist." Brave work, my masters! this is science! this is charity! this is bearing one another's burdens!

"Our eyes are always open," this wonderful Editor says. Indeed! as open as a puppy's just after birth—and no more open. He is purblind, who does not see that homœopathy is a *fact*. But we have no *euphrasy* for the cure of that mental blindness, no instrument for removing the hindrance of sight to that closed pupil. *Absit invidia verbo!*

"We are beaten by units"—truly so, the hundreds will beat your thousands, Mr. Editor.

"The voice has gone forth against the homœopaths. Their doom is overtaking them. If the profession be but true to themselves, the humbug and deception of this pseudo-science will be exploded in a very few years. Lord Robert Grosvenor, though high in rank, is not a man of sufficient talent or influence to advance the cause, and we opine that his connection with it has gone far to deprive him of the little reputation for judgment that he formerly possessed. It is notorious that the abettor of one form of quackery is the supporter in turn of all the others."

Lord Robert Grosvenor will be remembered by reason of his connection with homœopathy, when the ephemeral Editors of the *Lancet*, and the *Medical Times*, and the *Provincial Medical and Surgical Journal*, are forgotten amid the lumber of other forgotten things. The

Hosted by Google

doom of the homœopaths has been overtaking them every day since the year 1796, but somehow or other, their doom has not overtaken them yet. In that time dynasties have been changed often,—and allopathic medicine has been changed often,—and peacocks and oxen have lived and died—but homœopathy has been marhcing onward tranquilly and securely.

THE
HOMŒOPATHIC TIMES.

SATURDAY, AUGUST 30TH, 1851.

THE WOLF'S APOLOGY;

OR, THE EXCUSE OF THE EDINBURGH CLIQUE FOR WITHHOLDING THEIR DIPLOMA FROM MR. POPE.

THE Edinburgh professors have issued an exculpatory manifesto in their *Gazette*,—the so-called Monthly Journal of Medical Science. Although nominally a scientific periodical, this is in reality the organ of a petty clique, whose maxim is to write themselves up and their neighbours down. To show the trade spirit of the joint-stock concern, we may mention a recent transaction between one of the partners and a respectable publishing house in town. The Messrs. Griffin, proprietors of the *Encyclopædia Metropolitana*, conceived the idea of publishing cheap scientific manuals, and asked Professor Balfour to write one on botany, for although no authority in the science, yet, with Jussieu's plates supplied by the publishers, he was supposed equal to the task, and could powerfully assist its circulation. He jumped at the proposal, and agreed for £200 to do the work. The agreement was that the publishers, on the payment of the money, were to make what use they pleased of the hook. It was accordingly published and printed also in the *Encyclopædia*. After the sale of the first edition, the publishers applied to the Professor to correct a second, and offered him a handsome sum (£100) for his trouble. He declined, and said he should have nothing more to do with them, but would publish on his own hook. On this they applied to another Professor, who did what he could to amend the bad grammar and latinity of his northern colleague, and so a second edition appeared. Upon this our friend in the north waxed very wroth, repudiated his offspring, asserting that in its second birth its fair proportions had been so mutilated that he could not father it, and warned his class against this imputed bastard. The most glaring vices of this monster were, that the Hebrew words were wrongly spelt, rendering the work useless to biblical students (so that it seems in Scotland it is the practice to read the Scriptures in the original), and that the age of a plant in the Botanical Gardens had not been advanced in the second edition, but allowed, like an old maid, to stand still for two years. The Professor, being a holder of stock in the clique-gazette, covered his changeling with all manner of abuse in that organ, and insinuated that he, being but green (not yet sixty), and a child in all matters referring to book-making (though his father was a printer), had been duped by London sharpers, and was to be looked upon with extreme commiseration. The publishers, not liking to be so charged, and believing themselves to be just as honest as the northern star, published a reply to the insinuations of this *Ursa Major*. The reply is sharp, but contains no personalities. They sent an advertisement of their pamphlet to the so-called Journal of Science, *and it was refused insertion*. So much for the fair play of the north.

We shall now give the attempted exculpation:—

"Mr. Alfred Crosbie Pope having appeared before the second division of Examiners of the Medical Faculty, in the middle of June, underwent the usual written examination on the practical branches of medicine and surgery, and was afterwards subjected to an oral examination on the same subjects. He had satisfied several of the examiners; but *his surgical knowledge* was evidently defective. While under examination in midwifery, he was asked what doses of *Calomel*, *Opium*, *Tartar Emetic*, and *Aloin* he would give in certain diseases [supposing he treated

Hosted by Google

the cases allopathically, being, of course, understood.] In reply, he stated correctly the doses usually given in medical practice, and when asked whether these were the doses which he himself would prescribe, he replied that they were. [Supposing his treatment to be allopathic.] He then underwent an examination on Materia Medica, the professors of that branch and of clinical surgery being present. [There is only one professor of Materia Medica, but professors now a days are not so particularly correct in grammar.] *His replies were satisfactory enough.* The only objection of any moment, indeed, being that his doses of medicine were somewhat large. [An error likely to be corrected in practice.] The Faculty having been furnished with positive information that Mr. Pope had avowed his purpose to become a homœopathic practitioner [by whom? do they pay spies or entrap students into such fatal confessions under the guise of hospitality?], after graduating, it was determined [beforehand?] that he should have an opportunity of answering the charge, [*i. e.* of condemning himself! how English! Not like the Inquisition!] The question was put to him by Dr. Christison [or he was *put to the question*, this is more correct], and the following are the very words of the conversation that ensued. [Who was reporter to this secret tribunal? The minutes will be curious for the future historians of medicine.] 'Well, Mr. Pope, *I am satisfied so far with your answers* [the big doses were no impediment], but there is another point on which I wish to be informed, and as it is better not to beat about the bush, I shall put to you a plain question, in order that I may get a downright answer. [Why was not this plain question put at the beginning?] I am told by a colleague that he has been informed, on good authority [who was the informer, and what reward did he get?], that it is your intention to become a homœopathist after you graduate; *after the answers you have this day given me*, I feel bound to say I do not believe it [so the examination was a trap]; am I right? To which Mr. Pope replies, 'I am not now a homœopathist, but after graduation I mean to inquire into the truth of it.' Professor Syme then remarked. 'Now Mr. Pope, suppose this inquiry which you meditate were to confirm your belief in the truth of homœopathy—what would you do with the diploma received from us—would you burn it, or return it?' [Did Jenner burn his? did any one demand this even of Dr. Samuel Hahnemann?] 'No,' replied he, 'I would keep it.' 'For what purpose?' 'To show that I had studied regularly.' 'Studied what—delusion, fallacies, nonsense? It would only show you had misspent four or five years in studying what could not possibly be of any service, aceording to your own view; and I am sure, upon reflection, you would see how inconsistent it would be with common honesty or common sense to use a diploma after ceasing to entertain the principles which were professed in order to obtain it. [Unless Mr. Syme lost his memory in his "veni vidi et *fugi*" escapade hither, he must have known that he was stating an untruth, for if homœopathists considered his teaching as delusions and nonsense, why should they have called him in to consult with them?] But recollect, Mr. Pope, I offer this remark to you as a friend, not as a professor. [The most tender mercy of the inquisitors is the *coup de grace.*] Mr. Pope then withdrew, and in what remained of his examination he made a satisfactory appearance, except in medical jurisprudence, in which, as in surgery, he was defective. The case being a new one, it was refesred to the whole Medical Faculty for decision. Of the thirteen members, eleven were present. After considering the whole circumstances, the Faculty unanimously resolved—

"'That serious doubts are entertained as to Mr. Pope's principles of practice, and that on this account as well as his insufficiency on some subjects of examination, he shall be remitted to the end of July, by which time he will have had *ample opportunity of making the inquiry into the truth of homœopathy, which he says he contemplates.*" [So these modern Athenians consider six weeks *ample time* to test a system of medicine, besides acquiring the necessary knowledge of medical jurisprudence and surgery! In short, he was given time to recant, and these instructors of ingenuous youth held out a bribe to induce him to do so, although they knew beforehand, from *undoubted* authority, that his conviction was of years' growth,—*O! pudor!*] This resolution, which admitted of his graduating this year, in the event of his satisfying the Medical Faculty [*i. e.* denying his faith], was communicated to him in conversation by the Dean [the famous Dr. Balfour, the innocent pigeon that the savage griffin plucked]. Mr. Pope [not relishing the ignominious terms of capitulation] withdrew at once from the list of candidates."—*Monthly Journal of Medical Science*, August, pp. 196, 197.

We remark that the account given in the professorial manifesto corroborates the

Hosted by Google

statement made by Mr. Pope. *He was rejected for homœopathy.* No one can read the story without coming to this conclusion. To imagine that these good men had been suddenly impregnated with such a vivid zeal for absolute truth, as, on the slightest manifestation of hesitation on the part of a candidate, when bullied in the Old Bailey style, he should be refused his degree, is hardly credible. This new-born love of candour, at all events, presents a striking contrast to their former style of proceeding; for not many years ago, the Professor of Midwifery (Simpson) charged the Professor of Clinical Surgery (Syme) with the next thing to open falsehood, in a public letter, which we subjoin for the edification of their admirers. Nor are we aware that Professor Syme attempted to refute the charge. He probably found the "*tu quoque*" retort much more easy to give than a satisfactory reply. The letter is as follows:—

"To Dr. Beilby,

President of the Royal College of Physicians, Edinburgh.

"My dear Sir,—I have obtained, from one of the Fellows of the College, a sight of a letter addressed by Mr. Syme to you, and printed and circulated by him. On perusing it, my first impression decidedly was, that such a production really required no reply on my part. Some of the profession, however, seem to think that its misstatements should be corrected in the same manner that they have been made. Pardon me, therefore, while I encroach for a minute or two upon your time and my own in making the few following observations.,

"1. I do most solemnly assure you, that in almost every minor detail, Mr. Syme's letter contains a disingenuous and untrue statement of the *res gestæ* of our accidental meeting and conversation, on the occasion which he describes; and when I taxed him directly with his indecent and unfounded attack upon me in the number of Dr. Cormack's Journal, that had been published that morning. I do not write this to accuse Mr. Syme of express want of veracity in the present instance. It is quite explicable, I believe, on other grounds. For, during our brief interview,—(it did not last above two or three minutes),—Mr. Syme was in such a state of tremor and agitation, that I conscientiously believe his recollection of what took place immediately before it, of what I said to him during it, and of what he himself did, was necessarily afterwards strangely perverted.

"2. Mr. Syme's principal and most grievous complaint of me to you and to others is, that at this interview I spoke to him of his conduct being 'contemptible.' I assuredly did so. But the expression was not,—as Mr. Syme evidently wishes you to believe,—applied in any—even the most remote degree—to the attack which he had just published. It was used, as I stated to himself most explicitly at the time, to indicate my opinion of his language and conduct in reference to me a short time previously, in the house of a mutual patient, when he made a visit, at which I was not present. I had predetermined, both for his own sake and for the credit of the profession, to tell him distinctly my impression on this point. The meeting in question afforded me the first opportunity of doing so.

"3. Among his other misstatements to you, Mr. Syme has incautiously hazarded one assertion, which unfortunately for himself, admits of refutation, not only by personal but by documentary evidence. Dr. Cormack, the Editor of the Journal in whose pages Mr. Syme's remarks were improperly permitted to appear, had, previous to their publication, informed me, that he had received for the next number of his work, a paper from Mr. Syme, containing an attack upon me. At my interview with Mr. Syme, I mentioned Dr. Cormack's opinion, as the official authority which led me to consider myself the special object of his animadversions. Now, Mr. Syme roundly affirms to you in his printed letter, that I had no grounds for making this statement. To show the degree of credence to be attached to Mr. Syme's strongest asseverations, I shall quote his accusation of me on this head in his own words, and contrast it with an extract from a letter which I received from Dr. Cormack, on the 5th July, in answer to one of mine, referring to the subject. I transmit you Dr. Cormack's autograph letter along with this.

"'*Extract from Mr. Syme's Letter to Dr. Beilby, dated 1st July.*

"It may be proper to add, that, immediately after this occurrence, I called upon Dr. Cormack to inquire if he had told the Professor of Midwifery that any passage of my paper had been written against him, and was assured by that gentleman that he had never done so.'

"'*Extract from Dr. Cormack's Letter to Dr. Simpson, dated 5th July.*

"'It is correct that I stated to you two or three weeks ago that I had received for the next, or July Number of my Journal a paper from Mr. Syme in which there was an attack upon you.'"

Hosted by Google

"I feel assured that you will agree with mein this, that it is totally unnecessary to add a single word of comment.

"I remain, my dear Sir,

"Very respectfully yours,

"52 Queen Street, "J. Y. SIMPSON.

"July 28, 1845."

After perusing this, will any one believe that those who so readily bandy against each other charges of disingenuousness, will be roused to sudden indignation at the natural hesitation of an unfortunate youth put to *the question* by these unfeeling inquisitors? Unless it had appeared in the Inquisition Gazette, we should not have believed that the Professor of Clinical Surgery could have so entirely forgot what was due to his position. If they have any regard to their reputation let them gag the press.

IF we were inclined to believe one tithe of the vapid assertions made against homœopathy, we should be induced to suppose that our system and science was on its last legs. The "folly and delusion" which we are presumed to advocate would deserve to be extinguished, were it possible to prove a scintilla of the adverse evidence dished up in the most colorable manner by our opponents.

Homœopathy as represented by the allopathic profession is a mass of absurdity from beginning to end, and the public are called upon to scout its disciples and supporters as they would persons of demented intellect, or knaves who seek to profit by the introduction of self-evident quackery. But while the allopathic brotherhood are thus endeavouring to crush the doctrines of Hahnemann, the public do not apparently seem persuaded to cast them aside as ridiculous and unworthy of attention; on the contrary, a spirit of inquiry has been aroused by this fresh crusade, which promises greatly to benefit and assist our Cause.

The proceedings of the Scotch Medical Colleges, the Huddersfield and Halifax demonstrations, the Homœopathic Congress, are all events eliciting marked attention to our progress and success. Anathematized as we have been by the *Lancet* and the *Medical Times*, it is clear enough that the test of infinitesimal doses has created converts to our system from all ranks, and that the doom of boluses and black draughts has been unmistakably pronounced. It would, indeed, be surprising, after what has occurred with reference to the rapid strides which homœopathy has achieved within the last four or five years, were we to find the followers of the old school insensible to the inroad made upon their professional pursuits by their less antiquated competitors.

Self-preservation is the first law of nature. It is not remarkable, then, that the allopaths should seek to upset a science, the very basis of which so greatly interferes with their own notions of medical practice. The attempt is one, of course, which might have been anticipated, seeing the length to which they will go to accomplish any sought end. Homœopathists themselves would not have objected to a fair contest, conducted on honest principles, and followed out under circumstances which could not admit of partial inferences. In fact, they have all along and do now court investigation, if the question be approached in a proper manner, and no undue influence exerted to arrest the process necessary to establish its success or failure.

What greater proof of the sincerity of those who advocate homœopathy and its curative power can be required than this? The challenge has been before the world during the whole of the present century, but, with the exception of parties who have embraced the faith, few have dared to acknowledge its acceptance. And how do we account for the result? For the simple reason that no one has been sufficiently presumptuous, after having carefully examined the principles of homœopathy, to denounce it a fraud.

The majority who have examined have come over to our side. The remainder, blinded by prejudice and old associations, have deferred to what they describe as "wiser heads" than their own, and are

Hosted by Google

therefore content to sit in darkness. It is only the rash writers in the allopathic press who have the hardihood to brand us as impostors and the promulgators of spurious doctrines, their abuse springing from the lowest sources of envy and ignorance. Eventually, however, they will discover the truth of the old apothegm—*Nihil semper floret; ætas succedit ætati.*

Correspondence.

HOMŒOPATHY IN HIGH PLACES.

To the Editor of the Homœopathic Times.

SIR,—Knowing that you gladly receive any information indicative of progress in a right direction, I venture to send you copies of two prescriptions that accidentally came into my hands at a watering-place in one of the eastern counties, where a malignant scarlet fever raged with fearfully fatal violence last year.

FOR SCARLET FEVER.

Sir James Clarke's Prescription.

"Extract of *Belladonna* 5 grains; *Cinnamon-water* 2 ounces. Number of drops according to patient's age, before breakfast, not exceeding twenty, in about two table-spoonfuls of water."

Dr. Locock's Prescription

For a boy ten or eleven years old, who was exposed to the infection.

"Extract of *Belladonna* 3 grains; *Cinnamon water* 1½ ounces; of the solution twenty drops, to be taken three times a day."

Do the allopathic physicians, who prescribe homœopathically, give honour to whom honour is due?—I am, Mr. Editor,

A LOVER OF FAIR PLAY.

[Most of our readers are fully aware of the fact that the practitioners of the allopathic school ever and anon resort to remedies given on the homœopathic principle.—*Aconite, Arnica,* and *Belladonna* have been again and again given in this way by many allopathists. The two eminent physicians, mentioned by our correspondent, have distinguished themselves by their gentlemanly forbearance, and their courteous demeanour towards their homœopathic brethren. Neither of them has ever made any difficulty of meeting in consultation, at the request of the patient, any homœopathic practitioner, not for the treatment, but for an opinion of disease. Other eminent men of the "Faculty" have no less stood aloof from the intolerant bigotry and insolent exclusivism of a certain class of allopathists.—ED.]

To the Editor of the Homœopathic Times.

SIR,—Having for some weeks past been the subject of the grossest misrepresentation in the pages of the *Lancet,* respecting a case of strangulated hernia which occurred in my practice as surgeon to a Poor-law district in the Honiton Union, I shall feel obliged, with a view to set me right with the profession and the public, by your inserting the enclosed copy of my letter to the Poor-law Commissioners on the subject.

I am, Sir, etc.,

E. C. HOLLAND.

Honiton, April 30th, 1851.

GENTLEMEN,—Your letter of yesterday's date, No. $\frac{17833}{61}$, has this morning reached me, and I lose no time in furnishing the explanation you require.

It will perhaps be the better plan that I should give you a statement, chronologically arranged, and, in order to do this, I subjoin the particulars of interviews between John Collins, the son of the deceased, and my servant, William Corner, on the morning of March the 10th last.

My servant states that Collins called about half-past six in the morning, at my house; when, on being interrogated as to what he wanted, he replied that his father was very ill from great pain in the bowels, and wanted to know if I would let him have some medicine. My servant then asked if Collins wanted me to visit his father; to which he replied, no, he only wanted some medicine. My servant told him that I had been out nearly the whole of the night, and that I had not been in bed very long, requesting him, at the same time, to call again in an hour. Collins still expressed a wish to see me, and my servant came to my bedroom-door, and delivered the message. I told my servant to say that I was going to Farway in the morning, and that I would call and see his father. Collins then went away, and returned in half an hour. My servant saw him at the back-door at about half-past seven, and asked him what was the matter with his father. Collins replied that he had great pain in the bowels, and had been subject to a rupture complaint for several years; he stated, besides, that if his father was not soon relieved, he thought he would die. *Upon this,* my servant came again to my bedroom, and related what had passed, and I immediately went down stairs to see Collins.

I will now give you an open and candid statement of all the subsequent conversations and events.

On my interview with John Collins (the son), in reply to my inquiries, he stated that his father had great pain in his bowels, and was subject to a rupture complaint. I inquired whether the rupture was up or down. He stated he did not know, but that he knew his

Hosted by Google

father was always able to get it back. I inquired if the bowels had been moved, and he told me that they had, late the evening before. I then asked if his father had been sick; the son did not know. I then sent him some powders, which, in my judgment, I believed best calculated to relieve the pain, to be taken every half-hour; and promised to see him some part of the morning. Having kept a professional appointment that I had made for that morning, I went to Farway to see Collins, and arrived at his house at about half-past one. On visiting him, I found him labouring under all the symptoms of strangulated hernia, but he had been sick only twice. On examination, I found that the hernia was by no means tense or painful on pressure, and I endeavoured, by a steady but unsuccessful attempt for about half an hour, to reduce it by the taxis. Having thus failed, and guided by the advice of Mr. Liston (Operative Surgery, 2nd edition, p. 481), in similar cases, I determined on operating, and accordingly sent Collins's son on horseback to Honiton with a note to Mr. Wm. Cox (a medical gentleman who occasionally assists me in my business), in which I requested him to come immediately to Farway, to bring Liston's hernia case, and also to request the assistance of another surgeon. Reflecting, however, that Liston's case did not contain all the instruments that I required, I sent another messenger on horseback, with a second note to Mr. Cox, for them. At about half-past four in the afternoon Mr. Cox arrived, accompanied by Mr. Burd, a surgeon, of Honiton. On examining the tumour, Mr. Burd said he would try the taxis a little longer, before proceeding to the operation.

Having some other patients to visit close by, I left Mr. Burd with Collins; and on my return, in about half an hour, Mr. Burd told me he thought the hernia was yielding. He shortly afterwards said that the stricture was exceedingly tight, and that no further delay to the operation ought to take place. I then explained to Collins the nature of the operation, and that it was the only means of saving his life. He appealed to several bystanders whether they would submit to it under similar circumstances; all of whom dissuaded him from it. I continued to press him further on the subject, but without avail. I then left him, and, on going down stairs, remonstrated with the parties who had dissuaded Collins from submitting to the operation, telling them that they were inducing him to throw away the only means by which his life might be saved. After this, the parties alluded to persuaded Collins to submit to the operation, and at about eight o'clock, I operated on him. After the operation, I ordered enemata of warm water every two hours, but this was neglected (as I was informed on the following day). I also gave him some *Castor Oil.* At twelve o'clock that night, I again visited Collins and found him in a tranquil sleep, the temperature of the skin thoroughly established, and his pulse seventy in the minute. On the following day, Mr. Burd and myself visited him again; we found him very comfortable, with a good steady compressible pulse, and he congratulated himself on having had the operation performed. I again ordered the enemata to be continued, and then it was I learnt that my instructions on this head had not been attended to properly on the previous day. On Wednesday, the 12th, on again visiting Collins, I found him in a very collapsed condition, and I learnt that there had been no evacuations from the bowels, which had become very tympanitic; my impression then was, taking all the present symptoms into account, that the portion of the intestine which had been strangulated had given way, and that the case was hopeless. I ordered wine and arrow-root for him, and on Thursday, the 13th, the patient died. Such, Gentlemen, are the facts connected with this case. I beg your best consideration of the remarks which I will now take the liberty of making. I must, however, at once most emphatically deny the assertion of Collins, that he had represented to me that his father was unable to return the hernia, when he called on me. It is obvious that there are many points of discrepancy between the statements of my servant, the man Collins, and myself, not only so far as regards the lapse of time, but also with respect to the substance of the conversations that took place. I would, however, request you to divest the statement made to you by Mr. Christie of the ignorant assumptions and fabrications with which it abounds, and attach to it only so much of importance as is due to a preconceived determination to surround what otherwise would have been an easily elucidated case with a parcel of parenthetical and supposititious deductions.

It would appear that you labour under a misapprehension, in supposing that Mr. Christie was the person who preferred the charge against me at the meeting of the Board of Guardians, on April the 7th. It is a duty I owe to myself, however, to undeceive you in this respect. You will be pleased to remember that the case, on which this charge is founded, occurred on March the 10th, on which day the Board of Guardians met; and another meeting was held on the 24th. It is somewhat curious that at this last-named meeting no charge of neglect in this case was preferred against me, or even thought of; but it having been announced to Sir E. Prideaux, Bart., of Farway (a gentleman whose name you will recollect as occurring in a correspondence between myself and the Board), that I had omitted to send in my tender for re-election to my district, he imagined that it would be a very favourable opportunity successfully to oppose me, by sending to the Board, on the day that the election took place, a charge against me which, on a *prima facie* view, could be construed only into one of the grossest neglect. Accordingly, on the 7th of April, a month after the case had occurred, a messenger was dispatched to John Collins by Sir E. Prideaux, to desire him immediately to put on his best clothes and to repair to Honiton with letters to the Board of Guardians, together with a written statement of alleged neglect of his late father on the part of myself, which he was desired to confirm. I must confess, I was somewhat surprised at hearing that a charge was to be brought

Hosted by Google

against me on the subject, and more particularly so, as many persons in the village of Farway had announced to me that Sir Edmund Prideaux had expressed himself much pleased with the attention which I had paid to the deceased.

With respect to Mr. Christie, the Guardian of Salcombe, and the remarks contained in his letter to your secretary, with a copy of which I have been favoured by the clerk to the Honiton Board of Guardians, I feel it my duty to offer a few observations, although, from the unfair and ungentlemanly spirit in which those remarks are made, it would have been more consonant to my feelings to treat them with the contempt they merit, and have passed them over in silence. Lest, however, you might consider that by so doing I should admit the accuracy of his assertions, I think it better to adopt a different course.

I would inform you that Mr. Christie is a partially qualified member of the same profession as myself, and, for the first time, has this year been elected Guardian for Salcombe. That I was a stranger to him is perhaps true, but I was fully aware, although not knowing Mr. Christie personally, that he was a man quite prepared to adopt any unfair measures against one differing in the least from his own medical tenets. I was not prepared, however, to meet with such a total want of courtesy as he displayed in his mode of conducting his examination of myself on the subject in question—and when he put questions to me, totally irrelevant to the nature of the charge, I looked on them as impertinent, and hence the term "*hesitatingly*" so often appended to the answers I gave. The charge, it will be remembered, was one of neglect, my not having visited the deceased earlier, no allusion whatever being made as to the medicines furnished; but the whole of Mr. Christie's ingenuity was put into requisition, to bring the medical means I had adopted into ridicule. In the course of the examination, it is true Mr. Christie made use of his pathological skill in gainsaying opinions I offered; but that skill, put to the test by the works of such men as Mr. Liston and Sir Astley Cooper, will be found, on examination, to be exceedingly meagre and defective. I was told by Mr. Christie that the circumstance of the man having pain in the bowels ought at once to have informed me that he had strangulated hernia, it having been announced to me that the man was subject to a rupture complaint. Now, Sir Astley Cooper says, that pain in the bowels is never felt in strangulated hernia until it has passed into its last stage, but that the sensation of uneasiness is always referred to the diaphragm, and the patient complains of a feeling as if a cord were bound tightly round the upper part of the stomach; also, there is pain in the neck of the hernia. (Vide Lectures on Surgery, 8th edit., p. 262.)

Again, Mr. Christie assumed that the cessation of pain, on the day after the operation, arose from mortification, and was not at all indicative of convalescence. Taken in connection with the cessation of pain, the statement made by Mr. Burd and myself, that the man was better in every respect, that he had a nice moisture on the skin, that the temperature of the body was healthy, and his pulse seventy in the minute, Mr. Christie not only has no right to infer the existence of mortification, but betrays such an ignorance of the symptoms of mortification as the veriest tyro would blush at. Mr. Christie further assumes, that "Mr. Holland attributed the death of Collins to the omission of enemata which he had ordered."

Now, although I did not attribute his death to any such cause, still I may mention to you that Mr. Liston (Operative Surgery, 2nd edit. p. 493) laid very great stress on the necessity of copious enemata soon after the operation, and deprecated (Operative Surgery, 2nd edit. p. 481), in no very mild terms, the treatment which was usually adopted previous to the operation, by which he stated that many persons were hurried to their graves. I hear, moreover, that Mr. Christie has taken great pains to impress on the minds of many of the Guardians what, in his opinion, ought to have been done previous to the operation, and that the observance of it would have saved the man's life.

With respect to Mr. Christie's comments on the principles and practice of homœopathy, so ridiculous are they, and so gross a want of information do they display, that I should outrage my own feelings, and uselessly occupy your time, by further noticing them.

These are a few points to which I am anxious to refer, before bringing this letter to a close. In the first place, so very unusual is it for hernia to descend *when the subject of it is in a recumbent position*, that when a statement is made to a surgeon that a person is attacked some part of the night, after he had been in bed, with violent pain of the bowels, although he may be the subject of hernia, the idea of strangulation of the hernia would not be entertained. Again, with respect to the time when a strangulated hernia may become irreducible. Mr. Liston states (Operative Surgery, p. 479) that it very frequently is so, from the moment of its descent. He also puts surgeons on their guard, by suggesting (page 493) that although the operation may have been skilfully performed, still no movement of the bowels may take place, and the portion of intestine which had been strangulated may be perfectly paralysed, may give way at the strictured part, and death speedily ensue.

Can it be imagined that any medical man, when an announcement is made to him that a hernia could not be put back by the patient, would hesitate in affording his immediate aid? Had the son of this man made such a statement to me, I would not have delayed one instant in going to his rescue; and if I had suspected such a condition of affairs, surely I should have taken my instruments with me, and have asked the assistance of another surgeon, instead of hazarding the delay that must necessarily arise in sending from place to place for the requisite means.

So far as the want of skill in diagnosis is concerned, which Mr. Christie would, in his vulgar malignant remarks, induce you to believe me to possess, I feel persuaded that it is quite unnecessary for me to say one word.

Hosted by Google

With a view to have the merits of this unfortunate case thoroughly investigated, I considered it a paramount duty to myself to request the coroner for the district to have the body exhumed, and to hold an inquest on the remains; but, in his reply, he stated that he could not consent to do so, from the circumstance of there being no charge against me that would warrant such a step.

I can only add, in conclusion, that it will afford me the greatest pleasure, should you think it desirable to prosecute the inquiry further, to attend at any tribunal, and on my oath confirm the accuracy of the statement, with which I have in this letter furnished you.

I have the honour to be, Gentlemen,
Yours obediently, E. C. H.
To the Poor-law Board, London.

To the Editor of the Homœopathic Times.

SIR,—In the number of your ably-conducted Journal for July 26th is inserted an article from the *Chemical Record*, entitled "Homœopathy tested by chemistry and found wanting." To show how ignorant is the writer of that article of Hahnemann's principles and writings, I take the liberty of sending the following extract from his work on Chronic Diseases, which completely demolishes the proposed test of our opponent. I quote from the translation by Dr. Hempel, vol. i. p. 188:—

"No one will feel disposed to suspect that quartz, rock-crystal,—some of these crystals containing drops of water which have been enclosed there unaltered for thousands of years,—or *white sand* are soluble in water or alcohol, or are endowed with medicinal properties. However, silica may be made soluble both in water and alcohol, by triturating it *after it had first been melted by means of an alkali, and then precipitated again from that compound.* By this process, the medicinal properties of silica are developed to an almost infinite extent." Then follows, in a note: "*Quartz or silica, unless they have first undergone this preparation, will not show any medicinal properties.* This is the reason why medicinal substances may be triturated in the porcelain mortar, together with the homœopathic medicine *Sugar of Milk*, without any silica becoming mixed with it. Some hypercritical homœopathists have apprehended such a result."

I only add, continue your reprint of our adversaries' objections to homœopathy, in order that their utter baselessness may be made apparent.

Your most obedient servant,
York, Aug. 18, 1851. CHARLES RANSFORD.

Miscellaneous.

HEALTH.—Take, for example, a young girl brought up delicately in town; shut up in a nursery in her childhood—in a boarding-school through youth, never accustomed to air or exercise—two things which the Most High renders essential to health. She marries, and perhaps dies when her life is essential to her young children. "What a strange Providence," say some of her acquaintance; "how mysterious that a mother should be taken from her children!" Was it Providence? No! Her Maker had assigned her threescore years and ten—a term long enough to rear her children, and to see her children's children; but her parents did not obey for her the laws on which life depends, neither did she obey them.

A father is cut off in the midst of his days. He is a distinguished and useful citizen, and eminent in his profession. A general buzz rises on every side, of—"What a striking Providence!" Not at all. This man studied half the night; he gave himself no time for exercise; he ate luxurious dinners, and drank various kinds of wine; he daily violated the laws of nature. Did Providence cut him off? Assuredly not; he cut himself off.

Young ladies often walk in thin shoes and thin stockings when the ground is frozen. You may see a healthy, blooming girl thus dressed, in violation of Heaven's laws: well, she catches cold, becomes feverish, and dies. "What a sad Providence!" exclaim her friends. Was it Providence, or her own folly?

A beautiful young bride goes to parties made in honour of her marriage. She has a slight sore throat—perhaps the weather is inclement; but she must wear her arms and neck bare, for who ever saw a bride muffled up to the chin. An inflammation of the lungs ensues, and she dies before her bridal days are over. "Alas, alas! what a strange Providence!" most people exclaim, "cut off in the midst of happiness!" Did she not herself cut off the thread of life?

A country girl, exposed to this changing climate, gets for herself a new, smart bonnet when she ought to purchase flannel: a rheumatism is the consequence. Ought that girl to sit down and say that the Lord has afflicted her? or should she charge it to her vanity, and avoid the folly in future?

Look, my friends, at the mass of misery—of piteous diseases, which are incurred by intemperance in eating and drinking; by neglect of exercise, cleanliness, and pure air; by intense study, or close application to business, without early rising, and the morning walk; by tight lacing and scanty dress, for fashion's sake. And this is imputed to Providence! Is there not impiety as well as ignorance in this? Were people to obey the laws of nature from generation to generation, many frightful diseases that cut short life, and lingering maladies that make life a torment or a trial, would be prevented. Those who best understand the human structure, and are qualified to judge, assert that this wonderful machine, the body—this goodly temple, would gradually decay; and that men would die as if falling asleep, if they were but wise.—*Mrs. Sedgwick.*

ALLOPATHY AND HOMŒOPATHY COMPARED.

By a Progressist.

(*Continued from page* 49.)

When the body is in health it is supplied with a proportionate amount of muscular and nervous energy to provide for all its wants. As long as man was unacquainted with medicines, and his mode of life was in accordance with Nature, he remained healthy and strong. With the progress of time, stimulated food and artificial beverages assumed the place of plain diet, and the consequences of this luxurious mode of living soon made their appearance. Health, strength, and comfort now gave way to a state of chronical debility or enervation of the whole organism (the secondary action of these stimulants); derangements of the digestive organs, the functions of the mind, debility of the nervous system, etc., were created: this chronical languor and enervation (reduction of power) of the organism becomes complete. The original sickening agents now firmly stationed in the interior, causing symptomless debility, that is, the second decline of vitality, the organism desists from operating for its own recovery.

Medical men strove to remove these evils, and to restore the equilibrium of the system by a further encroachment upon Nature, and were forced for this purpose to have recourse to stimulating means; but when medicine was scarcely called into being, when Nature was left almost entirely to herself to repair the injuries and diseases of mankind, when art was yet unknown, and the science of medicine had not yet struggled into existence, it was to be expected that men would seek to relieve the few ailments that befel them by water or some simple remedy—his total unacquaintance with every medicinal remedy would alone lead him to do so. It was at the temple of Æsculapius, in Greece, that medical information was first recorded; diseases and cures were registered on tablets of marble, and the first professors of physic were the priests, who prepared remedies and directed their application. Medical and therapeutic agents were used in similar diseases as now. We read that Melampus of Argos, the most ancient Greek physician with whom we are acquainted, administered the rust of iron in wine for debility. The same physician gave hellebore to the daughters of King Prœtus, for melancholy. Bleeding was employed by Podalirius on his return from the Trojan war. We are told that the daughter of Damathus had fallen from a great height, and he cured her by bleeding from both her arms. Again, Helen administered to the guests of Menelaus a certain drug in their wine, called the Nepenthe, for the purpose of driving away their cares.

Since these days system followed upon system, error made way for error in the practice of medicine, as man digressed from the laws of Nature. Physicians were called on to produce an instant cure; they had recourse to stimulants—stimulant after stimulant, remedy after remedy was found inefficient, the body became accustomed to their use; the Faculty invented new remedies, until they have arrived at the great and flourishing extent of the Materia Medica of the present day. Purgatives are administered by the old school with a view of operating *revulsively* on the extensive surface of the alimentary canal, and how frequently does it happen that the unpleasant consequences of the medicine should

Hosted by Google

induce the practitioner to reject them altogether, particularly in those cases where gastric and intestinal susceptibility is high: in vain he may temper them, and vary them, and give them in a thousand different shapes—these ill effects are reproduced, and very frequently aggravated. It is undeniable, that repeated doses of purgative medicine debilitate the intestinal canal, that they increase nervous susceptibility, whilst they diminish its contractile force, giving rise to frequent derangement of the digestive function. In reality, when we take a purgative, we cause a fit of indigestion. So true is this, that if the medicine is digested, the purgative effect does not take place, a very frequent case in robust children. This class of medicines present considerable drawbacks, especially with certain patients. The exuberance of intestinal mucus promoted by them, and the stimulation of the absorbent vessels, are physiological effects far from being clearly demonstrated. *Revulsion*, which a purgative will effect, is, in truth, the most useful and important part of the phenomena induced. It must be observed that I am here speaking of *cathartics*, purgatives of moderate activity; but when there are administered those of great energy, which are designated *drastic*, their use calls for the greatest caution; in fact, they should not be used at all. Experience has demonstrated that they have three great objections: they may cause excessive alvine discharges, or, in other words, hypercatharsis; they may give rise to a chronic inflammatory visitation of the mucous membrane; lastly, their use is frequently followed by constipation. Homœopathy objects to the habitual use of aperients—

1. "*Because they are unnecessary*, inasmuch as Nature herself, if not improperly interfered with, takes sufficient care of that function in healthy people."

2. "*Because they invariably create a tendency to costiveness*, in consequence of inactivity of the bowels, which is the necessary effect of reaction after previous excitement."

3. "Because they afford in habitual costiveness at most only temporary relief, and never cure the disorder radically."

4. "Because all aperient medicines exercise their influence, not only on the bowels, but also on the stomach and liver, and on the frame in general."

"If people, in the absence of better means calculated to strengthen the proper propelling power of the bowels, by restoring the diminished tone of the muscular fibre, would leave off the use of aperients altogether, and take a glass of cold, fresh spring-water night and morning, or, if necessary, have recourse to occasional simple injections of tepid, or better, cold water, living at the same time upon a proper mixture of animal and vegetable food, and taking sufficient exercise in the open air, they would have a fair chance of arriving at that degree of regularity which their constitution requires, and which they have vainly attempted to attain by aperient medicine." Again: "The disordered state of the digestive organs, which is so common in these countries, is in a great measure owing to the abuse of this kind of medicines, and that frequently such disorders as irritation, enlargement, induration, and torpidity of the liver, want of regular appetite, bad taste, and parched feeling in the mouth, weakness of digestion, so-called bilious affections, pain in the stomach, flatulency, piles, various diseased states of the rectum, sick headache, etc., are either the mere consequence of such abuse, or are more or less complicated with the effects of these medicines."*

"The very anatomist," says Dr. Black, † "takes up the wondrous tale of the efficacy of purgatives, and, demonstrating to his delighted audience the immense extent of the mucous membrane of the bowels, he congratulates them on the extensive field now displayed for the exercise of their purgatives. How contradictory in the allopath to despise purgatives administered by empirics! Morison and all his followers argue in this way, that if the licensed profession administer purgatives successfully in every disease, if they consider 'the bowels to be the sink, whose part is to drain all noisome filth, and keep the kitchen clean,' why should he not?

"Since no disease is treated allopathically without purgatives, we are either to conclude that the practice is unsuccessful, or that there is nothing erroneous in the advertisement of the Hygeian College, that 'their pills purify the blood, and heal all the ills that flesh is heir to.'"

"The intimate and essential nature of a disease," says Mr. Yeldham,‡ "we may venture to state broadly, that it consists, as far as we can understand the matter, in a disordered action of the part or parts most prominently affected. This being the case, it follows that, for the rectification of that disordered action, a remedy should be employed which will exert a direct influence over the seat of disease. The simple action of an aperient is to stimulate the

* A Concise View of Homœopathy, p. 132.
† A Treatise on the Principles and Practice of Homœopathy, p. 7.
‡ Homœopathy in Acute Diseases, p. 19.

Hosted by Google

intestinal canal. Yet this is the agent which the allopathist employs, when the object sought is to rectify the defective performance of its duty on the part of some other, and probably distant, organ of the body. Has a patient inflammation of the eye? his physician purges the *bowels!* Has he inflammation of the *toe?* the same thing is done! Is there disease of the *lungs?* still he purges! Fever? still aperients! Gout, rheumatism, headache? whatever be the disorder, the remedy is everlastingly the same: like the laws of the Medes and Persians, it alters not. This mode of treatment would lead us to conclude that every disease has a *material* existence in the abdomen, and may be expelled by the physical force of aperient medicines!"

As various as are the causes of costiveness, the homœopathist is more successful in his treatment than the practitioners of the "old school" with their purgatives, which afford at the most but temporary relief, and more frequently increase the disturbance of the digestive organs. The habits of civilized society are incompatible with the enjoyment of health; nor can we calculate the immense sacrifice of life which is constantly made by the pernicious practice of stimulating the bowels with purgatives. The great principle should be to live according to Nature's laws, and assist Nature in her own way, when she is unable to perform her accustomed work. But instead of this, what do we see? As soon as we are born, we are crammed with butter and sugar, a dose of *Castor* or *Almond Oil*, or sugar and *Calomel*, which is rendered quite unnecessary by the mother's milk. The process of pregnancy and childbirth is one of the most natural and as holy as any ever set up by Nature, and the milk of the mother is sufficiently relaxing to evacuate the bowels of the infant. More harm is done by the officious interference of "doctors" with the bowels than any other organ. No sooner is the family physician consulted than he, nine times out of ten, will order some kind of cathartic. "Giving aperient medicine to the infant is reprehensible, because it lays the foundation for future costiveness. The tender surface of the infant's intestinal canal, which has never been in contact with any ungenial outward influence, is at that time exceedingly susceptible; and aperient medicine must, as such, necessarily create a temporary irritation in those organs." Not only by the young, the thoughtless, and the inexperienced is this purging considered "all right," but the more advanced in age rely implicitly upon the *ipse dixit* of their doctor; and nothing is too absurd for them to do, if these oracles only sanction it, even to the eating of *Magnesia* by the ounce, or taking physic daily. Now, it is not necessary to tell any well-informed person, one who is at all conversant with physiology, that this practice is entirely at variance with the laws of Nature. "Mankind," says Mr. Claridge, "like all other organic beings, ought to live according to Nature's laws, without pain, and die a natural death, *i. e.*, without illness or suffering." With us almost everybody dies from the effects of drugs. If mankind trusted more to Nature's laws, lived as they ought to live, they would, as a general rule, pass through the several stages of life, from infancy to old age, without sickness, enjoying health, serenity, and peace, their vital energies gradually wearing out, and at length the sleep of death would come without agony and without pain.

It is high time, oh, ye people of the nineteenth century, that ye began to think for yourselves, if not to act. The time is now come when people are beginning both to think and to speak, and the result is manifesting itself in the respect shown to homœopathy, and the advantages accruing from it. Most important it is, and most certain will it be, that homœopathy will ere long form a constituent part of general medical education; that young physicians of ability and education will devote themselves to its peculiar practice; that while it will more or less, in its leading principles, blend with other modes of scientific enlightenment, it will obtain for itself a due proportion of the growing intelligence, and that it will be rewarded with a college of its own.

Purgatives do not cure constipation—never did and never can: on the contrary, they increase the difficulty they were given to remove, by rendering the liver, etc., more unwilling to act, without being stimulated, than before. The primary action of a purgative is that of increasing the secretion of the alvine discharges; the secondary action is that of constipation, by debilitating the nervous energy of the intestines. Ten thousand men may swear to an error, and yet not make it a truth. Hundreds of things once believed by the learned have been repudiated by the same as unworthy of belief, "new light" having discovered to them the falsity thereof.

For years and years it was thought absolutely necessary to the salvation of small-pox patients to give them hot drinks, stimulating medicines, and keep them very warm. But now even the greatest advo-

Hosted by Google

cates of drug treatment forbid all this, keeping the patients as cool as possible, and giving scarcely any medicine.

If they were mistaken in one case, why not in others?

Stimulants, wherever applied, whether to the stomach or intestines, leave behind a corresponding degree of debility. Take *Calomel*, for instance—and I do not instance this preparation of mercury because it is a popular bugbear, but because it is one of the most potent medicines in the allopathic school—it is almost sure to act upon the liver, and will remove obstructions there quicker than any other article, but it produces a disease ten times worse; making the old adage true, that the remedy is worse than the disease. Chronic diseases, it has been said, are acute diseases run to seed. The improper manner in which acute diseases are treated is the cause of their becoming chronic or sub-acute. No one would venture to say a disease had been cured when it had only changed its form. Take a person diseased, put irritating medicine into his stomach, and what is the consequence? Why, the whole system becomes diseased, and the case becomes aggravated: it is like throwing gravel on the railroad track to make the engine run easier. The old allopathic errors must die: the sun of homœopathy has risen on the horizon of our hopes, and, surrounded by the effulgence of its own beams, is rapidly attaining its meridian glory; and we firmly believe that from this altitude it will continue to dispense its blessings through all coming time.

(To be continued.)

CHOICE OF DILUTIONS AND REPETITIONS OF MEDICAMENTS.

Communicated by DR. ROSENSTEIN.

(Continued from page 67.)

I. GENERAL PROPOSITIONS.

1. It is asserted that we only know what is material, and that we can only observe the phenomena of movements, transformations, and changes. We should say, perhaps with more reason, that we observe only phenomena, without which we know absolutely nothing of nature, because a substance which produces no action upon us and upon what surrounds it, does not exist for us.

2. We give the name of *forces* to the causes of these phenomena; to consider them as independent of matter is to attribute erroneously to the exterior world an impossible phenomenon.

3. To discuss the *priority* of matter and force would constitute an ungrateful work, because we know but the active phenomena of substances, and it is through analogy that we ascend to matter and force.

4. If, notwithstanding this inseparable union of force and matter, we observe the action of a force extend beyond the material limits of a substance, this does not imply a contradiction. This action may be effected either by means of the transmission of internal phenomena upon the ambient point (as for instance, the luminous waves, and the vibrations of the voice) or through intermediate substances, as takes place in the attraction of celestial bodies and of the magnet.

5. Gravitation and centrifugal force constitute the most general forces; but I doubt if all phenomena could be explained by them.

6. The best known laws are those of gravitation, by which all the substances of our globe acquire weight, which is so much stronger as the atoms attract reciprocally, and are more dense.

7. We speak of *imponderable bodies* combined with light, heat, electricity, and magnetism, without understanding to what purpose these bodies and forces are serviceable. If the sun, by means of attraction which operates through its immensity, can draw the earth towards it, it has also the power to enlighten the terrestrial globe with its rays, without the co-operation of a half material vehicle. The idea of a natural philosopher to subordinate even weight to an imponderable material, although it has not been admitted by the learned, has at least had the merit of logic in the eyes of those who could not dispense with imponderable bodies.

8. In representing to ourselves a substance, in which interior phenomena or external causes have produced a complete neutralization of weight and of expansion, this substance is not *palpable*, and is consequently imponderable. The homœopathic medicinal powers approach to that state.

9. Everything is infinite in nature, from the immense space in which float a multitude of worlds, and the sun itself, which seems to be small compared with that space, down to the minutest animalcules, and to the atoms of our medicaments, of which we may push the divisibility until they become imperceptible to our senses.

10. It is impossible to form a clear idea of infinite space, because no point of comparison exists for us, and the measure which is used is either too large or too

Hosted by Google

small for our powers of apprehension and comprehension.

It is singular, that whilst all the astronomical calculations are admitted without contest, comprising those of M. Leverrier, and the microscopic discoveries of animalcules are received with transport, the effects and presence of homœopathic remedies are denied, although some of them can be traced by means of a good microscope until the twelfth dilution.

It is easily forgotten that the epithets large and small, rapid and slow, high and low, are but relatives and not absolutes Sound travels about 1,400 feet in a second; its rapidity is great compared with that of a race-horse, but little compared with the rays of light, which pass through 42,000 miles in the same space of time.

The highest distinct sound makes 39,768 vibrations in a second, whilst the slightest luminous tinge, the red, makes 420 billions of luminous waves in the same time; the violet colour makes almost double that number In such cases, we may establish comparisons between the different degrees of swiftness, without being authorized to maintain that light is stronger than sound, and even without being able to pretend, so to speak, that the highest sound is stronger than the lowest, and *vice versâ*, because the idea of force cannot come into such a comparison.

11. Cohesion and affinity are attractions of the particles of a body towards its centre; their diminution and their augmentation obey, consequently, the laws of gravitation, unless they are changed by foreign causes.

12. The *force of attraction of bodies* diminishes in proportion to the square of distance from the centre of gravity. The same effect happens to all bodies in particular, consequently the expansive forces will increase in proportion as cohesion diminishes.

13. We call those forces latent which cannot act beyond the limit of space assigned to them; or those which find no analogous object upon which they can act. It is, therefore, the want of equilibrium which puts the force in movement; this removal from the centre is effected either through diminution of the cohesion of molecules with which the force is combined, or by contact of a substance having receptivity for it, and being analogous to its action.

14. Let us see how this applies to the homœopathic doses. The substance is divided *ad infinitum*; the diminution of the cohesion makes the force free, which is carried over to an analogous body. This force will exercise an action so much more energetic as the bodies become better identified with it, by the similitude of its morbid state.

15. As it is here not the question of the substance but of its activity, we may justly give the name of dynamization to our preparations, because it is evident that its manifestation of activity is increased when compared with that of its primitive state. The term power adopted by Hahnemann is almost synonymous.

Although all beings belong to nature, because they make a part of it, they establish, nevertheless, a contrast between themselves and nature, in constituting a *new centre*. This is a necessity, and it is only in this manner that they can hold out and preserve the peculiar character which rules them, they thus escape cosmical influences, or using them to their own profit. In this manner that force is developed which we call *vitality*, without knowing how to explain its nature or origin. Vitality does not exclude mechanical and chemical action, but subjects them to its own laws. The division of a substance which is effected in our higher potencies, does not modify the particular character; on the contrary, this character is manifested with an efficacy which is in proportion to the physical and chemical properties of that substance, as developed by the preparation. It is this activity of the particular character which authorizes us to speak of dynamism, and accord to it the preference over the ruder physical and chemical effects when brought in contact with vitality.

16. Proceeding from this point of view, in treating a substance after the homœopathic procedure, there results a development of its nature, intimately analogous to its physical properties, and which is manifested with so much the more liberty as the physical and chemical attraction is weakened. Hahnemann was justified in considering this procedure as a sort of dynamization, although this term is far from explaining the phenomena which are accomplished.

17. We ask, in the last place, what is that particular character which exists with so much persistency in minerals, vegetables, and animals, resisting all means of destruction, and abandoning them but with their existence—this character which, at the time even that the individual is to succumb, knows still how to preserve its species? Should this belong to the inferior degrees of the creation only? Is it not also the attribute of the higher degrees of the spirit which reasons, and whose ambition thinks itself often above nature? It is

Hosted by Google

thus that the first roots of our faith in immortality origtnate, apart from Revelation.

18. It is not our purpose to discuss the cosmical laws; we wish only to recall to mind, that in the organism they do not disappear completely, and that they are subordinate to the vital force, and modified by it. But it would be an absurdity if we should explain dynamization through electricity, or by the obscure phenomena of infection.

II. EFFECTS OF MEDICINAL POWERS.

1. *Physical Effects.*—The specific weight is naturally diminished by the separation of molecules; for this reason a great number of atoms, even of very heavy metals, float on the surface of water and alcohol, whilst others remain in the centre or fall to the bottom, which may be easily observed by means of a microscope. For want of sufficient experience, we are unacquainted if by degrees other molecules fall to the bottom, or if the greater part remain suspended. In making experiments with a solar microscope, I can simply state that the number of visible atoms remained, in appearance at least, the same for the powers which were at rest, as those which had before been shaken. It seems to me, that all further researches on this point cannot lead to a useful result, because the most powerful magnifying instruments cannot bring to our view the primitive atoms, for the thousand points which we see are still divisible molecules.

2. The manner of the relation of the potencies to the reactives aid us but little in our inquiry. These chemical decompositions are impotent to affect the smallest molecules. The reactives disclose, in fact, the presence of arsenic carried to the millionth degree of power (about the third and fourth), but this is a very feeble result, when we consider the action of the higher powers upon the organism. According to Klaproth, 1,000 feet of water of 12° Réaumur dissolve but $2\frac{1}{2}$ parts of arsenious acid. Mayerhofer, on the contrary, strong in his microscopical experiments, pretends that arsenic is altogether insoluble in water, remaining there only in suspension. But the experiments alone do not suffice to prove this opinion, because the molecules really dissolved escape our sight. Briefly, what seems to be positive is, that the solubility of arsenic is very weak, perhaps even less than Klaproth thinks, who might easily consider as dissolved what was but suspended in the liquid. The chemical analysis of organical substances is still in its infancy; in general, the discoveries of organic chemistry have not yet given advantageous results for the treatment of diseases. In the mean time, chemists will do well to look for, in the first potencies, the presence of metallic salts, really dissolved in the vehicle.

There is another question to resolve, whether, in the dynamization, the chemical effect ceases in consequence of the annihilation of certain conditions indispensable to its manifestation. Suffice it, that the preparations of the homœopathists are not without efficacy, that experience shows them to have indisputable effects.

To be continued.

ELEGANT EXTRACTS FROM THE LANCET.

"ALL Quackledom is in rumour and alarm. The globulists of the Continent meet in Prussia to rejoice over their gains; those of England propose to meet in London to beseech our pity for their sorrows and their losses. In their oppressed and benighted native land, they hold on their course boldly under the protection of kindred quackeries in other things, but still with a strange feeling of a day of reckoning to come. In England the hour of doom has already struck, and they have no other refuge but, like the associated rogues, to appeal to feelings they have never respected. Before we listen to their appeal for liberty of opinion, they must wipe away the stains of their scandalous detractions, and show us that they have a single principle which deserves a moment's pause for consideration, or a single well-established fact on which reliance can be placed.

"There seems to be a singular absurdity in these men seeking our confraternity, while they not only renounce and denounce our doctrines in public, but in the most malignant and scandalous manner revile us in private. Themselves alone could make us believe a thing so incredible and so disgraceful. But there is not a doubt of the fact; and instead of seeking a separate existence, as they would do if they placed any faith in their doctrines, and really sought their establishment with confidence in their truth; on the contrary, the more we repudiate them, the more they cling to us. They are plainly conscious that their respectability, such as it is, is only a reflected one. It is from us they derive what strength they have, even while they revile us. They denounce the science of medicine as false; we proclaim their doctrines and their pretended facts to be lies, and themselves, to use plain language, cheats. There can be no alliance which is not as unprofitable to us as it is dishonourable to them. For this reason we are determined it shall endure no longer; but for this very reason they cling to it the more, and on this account they are so much alarmed by the present movement, which annihilates them and their puerile pretences. They still, however, seek to perplex and confound the public, and for this purpose they set no limit to their

Hosted by Google

baseness. They would be both Mussulmen and Christians. With the dust of the cathedral on their knees, they would worship in a mosque. Teaching implicit reliance on globules, they employ behind the scenes the most dangerous and wicked means. Some, like the surgeon whose dishonesty was lately exposed, lend themselves to the vacillating humour of the public, and employ all means, having faith in none, and being probably as destitute of knowledge as of honour. Others thrust dangerous weapons into the womb and pour globules into the stomach. While the Edinburgh professor is willing, like the Vicar of Bray, to teach anything that will keep him in his place, or suppress anything which will bring him into risk.

"An absurd patience led the rogues into a great mistake. We congratulate the profession on their alarm. Let them meet. Let the heathen rage. Let them tell us their numbers. We shall hardly be frigbtened. Let them tell us of what silken lords find leisure from rational pursuits to wheedle with homœopathy, mesmerism, and all the allied abominations. Let them tell us of what silly women take counsel with them; and above all, let them tell us of what doctors keep a false faith with us, and give them encouragement and advice. We are prepared for all these things, and will grapple with them without fear, even should we find Royal Highnesses and their medical advisers in the ranks of our enemies. They may be assured we shall go on to the end, nothing fearing and nothing doubting.

THE
HOMŒOPATHIC TIMES.

SATURDAY, SEPTEMBER 6TH, 1851.

THE manner in which public attention has become engrossed by the struggle existing between homœopathy and allopathy for supremacy, is a fact patent to all who have in the least studied the progress of medical science. Never before was so fierce a warfare waged as that which at present distinguishes the proceedings of our opponents, who one and all seem to consider that they are engaged in a special duty in attempting to annihilate us—that is, if they can. The wish is certainly in this case the father to the thought, but the futility of the endeavour will before long be fouud out.

The most aggravating part of the business to the allopaths is, that while the small and junior members of their body are rabidly assaulting us with the coarsest epithets the vocabulary of Billingsgate can produce, we, to our perfect satisfaction, are daily being made acquainted with the recognition of our principles by some of their brightest ornaments, who do not hesitate publicly to adopt them whenever it suits their convenience. This must be highly exasperating to the gentlemen who "write down" homœopathy in the allopathic press, and who have invariably asserted for the last twelve or eighteen months, that this "sham and delusion" was nearly worn out.

It is not necessary to advert to recent events to strengthen our position in this respect. The *Lancet* has ample opportunity to rake up those transactions, and well its *employés* effect this description of business. Ours is the more grateful task of recording the steady and increasing success of homœopathy, and the important addition making to our ranks, both of professional and lay members. The doctrines of Hahnemann are now sufficiently appreciated by the public, to induce them to test them, and not to cast aside those principles which have been eliminated for their benefit.

In days that are past, the bigoted and prejudiced disciples of the old school would have discovered the task they have undertaken one of less onerous a nature than it in reality appears. The march of intellect unfortunately has set in with too strong a tide to permit them the exercise as formerly of that unbounded control over liberty and conscience, which in a measure constituted their prerogative. They learn this to their sorrow, and are therefore proportionately disappointed.

But for us, the crusade is one of remarkable significance. It establishes our position; it secures at least an augmented auditory. The larger the number of inquirers, the greater our prospect of conversion. In this manner, and through similar auxiliary means, will the truth concerning homœopathy be spread through the length and breadth of the land, and when that shall have been accomplished, the result need scarcely be predicted.

THE UNIVERSITY OF ABERDEEN.

We have the gratification to announce that another Scotch University, the *third*, has *pronounced* against homœopathy: we say the gratification, because the sooner we know the extent of this persecution the better. We insert two letters from Dr. Fyfe, who has taken on himself to represent Aberdeen.

"THE UNIVERSITY OF ABERDEEN AND HOMŒOPATHIC GRADUATES.

"*To the Editor of the Lancet.*

"SIR,—Having seen the letters published in the *Lancet* of Saturday last, regarding the graduation of John Say Clarke, at the University of Aberdeen, I beg to inform you that, at the time of his examination, not the slightest suspicion was entertained of his being a homœopathic practitioner, otherwise the degree would not have been conferred on him. I am, Sir, yours respectfully,

"ANDREW FYFE, Professor of Medicine,
"University and King's College, Aberdeen.
"Aug. 26, 1851."

We give also the communication of an anonymous correspondent of the *Lancet*. Dr. Blank would have done better to have given his name.

"A GLOBULISTIC GRADUATE OF ABERDEEN.

"*To the Editor of the Lancet.*

"SIR,—On looking over the list of graduates of the University of Aberdeen for this year, I perceived the name of "John Say Clarke, Bombay." I immediately communicated to Dr. Fyfe, that that gentleman was a homœopathic practitioner, residing at Canonbury-park, Islington; that he had been practising homœopathically for three or four years, (the period I am now sure I understated,) and that if he referred to a leading article in your journal of April 26th last, he would there see the name among the list of the most notorious globulists. The accompanying is Dr. Fyfe's answer to my communication, from which you will perceive that John Say Clarke has practised a most gross piece of deception upon the University of Aberdeen; and for the benefit of the profession, as well as in vindication of that most worthy member of our profession, Dr. Fyfe, as standing foremost in the Medical Faculty of the University of Aberdeen, may I request the favour of you to insert a copy of the same in the next number of your valuable journal?

"I remain, Sir, your obedient servant,
"August 25, 1851." "ANTI-GLOBULIST.

"[COPY.]

"August 29, 1851.

"MY DEAR SIR,—Absence from home has prevented me from receiving yours till this forenoon. I am vexed to hear of Clarke being a homœopathist. I recollect him well, and most undoubtedly he gave the examiners no reason to suppose that he belonged to that class, otherwise, most certainly, he should not have had the degree conferred on him. On my return to Aberdeen, I shall take the opinion of the senators on the subject.

"With many thanks for your attention,
"Believe me, yours truly,
"Dr. ——." "A. FYFE, M.D.

THE PROVINCIAL MEDICAL AND SURGICAL ASSOCIATION.

THREE hundred men, under Leonidas, defended the Pass of Thermopylæ against the Persian host. Three hundred medical men, on the part of the allopathists, have come to the assault of freedom in therapeutics. At the Annual Congress of the homœopathists, sixty medical men were present: we think these sixty more than a match for those three hundred. The *Lancet* is hounding on the persecution against us: nor is the war-cry of that unscrupulous journalist without effect. The Medical Faculties of three out of the four Scotch Universities have been frightened into pronouncing against homœopathy.

1. An individual, Dr. DAY, without any meeting of the *Senatus* of his University, took on himself to denounce homœopathy and re-claim his diploma from Dr. HALE. We are inclined to believe that the heading of one of the examination papers, which has been called a trap for the homœopathists, was also the work of an individual, and put there without the sanction of the *Senatus Academicus* of St. Andrew's.

2. The Medical Faculty of Edinburgh has virtually acknowledged that Mr. POPE was "remitted," and refused his diploma, after he had passed a very satisfactory examination, merely because he was a homœopathist. We have every reason to believe that the *Senatus Academicus* of Edinburgh did not sanction that proceeding.

3. An individual, Dr. FYFE, without any meeting of the *Senatus Academicus* of his University, has taken on himself to pronounce that Aberdeen will withhold diplomas from homœopathists.

It remains to ascertain the intention of the remaining eleven medical corporations

Hosted by Google

of these kingdoms. We hope that this spirit of exclusivism may not cross the Tweed. But there is no saying how many more of those corporations may be frightened by the *Lancet*. "It is a very pretty quarrel, as it stands," as Sir Lucius O'Trigger said: and the courage to do right and resist wrong may ooze out of these corporate bodies, as brute courage did out of the fingers of Bob Acres. But the sooner we know which of them are against us, the better.

We fear not the issue for our Cause. We have, by means of our adversaries, an immense publicity given to the progress of homœopathy. For this gratuitous service we are much indebted to them. We are further indebted to the hostile periodical press for the expression of rage and manifest apprehension of our continued progress which is exhibited. This cannot fail to do us good even with the profession. We insert, from the *Brighton Herald*, a communication which speaks for itself. We think there should be a homœopathic association, like that of Brighton, in every city and town where homœopathy is practised.

"THE CLAIMS OF HOMŒOPATHY.

"*To the Editor of the Brighton Herald.*

"SIR,—Our attention having been called to the proceedings of the Provincial Medical and Surgical Association, reported in your paper of last Saturday, we have noticed with surprise and regret the manner in which the medical gentlemen belonging to that Association have expressed their opinions regarding homœopathy and its practitioners.

"We were well aware that a violent paper war has been waged for a considerable time past by the doctors who practise in the more ordinary manner against those who have adopted the doctrines of that illustrious German, Dr. Samuel Hahnemann; so long, however, as this was confined to the pages of the medical periodicals, though we may have deeply lamented that men belonging to an honourable and liberal profession should have so demeaned themselves as to give utterance, or approval, to such foul and abusive articles as have for many weeks past appeared in the *Lancet*, we did not feel ourselves called upon to express in any public way our conviction of the utter falseness of the accusations brought against homœopathy, and we fully approved of the quiet and dignified demeanour of the practitioners of this system, the majority of whom took no notice whatever of the calumnies heaped upon them by their avowed enemies.

"The case is altogether different, however, when a large body of medical men, assembled for the purpose of promoting the interests and advancing the science of this profession, deliberately issue a manifesto, which is declared to have been adopted unanimously, wherein they state, 'That homœopathy, as propounded by Hahnemann and practised by his followers, is so utterly opposed to science and common sense, as well as so completely at variance with the experience of the medical profession, that it ought to be in no way or degree practised or countenanced by any regularly-educated medical practitioner;' that 'it is derogatory to the honour of the members of this Association to hold any kind of professional intercourse with homœopathic practitioners;' and wind up by declaring that, 'in proposing these resolutions,' 'they are actuated by a strong sense of the importance of the subject in its relation both to humanity and morals.' We repeat, Sir, that when such a document as this has been published, and great pains taken to circulate it as widely as possible, and when, in addition, a letter containing a most scurrilous and false view of homœopathy, by Dr. John Rose Cormack, has been left at the hotels and other places of this town, we, as the Acting Committee of the Homœopathic Dispensary, feel it our bounden duty to set the public of Brighton right on this most important subject, and to show to them that we and the thousands,—yea, millions,—who now trust their own health and that of all dear to them to the care of homœopathic practitioners are not guilty of such unheard-of folly as these self-appointed judges would have us believe.

"It is impossible for us, in the space of a letter, to enter at all minutely into the relations between homœopathy and the more ordinary system of medical practice; but enough can be said to disprove the declarations made by our opponents; and those who may desire further information will find it in such works as the following:—'Homœopathy, its Principles, Theory, and Practice,' by M. B. Sampson; 'Truths and their Reception, considered in relation to the Doctrine of Homœopathy;' 'Principles of Homœopathy,' by Dr. Joslin; 'A Brief Attempt to show the Truth and Value of Homœopathy,' by J. E. Norton, M.D.; 'Health, Disease, and Homœopathic Treatment rationally considered,' by J. S. Sutherland, M.D.; 'Homœopathy, together with some Remarks on Asiatic Cholera,' by Arthur Guinness, M.D.; 'An Introduction to the Study of Homœopathy,' by Drs. Russel and Drysdale, and numerous others, which contain a full history of the rise, progress, and present position of this most important and beneficent medical reform.

"Leaving, therefore, those who desiderate a more complete acquaintance with this science to find it in some of the above-named works and pamphlets, we proceed at once to deal with the accusations so recklessly dealt out against the homœopathic practitioners by the Provincial Medical and Surgical Association, in council assembled.

"It will be observed that the first resolution

Hosted by Google

declares 'That homœopathy, as propounded by Hahnemann and practised by his followers, is so utterly opposed to science and common sense, as well as so completely at variance with the experience of the medical profession, etc.;' and Dr. Cormack, in his letter, paraphrases this as follows:—'The homœopathic dogma has, as far as I can judge, no adequate basis to rest upon; and the doctrine of infinitesimal doses is immeasurably beyond the grasp of my intellect.' Now, this may be all very true as regards Dr. Cormack himself; but if we look into the history of medicine, we shall find that the homœopathic law (which means that *like cures like*) has been more or less acknowledged from the earliest antiquity, having been distinctly traced in the writings of men who lived prior to Hippocrates, and being announced directly in one of the reputed works of that great father of medicine. Never, however, until the time of Hahnemann, was it made the groundwork and fundamental law of medical practice, or proved to be applicable to all diseases and all remedies. Dr. Cormack, however, tells us that this law, or dogma, as he pleases to call it, has no adequate basis to rest upon. But now let us hear what a distinguished professor of the very College from which Dr. Cormack boasts of having received his degree, and who, be it remembered, has always been a most bitter opponent to homœopathic practice, says regarding this very law of healing which the learned doctor of Putney ignores. In the first resolution passed by the Royal College of Physicians of Edinburgh against homœopathy (and which resolutions are published in an Appendix to Dr. C.'s letter), it is stated: That the College 'did, several yeas ago, publicly express its opinion of homœopathy and homœopathic practitioners, by peremptorily declining to admit into its body a candidate for its Fellowship who belonged to that denomination,' etc.

"Now, we have been given to understand that, on the occasion referred to in the above resolution, Dr. Christison expressed himself in words to this effect:—'Besides this, it is a piece of unwarrantable presumption for these men to arrogate to themselves the title of homœopathists, seeing the homœopathic law is acknowledged and acted upon by us all.' Dr. Christison, of Edinburgh, therefore, it would appear, saw some more sufficient basis for this law than has yet been revealed to Dr. Cormack of Putney.

"But, to us non-professional men, the practice of medicine is of vastly more consequence than the theory, and, therefore, we will pass on to that which more immediately concerns ourselves, viz., the doses which we are condemned to swallow when visited by sore affliction. In one respect we often think the ordinary practitioners are more literally homœopathic in their practice than the avowed followers of Hahnemann, for, while the latter give mild, gentle, and tasteless remedies for almost every disease, the gentlemen of the larger doses find it necessary to follow the rule—the more painful the disease, so much the more painful must be the treatment; the more violent the disease, the more violent must be the remedy; and in fatal cases we have often heard it lamented that the patients had become so exhausted by the disease as to be unable to bear the severe treatment necessary for their restoration.

"Now, however beautiful this may be in theory, we confess that we shrink from its practical application, and we must say that we should regard any discovery as a great boon which held out the promise of effecting a cure without all the additional distress of bleeding, blistering, purging, and the like. We had always understood that the question of the proper dose was one which could only be settled by direct experiment, and one would think, arguing *à priori*, that, since all medicines are poisons, the less the dose was the better, provided it effected the desired result. But no! we non-professional men have, it appears, made a sad blunder here. Hahnemann and his followers have been dinning it into the ears of the profession for the last fifty-five years, that medicines will act beneficially, *if properly selected according to the homœopathic law*, in doses too small to be capable of doing any injury to the health, and, in the majority of instances, so small as to be without taste or smell; but will it be credited, Sir, when we tell you that, in spite of all the pains these homœopathic gentlemen have taken to persuade medical men to examine into the truth of this statement, in the only possible way of doing so, namely, by giving the medicines or watching their effects when administered by others, the body of the profession have contented themselves by pooh-poohing the whole affair, and declaring, without the smallest experimental proof, that it is all nonsense and falsehood.

"But this is not all. If the whole question involved was one of the size of a dose; if the whole matter at issue was whether we should swallow a spoonful of what to our taste differs nothing from cold water, or should gulp down a nasty black decoction, whose very odour we are fain to avoid by grasping our noses with finger and thumb; if, to touch a more tender string, we had merely to decide whether a globule should be dropped between the lips of our restlessly slumbering infant, or whether, armed with the fell medicine-spoon, we should drench the poor child, heedless alike of its screams and struggles; if, we repeat, it were a mere question of dose, we might possibly submit and, rather than change 'our family friend,' consign ourselves, with some show of patience, to the torture of being cured. But, if we look a little further, we find it by no means limited to the matter of doses; for, if we examine the results of the two methods of treatment, we shall find that we have a much better chance of getting cured by the homœopathic doses than by the large and nauseous drugs of the self-styled orthodox practitioners; for, on referring to the 'Introduction to the Study of Homœopathy,' formerly mentioned, we find a statistical comparison of the results obtained in hospital practice by these two methods of treatment, from which it appears that in inflammation of

Hosted by Google

the substance of the lungs (pneumonia), of those treated homœopathically about 1 in 15 died; whereas, when the same disease was treated in the more usual way, about 1 of every four cases terminated fatally. In inflammation of the covering of the lungs (pleurisy), as treated in the Edinburgh Infirmary, about every eighth case proved fatal, whereas in the same disease, treated homœopathically, only 3 out of 224 died. In inflammation of the bowels, treated in the ordinary way, 6 out of 21 cases died; while of 105 cases treated homœopathically, only three terminated fatally. Lastly, in the frightful scourge, the Asiatic cholera, it was found that while two-thirds died when treated in the ordinary way, two-thirds of those to whom homœopathic remedies were given recovered. Indeed, it was the satisfactory results of the treatment of this dire malady which led the Austrian Government to establish a homœopathic hospital in Vienna.

"But you will naturally ask, is it possible that men of a liberal and enlightened profession can hear these results and yet take no pains to ascertain their truth? To which question we can only reply, read the work entitled 'Truths and their Reception,' and you will find that analogous inexplicable facts have occurred in the history of every great truth given to mankind.

"Now, what we complain of,—and we think justly,—is, that these worthy doctors, who talk so loudly against homœopathy, and characterise it as 'utterly opposed to science and to common sense,' have never yet taken the only possible way of setting the question at rest, viz., by a calm dispassionate experimental examination of its claims. Of a truth, a goodly number of individual practitioners have fairly tested its merits; but the result has so invariably been that they have come over to the side of homœopathy, that we cannot help surmising that the great reason why the majority resist all their entreaties to try the system, is a secret fear that, by so doing, they should commit themselves.

"But you will remind us here that Dr. Malden, of Worcester, told you the other day, in his speech at the Pavilion, that 'When truth in this (the medical) art was discovered, it was criminal to conceal it—it belonged to the profession—it belonged to all mankind;' in which sentiment we perfectly agree with him, and would ask the learned doctor wherein lies the practical difference between concealing a truth one does know, and refusing to examine a new truth, declared to be of great value? But Dr. Malden goes on to state it is 'neither rational nor honest for medical men, like the homœopathists, to have secrets.' Now, this is a total misrepresentation. We do not believe the homœopathists have any secrets. On the contrary, they are perpetually courting inquiry. In almost every town where there is a homœopathic practitioner, there is a Dispensary, at which any medical man who chooses may attend and examine for himself; and in London and Manchester there are large hospitals, where the whole practical bearings of the system may be scrutinized. It is too bad, therefore, to speak of secrets and to hint at mysteries which have no existence save in the minds of those who will not take a fair and manly view of the case.

"We cannot help referring here to some remarks by Dr. Chas. Ransford, of York, who has recently adopted homœopathy, after being a violent and active opponent of the system for many years, which remarks were published last month in the 'British Journal of Homœopathy.' It appears that Dr. Ransford was for many years the highly esteemed and respected treasurer of the Royal College of Physicians, of Edinburgh, and, on the occasion of his leaving Scotland, two or three years ago, a piece of plate was presented to him by his colleagues. You may imagine, therefore, that they are not a little annoyed to find that their former treasurer has now become an avowed homœopathist from conviction, and has, moreover, published not only his reasons for becoming one, but has openly confessed the unfair and bigoted way in which he himself and his former colleagues wilfully shut their eyes against conviction.

"Dr. Cormack, in his letter already mentioned, has the rashness to state that 'the worse part of homœopathy is the DISHONESTY of the majority of those who live by it. When patients are once secured, they are, I think, very rarely treated in accordance with the principles of Hahnemann;' and further on he declares—'I have not been able to hear of any practitioner who honestly relies on homœopathy for the cure of diseases.'

"Now, Sir, if we answered Dr. Cormack in the way he deserves, we should make use of very strong language; but we forbear. We, however, can confidently declare that we ourselves know several honest homœopathists,—men who both believe and practise according to the principles of Hahnemann, and men whose characters will bear the closest scrutiny and investigation, who have adopted homœopathy solely because they believe it to be true, and who would be among the very first to lay it aside were it proved to be no longer worthy of their confidence. But hear what Dr. Charles Ransford says on the subject:—'Still with all the apparent difficulties and absurdities (as we styled their doctrines), our patients resorted to these heretical practitioners—and generally assured us, to our ill-concealed mortification, that they received benefit at their hands. Notwithstanding our prognostications of the ephemeral nature of the system, it continued to increase in favour, and its disciples were to be found amongst the most intellectual and calm-thinking members of society. We said to one another, "What do these men give their patients?" One physician informed the writer that tartarized antimony, in small doses, would act as a sufficient aperient; and doubtless that this was the preparation exhibited for the purpose in cases of constipated bowels. Ashamed is the author to confess that he and others, utterly ignorant of the subject, and refusing to inform themselves by actual experience, not merely suspected, but asserted, that men of unimpeachable integrity gave ordinary drugs, under

Hosted by Google

a feigned name, for the purpose of producing certain effects; without trying the effects of remedies upon this (the homœopathic) principle, we publicly declared the entire band of homœopathic practitioners as unworthy of our society. By these acts we virtually, if not really, asserted that they were banded together to propagate a delusion and a fraud. What a proof this was of our own extreme credulity! and of the "characteristic obstinacy of the medical profession."'

"Dr. Cormack, however, goes still further, and gives an example in which a so-called homœopathic practitioner actually gave large doses of aloes as an aperient. All we can say is, that if this was actually the case, the person so acting did not deserve the name of homœopathist and would have been denounced by his brethren. But Dr. C. must forgive us if we doubt his statement; for the fact is that, week after week, for a long time past, the *Lancet* has been giving similar cases, *most of which we have been able to trace, and found to be so gross a tissue of misrepresentations*, that we are becoming very chary of believing the reports of so-called homœopathic cases which appear in the publications of the avowed enemies of this system.

"We must, however, hasten to conclude this letter. The case is simply this:—For the last twenty years there has been a rapidly-increasing number of well-educated medical men in this country, amounting to at least 160, who have conscientiously declared that, after careful investigation of the doctrine and practice of homœopathy, they have found it to be a safer, milder, and more certain mode of curing diseases than that more usually practised; and have avowed their intention to employ it themselves and endeavour to extend its benefits to their suffering fellow-creatures. These men have, moreover, published all the particulars of this method of practice, and have urged their medical brethren to examine carefully into its merits; while, on the other hand, the medical profession have never ceased to abuse and vilify these their former colleagues, changing their ground of accusation from time to time, but ever striving, though in vain, to oppose their progress; at one time declaring their medicines to contain nothing at all; at another, denouncing them as the concentrated essence of the most deadly poisons; at one time they asserted that the so-called cures performed by homœopathists were nothing more than natural recoveries, and then, again, finding they had burnt their own fingers by confessing too much, and acknowledging that persons got on best when left alone, they shifted their ground, and accused the homœopathists of dishonestly professing to give small doses, but, in reality, administering large ones; as if we could not distinguish between tasteless remedies and a lump of aloes. Thus, we repeat, while the homœopathists have cautiously pursued their course of doing good, and invited others to join them in their beneficent art, the medical men of the old school have scorned the offer to examine into the merits of their cause, and contented themselves with dogmatically denying their assertions and belying their characters. They have never fairly tested the practice, nor have they brought forward any single well-founded arguments against its theory. In this state of matters, it is rather too much to expect that free-born Englishmen, who have learned to think for themselves, should quietly submit to be drilled into swallowing blue pills and black draughts, *et hoc genus omne*, when experience has told them they can get on better without them. And, for ourselves, we can only say that, as long as we find the practical result satisfactory, we shall abide by it, and so long as we find that numbers of the poor flock to our Dispensary (between 3,000 and 4,000 since the opening of the Institution), the majority of whom have tried in vain to find relief at the other medical charities of this town; and so long as these suffering creatures pour their grateful thanks into our ears for the benefit received from the treatment pursued by our medical officers, we shall boldly advocate the claims of our Dispensary, and use our best endeavours to disseminate the knowledge of homœopathy among our friends and neighbours.

We remain, Sir,
Your obedient servants,
JOHN FAWCETT,
ARTHUR H. HULL,

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—It is very amusing to witness the grotesque antics of the *Lancet*, in its Quixotic attempts to put down homœopathy. If "laugh and grow fat" be practically correct, we shall certainly be indebted to even the *Lancet* for a considerable quantity of "Nature's own padding." We confess to it, that we have lately derived both amusement and gratification from his weekly exhibition of zeal for the good old days of the "lancet" and the blister; but we have derived more than usual fun from a late number. In that number this modern Quixote has bestowed even more attention than usual on the subject which troubles him so much—to wit, homœopathy. He has "whacked" it in every "leading article" in the number; he has kicked it in the review, and marshalled his army of "correspondents" against it. He did not forget to give it such thrusts as the opportunity afforded in his "answers to correspondents;" and in the same number declares it a "*mere waste of time to notice the sophistical fancies of homœopathists.*" Not at all, Mister *Lancet:* it does good in many ways. For one thing, it affords great amusement to the homœopaths, and thus

Hosted by Google

helps their digestion; for another, it helps on their Cause, by setting unprejudiced people a thinking. We would not have you stop your abuse on any account, so long as you are "the lancet." No; the office of the "lancet" is to cut, and we sincerely hope it will cut until it cuts for the last time, and then is closed—closed only to be opened many years hence, when some future Sampson wishes to illustrate the history of "Truths and their Reception."

But our *Lancet* friend has his lucid periods at times, as one extract will show. He says in a leading article in the number referred to, in giving advice as to the best mode of putting down this "futile" system, which he had declared it a "mere waste of time to notice:"—"LET THERE BE NO ANGER, NO ABUSE; LET ALL BE CALM AND TEMPERATE AS BECOMES A GREAT PROFESSION." Excellent! Let us quote some few samples from the same number of the *Lancet*, to illustrate his unique ideas of "no anger, no abuse; let all be calm and temperate." Within the compass of six pages he designates the obnoxious doctrine as "absurd," "heretical," "futile," "sophistical fancies," "imposture," "vile and wicked imposture," "quackery," "fashionable quackery," "pestilent quackery," "worst form of quackery," "sham," "a wicked system of humbug and imposture," "alike repugnant to honour, honesty, and truth." This is pretty well for a beginning of the illustrations of what he means by "let there be no anger, no abuse; let all be calm and temperate." Within the same compass he designates the practitioners of the system,—"quacks," "homœopathic quacks," "globulistic quacks," "pestilent quacks," "violators of their college oath," "wanderers from the paths of science," "panderers to the popular delusions of the day," "deluders of the public," "disgrace to the college," "shams," "treasonable and bad," "homœopathic fools," "foreign impostors," "swell mobs," "rogues," and "traitors." This also is not amiss from one whose advice is "let there be no anger, no abuse; let all be calm and temperate as becomes a great profession." There is a proverb in Lancashire, "Where there's least room there's most thrutchin" (pressure).

The number of the *Lancet* referred to is for August 9th.

A LOOKER-ON.

To the Editor of the Homœopathic Times.

SIR,—In the course of my reading last night, the following thought occurred to me. I do not send it on account of its intrinsic merit, but to induce others to send their single, isolated thoughts to you, that thus the *Homœopathic Times* may become a kind of armoury, from which future writers may derive valuable materials for the defence of homœopathy.

I am persuaded that very many thoughts on very many subjects are entirely lost to the world, from the non-existence of a register for isolated thoughts. Few persons can be deeply interested in any subject, without having original and valuable thoughts occasionally suggested to their minds in relation to it. Of such individuals, some have not the time to elaborate their thoughts into a letter, whilst others are deterred, by the idea of the implied importance of addressing a letter to the Editor of a periodical: the consequence of which is, the loss to the community of much that is original and useful. As a remedy for the evil, permit me to suggest the policy of your opening a column for "Thoughts," and inviting the homœopathic world to send such as occur to them, how crude soever they may be—not, of course, pledging yourself to insert *all* that are sent, but only such as you may deem worthy of preservation. For some weeks, perhaps, you will receive very few; but I cannot doubt, that when once the plan becomes extensively known, you will obtain many very valuable thoughts well worth the space devoted to their registration.

But it is time that I came to my Night-thought. Mankind is very apt to consider that there must be some very complex cause for every apparently complex effect: hence the fluid medium and vortices of Descartes were much more satisfactory to the minds even of philosophers than the simple law of gravitation propounded by Newton; and it took much argument to convince the scientific world of the truth of "the Newtonian theory." Should it, then, be a matter of surprise, that the complex systems of allopathy with its fluid medium (draughts, etc.), making a vortex of the stomach, should be so acceptable to the multitude, and that it should require much argument to convince the world of the truth of Hahnemann's simple law of healing, and of the power of infinitesimal doses?

I am, Sir, your obedient servant,

F. J. SMITH.

Oak Lodge, Highgate,

To the Editor of the Homœopathic Times.

34, South Castle Street,
Edinburgh, Aug. 25, 1851.

SIR,—In the history of homœopathy there never was a time when it was more incumbent upon those connected with it to avoid anything which might serve as a handle to our opponents than the present. I am led to this remark by the observations of Dr. Rosenstein on "Allopathic and Homœopathic Quackery," which appeared in your last number. He asks, "What right have chemists to prescribe?" As one of that body, I unhesitatingly reply, none. The avocation of a homœopathic chemist is a respectable, though laborious one, but that respectability will be materially injured if he travel beyond the legitimate sphere as a *chemist*, by taking upon himself duties belonging only to the medical practitioner, who has spent many valuable years in the acquisition of the knowledge required to perform what the chemist, with his limited knowledge of such subjects, endeavours to do. It is not a question of taking a fee from the pocket of the medical man, but it is an important one to the Cause. The chemist will find, that to keep up with the progress of dis-

Hosted by Google

covery in the boundless field of chemical science, which the public has a right to expect from him, will leave him little leisure time to acquaint himself with "anatomy, pathology, physiology, etc." Besides, the combination of the two is unjust to the pure chemist and the physician, to say nothing of their incompatibility. If the allopathic chemist is regarded unfit for his profession without an acquaintance with chemistry, how much more is a knowledge of it required by the homœopathic chemist, the delicacy of some of whose manipulations is as great as is required in a laboratory of research. The chemist may do much to disseminate the truths of homœopathy, but I do entreat all who make a practice of prescribing, to at once discontinue or follow the honourable and legitimate course, by protecting themselves with a diploma, and then turn their attention *solely* to the healing of the sick.

Trusting that my brethren perceive the subject in the same light as myself, and apologizing for this encroachment on your space,

I remain, your obedient servant,

JAMES BROWN.

Miscellaneous.

CHESTER HOMŒOPATHIC DISPENSARY.—(Cases, to be instructive, should record failures as well as cures.) *Case.*—The following case details the consequences of large doses of *Mercury*, given as it would appear, most wantonly, the patient only labouring under a common cold at the time. It also illustrates the power which *Aurum* possesses to antidote the poisonous effects of *Mercury*; lastly, it exemplifies a well-known peculiarity of *Rhus*, the power to cure all kinds of symptoms which are worse *when lying down*. In reference to this peculiar power of *Rhus*, the writer remembers a case, treated by Dr. Chapman, which showed it forcibly. A medical man, had suffered from pain in the spine at the small of the back, for some years; he had been treated by many eminent allopathic practitioners, and had undergone an immense variety of both external and internal treatment, not only without benefit, but every day growing worse. The singular feature of his case was, that when lying down, he had incessant pain in the spine, which abated when he stood erect; so invariable was this rule, that on one occasion, when he had to travel a long distance by coach, he was compelled to stand during the whole journey. *Rhus* was prescribed, and before it, this and most of his other symptoms vanished, his health became in a little time comparatively restored, and he resumed his practice—this time to practise homœopathy. Some time afterwards he was seized with another illness, which proved fatal. His medical attendant, anxious to know the state of the old disease of the spine, had it examined, and found complete decay of two or three of the lumbar vertebræ. But what was thought remarkable, a new shell of bone had grown around the carious parts, and, judging by its quantity and appearance, its commencement might be dated from the time the *Rhus* had produced a favourable change in the disease, and which is also remarkable, with the interior of the bones decayed away, this shell of bone did the duty of perfect vertebræ for several months, during which the patient, considering himself quite convalescent, followed the laborious duties of the medical profession.

Case.—Henry Dutton, æt, 25, was under medical advice, took *Mercury* to salivation for a common cold, and again took cold when recovering from the effects of the *Mercury*, and thus occasioned his present illness. He complains of a violent pain, shooting in the fore and back part of the head, down the face and into the teeth; he has also pain in the loins, and is so weak and nervous, that at times he cannot speak to any one. His appetite is variable; he has dysuria, and urine of a deep brown colour, both of which came on when taking the *Mercury*. The pains are most decidedly *worse at night*, and so much *increased by lying down*, that he is compelled to walk about most of the night. Prescribed *Aurum* 3, one pilule thrice a day. April 21st. Better in spirits; had better nights, and is generally improved. Continue *Aurum*. May 19th. Has had no pain for a fortnight; sleeps well; is not nearly so nervous, but there is a little lightness or giddiness in the head occasionally. Continue *Aurum*. 23rd. On the 20th, the pain in the back of the head suddenly returned, with sickness, vomiting, faintings, and a drunken feeling. These sensations are much worse when lying down, so much so, that he dare not lie down for more than a few minutes at a time. The last two nights he has passed entirely without sleep. He has profuse perspirations during the night. He has no appetite, but great thirst. Ordered *Rhus* 3, a pilule every three hours. 24th. Feels a little better; could lie down a little last night. 29th. Lies down and sleeps pretty well now; is less nervous than he has been for a long time. Continue *Rhus*. He did not again return to the dispensary, and judging by the great improvement at his last visit, is considered to have been cured.

BENEFICIAL EFFECTS OF INDUSTRY.—A spirit of industry, when once it has been excited in the common forms of education, may be transferred to objects of more exalted dignity, and more extensive utility. It qualifies men for the highest and for the lowest employments. It gives perseverance to the workman, and firmness to the statesman. It opens a broader field for the display of every talent, and inspires us with new vigour in the performance of every social and religious duty.—*Family Friend.*

THE VITAL PRINCIPLE, OR VIS MEDICATRIX NATURÆ.

By Dr. Strong.

In a former "Study," printed in No. 96 of the *Homœopathic Times*, an imperfect attempt was made to ascertain how far Hahnemann's theory of chronic diseases, commonly known as the psora theory, was consistent with acknowledged pathological truths. To what extent the dim shining of a student's lamp may illuminate an obscure or even mysterious subject, others may best judge. One result to the writer of that investigation, was a profound conviction of the vast powers of Hahnemann's genius, of his learned research and diligent sifting of facts. A commendation not intended to be bestowed here on his very careful and original provings of remedies upon the healthy (though his *Materia Medica Pura* alone were enough to found the fame and immortalize the memory of any one man), but particularly on the cases and opinions he has selected from various literary and medical authorities of ages, languages, and schools, far apart from his own; and on his still more wonderful capabilities of generalization and abstraction. His invaluable writings, it is almost superfluous to remark, are rendered distasteful to the reader by an aggressive acrimonious tone, and a lamentable bitterness of feeling continually recurring, which, however pardonable in an ill-used genius, far in advance of his age, are not the less repugnant even to his admiring followers. But besides the colouring just alluded to, they will never, from their compressed style and German inversions, become popular with us; be it said without the slightest disrespect to their present English dress. The Organon especially reminds one too much of the insufferable sentences and unreadable pages of John Hunter; but notwithstanding, to the apprehensive mind this remarkable book abounds in

> "Thoughts too deep to be expressed,
> And too strong to be suppressed."*

Section XV of the Organon may be cited as exhibiting a fair sample of a Hahnemannian sentence, wherein the violent contortions of a mighty thought, struggling with incapable language, end in a sort of dishonourable and most unattractive compromise.

"§ XV. The affection of the morbidly deranged, spiritual dynamis (vital force) that animates our body, in the invisible interior, and the sum total of the outwardly cognisable symptoms produced by it in the organism, and representing the existing malady, constitute a whole; they are one and the same."

Much resembling Cuvier, an admirable faculty of observation and of discrimination, early developed in the German student, laid a sure foundation for the grand generalizations in his various writings, which, when we first come upon them, like the sudden burst of a noble landscape, almost seem to take away the breath of the traveller. The development of such minds is uniform. "Particular matters of fact," says one of our soundest writers, "are the undoubted foundations on which our civil and natural knowledge is built; the benefit the understanding makes of them is to draw from them conclusions, which may be as standing rules of knowledge, and consequently of practice."* Tracing up some of the chief medical "conclusions" of his day, to the "particular matters of fact" on which they rested, Hahnemann soon detected the illogical nature of several of them, and in their stead he has, with oracular acumen, attempted to substitute a set of conclusions, which prejudice and bigotry alone, to this day, have hindered the world from either receiving or examining. The masterly views which he was thus led to take, fairly amount to a revolution in medical doctrine as well as in practice. They may be stated as under.

Disease is produced by none other than a morbid affection of the vital force, or principle.

The importance of an exact study of symptoms.

The *specific* action of the articles of the Materia Medica.

The proving of remedies upon the healthy body.

Minute or subtilized doses.
The repetition and sequence of remedies.
A judicious dietary.
The doctrine of chronic diseases.
The Homœopathic Law.

Such are the chief heads of the Hahnemannian doctrines, and they constitute a very wide series of subjects, which the medical student must make himself master of, in addition to his ordinary routine education, before he can become a competent homœopathic practitioner.

As utilitarian and experimental as the age can desire, these doctrines are raising a clear and commanding voice; already they have silenced the vulgar clamour of the populace, and enlisted in their favour the aristocratic element of the nation, while backed by numbers, they knock even now at the grey and moss-grown portals of the ancient Æsculapian halls and temples. But to return: to appreciate properly the full value and scope of an axiomatic doctrine enunciated by a great mind—the secret corollary perhaps of unrecorded impressions, observations, and facts—we may often advantageously reverse the constructive mental process, descending from the rule to the example, from generalities to the particular. The text that suggests the present train of analytical considerations is the following very important one from the twelfth section of the Organon: "IT IS THE MORBIDLY-AFFECTED VITAL FORCE ALONE THAT PRODUCES DISEASES."

More than probable is it that none of those theories dignified even with the title of *first laws*, such as the attraction of matter, gravitation, the *vis inertiæ*, etc., are really exact expressions of those commands by which the Creation of this world is ordered, although they may very well be the expressions of facts in nature. Just so the *vis insita*, vital force, or the breath of life, is a conventional mode, coeval with the origin of man himself, of expressing that of which we witness only the effect. Nor need any one captiously object that this "*spiritual dynamis*" is not a "particular matter of fact;" for the human mind appears to be so constituted, that though continually led into the grossest errors or most absurd delusions by its habit of theorising, yet it actually is incapable of turning its observations to any profitable account without a theory (good or bad) to connect and arrange these by.

The physiologists dwell but little upon the subject, or give it a colouring of their own. Thus Richerand: "Peu de gens aujourd'hui contestent l'existence d'un principe de vie, qui soumet les êtres qui en jouissent à un ordre de lois différentes de celles auxquelles obéissent les êtres inanimés, force à laquelle on pourrait assigner, comme principaux caractères, de soustraire les corps qu'elle anime à l'empire absolu des affinités chimiques, auxquelles ils auraient tant de tendance à céder, en vertu de la multiplicité de leurs éléments, et de maintenir leur température à un degré presque égal, quelle que soit d'ailleurs celle de l'atmosphére * * * L'hypothése du principe vital est à la physique des corps animés ce qu'est l'attraction à l'astronomie —mais il faut de ne prendre ce terme qu'au sens métaphorique et figuré." (Nouveaux Elémens. Ed. 1833.)

Dr. Carpenter, quite towards the close of his elaborate work (page 631), remarks: "The progress of research obviously leads to the conclusion, that in every part of the living body there is an inherent and independent vitality, which enables it to grow and maintain its normal structure and constitution, so long as it is supplied with the requisite materials; and that changes in the character of the tissue can be referred to nothing else than to alterations in its properties, resulting from external agencies, or to alterations in the materials supplied for its renewal."

So much, by way of apology, for this postulate—"*vital force*."

Like Stahl and Boerhaave, or indeed all other physicians, Hahnemann found that he could not teach, or perhaps scarcely practise, his new system of remedies without proposing a plausible theory of disease. He had discovered, by the infallible process of experimentation, a set of agents which seemed to apply themselves to the finer parts of our organization—agents which, destitute of taste or odour, and which from their extreme attenuation equally escaped the senses of sight and touch, yet produced each its specific effect, not only on the senses and sentient parts of the frame, but upon bone and muscle, upon the secretions, the excretions, and every living laboratory, whether of the body or of the mind. These agents, so fabulously minute as to defy measure or weight, and almost to baffle calculation, seemed most to resemble malaria or contagious effluvia, or even the yet more subtle powers of galvanism and mesmerism. The similarity indeed was close and obvious. But when, turning from his experiments or provings, as he called them, with these agents upon healthy persons, he applied them to individuals who were the subjects of disease, and discovered that these medicaments possessed marvellous controlling powers, each according to its "hidden virtue," he was compelled to protest against the coarser doc-

Hosted by Google

trines of the older schools—against the mechanical "*error loci* of the blood-globules" as a theoretical cause of disease; and equally against "spasm of the blood-vessels," "crudities of the humours," "or phlogiston," the *plurima mortis imago* of a bygone age. Still less could he recognise "depraved secretions," or "pathological lesions," as *causes* of disease, when these very conditions frequently appeared as the sequelæ of the provings he had instituted. For if he could produce such-like morbid symptoms artificially at pleasure, by means of his new medicaments, it was quite probable, and indeed almost certain, that thence could not be the true starting-point of natural diseases, but that he must ascend a step higher in the chain of causation.

In such a dilemma, we may fairly picture to ourselves Hahnemann pondering over this abstruse subject, and passing in review the various conjectures and hypotheses that ancient learning, still older tradition, or modern experiments, offered for its solution. What then, he must have asked, is this internal principle,—this wonderful and ever-active power, which, in some sort or other, equally pervades animals and vegetables—this fleeting and evanescent energy, which, unseen by the eye, untracked by the understanding, is only known, like its great Author, by its effects? Can life, as some have imagined, be the result of a general harmony or consent of action between the different organs of which the vital frame consists? His experience of disease negatived the crude supposition.

Can the principle of life be inherent in the blood, or possibly, as hinted in the Mosaic writings, can the blood itself be regarded as the principle of life? An expression used by Homer, *πορφυρεος θανατος*, or *purple death*, shows that this idea was entertained by the Greeks. In this country, the name of John Hunter is immortalized by his experiments upon the blood; and yet more recently, Majendie, an eminent physiologist of Paris, has searched the sanguine element, and tested its alterations experimentally *usque ad nauseam*, without, however, arriving at any definite conclusion.

Some have imagined that the vital principle was an exquisitely subtle gas or *laura*; by turns assumed to be identical with caloric, with oxygen, then with galvanism,* or mesmerism: and at this notion of a vivifying essence, the speculations of our great Master seem to have arrested their career.

Now, though we may suppose that Hahnemann followed some such train of reasoning as his experiments above alluded to would of themselves suggest, there were not wanting meanwhile pathologists of a far different school, who, taking another pathway, yet arrived at the self-same conclusion. Among them is our very learned and judicious friend, Dr. Copland; nor can we think of omitting here so flattering a testimony as the following, from an author who, having no theory of his own to serve, has so unconsciously contributed to the confirmation of that which is now under our consideration.

"*Ætiology.*—Although the various textures and organs of the body display the fixed combinations of mechanism, and the most beautiful principles of action presented by the physical world, yet they are entirely under the dominion of life, by which only they are actuated, and on which they entirely depend for the functions they present. It is not upon the textures or organs themselves that the causes of disease generally make their first impression; and even when they are brought in immediate relation to a particular organ or structure of the body, we have no evidence to furnish that they derange those parts by primarily affecting the machinery of which they are composed; but, on the contrary, from the gradual manner in which derangement is produced, from the nature and effects of the disorder which follows, and numerous other considerations, it may be inferred that they make their first impression upon the vital endowment of the organ, disordering the functions which it performs under the dominion of life. * * * * With few exceptions, the causes of disease *first* modify the manifestations of *life* in some one or more of the systems and organs with which it is allied. * * * From this and what has been already stated, it will appear that a great proportion—nay all—of those disorders of internal parts, which have been viewed as *intrinsic* predisposing and exciting causes of disease, are in truth pathological conditions or existing states of disease, induced by some one or more of the causes specified above, and ready to produce further disease, or to lead on to a salutary change, according as the existing state of vital power or resistance, and the influences or agents acting on it, may determine the procession of phenomena, or incline the balance."*

The most unequivocal language is here employed; but if imagery can assist to set the idea of Hahnemann in a more clear light before some of our readers, we will

Hosted by Google

venture to adorn our argument with a highly poetical passage from "Paradise Lost." It is where Satan (an incorporeal being, like the "Spiritual Dynamis") receives a wound from the weapon of Michael the Archangel; and the trope in this new sense is sustained admirably, even to the armour or outward covering being disordered from the gash inflicted with an invisible steel:—

——"Then Satan first knew pain,
And writhed him to and fro convolved; so sore
The griding sword with discontinuous wound
Pass'd through him: But the etherial substance
Not long divisible; and from the gash [closed,
A stream of nectarous humour issuing flow'd
Sanguine, such as celestial spirits may bleed,
And all his armour stain'd, erewhile so bright."
BOOK vi.

A philosopher asserts a new doctrine, and adduces in its support very original and peculiar experiments; these consist in the provings of drugs upon the healthy subject, and the administration of them to the sick. Yet in his day, and ever since, the materialists of the widely-spread school of Broussais have not hesitated recklessly to assert the contrary: for instance, to ascribe many and various kinds of fever to an affection of the glands of Peyer;* and the very favourable reception accorded to this clumsy and ill-concealed sophism offers a striking illustration, by the way, of the gregarious tendencies and weaknesses of the human mind, amongst even a well-educated and, here and there, highly-lettered class of society. In direct antagonism, therefore, to Broussais and his eminent and richly-endowed followers, and some gifted countrymen of our own, stands the dogma of Hahnemann, "IT IS THE MORBIDLY-AFFECTED VITAL FORCE ALONE THAT PRODUCES DISEASES."

When, in order to cover the effects of your own obstinacy, which caused you to miss the train, you treat your daughter to a view of the electric telegraph—or when you forward to your astonished wife a smart red morocco case, containing your photograph, by Kilburn or Beard—when, I say, you are guilty of these base subterfuges, you tacitly recognise the existence and full activity of agents of that class called *immaterial*. The older chemists reckoned three of these—light, heat, and electricity, in addition to the sixty or seventy simple bodies constituting our globe. Modern research has added to the number, galvanism, magnetism, chemical affinity, and odyle; nor can we, without injustice, exclude vitality from this list of "imponderables." In an age, then, signalised by the discovery and skilful adaptation to man's use of the mysterious powers above named, why should materialism be more rife among physicians than amongst other classes? Why should Dr. Billing be counted almost heterodox for maintaining that most diseases invade primarily the nervous energy? Are the professors of morbid anatomy the chief disseminators of so strange a belief, through an overweening conceit of the importance of their labours?

The late Dr. Abercrombie, of Edinburgh, was a striking example of the materialist school. Throughout his valuable "Researches into the Diseases of the Brain and Spinal Cord," he seems to have applied all his energies to one point—the discovery of a connection between the morbid appearances in the encephalon and the symptoms during life. One interesting series of cases is headed thus: "Apoplexy *without* any morbid appearance, or simple apoplexy." And the section on serous apoplexy concludes thus: "It is probable that the affection which has been called serous apoplexy is to be considered as simple apoplexy, terminating by effusion." Here, then, between serous and simple, between deaths and recoveries, is a pretty large group, amounting probably to one-half of all the cases of apoplexy that occur in practice, *distinguished* by an absence of morbid appearances; and yet the writer continues a materialist!! On the topic of paralysis, he writes thus: "In the general pathology of paralysis there is much obscurity. We find it connected with a great variety of morbid conditions of the brain, and on the other hand, we find all these existing without producing it. We cannot attempt to explain these difficulties, and must content ourselves with a simple view of the facts as they stand, in the present state of our knowledge." Did it never occur to this acute thinker to question the doctrine he was supporting, viz., that paralysis invariably depends upon some organic change of structure; or was he too timid to avow openly the conclusion to which his own facts and observations so markedly led him?

A few words now as to the importance of establishing a sound theory of disease. The old practitioner troubles himself very little about the abstract principle of vitality. When he has relieved one of the symptoms, we will suppose pain, by blood-letting, he trusts to the *vis medicatrix naturæ*, a deity who presides over diseases only, to step forward and remove the others. If he can produce a good night by means of

* Vide a recent work of the eminent pathologist, M. Louis, of Paris, on Adynamic and Ataxic Fevers, etc.

Hosted by Google

opiates, the goddess, it is to be hoped, will again prove propitious: and thus day by day, one or two of the most prominent symptoms are combated, leaving poor Nature to deal with the remainder. What is all this but a practical acknowledgment, a partial recognition, of a vital principle in difficulties? Symptoms may be compared to the evidence brought forward in a court of justice: the most trifling incident is sifted, and the whole is connectedly laid before the jury. Nor is the trial but for one offence only, of which the counterpart is to be found in the well-known aphorism of Hunter, that two diseases cannot coexist in the same individual, or at least that one of them must overpower and silence the other. Therefore the entire collection of symptoms is referable solely to one disease: there is an observable *unity* in the deviations from health; a fact which has been much obscured by the vague employment of the phrase "sympathetic symptoms." An ailment is very rarely, if ever, limited to a single spot or point; the whole system is from the first informed of it: thus it is said by military men that a gunshot often occasions no pain at the instant, but that almost invariably the man falls, though the wound may eventually prove to be but slight.

Now the evidence which the vital principle gives of its troubles and sufferings is occasionally most unexpected, and certainly such as anatomy and physiology by themselves would not at all lead one to anticipate. This grouping of symptoms is well shown in the following case.

A gentleman's cook, single, about five-and-thirty years of age, consulted me on the 5th of March, 1851, for a cancer of the left breast, which had been condemned to excision. For the last twelve months she had noticed a lump in the bosom near the nipple, where she once had an abscess. On examination, three tumours can be distinctly felt, nearly united together, hard, almost stony; flat, and not painful on handling. On a change of weather it burns and feels inflamed. It is worse and swells at the period. She has lost much flesh, and become extremely weak; complexion dirty-looking. Bowels confined. Catamenia every three weeks, scanty. For two or three years past has experienced a difficulty in swallowing, about the back of the tongue. She cannot swallow meat, and sometimes cannot drink; can eat dry bread best; a sour taste in the morning. Legs and knees ache by day.

Of such a case, what satisfactory diagnosis could be made? In what school of medicine is taught the connection of symptoms such as are here detailed? Yet they must all arise from *one* disease; it is *one* affection that we have before us, not a complication of two or three maladies, if there be truth in Hunter's axiom. What has induration of the mamma to do with the throat? What has difficulty of swallowing in common with an aching of the legs and knees? The patient meanwhile is particularly anxious to know the *name* of her complaint. What if, notwithstanding so many months of suffering, there be *no organic seat* of disease! what if the organs implicated, sympathise not with each other, as heretofore taught, through nerve and ganglion and absorbents, but through the vital force that animates them, whose tale of woe they thus tell, whose sufferings are expressed and manifested in this way! The wonderful provings instituted by Hahnemann disclose sympathetic relations upon healthy persons, which in natural disease the old school, regardless of their conflicting and even contradictory theories, would denominate "a complication of affections." According to Bœnninghausen, there is one drug which covers all the symptoms, those, namely, of the pharynx, mamma, uterus, bowels, legs, complexion, and nutrition; she therefore had given to her *Arsenic*, two globules of the 30th dilution in six parts, one each morning.

March 19th. A little pain in the bosom, which was rather more swelled. Bowels confined, only one motion since the 5th. She can swallow better, and feels her throat somewhat sore. *Nux vom.*, three drops, 12th dilution, a sixth part every eight hours until the bowels are relieved.

24th. Medicine makes the head ache still; a very scanty motion on the 21st; before that no passage for fourteen days. Appetite has improved. Catamenia lasted two full days. She has gained flesh, and has much less burning in the mamma; at the last period it was swollen only, not painful. Legs and knees are very much better. Can drink much better, but cannot yet swallow meat; has experienced an itching eruption, now subsided. Repeat *Ars.*, two globules, 30th dilution, in six portions as before.

April 14th. Bowels are quite regular now daily. Appetite good, but thirst all day, and the mouth feels hot. Catamenia again at three weeks, but lasting four days. Bosom feels better, pain only occasionally, and not severe; she can now swallow food or liquids pretty well; much itching about the trunk. On the chin there is still an eruption of papulæ. The head and eyes have been giddy and much tried. *Sacch.*

Hosted by Google

28th. Examination. No tumours to be felt in the bosom; the gland feels almost quite natural to the touch. Can eat meat now if cut small; some irritation still about her, and some giddiness.

A perfect cure of this ugly-looking case was thus effected in two months, by means of an almost incalculable small amount of mineral matter; and surely no one can peruse the details, without admitting how much better the doctrine taught by Hahnemann accords with the facts—*i. e.*, with the morbid symptoms, with the small bulk of the remedy, with its provings, with the cure—than any other scheme which has yet been brought before the world.

In conclusion we may observe, that Hahnemann's theory can now no longer be denounced as visionary or as unsound; its supporters are too numerous for the one, and the success of his system of cure too well admitted for the other. Physiologists indeed disregard or shun the question of the vital principle; pathologists differ widely amongst themselves respecting its very existence, let alone its being the seat of disease; but all who have been cured by a course of homœopathic medicines, and all who have scientifically proved these medicines on their own bodies, are convinced of the truth of Hahnemann's assertion, by that inward argument from which there is no appeal—the testimony of their own sensations.

CHOICE OF DILUTIONS AND REPETITION OF MEDICAMENTS.

Communicated by Dr. Rosenstein.

(*Continued from page* 84.)

3. The scent perceptible in minute particles of very odoriferous substances. According to J.O. Müller, five centigrammes of musk divided into 320 quadrillions of molecules still retain their odour. It is the same with many other substances, although the experiments have been made with little precision.

4. Patients affirm that they have occasionally detected the taste of certain medicaments, such as *Sulphur*, administered at a very high power, and it has sometimes happened that they have not been mistaken. But until positive observations have undeniably established the fact, we must consider this pretended perception as illusory.

5. We have long known that we could recognise substances in the higher powers. Five centigrammes of carmine are perceptible in ten kilogrammes of water, and each of its colouring particles has but the dimensions of 1-50,000,000th of an inch. The ductility of silver is such, that eight millions of leaves of this metal superposed constitute but a thickness of one line and a quarter, and yet taken separately are all very visible. Mayerhofer, by means of a microscope magnifying from 14,000 to 90,000 times, has recognised the presence of a metal in the 9th, and up to the 14th trituration, according to the different properties of metals. With reference to zinc, the diameter was from the 1-120th to the 1-200th of a line. Thus, for example, five centigrammes of the 3rd trituration of zinc (decimal scale) contain 576,000,000 of divisible molecules; these molecules are all of the same dimensions in the triturations, but they diminish in volume according to their division; therefore it seems to me that they should appear smaller. The results of experiments proved the higher powers to have, in fact, but a limited importance. In devoting myself recently to researches of this nature, I think I have discovered, with some appearance of reality, metallic atoms in the alcoholic powers 12 to 30. Making allowance for the insufficiency of our instruments, and for the imperfections of our observations, these experiments are not less profitable to the science; in showing us the presence of material particles in the higher powers, they prove that the substance exists there. Nothing authorizes us to deny in the 15th power the existence of a metal which we have found in the 14th, because its presence there is less palpable; we might, with equal reason, maintain that there are not more stars in the heavens than are visible to us.

This progressive divisibility which we observe in opaque metals also belongs to all really soluble medicinal substances, and which consequently escapes the sight. As to the latter, their solubility increases the divisions from the first numbers, and we may infer from this, with reason, that the dynamization follows a much greater progression in the subsequent numbers.

The metals particularly and, in general, the insoluble substances, do they require a higher dynamization to disengage all the powers? The lower potencies, do they suffice for soluble substances? Other researches than those which have hitherto been made will be necessary to resolve these questions.

These microscopic experiments refute in a striking manner the arguments of the adversaries of the higher potencies; they will understand that we attribute to this progressive division of substances their penetration into the smallest con-

Hosted by Google

duits of the organism. If five centigrammes of the 3rd trituration of zinc contain already 676,000,000 of molecules, this proportion must considerably increase for the 30th, and the number of atoms contained in a moistened globule must be so great, that the effect could not escape even the materialists, provided they act upon a part of the organism liable to be impressed by them, viz., upon a diseased part, and of an analogous tendency.

6. The action upon the sensitive point of the organism will always be the main support (fulcrum) for the medicinal powers.

Hahnemann, as we know, attributed, in the first instance, to the dilutions the property of modifying the too energetic hostile action of the medicaments. But having perceived that the action of these preparations was far from being weakened, and that many of them showed even a greater energy of action than the pure substance, he was led to adopt a different opinion, in affirming that the trituration and the succussion of substances determine the development of the curative virtues. This assertion met with numerous objectors; many taxed it with exaggeration, and a secession was on the point of taking place among the partisans of the new doctrine. However, Hahnemann, pursuing his experiments on healthy subjects, made use almost exclusively of the higher potencies (18 to 30), particularly with the so-called antipsoric remedies. This agitation gradually abated; arguments were no longer raised upon the possibility of action of the higher powers, but rather upon the more or less convenience of the lower and higher powers; this was an advancement. The Proving Society at Vienna also made trials with the higher potencies, and the symptoms produced by those of silver were evidently more numerous and more important than those furnished by the lower powers. The experiments made with *Muriate of Soda* gave still more conclusive results; and it was with a marked repugnance that the organ of this Society declared the action of these powers more energetic and more characterised. This acknowledgment is of a high importance for the solution of the question to be answered. Whilst the daily use of common salt produces upon the healthy organism no appreciable effect, this substance employed in a state of potency has produced upon various subjects submitted to experiment characteristic phenomena, and often reappearing.

7. *Effects produced upon the diseased organism* by remedies chosen according to the law of similarity. The opinions of homœopathic physicians upon the use of potencies are contradictory; some extol the lower powers, others, on the contrary, praise the highest: some employ both; there are some who act according to fixed rules; others proceed in an arbitrary manner. What is the use of these different procedures, and which is that which obtains the most cures? Although documents based upon the authority of numbers would have answered this important question, it would be necessary to give a portion of the greater and less aptitude of the practitioner, as well as accessory circumstances favourable or unfavourable to the cure.

The reason many medical men do not attach the least importance to the degrees of dynamization is that, in their view, the difference which exists between the various potencies is so insignificant as to escape observation, and consequently of no utility to the physician.

If the question were only to point out the difference between the potencies near to each other, this opinion might be justifiable; but there must be a considerable difference between the 1st and the 200th potency, and as nobody disputes this fact, this difference should be rectified.

The attempts which have hitherto been made to form laws upon this matter have completely failed. However, all seem to agree, that the physician should dispose of the whole scale of potencies. The higher potencies have of late regained that favour of which the lower potencies ten years since appeared to have deprived them.

During the latter part of Hahnemann's residence in Germany he proclaimed the 30th potency as the most convenient to obtain a certain uniformity in experiments. He thought that this potency would suffice under all circumstances, and would have the advantage by its action over the lower. In France, Hahnemann seems to have employed much higher powers; however, I do not think that he often went beyond the 30th potency.

The author of this memoir has seen, at different periods, physicians pass from the lower and middle potencies to the highest, then go back after a short time to the lowest, and ascend soon to the 30th, and beyond. On his part, he reserved to himself the whole series of potencies; he would never follow exclusively any of these tendencies.

III. PROPERTIES OF THE HIGHER AND LOWER POTENCIES.

1. The choice of a potency should be subordinate to the individual case. *No*

Hosted by Google

potency could absolutely be preferred to all others.

2. The effect of each potency is certainly ruled according to *immutable natural laws;* but it is difficult to give it a form; a correct interpretation is necessary in each case, which a skilful observer alone is able to give.

3. *All the potencies cure diseases,* but each potency does not equally produce a perfect, prompt, and a sure cure.

4. The physician who by a long habitude has become familiar with the effects and the duration of action of such or such series of potencies, may cure with certainty by means of less appropriate potencies on the other hand, the practitioner accustomed to employ exclusively lower potencies will often have to deplore the result obtained with higher potencies, and *vice versâ.* We must know the effect of each series, the results obtained either by repeating or suspending the use of each of the potencies, and finally, the means of neutralizing the injurious effect of that which is less suitable for the disease, and to supply its place.

5. There exists, in fact, a *marked difference* between the higher and lower potencies, but it is impossible to determine at first where the higher potencies commence. There are intermediate degrees, which, according to the various medicaments, approach sometimes nearer to the higher potencies, at other times to those of the lower. The difference between the mother tincture and the 1st or 6th potency seems much greater than that which distinguishes the 6th and the 10th, or a higher power. The more we rise in the scale, as in the higher potencies, for example, the more sensible is the difference which exists in their effects. It becomes at last so weak, that it is almost imperceptible between the 200th and the 400th. The potencies between 6 and 18 have long since been considered as the middle, but since the employment of the higher potencies, this place has been assigned to the 30th.

6. According to the example of many allopathic physicians (who seem to glory in it), in prescribing large doses without producing intoxication, a great number of homœopaths also commit a great error in prescribing higher and higher potencies, in order to see how feeble a dose it would require to produce a salutary change; such a proceeding confuses the true observation of nature,

7. *The medicaments administered in substance are far from exercising upon the organism an equally energetic action.* This action is, on the contrary, extremely varied. Certain therapeutical agents, such as the noble metals, *Carbo,* and *Silica,* produce no effect; others, common salt, for example, act in an almost imperceptible manner; others produce but a slight action, as *Asparagus, Leontodon,* or they are endowed with a great energy, and affect vitality powerfully, as the narcotics, *Belladonna, Nux vomica, Opium.* There are besides those which we have signalised, others possessing a chemical action, disorganizing or destroying the texture, such are the concentrated mineral acids, many metallic salts, *Sublimate, Arsenic.* The dynamization produces in them accessory and very important changes, by which we may profit, provided this injurious action has been neutralized without modifying or weakening the specific power. The energy of action of substances appertaining to the first category becomes free, when their efficacy becomes manifest; those of the second do not undergo a very marked change, they only lose their taste and their odour; those of the third are deprived, to the profit of the diseased, of their injurious action, by which means they become genuine curative agents; the others partake of a similar advantage, and lose at the same time their chemical destructive properties. Evidently the advantage is altogether for the first; the substances of the second gain but little by their transformation; those of the third and fourth gain much. Therefore, for some medicaments the dynamization is necessary, others allow it; the result for all is an augmentation of curative virtue, which becomes penetrating and less tumultuous. If we cannot accord this eulogy to all the medicaments, it is at least certain what is a necessity for some is at least optional for others.

9. *To develope the specific medicinal virtue is the true sense and only aim of the dynamization.* In this point of view we must judge the nature or the utility, and what is inadmissible in it. When the question is to operate a partial destruction, to narcotise, to introduce in the organism absent constitutive parts, there can be no question of our potencies. But when it is our intention to rouse the latent specific properties of medicaments, which, before they are subjected to this operation, remain almost without effect, or produce but an imperceptible action, as certain metals, the neutral salts, and the alkalies, then the potencies are suitable, and cannot be replaced.

10. The medicaments in substance and the lower potencies employed in the pure experiments, provoke symptoms relatively of a greater gravity, but more superficial and more *fugace,* (*fugax*); the higher potencies, on the contrary, produce symp-

Hosted by Google

toms less tumultuous but graver, and of a longer duration. It has been asserted that the lower potencies are applicable in acute affections, whilst the higher answer better in chronic maladies. This precept would be excellent, if it did not implicate numerous exceptions, whereas more predominate laws bring considerable modifications in its application.

This result obtained by experimenters fully accords with the observations of physicians of the old school. Massive doses, as for instance, 50 or 100 centigrammes of *Calomel*, produce violent effects, but at the same time more transient than the same substance administered in a fractional dose from two milligrammes, repeated for many weeks. The same relation exists between the 1st and the 30th potency. In a theoretical point of view, it is very doubtful whether in acute affections it would always be suitable to proceed in a violent manner; we must consider that the acute maladies are often sudden and transitory manifestations of a morbid chronic state, and that a therapeutic agent whose action does not extend profoundly will be altogether insufficient. In these cases we must, on the contrary, administer, with a due regard to their repetition, medicaments endowed with an energetic action, and which penetrate into the economy. These are precisely the higher potencies, of which experience has proved the good effects in these cases.

11. It has been advised *to administer first a lower, following it by a higher potency* when it does not produce the desired effect, and when it is necessary to give a second dose. This advice is wise and useful; but nothing proves that it is always necessary to act so, in order to obtain good results with the higher potencies. Again, it has been recommended to descend from the higher to the lower potencies, when the first have proved insufficient. This procedure will but rarely answer. What is true in this proposition is, that if it is advantageous to change the potencies in repeating the medicaments, then it is natural that a stronger potency should follow up a weaker one.

12. But this point presents yet another very important feature. The lower or higher potencies do not alone determine the *promptitude, and the more or less duration, of the action of the medicament*, the nature proper to the therapeutic agent contributes also. In relation to this, the medicinal substances offer extremely varied conditions. *Camphor, Coffee*, and *Aconite* act very rapidly; *Rhus, Causticum*, etc., provoke but slow effects. The choice of the remedy, according as its exercise is slow or prompt, is of great importance. We have seen that the degree of potency may modify the effects of a medicament administered; for example, in a higher potency it loses in effect much of its promptness. Experience shows, besides, that these rules have but a secondary signification, although we should also pay regard to them; but the principal influence of the duration of action depends on the course of the disease, to which everything should be subordinate.

To be continued.

THE
HOMŒOPATHIC TIMES.

SATURDAY, SEPTEMBER 13TH, 1851.

ASSOCIATION FOR THE PROTECTION OF HOMŒOPATHIC STUDENTS AND PRACTITIONERS.

WE have great pleasure in calling the attion of our readers to this Association. They have seen the intemperate and ill-tempered Resolutions of the Provincial Medical and Surgical Association; three hundred allopathic practitioners met at Brighton for divers purposes laudable enough—but did not part without endeavouring to do what they could to damage, by denouncing, homœopathy—a method of practice of which they absolutely know nothing.

If homœopathy has been tested, and found insufficient, why do they not publish their evidence? Why repeat idle assumptions, and malicious assertions? Why not delegate two or three of their body to conduct, in concert with two or three of our body, a full series of experiments? We should not object to name three of the London College of Physicians to examine the evidence, and pronounce a decision on it. The choice of these umpires should be ours. Definite rules should be laid down for the conduct of the series of experiments. Would not this be a more sensible way of endeavouring to arrive at a just conclusion, than the very silly and inglorious method of clap-trap declamation, and rash assertion?

Hosted by Google

The Resolutions of the Committee of the Association for the Protection of Homœopathic Students and Practitioners are very few, but are very pertinent. The language is calm and temperate. Let us examine them, briefly, in detail.

"1. Homœopathy is thoroughly reconcilable with science and common sense, is in accordance with the experience of some thousands of medical men, and deserves the study of practitioners and the confidence of the public."

Is it not so? let the objectors disprove this proposition. Let them *show* that homœopathy is irreconcilable with science and common sense, and that it has not been borne out by the experience of several thousands of medical men, and then they might have some excuse for saying, that it does not deserve the study of practitioners and the confidence of the public. Let them disprove our published statistics.

"2. The framers of the hostile Resolutions referred to, and other prejudiced opponents, are totally ignorant of homœopathy, avowedly refusing to study its principles (in the writings of Hahnemann and of others,) and to witness its practice in the homœopathic hospitals and dispensaries, to which they have been repeatedly and cordially invited."

Is it not so? let the objectors show that they have studied the principles, and have witnessed the practice of homœopathy. Let the three hundred provincials, or any three, or any one of them, give satisfactory evidence that they have *studied* the principles and have *seen* the practice of homœopathy."

"3. Notwithstanding their difference in the treatment of disease, there can be nothing derogatory in homœopathists and allopathists—equals in education, science and social position—consulting together at the request of patients and their friends as to the nature of the malady."

Is it not so? let the objectors show the immorality of such consultations for such a purpose, and, meanwhile, let the public be assured that well-educated and experienced medical men who are homœopathists, do not seek for such consultations, and only agree to them at the request of their patients. There are many homœopathic practitioners who are quite as able as any of the allopathic body to decide on the nature of disorder or disease; and we are assured that, from their knowledge of the properties of medicines—in kind and amount very different from, and superior to that possessed by their opponents—and from their having a definite law for the application of their remedies, they know much better than those opponents how to treat disorder and disease.

The question whether homœopathy is or is not true, is a public one. It concerns the well-being of the present and of all succeeding generations. Let the public look to it—and mistrust the enemies of homœopathy, who abuse they know not what, and wilfully and perversely, and, because wilfully and perversely, wickedly refuse to investigate the claims of a method of practice they think proper to denounce without inquiry.

"ASSOCIATION FOR THE PROTECTION OF HOMŒOPATHIC STUDENTS AND PRACTITIONERS. At a meeting of the Committee, held on the 1st of September, in consequence of the recently published resolutions of the Provincial Medical and Surgical Association, and other allopathic bodies regarding homœopathy, it was resolved,

"1. That homœopathy is thoroughly reconcilable with science and common sense, is in accordance with the experience of some thousands of medical men, and deserves the study of practitioners and the confidence of the public.

"2. That the framers of the hostile resolutions referred to, and other prejudiced opponents, are totally ignorant of homœopathy, avowedly refusing to study its principles (in the writings of Hahnemann and others), and to witness its practice in the homœopathic hospitals and dispensaries, to which they have been repeatedly and cordially invited.

"3. That notwithstanding the difference in their treatment of disease, there can be nothing derogatory in homœopathists and allopathists (equals in education, science, and social position) consulting together at the request of patients and their friends as to the nature of the malady.

"4. That the resolutions of the Provincial Medical and Surgical Asssociation, representing as they do, the opinions of only a small fraction of the allopathic body, are in themselves, and for the reasons given above, utterly valneless.

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—Many of your readers are doubtless interested in the progress of hydropathy as well as homœopathy. I have thought, therefore, that a brief notice of its efficacy in acute disease might not be unacceptable in your columns; especially as in most hydropathic treatises, attention is almost exclusively devoted to the application of its various methods of treatment in cases of a chronic kind. My own experience, however, for several years past has convinced me that in many of the acute diseases, the result of which is so more than doubtful under allopathic treatment, a judicious employment of the means which hydropathy places at our disposal will not less than in chronic ones prove a very important addition to the curative art. Of this, the following case will serve as some illustration.

This patient came under my care in November, 1845. Her brother and sister had just fallen victims to typhus, but not under hydropathic treatment. Her age was twenty-four, and the symptoms were as follows: delirious, with incessant and incoherent talking, great excitement, anxious expression of countenance; constant movement and restlessness; complained of intense burning and distracting sensation within and at the top of the head, which was accompanied by general heat of the skin, more especially in the abdominal region.

Treatment.—For the general symptoms, successive entire damp-sheet packings, but each for only a short duration, were had recourse to. This was accomplished three times during the first twelve hours of the treatment, though not without some difficulty, owing to the extreme restlessness of the patient. At the same time, thick diaper bandages several times doubled, and scarcely wrung out from fresh spring water, to which a freezing mixture was added, were applied to the scalp and forehead, and changed every few minutes as they became warm. The packings were followed by tepid ablutions, and after the first of them the patient became cooler, soothed, and tranquil; and whenever the febrile exacerbation recurred, the treatment was repeated, and in addition a wet bandage was occasionally applied to the abdomen.

In this way, at the end of twelve hours, and after three packings, and the other means mentioned above, the fever was completely subdued, the head cool and comfortable, and the pulse, which previously could not be counted, was reduced to sixty. Delicious and refreshing sleep, attended by gentle perspiration, followed. From this time the treatment was modified, with the view of inducing a restorative and tonic rather than sedative effect; the damp-sheet packings, which had been previously each only of a quarter of an hour's duration, were now prolonged, but were applied less frequently; the subsequent ablutions or baths were changed from tepid to cold as circumstances indicated; and more and colder water was given internally, and in a few weeks the patient was restored to her usual health.

Thus, by the suitable adaptation of the simple means of hydropathy alone, we have been enabled to meet and check the varied symptoms of this dangerous disease throughout its progress in an unusually aggravated case; and it may reasonably be questioned whether any other known methods of treatment could have been employed which would have had equally rapid effect in the earlier and more active stages of the disease, and at the same time have conduced to so speedy a restoration of health and strength. I may add that I have met with similar success in the use of the varied appliances of the water-cure in several other severe cases of this disease, as also in small-pox, croup, bronchitis, and other acute affections.

I am, Sir, your obedient servant,
WM. FORBES LAURIE, M.D. Edin.
Dunstable, Bedfordshire,
Sept. 5th, 1851.

To the Editor of the Homœopathic Times.

—— Rectory, Sept. 2nd, 1851.

SIR,—While my physician (a homœopath) was lately visiting me professionally, my servant came into the room in much alarm, saying that my horse, which I had ordered to be harnessed, was suddenly taken very ill with the colic. I asked the doctor what was best to be done. He recommended *Chamomilla*, and at once mixed twenty-five drops in about a pint of water, which he kindly saw administered. Upon his leaving me, he told me, if the horse were not better in an hour, to repeat the dose. As the hour expired, I went, not without some misgivings, to the stable, and found the horse rolling on the ground, evidently in much pain; and when he was made to stand up, his head hung down nearly to the ground, his eyes were dull and heavy, and the flanks heaving violently. The groom said it was a *bad case;* that he thought he knew the horse's constitution better than the doctor, and suggested that the horse had better be bled immediately. I thought differently, and saw a second dose of the *Chamomilla* given. In less than half an hour, to the astonishment of all who saw it, the horse was PERFECTLY WELL, and has continued so to this time.

I do not suppose that you take the veterinary art under your protection, but this case proves at least that a *small* dose can have an almost instantaneous effect on a large powerful horse; and *à fortiori* on a delicate human frame.

What will the allopaths say to this? They may, with their usual politeness, call me a fool or a knave, but I can tell them that I am a living proof of the value of homœopathy.

I send you my name, though I do not wish you to publish it, even if you think the case worthy of notice.

I am, your constant reader,
C. H., Rector of ——

Hosted by Google

To the Editor of the Homœopathic Times.

DEAR SIR,—Should you find place for the insertion of the following article on Metallotherapeia, I shall endeavour to send you a second one regarding this interesting therapeutical branch of science, which is already acknowledged by many of the first physicians in Paris, notwithstanding the homœopathic law is its basis.

METALLOTHERAPEIA;

OR, THE EXTERNAL APPLICATION OF METALS FOR THE CURE OF CERTAIN DISEASES.

Communicated by Dr. ROTH.

I have had repeated opportunities in your journal of observing the truth of the law "like cures like," partly by extracts from the writings of allopathic physicians, partly by the interesting communications of the effects of electricity in diseases, similar to those which are produced by it, and partly by showing the homœopathicity of movements and water in certain diseases, which explains the good results of these natural agents as being based on the only real law of healing. It is gratifying to have another proof of the truth of the great Hahnemannian law in the external application of metals in different diseases of the nerves. This new therapeutic application of metals is a recent discovery of a young French physician, Dr. Burg, who is no homœopathist, and who has been kind enough to give the necessary theoretical and practical information in this hitherto empirical application. Having had occasion to witness some of the effects produced by metals, permit me to call the attention of our homœopathic colleagues to the subject. The primary effects of copper and gold, externally employed on the skin, have been already observed. Hahnemann recommended the external use of copper in cholera; the external application of iron or steel in different cramps of the arms and legs is in many countries a popular remedy, and I have lately read some observations on the strengthening effect of steel-filings, which were placed in a small linen bag on the eyelids in a weakened eyesight. To those who are acquainted with the power of mesmerism, the different influences of various metals are also known. All these facts ought to induce us to examine the effects of Dr. Burg's system of Metallotherapeia, of which the following short account, published in various French journals, may prove interesting.

Dr. Burg, who has occupied himself during several years with the most *delicate* and very little known phenomena of the pathology of the nerves, has invented for their cure a system of what he calls metallic *armatures*. He presented lately to the Institute of France two of his apparatuses, one in steel, the other in copper, with a paper on the means of instituting an examination of the patient by metals, in which his discovery is set forth by the following four *propositions*.

1. The majority of those diseases known as neurosis, hysteria, hypochondriasis, catalepsy, megrim, spasms, gastralgia, different kinds of neuralgia, and certain forms of *madness*, show nearly always, or rather always, a diminution (more or less pronounced, according to the degree of the case) of the sensibility or of the muscular force, or more frequently of both.

2. In the greatest number of patients in whom the sensibility or the muscular strength is diminished, both return and become *normal*, by the application of pieces (*plaques*) of metal on the affected parts; the metal is chosen according to certain conditions, which are not yet known to us, and consists, in one case, of copper, in another of silver, steel, gold, etc.; sometimes it is a definite *mélange* of metals, and in this case it is almost nearly always an *alloy* of metals.

3. All patients who are treated by the external application of large pieces or *armatures* of the metal, which without doubt produces the return of the sensibility and muscular strength, are rapidly cured, whatever may be the intensity and duration of the disease.

4. If there is a nervous affection with diminution of sensibility and muscular strength, the difficulty of the cure consists in the determination (choice) of the single metal or the mixture of metals which is capable of reproducing the normal state of sensibility and muscular strength.

For this purpose, and for the use of physicians, Luertan, an instrument-maker, manufactured, according to Dr. Burg's directions, a set of instruments for the examination by metals, which consist of—

1. Several long pins of platina or steel.

2. A small dynamometer, with the necessary divisions for the indication of the muscular strength.

3. Thirty or forty little pieces of different simple metals, or of a mixture of metals.

These pins and the dynamometer are used in order to examine the degree of the sensibility and muscular strength; afterwards, one or more pieces of metal are employed on those points in which the sensibility is the most defective, and the different metals are successively tried, till one is found under the influence of which the sensibility is revived on the part whereon the metal had been placed.

As soon as this result is obtained, a large ring, in the form of a bracelet, 15 to 16 centimetres wide, must be made of the same metal, which is destined to encircle that arm where both the sensibility and muscular strength are diminished or entirely absent; if after a certain time (one or two hours are generally sufficient) both these powers are manifested, and certain phenomena become visible, which are distinctly to be observed as often as the metal acts, and which consist in a feeling of *formication*, heat, and perspiration, then a whole *armature* must be prepared, which consists of ten principal pieces, namely, two large rings for each limb, and two large pieces for the trunk, which are employed in such a manner that they cover large portions of the skin. By this process, which is an entirely new treatment, the cure,

Hosted by Google

according to Dr. Burg, is always sure, excepting in those very rare cases in which the metal displays no action on the sensibility and muscular strength.

For the confirmation of his discovery, the inventor published a certain number of observations, which had been made in one of the most frequented hospitals of Paris, and which are signed by the assistant house-surgeon (*interne*).

In 48 cases, 28 were cured by copper.
" 8 " by steel.
" 4 " by silver.
" 2 " by gold.
" 6 were only slightly and slowly influenced by copper, and in several other cases it acted only on the sensibility.

According to different observations in the hospitals at Paris, the metallotherapeia was useful in many cases of spasmodic affection; also in patients afflicted with cholera, in the year 1849. Two physicians sent into the department of the Haute Marne, during the same epidemy, used frequently these metallic *armatures*, with such success that the application of metals became almost a popular remedy, and in many families where there had been a patient with cholera, they improvised, even before the arrival of the doctor, such metallic bands, which were of ready access in these localities, as the majority of the inhabitants are cutlers by trade.

I am, yours truly,
M. Roth.

16, Old Cavendish-street, Cavendish-square.

To the Editor of the Homœopathic Times.

Sir,—The *Homœopathic Times* of Saturday, August 23, contains an article by Dr. Rosenstein, on one part of which, headed, not very justly so, "Homœopathic Quackery," I think a few words are necessary.

A lady had consulted a homœopathic chemist in a case of a cold, and the chemist had prescribed and apparently incorrectly.

Dr. Rosenstein inquires, "What right has the allopathic or homœopathic chemist to prescribe? No right whatever."

I think I am correct in stating that the conduct of the chemist in question must be looked upon as the exception and not the rule, as I believe our fraternity are not in the habit of prescribing. I am able to speak confidently of one chemist, Mr. Turner, of Manchester, and it is his rule, as it is also my own, never to prescribe under any circumstances, however strongly solicited.

Such a rule should be universal with all who come before the public as homœopathic chemists.

The chemist, as Dr. Rosenstein observes, "knows nothing (necessarily) of anatomy, physiology, or pathology;" and it is apparent that if the dignity to which homœopathy is beginning to attain in our country is to be preserved and to increase, unqualified persons must not take upon themselves to prescribe. I am informed by a lady recently returned from New York that it is by no means uncommon, in the cities of the United States, for unqualified persons to possess themselves of a stock of the medicines and the requisite books, and commence the practice of homœopathy, and the pursuit would seem to be sanctioned to some extent, as my informant herself has seen carriages in waiting, and that frequently at the door of an individual, whose sole title to the dignity of a medical man was having been a druggist.

This state of things is much to be lamented, but remark on it is unnecessary, as to all who comprehend the subject, it must be clear that in proportion to the extent that unqualified persons trespass on the province of the regularly educated and qualified practitioner, must the true interests, *status*, and extension of the cause of homœopathy itself suffer and languish.

I am, Sir, yours obediently,
Wm. H. Billing.

Glasgow, August 28, 1851.

To the Editor of the Homœopathic Times.

Sir,—I was one of those who were inclined to think it better for us to have two homœopathic hospitals in London on a small scale, rather than only one on a larger, thinking that the species of rivalry which would exist between them, might have a wholesome effect in urging each to increased exertions. I am now, however, of a different opinion, and therefore beg to suggest, through the medium of your columns, a plan for promoting a fusion of the two. Should any of your readers be able to suggest an improvement upon my plan, either privately to some of the leading homœopathists, or publicly through your columns, so much the better.

It appears to be generally understood that the chief opponent of a union of the two hospitals, is a layman who has done great service to our cause by his writings, but who has unfortunately had an irreconcilable quarrel with one of the medical men attached to the Hahnemann Hospital, and who is determined that the rules of any hospital which he supports shall be so contrived as virtually to exclude this, to him, obnoxious individual from becoming one of its medical officers. Some, if not all, of the medical officers attached to the Golden Square Hospital affirm that the blame of keeping the two hospitals apart rests not upon them, but upon this layman. Now, however grateful we may be for the assistance he has rendered to our Cause, we can have nothing whatever to do with his personal quarrels, nor ought they to be allowed to interfere with any steps that may be judged necessary for teaching our system.

Unfortunately, this person seems to exercise a sort of mesmeric influence over some, obliging them to act in a manner not consonant with their better judgment, and in this way the overtures made by the *Board of Management* of the Hahnemann Hospital to that of the Golden Square one appear to have been rendered nugatory.

I propose, therefore, that three or four of the London subscribers to the Hahnemann Hospital should seek out an equal number of the subscribers to the Golden Square Hospital, and have a

Hosted by Google

conference with them, and that they should draw up between them a short, clear statement of the disadvantages and dangers of the present system of separate hospitals, and of the advantages which would result from their union; and that a copy with their signatures attached should be transmitted to each of the subscribers to the hospitals, with a request that they would state in a reply whether they were in favour of a union, and if they would sanction these six or eight, or whatever the number may be, forming themselves into a permanent committee, to be considered as acting in the name of the general body of the subscribers, and having power to take the necessary steps for promoting a union of the hospitals.

As soon as a sufficient number of subscribers had consented to offer the alternative of continuing to subscribe, if a union were effected, or of withdrawing their subscriptions from the hospital whose Board of Management should throw obstacles in the way of a union (and perhaps of transferring them to the other hospital), it would become necessary to consider the mode in which the united hospitals should be in future carried on; and certain suggestions touching that point I shall be prepared to offer when required.

In a matter like this two considerations alone should have weight; first, whether it will be advantageous for the common weal that a union be effected; and, if so, how that can be brought about. We cannot stop to consider how it will affect this person or that body of men.

I am, Sir, your obedient servant,
GEORGE FEARON.

Birmingham, Sept. 4th, 1851.

P.S. If such a mixed committee be formed, it should be notified in the *Homœopathic Times*, in order that suggestions may be sent to it.

Miscellaneous.

ON TIME.—In all the actions that a man performs, some part of his life passeth. We die with doing that for which only our sliding life was granted. Nay, though we do nothing, Time keeps his constant pace, and flies as fast in idleness as in employ.

An hour of vice is as long as an hour of virtue; but the difference which follows upon good actions is infinite from that of ill ones. The good, though it diminishes our time here, yet it lays up a pleasure for eternity, and will recompense what it taketh away with a plentiful return at last. When we trade with virtue, we do but buy pleasure with expense of time; so it is not so much a consuming of time as an exchange.

Time is a ship which never anchors; while I am aboard, I had better do those things that may advantage my landing, than practise such as shall cause my commitment when I come to the shore.

All that have obtained for themselves great and permanent reputation, have won and secured it by patient and persevering labour: by treating time not as a waste land fit only for stubble and the goose, but as a true estate of which no corner is to be left uncultivated. Locke carried his note-book in his pocket, to catch the scintillations of even common conversation. Pope employed the wakeful moments of the night. They felt as did Arnault, when he replied to the objection of Nicole, who on a new work being proposed said—"We are now old, is it not time we should rest?"—"Rest!" exclaimed Arnault, "*have we not all eternity to rest in?*" Hear how Hazlitt, in the green vigour of his genius speaks to us from his grave: "The more people do, the more they can do. He that does nothing renders himself incapable of doing anything. While we are executing one work, we are preparing ourselves to undertake another."—*Family Friend.*

SYRIAN NOTIONS OF MEDICAL PRACTICE.—A doctor is thought nothing of here unless he resorts to violent remedies. I was told a curious anecdote of a *soi-disant* doctor, who acquired a great reputation in Beilan. He was much given to administering emetics, and having a very delicate patient, resorted as usual to this method of cure, leaving in the hands of the patient's brother three strong doses of emetic, which he directed should be administered at intervals of three hours. The brother, finding the first powder had no immediate effect, gave the unfortunate invalid the remaining two within five minutes. The result was violent sickness, succeeded by spasms and cramp, which, in a few hours, terminated fatally. Next day the doctor was astounded to learn, on inquiring, that his patient was dead; and evinced his concern in his face. "Never mind," said the brother, "it was so fated; but Mashalla! you are a great doctor: the medicine you gave never ceased operating till the moment of my brother's death. It was a fine medicine, and if it couldn't cure him, nothing earthly could.—*Neale's Eight Years in Syria.*

WOMAN'S INTUITION.—The perception of a woman is quick as lightning; her penetration is intuition, almost instinct. By a glance she will draw a deep and just conclusion. Ask her how she found it, and she cannot answer the question. A philosopher deduces inferences, and his inferences shall be right; he gets to the head of the staircase (if I may so say) by slow degrees, mounting step by step. She arrives at the top of the staircase as well as he; but whether she flew there is more than she knows herself. —*Sherlock.*

OUR FIRST FAULT.—Our first fault, like the prolific poppy of Aboutage, produces seeds innumerable. The wind wafts them away, and we know not where they fall nor when they may rise; but this we know, that they meet us at every step upon the path of life, and strew it with plants of bitterness.—*Mirror.*

HAHNEMANNIAN ESSAYS.

No. XXIII.

"The way to conquer Nature is to obey her," was a grand saying of Bacon. Nature demands our reverence: there is a spiritual life in human nature: the word is an expression for something higher and holier than is dreampt of by materialists. The allopaths, as medical men, are materialists; they deal with gross medicines to act on the gross material of the body. They think not of the wheel within wheel of the wonderful organism of the human body. They boast of the antiquity of their method of treatment.

"Old mother of records,
Thou know'st her pedigree then; whose daughter is she?"

Let them answer. Came this allopathy from Tubal-Cain? Was it antediluvian? Was it known to Job? Was it known to the watcher of the stars on the lofty towers of Babel? Did the Chaldean sages and the Egyptian magians practise it? Who was Esculapius? How was it that prescriptions were written on tablets, and suspended in the temples? What was the condition of medicine before Hippocrates?

Wonderful Cöan! we acknowledge thy greatness, thy pains-taking, thy patient watching and looking at a patient; thy partial recognition of the homœopathic law; thy almost anticipation of Hahnemann. How was it that two thousand years should pass before thy real Successor should appear? Let the materialists answer. We confess that we cannot, except by saying that it so pleased the Arbiter—the All-father. We only know that from Hippocrates to Hahnemann, though twenty centuries intervened—nearly one-third part of the existence of the human race—there was but a step; that no real, downright, substantial progress in therapeutics was made in the interval. Great men were there in the interval—Paracelsus, Stahl, Boerhaave, Harvey, Sydenham, and hundreds more before them—but still no real progress. What hindered them? They wanted that law of healing, of which Hippocrates had a glimpse, but whose *generaiity* it was reserved for Hahnemann to enounce.

It is enounced. The wide world is ready to receive it in its beneficent applications. What hinders? The bigotry of the old school; the pride of sciolists; the fears of the timid, who love to skirt the coasts with which they are familiar, but dare not put to sea; the pharisaical over-righteousness of those who will stand on the old ways because they are *old*, who prefer to worship Jupiter Tonans to listening to Paul in the palace of Nero; the fear of change; the superstitious idolatry of material images, of the cap and red gown, and the serpents; the promptings of selfish respect and of self-interest; the awe of Authority; the dread of collegiate censures, and of the scurrilous attacks of a wanton press; the natural tendency to acquiesce in the condition of things as each finds them; the submission of youth to teachers; the scepticism of adult age. Hindrances enow! and right willing are we to make all due allowance for all fair hostility. It has been seen that homœopathy is looked on as some "Gorgon or Chimera dire;" it is denounced as quackery; it is branded as dishonesty; at one time it is said that its remedies are *nothing*, at another time, concentrated and deadly poisons.

Can homœopathy be really hindered? Assuredly not. The progress of science,

Hosted by Google

and the daily experience of myriads, confirm it. It includes in its vast scope all curative agencies and appliances. Good allopathy, that of cautious and observant practitioners, when its cures are analysed, will be found to have been on homœopathic principles, though the men who practise it would shrink with horror from the imputation of practising homœopathy. Such is the force of prejudice.

Blasius is a notable man; the sun stands still for him: he thinks his word is law; he gives his *veto* to homœopathy; he will not meet any homœopathic practitioner: snubbed formerly by the *Lancet*, he is now praised by the same ephemeral pundit, because he "stands by his order," and says sharp things of homœopathists. Is *Blasius* content?

Rosulus is a *stickit* doctor; he has conducted a journal; he is, in his own estimation, an authority; he wants notoriety, fame, renown—grist for his mill. *Rosulus* rushes into a border war against homœopathy; he accuses a clergyman of blasphemy, because he believes in homœopathy; he loads all homœopathists with opprobrious epithets; he is the Iülus, the "*spes altera*" of allopathy. Is *Rosulus* content?

From the sedgy banks of the Cam, from the borders of Isis, from collegiate cities and towns, from village and hamlet, from mountain and valley, from hall and garret, rush the swarming foes of homœopathy.

"The doughty heroes entering in the lists
To make fierce war with homœopathists,
With dreadful aspect and undaunted hearts,
Hither and thither throw their poisoned darts;
Nor summer heat, nor winter cold they shun;
Heroic hearts! their office must be done.
They rush infuriate on their ready prey;
The sword is drawn, the scabbard thrown away.
The battle is not always to the strong;
And justice, sometimes, triumphs over wrong.
The followers of Hahnemann keep their own,
And the down-beaten heroes sigh and moan;
They lose their battle, and they rage the more,
While to their screams their halls, rebellowing, roar."

Can they not see, will they not believe, these one-eyed and one-sided partisans, that they greatly advance the Cause of those they call their opponents? If homœopathy be not true, can they not prove that it is untrue? If it be not real, can they not prove its nonentity? But if it be a substantive thing, if it be a very fact, a truth indeed, how can they quench it by ungentlemanly outrage, vehement denunciation, and blustering animosity? Truth of any kind must prevail.

Legitimate medicine! illegitimate homœopathy! Go into court, *Blasius*, and prove the legitimacy of your dogma, and the illegitimacy of ours. We demand proofs.

The wondrous time is teeming with prodigies; all real science is showing the might of imponderable forces, and of the subtle spirits of all skyey and telluric influences. The course of events—the history of nations, of the animal, vegetable, and mineral kingdoms, and the cosmic arrangements of all creation, show that every thing is under law and governance. Is the so-called science of therapeutics, the art of healing, to be the only thing without a law? Go to!

Certain it is that the virulent opposition shown by a portion of the allopathists, the malice, hatred, and uncharitableness exhibited by some few, and the entire absence of all fairness in the way of dealing with a subject that concerns the destiny of mankind, are producing a strong sensation on the public mind, and that is in favour of the persecuted, of homœopathy.

But the roots of our doctrine are so deep, the stem so full of sap, the branches so full of life, that homœopathy must endure, and flourish. It has already undergone and outlived the stage of hostile persecution in other lands; the same fate attends it in Britain. We are sorry, however, that any men of mark among our opponents should be illiberal, and without inquiry, and merely from a rash prejudice, refuse to concede the claim of genius to Hahnemann, and of honesty to his disciples. We are sorry that three Scottish Universities should have been terrified by the *Lancet* into a huckster-like exclusivism; but we feel assured that our Cause gains daily accessions of strength from these unworthy assaults, and frequent recruits from the ranks of our reckless antagonists, in consequence of their illiberality, unfairness, and brute violence.

CHOICE OF DILUTIONS AND REPETITION OF MEDICAMENTS.

Communicated by DR. ROSENSTEIN.

(*Continued from page* 101.)

13. THE experiment of a therapeutical agent upon the healthy body does not manifest itself immediately, but *successively*. Employed in substance or in lower potencies, the remedy produces well-characterised primary effects; the use of higher potencies determines rather consecutive effects, which are of longer duration. For this reason it has been recommended that the medicinal symptoms should be divided into two series, and that the primary effects should be employed for the cure of acute maladies, and the consecutive effects for that of chronic affections. Closely examined, this idea loses much of its apparent value when we consider the numerous difficulties opposed to its execution. Hitherto we have not been able to account for the primary and secondary effects; a predominant action has been attributed to the medicaments, and the organism was looked upon altogether as passive. The consecutive effects have been considered as a particular development of power, or reaction of the organism against external attacks.

Later, the consecutive effects have been considered, so to speak, as the progressive movement, and the penetration of the medicinal force into other systems and into different organs. Without inquiring which of these theories is most correct, it is no less certain that neither one nor the other can remain without influence upon the precept that we have expressed, and which can have no real value until the true nature of the primary and consecutive effects is illustrated. Besides, in a given case, it is extremely difficult, sometimes almost impossible, to determine to which class of the phenomena such or such a symptom belongs, the more so, from the alternating effects adding further to the confusion. Finally, the line of demarcation which separates acute from chronic maladies cannot be distinctly traced; whereas the transition of these morbid states is frequently observed.

14. All affections follow a more or less fixed course, and then terminate; they are either acute or chronic, according as the termination arrives with more or less promptness. The objection made above, according to which this division could not always be sustained for particular cases, cannot be taken into consideration here, because the question is not to class a given disease in such or such a category, but to ascertain the relation which exists between the course of a known malady when left to itself and that which it will run after the use of a medicament whose duration of action and natural tendencies are familiar to us. The question then is, what is the relation existing between a disease whose course is almost known, and a medicament of which we know the shorter or longer duration of action?

With respect to this, experience teaches us that an affection which runs a rapid course may be modified in a prompt manner even by medicaments whose action is slow, chosen according to similitude, and chronic affections may also be cured by medicaments of a speedy action. This seems to prove, evidently, that *the more or less rapid action of a medicament principally depends upon the nature of the disease.* The law should be formed as follows: *the natural course of a disease determines principally the more or less prompt action of the medicament, as well as its duration.*

In this manner we succeed in curing acute diseases with medicaments which act slowly, and with higher potencies; and *vice versâ*, chronic affections with remedies of a prompt action, particularly in taking care to administer those of higher potencies, which certainly penetrate deeper into the organism. Therefore as the natural course of a disease constitutes its character, and regard should be paid to the choice of the remedy, it follows that a chronic affection oftener finds its correspondent remedy amongst those which produce a slow action, than amongst the more rapidly, acting remedies. However this sort of analogy may, much less than others, serve here for a rule, experience teaches us, in fact, that remedies acting slowly, otherwise well chosen, cure acute maladies, as well as those whose action is more prompt.

15. We have seen that the duration of action of a medicament principally depends upon the natural course of a disease, and the use of a remedy with a slow action may singularly shorten the duration of an acute affection. Moreover we have seen that, although this law is predominant, it does not exclude that which demands we should take into consideration the duration of action and the penetration proper to the medicaments, as well as those acquired by the degree of potency.

It is the simultaneousness, the concurrence of these different laws opposed to each other, or nullifying each other, which cause so many restrictions to the considered precepts, simply as exceptions, with-

Hosted by Google

out being able to explain them, and which have favoured in practice the extreme diversity which prevails in this respect in the posology.

Although under the governance of more simple laws, the heavenly bodies, in attracting each other, undergo in their revolutions various modifications and perturbations; the gravitation of the planets towards the sun is always the fundamental law; but even here, the gravitation of the planets in this attraction does not allow any variation in the natural course of their evolutions. In the domain of liberty, in the organism, this reaction, these perturbations of different forces, must necessarily be more frequent, unless the laws are false and without effect.

16. When an isolated case presents the union of *three conditions*, which all bear towards the same point, for instance, a chronic affection, a medicament acting slowly, and a high potency, then the effect of the remedy is considerably increased, in such a manner as to favour the cure. It is the same in the coincidence of an acute malady with a remedy whose effect is prompt and of a low potency. In the latter case, we may derive considerable advantage in administering higher potencies, to make the action deeper and more durable. For this reason we may generally, also, in acute maladies, accord the preference to the higher potencies, without failing in the rules before mentioned. The dynamization seems to have this great advantage, to render the action of the therapeutical agent more penetrating, without offering the least inconvenience.

17. If we were always certain of having chosen the appropriate remedy, which unfortunately is not the case, when we hesitate on the choice to make between many medicinal substances which seem to be indicated, a higher potency would generally be preferable, because we can modify at will the effect, either in waiting, or in repeating, or in administering a dose excessively small.

The following objection has been made on this subject: Is it not to proceed without aim, first to increase with many efforts the medicinal virtues, by means of the dynamization, then to diminish them by administering a small dose? Could we not procure the same result in a more simple manner? Those who reason in this manner have forgotten that the high degree of penetration attributed to the potencies has a very precious advantage. We frequently obtain cures with the different potencies, but the higher potencies only furnish surprising cures. To arrive at this result there should be perfect harmony; then the effect almost approaches the marvellous, even in the gravest cases.

18. It was intended to regulate the *degree of potency by the duration of the disease.* Setting aside the difficulty of ascertaining the real beginning of chronic affections, all this reasoning rests upon a false hypothesis. What relation can there be between two things so different as the duration of a disease and the degree of a potency? Besides, we have not sufficient knowledge of the laws to which the disease and the cure are subordinate, to enable us to rely upon arithmetical calculations.

19. Such is the confusion which prevails in the ideas of volume, of height, and force, that the higher potencies are considered as particularly apt to be opposed to severe pain, attributable to the exaltations of the sensibility, and the lower potencies have been considered inefficacious and inopportune for robust constitutions, which is also a false supposition. Such reasons do not suffice for practical data. It is precisely the contrary which takes place; the sensibility being exalted to a high degree, we should rather refrain from the use of the very high potencies.

20. The homœopathist knows better than the old-school practitioner how to prolong the term of existence of persons affected with incurable chronic maladies. In all cases we should rather avoid the use of the higher potencies than to give them the preference.

21. Strictly speaking, *there are no local maladies,* but there are localized affections; for this reason, that the first attack of a morbific agent is ordinarily local. Thus, for instance, badly-digested food affects the stomach; the air penetrating the air-passages attacks the nasal and the bronchial mucus; burns and contusions touch the skin and the subjacent tissue; chancre and the virus of the itch strike the cutaneous system. *All these forms do not only admit, but demand the use of low potencies,* particularly chancre and scabies, when they are of recent origin.* In all the other morbid states which we have enumerated, the whole system being often sympathetically affected, the higher potencies may be used with more advantage. The therapeutic procedure of experienced practitioners fully accords with this rule.

22. We should be careful not to confound with these local essential maladies, those which are but the natural consequences of a general cachexy. Of this number are polypes, secondary syphilitic ulcers, consecutive affections of the itch;

* See the 8th proposition.

Hosted by Google

here the higher potencies suit better than the others. It is the same with chronic nervous maladies, as epilepsy, neuralgies, and neuroses.

23. The doses of a homœopathic medicament cannot be small enough, so as to render it inferior to the force of the disease.*

This is not the place to examine if a strong dose is always injurious, but it may be said, *en passant*, that the harmlessness is rather in the lower than in the higher potencies; for this reason, that the higher potencies are always employed in the form of globules, whilst of the others, drops and grains are administered. Experience has confirmed the opportuneness of both these modes of administration.

To be continued.

ANNUAL MEETING OF THE RHODE ISLAND HOMŒOPATHIC SOCIETY.

The Annual Meeting of the above Society was held in Providence on the 7th of May last. A large audience attended, and listened with great attention to the first lecture on homœopathy ever delivered in the island. Dr. Charles Neidhard, Professor of Clinical Medicine in the Homœopathic College of Pennsylvania, delivered the Annual Address, from which we extract:—

The object of the Society, as expressed in their Constitution, is "the advancement of the science of homœopathy," a vast subject, not only important to the members of the Society, but to the public generally, which every year take a deeper interest in these annual addresses of medical men, giving a *résumé* of its progress during the year. In former times the public cared very little about medical controversies, because all the innovations in medicine did not establish the science on a sounder basis; but the discovery of a new and eternal law of cure has naturally riveted all eyes. The people wish to understand the true grounds which made such a great body of physicians deserters from the regular ranks, being well aware that upon the truth or falsehood of their convictions, their own lives as well as that of their families may depend.

It is a pleasant task, when the physician, whose sympathies are almost exhausted by a reiteration of the same routine duties, can for a moment at least free himself from his arduous calling and look back with his friends and fellow-physicians to the past. The homœopathic reformer is then particularly inclined to ask himself, if the faith of the community in his favourite doctrine has been strengthened. Have the eyes of the people generally been further opened to the light of the new science? and do our colleagues of the ancient system still persist in what we must call their blindness? On all these points a favourable answer may be given. Homœopathy has never made more progress than at the present period. Homœopathy has at an early day enlisted in its favour the voices of some of the most intellectual and noble men of the age. It has on its side the good wishes of the hopeful and generous, and above all, the sympathies of a vast number of those restored to health by its means. Some of the most distinguished men of the old system, like Tessier, of the Hôpital St. Marguerite, in Paris, and Dr. Varley, in a discourse before the Royal Belgian Academy of Medicine, have only lately offered their testimony in favour of the science, and eminent professors in our country have acknowledged their belief in the truth of the homœopathic principle; but strange and paradoxical as it may appear to you, not in the Hahnemannian doctrines. I trust they have been sincere.

It is well worth while to canvass the whole length and breadth of our doctrine on occasions like the present, in order to be again reassured whether we, the advocates of this doctrine, are on the right track, whether the great law, which we have selected for our guiding star, is truly that great law of nature which we claim it to be, and which was revealed to man by a superior power for the cure of his diseases. I hope to be successful in this lecture in convincing my audience in some degree, at least, of the supremacy and universality of the Hahnemannian law of cure.

When Hahnemann first promulgated it to the medical world, the latter felt perfectly amazed. Not a few independent medical men were struck with its inward truthfulness; many openly confessed their belief of its consonance with other laws of nature, but at the same time declared that it was by no means new; a few vain-glorious professors at the universities, and authors of very sublime systems of medicine, completely denied the existence of such a law. But although many had more or less faith in the homœopathic law of cure, few physicians nevertheless adopted it at that early stage, because it was connected with another doctrine, that of the infinitesimal doses, which they were not prepared to adopt, although it was but a necessary consequence of the former. Let us endeavour to grasp some of the hidden meanings of this law, although in our obscure human mental vision, we may never be able to unravel its whole inward mystery—never fathom its whole depth. Let us examine the reasons and arguments which may be advanced for placing it on an unimpregnable basis.

In the first place stands the great fact, that from the time of Hahnemann, from the time of Hippocrates, and as far as any records are left, from the beginning of all times, all true cures of diseases were always performed according to the homœopathic law. Hahnemann, in his Organon, quotes about fifty cases of such homœopathic cures, which he has collected from the writings of different allopathic physicians of all times.

The evidence in favour of the homœopathic

* See Organon.

Hosted by Google

law from men distinguished in medical science, is not unimportant. In the writings attributed to Hippocrates there occur the following remarkable words:—"Vomiting is cured by vomiting. There are diseases whose cause and remedy are of the same nature, or homogeneous."

A Danish army physician, of the name of Stahl, says distinctly:—"The rule generally acted on in medicine, to treat by means of oppositely acting remedies, is quite false and the reverse of what it ought to be. I am, on the contrary convinced; that diseases will yield to and be cured by remedies that produce a similar affection *(similia similibus)*, burns by exposure to the fire, frost-bitten limbs by the application of snow and the coldest water, inflammation and bruises by distilled spirits, and in like manner I have treated a tendency to acidity of the stomach by a very small dose of *Sulphuric acid*, with the most successful result, in cases where a number of absorbent remedies had been fruitlessly employed." Dr. Saint Marie, at the head of the Lyonnese Faculty, has said in his Medical Formulary:—"It is certain, that we sometimes cure by acting in the same direction as Nature does, and by completing through our means the salutary efforts which she has commenced, but which she has not the power to accomplish. It is thus, that at an epoch, when *Quinine* was unknown, irregular intermittent fevers, characterised by sopor, have been cured by *Opium*." He also refers to diarrhœas as having been removed by drastic purgatives, and epilepsies cured by an empiric, by means of a remedy which in the first twenty-four hours caused more violent attacks of the disease. He continues: "It is impossible that these cures should be nothing but lucky hits, they are undoubtedly to be ascribed to some great Therapeutic Law."

Messrs. Merat and Delens have written: "It is a remarkable circumstance to see some remedies recommended to cure nearly the same diseases, which other practitioners see them produce. Messrs. Trousseau and Pidoux (Therapeutics, 2nd edit.): "Experience has proved that a great number of diseases are cured by therapeutic agents, which seem to act in the same manner as the cause of the evil to which they are opposed." Dr. Fodera: "A disease of irritability may be cured by irritants."

Haller, Stahl, and Linnee are of opinion, that to treat diseases by contraries is completely false and absurd.

Descartes, in his "Outlines of Medicine," has established the fact that "like cures like."

Professor Eshenmayer says: "Homœopathy is the direct method, and allopathy the indirect. Of direct methods there can only be one, of the indirect, many, as the antiphlogistic, resolvent, revulsive, deobstruent, etc. By the direct method an impulse is given to the specific reaction of the healing power, so that the disease is not only attacked in its effects upon different organs or systems, as with the indirect method, but in its origin and seat, whereby it is prevented from passing through its different stages. Why should this not be possible? Why should we not be able to find agents having a direct effect upon the specific reaction of the healing power? There is no reasonable ground to doubt it. With homœopathy, experience has already strongly corroborated this by facts. To pretend to deny it, displays either ignorance, stubbornness, indolence, or dread of the new system.

Similar admissions with regard to the truth of the homœopathic law might be quoted from the works of Paracelsus, Hunter, Sydenham, Hiester, Stoerk, Van Helmont, Brera, and many others.

At a later period, Dr. Amador de Rosnero, one of the most distinguished professors of the University at Montpellier, uttered the following language: "Practically, homœopathy is a method which may be added to those already existing, but generally surpasses the others. It is one road more, but one more direct, on which one passes with greater celerity and with more speed and comfort even. The new therapeutics addresses itself to the vital forces in order to cure a disease, as the vital pathology investigates these forces in order to understand their growth. The doctrine of vitality has always professed the great principle, that, above all, the vital force was the original source of the disease, and therefore it was, above all, against these same forces that the agent was to be directed, which was to destroy the morbid changes. By the great and beautiful discovery of Hahnemann, the sphere of vitalism has been greatly enlarged, and, what is more, he has placed this doctrine on a practical basis, which will continue to exist henceforward beyond a doubt.

In addition to the above, an advanced section of the allopathic school, comprising some of the most eminent physicians of modern times, acknowledges the truth of the homœopathic law in a limited sense, it strenuously, however, denies its universality, for which we contend.

These physicians, for instance, could never disavow those familiar illustrations of the homœopathic law, which are now known and understood by every one, such as the prevention of smallpox by vaccination, the cure of frost-bitten limbs by snow, burns by application of heat, the quicker and more permanent removal of heat from the body by a cup of hot tea, than by a drink of cold water. Sea-sickness is best cured by following the motions of the ship, as every sailor knows.

Says Hahnemann: "Why does the brilliant planet Jupiter, disappear in the twilight from the eyes of him who gazes at it? Because a similar but more potent power, the light of breaking day, then acts upon these organs. By what means does the soldier cunningly remove from the ears of the compassionate spectator the cries of him who runs the gauntlet? By the piercing tones of the fife, coupled with the noise of the drum. By what means do they drown the distant roar of the enemy's cannon, which carries terror to the heart of the soldier? By the deep-mouthed clamour of the big drum.—Neither the compassion nor the terror could be suppressed by reprimands or a distribution of brilliant uniforms. In the same manner, mourning and sadness are extinguished in the soul, when the news reaches us of a still greater misfortune occurring to another."

Hosted by Google

I will now review the different faculties common to man and animals, and then those common to man alone, which strikingly illustrate this law.

You have often heard it laughingly said, that the best cure for love is the possession of the beloved object, which is quite true. Opposition to it on the side of parents, guardians, or friends will only strengthen this passion, as the experience of all ages has shown. Nostalgia, home-sickness, that singular disease, with which the Swiss nation are particularly affected, is cured by a return to their mountain home, or the removal of the patient to a mountainous country, similar to his own. A Swiss lady of my acquaintance, whose health, strength, and spirits were rapidly failing from this disease, whilst living in a large and crowded Atlantic city—she was only the shadow of her former self—was immediately restored by removing with her family to a beautiful and romantic region in the Blue Mountains, which somewhat resembled her own Swiss home.

Fear.—We can best cure a timid man of fear, by placing him in situations of great danger, where all his courage must be exerted, causing him to disregard all fear. Thus the young recruits are seldom able to stand the first onslaught of the enemy, they will only gradually become accustomed to scenes of danger, while the veteran of a hundred battle-fields, like the war-horse in Job, "mocketh at fear, and is not affrighted, neither turneth he back from the sword."

Pride.—A proud man is never cured of his pride by the utmost exercise of humility on the part of his dependant, but only by a dignified and manly behaviour. The more the latter humbles himself, the more arrogant becomes the former.

Vanity.—A lady of my acquaintance lately wrote from the West Indies that, according to her opinion, ladies could be easiest cured of their love of finery by seeing the West Indian negresses extravagantly indulge themselves in the same propensity without measure or sense. The best lecture on the subject would not have an equally beneficial effect.

The modern treatment of the insane is entirely conducted on homœopathic principles. The physician never flatly contradicts the absurd vagaries or ravings of his patient, but apparently enters into his feelings, and gradually seeks to draw him out of it by his own inward impulse, by addressing the small portion of good sense that is still left to him. Thus a very beautiful girl in a state of insanity fancied she had become very ugly, and was inconsolable. Her parents, friends, and admirers did not contradict her, but pretended that they could hardly look at her on acccount of her extreme ugliness. This had the desired effect, and she again became sane.

The celebrated Sir Astley Cooper had the misfortune on a journey to be carried by mistake into an Insane Asylum, and to be subjected to the medical treatment of a madman, who gave himself out for a physician. His prescription was the following: first, venesection; then the douche-bath and starvation; finally, the great shower-bath, extraction of three teeth, bastinado, and incarceration. Astley Cooper himself says: "I trembled all over, for such treatment would certainly have made me insane."

Nature, if left to her unaided exertions, will cure homœopathically. The microscopical discoveries of the allopathic physician Kaltenbrunner always seemed to me to contain the most powerful arguments in favour of the truth of the homœopathic law. A person receives a wound, but leaves its cure entirely to nature. How does the latter effect it? In all cases for the cure and dissipation of the morbid inflammation, a state perfectly similar to it is developed, which Kaltenbrunner calls the curative inflammation. "Driven with accelerated motion, masses of the globules of the blood (here and there) rush by starts from the capillaries and pour themselves into the parenchyma of the inflamed part. Here they lie, as bright red spots or islands of different sizes. Soon the whole wound is surrounded by these islands, and the intervening tissue becomes highly turgid. This process which appears at first at the circumference of the inflammation, by degrees also involves the centre, completely resembling the morbid inflammation, and it is by its means that the morbid changes produced by the latter are gradually extinguished."

Now the homœopathic principle cannot be more beautifully illustrated than by these discoveries. That what is called allopathic medicine is not in the least supported by them. Thus Nature itself confirms the homœopathic law.

Many of the operations enjoined in the system of Swedish medical gymnastics are strikingly in conformity with the homœopathic principles. Thus for vertigo it is usual to use a whirling movement of the head or the neck; for congestion to the head, pressure on the jugular veins; for hot palms and soles, frictions on these parts; for swelling of the extremities, ligature above the swollen part; for hæmoptysis, percussion on the chest, etc., all which operations produce the same symptoms they are employed to remove.

If anything, however, were wanting to convince us in a familiar and incontrovertible manner of the truth of our fundamental principle, we need only refer to the cure of the diseases of the dumb creation, by homœopathic medicines. The most confirmed sceptic could not withhold his assent, if he saw old chronic diseases in animals gradually yield to the influence of the proper homœopathic specifics, particularly if he had seen the same disease remain stationary, or gradually become aggravated under the other treatment. Although any allopathic physician can at any moment satisfy himself of the truth of this asssertion by attending the different homœopathic veterinary establishments existing in this country, he is too firmly convinced in his mind of the folly of the homœopathic doctrine, to avail himself of these means of information. He prefers to dwell on the power of the imagination of the homœopathist as a reason for opposing homœo-

Hosted by Google

pathy, which argument of course fails here in the case of animals. Unfortunately for him, they are cured without knowing much about it.

The poets also come to our aid in their advocacy of the homœopathic law. The beautiful verses from Shakespeare, commencing—

"One fire burns out another's burning,"

are well known to you all; and the celebrated physician and poet, Paul Flemming, already had a knowledge of homœopathy and practised it in the seventeenth century, as may be seen from one of his poems, which I will here subjoin in a free translation:

"A wise physician he, who, from the self-same source
Doth draw the antidote and bane.
Of this, a single grain works more efficiently
Than that long draught.
Is that physician to be praised who writes
Prescriptions yard in length to win
The thanks of the apothecary?"

A Latin poet also gives the following:

"Balnea, vina,
Venus consumunt corpora nostra;
Sed vitam faciunt balnea, vina, Venus."

After we have once established the truth of the homœopathic law, the comprehension of the action of the infinitesimal doses becomes comparatively easy, because they both are identical. This can hardly be controverted at the present day, when we remember that the disease and the homœopathic remedy are so nearly related to each other, resemble each other in so many points, that the medicine, prescribed according to the homœopathic law, would be most destructive in its operation, if it were taken in too large doses, in the same way as the report of a cannon may completely destroy the hearing, already sensitive from disease. You will thus perceive that a dose of the true homœopathic remedy, that which has some affinity to the disease, cannot according to its nature be otherwise than small.

Allopathy, on the other hand, acts consistently in giving large doses of its remedies, because these remedies generally stand in no relation whatever to the disease; but when this does accidentally happen, the consequences are most deleterious.

The mineral, vegetable, and animal kingdoms contain innumerable substances, which all have some affinity to man and his diseases, and this does not merely relate to what may strictly be called medicines, but every substance, particularly food, has some affinity to a particular constitution, or man. As certain manures will only improve certain soils, in the same way definite articles of diet and medicines will only be consonant to the individual nature. It is here, where the law of idiosyncrasies becomes so closely united with that of homœopathy. This will explain to us why one person is made sick by the same diet that agrees so well with another.

My aim, which I hope I have at least in part attained, was to impress upon your minds my conviction of the following truths:

1. That the homœopathic law is not merely a rule devised by man, like allopathy, hydropathy, and other methods, but a divine law of Nature.

2. That all the greatest powers of Nature are of the most subtile kind, but must have some affinity to man or his diseases, in order to produce a powerful and striking effect.

3. That both being thus related to each other, the dose must be necessarily small, and consequently the law "*similia similibus*" and the homœopathic dose must stand or fall together.

One word more in conclusion: the great issue between the ancient and new system of medicine is the old contest between matter and spirit; and every one will be obliged to take part in it, sooner or later, and range himself on one side or the other. In the chemical laboratory, in Liebig's theories, is now sought the health of mankind, and this at a time when all over the world the best minds are proclaiming the advent of a more spiritual era.

As yet there stand many proud structures, in different parts of our country, devoted to medical teaching of what we must call the false and exploded doctrine of allopathy. In saying this, I, of course, do not refer to the auxiliary sciences of medicine; I mean that the general prevalence of the present allopathic doctrines has been rather fatal to mankind, in which belief I am fully sustained by the testimony of the most celebrated allopathic names, which it will not be necessary here to quote. In a reformatory science like homœopathy, which still requires much cultivation to perfect it, I would, however, rather favour a certain humility of spirit, and a contempt to win laurels by any unworthy means. Let its own inward truth be its only weapon, and that will surely in the end carry the day. In the distant horizon I see a light arise, which is becoming gradually brighter and brighter; it is our own divine science of homœopathy, whose rays will entirely dissipate the darkness created by the ancient method.

In the words of Jean Paul Richter, I say to you: "There will come another period of time, when it shall be day, and when man shall awaken from his lofty dreams only to realize them; because he shall lose nothing but sleep; and upon the eastern gate of this century is written: This is the road to virtue and wisdom, even as upon the eastern gate of Chersonesus stood the inscription—'This is the road to Byzantium.'

"Infinite Providence! thou wilt cause the day to dawn! as yet, however, lingers the twelfth hour of the night. The midnight birds of prey are upon the wing—the spirits knock—the living dream."

THE
HOMŒOPATHIC TIMES.

SATURDAY, SEPTEMBER 20TH, 1851.

WE have heard favourable reports of the Homœopathic Congress held lately at Paris. The proceedings passed over in the most satisfactory manner, and there were repre-

Hosted by Google

sentatives present from most quarters of the world. This will prove another awkward fact for the *Lancet*, and probably it may invite the wrath of the Editors to make it the source of fresh attacks upon our principles and practice.

But for such a course of conduct we do not care. What we look at is the success of our philosophy; that is becoming every day more certain, and therefore we can afford to suffer our adversaries to rail at their leisure. When we now find that homœopathy is generally courted instead of being reviled as formerly, no occasion exists for our betraying fears for its progress. Based as the principles of the science are on truth, they have only to be widely disseminated to be proportionately appreciated.

It is the extremely simple nature of Hahnemann's doctrines, associated as they are with the experience of every-day life, that render them so popular when once they are studied. Unencumbered by the professional mystery of the old school, neophytes readily enter into the practical detail of that which, according to the labyrinth of ancient etiquette, would take them years to acquire. The "royal road" thus opened is naturally distasteful to the allopath, because it lays bare the fraud and deceit so long successfully practised upon the unsuspecting public.

The iniquity encouraged by the colleges, under the immediate sanction of the highest names in the allopathic profession, will, ere long, receive its due reward. The period is fast approaching when the respective administrations of those institutions will discover that the public have become as enlightened as themselves on the fallacies they have propagated. When it is too late they will wish they could retrace their steps, and reconstitute their bodies on some higher and surer foundation.

The experience of the last decade must teach them that the scales are fast falling from the vision of their victims, and that the more extensive the circulation of homœopathic principles become, the more certain is the issue of the doom that awaits them. It merely requires homœopathists to be true to themselves, to achieve this result much earlier than their opponents calculate or desire.

To work out this end, all ought to co-operate zealously together. Any lukewarmness must be set aside—steady, persevering endeavours must be made to give full effect to the progress of the Cause, which, for the sake of humanity at large, deserves our most cheerful and unrelaxing support. By these means we shall work such a revolution in the theory and practice of the old school of medicine, as shall benefit not alone health, but also the pocket,—the latter a thing of no mean importance with most classes, whether high or low, but especially among those whose resources are diminished when incapacitated by sickness from following the occupations in which they are placed. The length of the doctor's bill has, from time immemorial, constituted a ground of complaint with the public, and the public have now the remedy in their own hands.

Correspondence.

To the Editor of the Homœopathic Times.

Sir,—It has been, for the last seven years, my good fortune as well as my pride to bring over many converts to the system of Hahnemann. Many have first heard of homœopathy from me; many more have been built up in their belief; while numbers of all ranks have, at least, been convinced by the effects of the globules I have administered to them, that infinitesimal doses of medicine are by no means powerless, and that those who scoff at them, as utterly ineffectual for good or evil, speak foolishly and presumptuously of things which they neither understand nor take the trouble fairly to investigate. Judge then of my astonishment, when I was lately presented with a pamphlet, from an anonymous well-wisher, which, it was stated, was to convince me that homœopathy was a complete imposition from beginning to end. The pamphlet is termed "Homœopathy Unveiled," by William Perrin Brodribb, Member of the Royal College of Surgeons, England, etc., etc.

On turning to the *Homœopathic Times* of June 14th, 1851, I find this pamphlet criticised in the nineteenth Hahnemannian Essay, but, on a perusal of the pamphlet and essay, I am disposed to think that the essayist has treated Mr. Brodribb rather too mercifully.

With your permission, and for the benefit of your readers, I will mention some of Mr. Brod-

Hosted by Google

ribb's weak points, from which I think it will be evident that he does not deserve the title which the essayist awards him of an honourable opponent.

Mr. Brodribb sets out with stating that the disciples of Hahnemann may fairly be allowed to say, "Do not reject without investigation; and, before you condemn, fairly examine." He then adds, "Truth can never suffer from being thoroughly sifted; while observation and experience teach us that a slight and partial examination of a subject often serves only to confirm us in the belief of error." He then goes on to state, that because "the public are very imperfect judges of many questions, and especially in medical science," "therefore it seems to be a duty especially incumbent on members of the medical profession to inquire into the merits of a system claiming for itself not only new and valuable discoveries, but also the only true and safe method of healing."

After such an exordium, every reader of "Homœopathy Unveiled" expects, and has a fair right to expect, investigation, fair examination, a thorough sifting; above all things, no slight or partial examination, but a full inquiry into the merits of the homœopathic system of medicine.

Deluded reader, I wish you may get all this! The ink has not ebbed dry in Mr. Brodribb's pen before he dissipates all hopes of fair treatment, by stating, "At the very threshold, however, of our inquiry into the truth of homœopathy, we meet with assumptions so gross, and pretensions so extravagant, as to render investigation absolutely puerile and absurd." Of course, Mr. Brodribb could not be expected to condescend to inquire into such follies. Honest Brodribb! straightforward investigator! fair examiner! thorough sifter! may I not well compare him to an unwilling horse which, when put into the shafts to draw a heavy carriage up a steep hill, not relishing the job, yet from old habit willing to please its masters, makes pretence to touch the collar, and then, disappointing the reasonable hopes of the bystanders, jibs and upsets the equipage into the adjoining ditch?

Yet Mr. Brodribb would make us believe that he will do the work after all: "Notwithstanding the disagreeableness of such a voluntary humiliation, I determined to enter upon the work, and to the best of my ability to examine and judge for myself. For this purpose, I resolved to study the doctrines and principles of the system, to test the homœopathic medicines, and to witness the practice as seen in the hospitals."

Now, then, he has got his neck against the collar again, the carriage is righted, and we shall get up the hill after all. But no! will it be believed that of these three points, which to the best of his ability he is going to examine, he writes *not one line* upon the last; while of the second he says but *very little*, and that not at all after the manner of a straightforward investigator, a fair examiner, or a thorough sifter?

Being a non-medical by profession, I do not pretend to argue with Mr. Brodribb upon the first point, the study of the doctrines and principles of the system. I leave him to the M.D.s. At the same time, I cannot help pointing out one or two strange statements for an impartial pamphleteer. Mr. Brodribb finds fault with Hahnemann for "rejecting all instructions from others." He accuses the great founder of our system of "laying down, as so many principles and laws, the wildest and most theoretical notions, and of assuming as true, propositions which no amount of experiment can ever verify and establish." Again, he states that Hahnemann, "by a false generalization, has built upon the doctrine *similia similibus curantur* a superstructure entirely fictitious and imaginary." Now one would think that our impartial Mr. Brodribb would have produced good reasons to support these statements. But what do we find? Merely the *ipse dixit* of allopathy; partial, unfair, uninquiring, unsifting allopathy. "With certain exceptions," writes the oracular Mr. Brodribb, "it is a misstatement of facts to represent medicines as capable of producing symptoms corresponding to real diseases." Again: "We have reason to believe that the great majority of medicines have certainly no specific power." Again: "In a very few instances only, we can ascribe to certain remedies a specific power of counteracting certain morbid actions." Again: "The beneficial action of all other remedies (save *Cinchona*, *Mercury*, and *Sulphur*) is secondary, and only auxiliary to the powers of nature, by placing the body in circumstances more favourable to the spontaneous decline of diseases." Again: "*Lead* will give rise to the symptoms of colic and of paralysis, but it will not cure those affections." Again; "We find that all these medicines are in reality reduced to the same level of nothingness, by the infinitesimal doses in which they are given." Again; "Nothing in the fictions of poetry or romance, or even in the lying wonders of a credulous superstition, can surpass the pretensions of these magical, wonder-working globules."

Now really, after all these oracular statements, one would believe that Mr. Brodribb had gone through all the homœopathic pharmacopœia as a prover, and found the whole to be neither more nor less than a fudge.

Has he done so? Let us proceed to his *second* point of inquiry. "I resolved to test the homœopathic medicines." What does he appear to have done in this way? "I have often given to persons homœopathic medicines, but without their producing any effect. I have also repeatedly made trial of them on myself by taking some for several days together. I have taken daily for a fortnight some globules of *Rhus Toxicodendron*. I have taken also, for the same period, globules of *Nux Vomica*, of *Aconite*, of *Pulsatilla*, of *Mercurius*, and of *Arsenic*, and on each occasion without feeling the slightest effect whatever."

How barren is Mr. Brodribb's statement with reference to his practice on others! "I have often given to persons homœopathic medicines, but without their producing any effect." Now, when a man sits down to unveil homœopathy,

Hosted by Google

he certainly should have told us who his patients were, men, women, or children; what were their complaints; and what the homœopathic remedies he gave them. I do not feel satisfied myself that this bold pamphleteer understands enough of the system of homœopathy to treat the simplest case. I gather this from one part of his *brochure*, where he says, that it is allopathic practice to give a few drops of *Laudanum* to send a man to sleep and relieve pain; and then argues as if it would be homœopathic practice to dilute these in gallons of water, and then give an equal number of drops to produce the same results. I should not be at all surprised if he has been giving a globule of *Jalap*, with the idea that the homœopathic law is that such an infinitesimal will purge a patient, as well as a bolus of the same medicine. If such be Mr. Brodribb's apprehension of homœopathy, I cannot help fancying that he is not much unlike an aspiring mathematical student, who fancies himself a thorough geometrician, though he has never fairly got over the *Pons Asinorum*. I imagine that most non-medical homœopaths know more of homœopathy, and have more fairly tested its merits than Mr. Brodribb. I can safely say, that I have very seldom administered globules without having their powers recognised by rich and poor, and that, had I the time and space, I could mention many cases to show the plain effects of the medicines on men, women, and children. I will mention one instance which any one may test, namely, the administration of *Aconite* to infants, when suffering from teething. Suppose a child to have been awake for a couple of hours, unable to rest, with its gums inflamed and hot; screaming, and refusing to be quieted. One globule of *Aconite*, in a teaspoonful of water, will relieve that child, and permit it to fall asleep, free from pain, in from five minutes to a quarter of an hour. I have tested this, many a time and oft, upon my own children. To nurses it appears almost miraculous, so instantaneous, in general, is the relief. I will mention one more case, to show the effects of *Belladonna* in relieving the head. A little boy of mine, of three years and a half old, had a bad feverish attack, his head becoming very much affected, and his extremities very cold. I instructed my wife to give him a globule of *Belladonna* to relieve these symptoms. In less than a quarter of an hour, he called out, "Mamma, take the bedclothes off my feet, they are so hot." On feeling his hands and his feet, they had become hot and burning, like the rest of his body, and his head was relieved. I mention these cases, because such young children are not influenced by faith, to which Mr. Brodribb quietly attributes any apparent results of our system.

I only wish that twelve honest allopathic doctors would form a jury to witness the treatment of infants *only*, under a year old, and I suspect when they had seen a few bad cases of croup, bronchitis, etc. etc., successfully and speedily cured, that they would be obliged to give a verdict against Mr. Brodribb, and acknowledge that homœopathy is, *at least*, a real curative principle, and not a downright imposture.

But I must not forget that Mr. Brodribb also tested the homœopathic medicines on himself. I cannot say, however, that I think his statement on this point is satisfactory. It is, to say the least, very meagre. Let me endeavour to fill up the void, and picture to you Mr. Brodribb testing the globules. I will imagine our honourable opponent swallowing the infinitesimals on rising from bed, then shaving with Naples soap strongly perfumed with peppermint, washing his face and hands with camphor soap, and his teeth with a camphorated dentifrice; then, his toilet being nearly completed, greasing his hair with pomatum scented with essential oil of almonds, and perfuming his handkerchief with eau de Cologne. Follow him into his breakfast-room, and see him taking a couple of cups of coffee and one of strong tea, a well-peppered mutton chop, or a leg of a chicken well flavoured with cayenne. Perhaps after his morning meal Mr. Brodribb smokes a cigar to promote digestion. Possibly this is not his only acquaintance with the Virginian weed, perhaps he takes an occasional pinch of snuff between whiles. After this, in the course of the morning, I will imagine him strolling into some favourite chemist's shop, and snuffing up some of the hydra-headed scents of such a *locale*, or passing through the wards of a hospital and inhaling a few infinitesimal exhalations of the old school of allopathy. I next see him, in my mind's eye, at his luncheon, some bread and cheese, with a glass of the best bitter ale (genuine malt and hops), send him out strengthened to visit his patients. Next, I trace him to the dinner-table; where some highly-peppered soup flavoured with asparagus, if in the spring, or with celery in the winter, some roast beef and horseradish, some mild Portugal onions, and a salad, make up his meal, which is washed down with some more bitter beer and a glass or two of wine; another cup of coffee probably follows, and then, with a cup or two of tea at a later hour, our honourable opponent's consumption of solids and fluids ends for the day, and our straightforward investigator, our fair examiner, our thorough sifter, goes to bed, flattering himself that he is proving globules in the most exemplary manner. Now this picture may be a little exaggerated, but if so, it is Mr. Brodribb's own fault, as he has never given us an idea how he dieted himself while he tested the homœopathic medicines; we are not even sure that our honourable opponent did not swallow the globules upon a full stomach. I imagine that one-fourth part of the transgressions in diet, etc., which I have pictured to myself, would be sufficient to neutralize the effects of any globules.

But to proceed with Mr. Brodribb's meagre statements. "Desirous of testing them as fairly as possible, I have requested homœopathic practitioners to give me any of their medicines, offering to take them in any dose, and for any length of time they pleased, but these offers have always been declined." It would have been well had the names of these practitioners been mentioned; for my part, I cannot believe that any fair inquirer would be thus treated. He then finishes this part of his subject by de-

Hosted by Google

claring, "From the trials made of the medicines on myself, and from all other means of judging, I do not hesitate to declare that these globules have no more effect than so many particles of starch or of sugar: that, like the gods of the heathen, they cannot do evil, neither also is it in them to do good." What were his other means of judging? He should in common fairness have mentioned them.

I come now to Mr. Brodribb's *third* resolution. "I resolved to witness the practice as seen in the hospitals." But as I cannot find another word on this point in the whole pamphlet, I conclude *his other means of judging* must stand for this. Now, if Mr. Brodribb had stated, "I saw, on such a day, a case of pneumonia die in the London Homœopathic Hospital, under Dr. A.; and I saw a case of erysipelas die on another day in the Hahnemann Hospital, under Dr. B.; and they were such cases as, in all human probability, would have done well under severer treatment," then he would have wound up his pamphlet with at least an apparent triumph over Hahnemann and his followers. As it is, I can only suppose that Mr. Brodribb has either never put his foot inside a homœopathic hospital, or that, if he has done so, he has not been able to strengthen his case. Possibly it is only by an oversight that we have his threefold resolution in the exordium, he having, on second thoughts, considered it advisable not to touch upon the third division of his resolution when finishing his pamphlet.

Mr. Brodribb's performance, "Homœopathy Unveiled," is, in point of fact, an absurdity; the *first* part is the one-sided judgment of allopathy upon homœopathy (the judgment given before the evidence has been produced, and one-third of which evidence is withheld), merely because its doctrines are strange and unaccountable to the old school; the *second* part, the testing of the medicines, is got over in one page out of twenty-eight; the *third* part, and to an Unveiler of Homœopathy the most important one, is burked altogether. The testing of the medicines and the failure of the hospital practice (could such failure have been discovered, we should have heard of it), ought to have been the data upon which to condemn Hahnemann and his system. As it is, our great Reformer of medicine is branded as insane by one who has shown so little common sense as to rush into print, and exhibit so perfect a knowledge of his subject, as absolutely to omit the most important part of it before he reached the limit of twenty-eight octavo pages of large type. I fancy Hahnemann's mind was of a somewhat sounder and more extensive calibre than that of our pamphleteer. Leaving it to yourself and your readers to decide whether you consider Mr. Brodribb to be a wise man and an honourable opponent,

I remain, Sir, faithfully yours,

A NON-MEDICAL OBSERVER.

To the Editor of the Homœopathic Times.

SIR,—The last few numbers of your journal, in which you relate the proceedings of the Universities of St. Andrew's and Edinburgh, of the College of Physicians of Edinburgh, and the Provincial Medical and Surgical Association, have given us intense delight, so intense indeed, that from a casual reader of your excellent pages I shall henceforth become a regular subscriber.

The homœopaths of Great Britain ought to look upon the indirectly suicidal acts of those foolish men as an invaluable godsend, and inwardly rejoice at them. Those short-sighted persons could never have done anything else half so good for the advancement of homœopathy. Human nature is, and ever will be, callous to the lesson of history. Only, for God's sake, strike the iron whilst it is hot—don't let it get cold again. The glove has been thrown down, let homœopathy take it up with a vengeance! Agitate, agitate, agitate. Don't keep only on the defensive, attack the lion in his own den. The *Lancet*, *Medical Times*, and other allopathic journals, furnish you with innumerable cases, which are libels on common sense and common humanity, and form excellent starting-points for attack. Believe me, the enemy is driven to a last desperate effort. Forward with your best troops and at them!!

Sir, I have been many years on the Continent, and have known intimately the Coryphæi of homœopathy; indeed, I may say, I know a little of homœopathic science and practice, and I rejoice additionally at the present attacks on homœopathy, because there is, *at last*, some hope that the homœopathic practitioners will thereby be pushed (not to use a more forcible expression) *into a sense of their own dignity*. Hitherto it has been a source of pain and regret, not to say indignation, to those who are acquainted with the spirit of Hahnemann's doctrine, and have gone in their study of it beyond Messrs. Jahr and Co.'s little books, that too many of the professors of those glorious truths, instead of assuming that proud and lofty stand which the inseparable importance and outward interest of homœopathy imperatively required, have, in their anxiety to conciliate their step-brethren of allopathy, entirely lost sight of what was due to themselves as men of science, to their illustrious master and his saving doctrines. On this subject, I should like to be allowed to address you on a future occasion. Let us hope that henceforth the disciples of Hahnemann will assume that lofty and independent stand to which they are entitled, and if they truly save life and restore health, the public will not be slow in recognising them among the greatest benefactors of mankind, and award them such a position as will be inferior to none in the state. They will have the additional merit of rescuing the truly noble profession of medicine from the present degraded social position to which vulgarity, ignorance, and uncouth treatment of disease have reduced it. Medicine requires as much external as internal reform, and it appears to be the especial duty of the homœopaths to reconstruct the whole edifice from its foundation.

Apologizing for the length of this epistle,

I remain, Sir, your obedient servant,

CAVENDISH W. LEONARD.

Birmingham, Sept. 1, 1851.

To the Editor of the Homœopathic Times.

SIR, — It may be encouraging to the public advocates of homœopathy to know how this noble cause of humanity is finding its way into and making progress in remote districts of the country. Here is a district containing a popu- of about 4,000, and, although largely supplied with allopathic doctors and druggists' shops, it is forty miles distant from the nearest homœopathic physician. Were we to continue to be drugged according to the common system until a physician of the new school arrived amongst us? The grave might have been our lodging-house ere that, for until more populous districts are supplied, the lesser ones must be content to be without one. Many of us are taking the matter into our own hands, and doing the best we can in the meantime, anxiously desiring that a properly qualified person may at some future time settle among us. And who can blame us? When, finding that *Nux vomica* and *Sulphur* are more efficient in relieving constipation than *Salts, Senna*, or *Castor oil*, etc., does not common sense dictate the use of them rather than these nauseous drugs? Or, finding that *Belladonna* is more efficient in curing sore throat than mustard blisters and pungent gargles, is it not more easy and natural to apply the one than these others? Just so; and that is being done. What think ye? There are five cases of homœopathic medicine in this district, and another is to be added shortly, and besides domestic treatises to them all, there are several "*Jahrs.*" Rest assured, with these means we are not idle, and there are many, from personal experience of the healing virtues of the new science, who are enthusiastic in its advocacy, through good and bad report. It is becoming a living fact, and pregnant with agitation. Put it down! The *Lancet* may as well attempt to bellow down the rising sun, and hinder it from illumining the world with its cheering beams. That wrathful Goliah, that would tread the truth and the best of men under his feet, may cease his mad ravings; for young homœopathy, like young David, will, ere long, lay his huge dimensions in the dust, and wrench from his clutches the reeking instrument that spilled the life's blood of thousands. Pooh! will we allow a brandishing lancet to pierce our veins now, and drain away the stream of life, while a few drops of *Aconite* will do the work infinitely better? Or consent to swallow a bitter aloetic pill, when a sweet little globule will do? No, no, it won't do. No assertions of the medical press nor anathemas of colleges will make the public believe that bitter's sweet, and sweet's bitter. And mark this, it is the public that is to settle the matter. The doctors exist for the public, and not the public for the doctors; and so far as the public are concerned, and have had opportunity, they are rapidly giving in their adhesion to homœopathy. Suffering humanity over the whole land is sighing for this divine gift, and physicians duly qualified to apply it have only to make their appearance to be welcomed as benefactors. In the meantime, lay homœopaths must do their duty in their own circles in spreading the new system, to open up the way for physicians at once entering upon a work of usefulness. This has been our work for some time past, and with no small success. Scarcely a day passes by, but some patient applies to be treated by the little tasteless doses, after having been drugged to their loss by all the heterogeneous mass of compounds in vogue in the old school.

Take one case for the present as a "*tit bit*" for the *Lancet*, A woman, who had been treated by her family doctor for about thirty years, and was nothing the better, but much the worse, complained of the following symptoms:

1. A swelled stomach.
2. Inability to bear her clothes round the hypochondria.
3. A tickling cough, which allows her no rest during the night.
4. Difficulty of breathing.
5. Palpitation of the heart on making exertion.
6. Great languor in the morning, and difficulty in rising from the bed, from weakness, with dry tongue and bad taste in the mouth.
7. Water-brash.
8. Great fatigue after a walk, with pains in the loins.
9. Occasionally feverish, with flushed cheeks, and cold hands and feet.
10. Inclined to speak much about her disease despondingly.

Nux covering all the symptoms, with the exception of water-brash, which indicated *Sulphur*, the former was given principally for several weeks, with an occasional dose of *Sulphur*, and to her no small astonishment and comfort, she was completely relieved. The cough is entirely gone, and, as she expresses it herself, "I am a new person."

Dunse, Berwickshire, August 28. RUSTICUS.

To the Editor of the Homœopathic Times.

Wickwar, Sept. 1, 1851.

SIR, — Some articles have appeared in the *Lancet* concerning me and the affair of my resignation of membership in the Medical and Surgical Association of this county. The report of the proceedings at the annual meeting on the 10th of July, given in the *Lancet* of August 2nd, is substantially correct, though a little coloured. As to the comments made on that report in subsequent numbers by the editor, whose lucubrations you have honoured by transcribing in your paper of Saturday, the 30th of August, I feel quite incompetent to make any reply to them, so little versed am I in the slashing style of those precious *morceaux*. I will, however, with your permission, make a few statements bearing on the matter, so that you may know the origin and progress of it.

I was present at a quarterly meeting of the Association at Stroud, in the autumn of last year, where, after dinner, the conversation incidentally turned on the subject of homœopathy,

Hosted by Google

and I mentioned that I had prepared and administered medicines in accordance with Hahnemann's principles, with success, in several instances. Previous to our breaking up, the secretary said, that if I, or the other gentleman who spoke about homœopathy, would prepare a paper on the subject, it might be brought forward at a meeting of the Association to be called for the purpose. The matter rested there; and I was debating whether I should call a meeting for the purpose of entertaining the subject, when I heard, that some of the members resident at Cheltenham, having seen my name in the list of homœopaths in the Directory, intended to propose my expulsion from the Association at the next meeting in April. I then consulted the President of the year, who is my relative, and he advised me to avoid, if I could, any public noise about the matter, and to tender my resignation. My own feelings seconded his view. I felt, that to continue a member of an Association whose members would repudiate me, was to remain in a humiliating position, revolting alike to my pride and delicacy. Therefore I sent to the secretary a letter of resignation, to be presented on the next day of meeting, and did not attend personally. The secretary was from home at that time, and his representative did not read my communication; I know not how it was, but so it was. No one mentioned my name, or that of homœopathy, and the matter remained in *statu quo* until the annual meeting.

I was present at that meeting, and found a very small number of members present, most of whom were of Cheltenham. Dr. Brookes rose to move that a reporter from the *Lancet* be admitted; which was objected to; but the objection was waived, on my stating that I knew the object of having the proceedings reported, and that I had nothing to fear from any investigation that might be made into my principles or practice. Dr. Brookes then proceeded to read a speech, under strong excitement, in the course of which he said that either he or I must be a rogue. "If you believe in homœopathy," said he, turning to me, "you must think I am a rogue." "No, no," from myself. The President.—"I deny it." Then, falling foul of the council, Dr. Brookes lost the thread of his discourse, and fell into a tirade of abuse of the council and officers, and homœopathy, preventing Mr. Wilton for about half an hour from reading my letter which he held in his hand. At length, Mr. Wilton seized a lull in the tempest, and read as follows:—

"DEAR MR. WILTON,—I have had some communication with the President of the Medical Association respecting the bringing forward a paper on the new therapeutic system termed homœopathy. On canvassing the matter very fully with him, I have come to the conclusion, that it will be better not to press the matter on the notice of the Association, especially as the profession have so determinedly set their faces against any innovation in the received system of drugging. And as I do not wish to create any disturbance in the Society, I had rather resign membership in it, than be looked upon as an obtruder of heretical opinions on a body so select, so united. I must claim the right of independence in the forming of my opinions on matters of practice; and if I be placed in the position of a dissenter with respect to the received doctrines of therapeutics, I must secede. Therefore I request that you will be kind enough to offer my resignation to the Society at the next meeting.

"Believe me to remain very faithfully yours,
"ADRIAN STOKES.
"Wickwar, March 28th, 1851."

To this Dr. Brookes had nothing more to say than that he wished it had been read before. The motion was put and seconded, that my resignation be accepted, and I was no longer a member of the Association.

It is a fine thing, Sir, to be the champion of orthodoxy in the provinces, and to stand up and do battle in the gap that young homœopathy has made in the bulwarks of old allopathy. How grateful and congenial the praise of the *Lancet* must be to such a champion! During the volley he fired against me and my adopted system, I said but very few words, knowing that my letter would be the best answer to the insinuated charge of dishonesty. Truly, it is hard to kick against the pricks! It were to be wished, for his own sake and that of good manners, that this warlike champion had somewhat restrained his ardour for the protection of "his doxy," and that he had spared his wrath and his breath; but let us hope it will not annihilate us, but that we may, like Mr. Weller, in a similar case, "manage to surwive it." 'Tis a pitiful case to be reduced to such a style of argument as that of the *Lancet* and its second. When men are reduced to that, it shows clearly enough they have no other leg to stand on; and if so, that one is crippled indeed.

I remain, Sir, your obedient servant,
ADRIAN STOKES.

Miscellaneous.

PLANTS vitiate the air of a room at night, *not* because they part with carbonic acid, and inhale oxygen—for a human being would vitiate it more in this way—but from their powerful odour, which has a most violent effect on the nervous system of some persons.—*Chambers's Ed. Jour.*

A MEETING of homœopathic practitioners has been held at York this summer, at which it was resolved to establish a provincial homœopathic association, to be called "The Lancashire and Yorkshire Homœopathic Association," for mutual co-operation and to protection, and promote, by frequent meetings, friendly intercourse between the members. Dr. G. Atkin was appointed Interim General Secretary.

Communications.

LETTER TO ROBERT CHRISTISON, M.D., V.P.R.S.E.,

AND PROFESSOR OF MATERIA MEDICA IN THE UNIVERSITY OF EDINBURGH.

Sir,—The price at which men purchase a prominent position in any walk of life is the liability they incur of having their words and deeds submitted to the ordeal of public opinion. Upon this ground, therefore, I claim the right of making a few remarks on your official "Inaugural Address" to the graduates of 1851. The responsibilities, the labours, the experience of twenty professional years strengthen my claim, but had others been wanted, a voice from within whispers that the task is a duty which cannot be passed over at a time when the public ear and the public eye are filled with a great medical question, which, however unpalatable it may be to you, is rapidly undermining the science of therapeutics.

With every wish that you may continue to enjoy the reputation which your researches in toxicology have so justly earned for you, the day is approaching when the merit of these researches will be proved to consist in the evidence they afford of the truth of homœopathy. It is strange indeed to see the right hand unwittingly putting down the left, to witness your toxicology digging the grave of your own therapeutics. Considering, therefore, your sad confessions, your chair was the very last one of the Faculty from which it was becoming a graduation address to emanate.

I heartily concur with that portion of your address wherein you point out the position of the young physician. Your hints as to moral and religious conduct are highly satisfactory; your exhortations to study continuously are well called for; and if you throw cold water (as lavishly as if you had been the hydropath you sneer at) upon the zeal of the youthful graduates, by telling them that a few of their number, a chosen few, *may*, after a lifetime of zeal and labour, perhaps be successful in attaining the loaves and fishes, it is the more excusable, as it assimilates so nearly to a reflection of your own career.

I am inclined, however, to anticipate a more liberal amount of success to the graduates of 1851; but the portion of your address which demands the deepest consideration of these young physicians, consists in its wonderfully candid but not less lamentable confessions as to the condition of your own department, therapeutics.

It is exceedingly gratifying to me, a homœopath, who some years ago became sensible of the deficiencies which you now publicly acknowledge, to note how impossible it is for any allopath to speak or write a word upon his own "doxy," without immeasurably damaging it. You can scarcely have had any idea of the effect produced upon the graduates, and reproduced ten thousand fold upon the public, by your acknowledgment that, "of all medical sciences, therapeutics is the most unsettled, and most unsatisfactory in its present state, and the least advanced in progress, and surrounded by the most numerous and most deceitful sources of fallacy." You exhibit a professional picture to the graduates which must perplex them sadly; you justly praise the high advancement of all the elementary branches and distinct collateral sciences; you tell them that upon these is based "physic," with which they are now loaded and sent forth to distribute it as best they may; but you candidly tell them that physic is trash, although founded upon such noble sciences. You strengthen the position of your opponents by quoting the opinion entertained of physic by a very eminent legal authority, "Glassford," who, in his Principles of Evidence, thus speaks of therapeutic inquiries: "In reasoning as to the probable effects of particular remedies on the human body, the condition and circumstances of the latter are so various in different cases, and the number of concomitants which are to be considered, in addition to the more obvious facts and symptoms, is so great, that the utmost exertion of human sagacity, founded upon the largest induction of particulars which any one mind is capable of embracing and retaining, can do no more than approximate to that real evidence, of which the case

Hosted by Google

seems by its proper nature to be susceptible."

This legal elucidation of the value of therapeutics is worthy of the subject. At one sweep, the astuteness of the "law" consigns unhesitatingly the science you are appointed to teach to that "incalculable mass of rubbish, the offspring of delusion and imposture," which you allude to in a subsequent part of your address. With legal acumen so close at your elbow, and with the experience of its application to medical affairs so brilliantly displayed by that "polished gentleman" who conducts the *Lancet*, it is difficult to explain your motives for such a gratuitous admission. Nay! your legal authority has not even saved from the wreck of therapeutics *Bark* and *Lime-juice*, *Mercury* and *Arsenic*, so long your only surety, and purloined from a system better than your own. It was most unkind of your judge not to leave you one step in your position, although an unmerited one.

It gives me a stronger hope than I had, that a dawn in therapeutics is succeeding a night of darkness, when you, its most distinguished teacher, make the following admission:—"We have no new instruments to aid inquiry, no galaxy of talent concentrated on its cultivation, no great discoveries, even few great improvements commensurate at least with its vast importance, or with the improvements made in other medical sciences, and as for the theory of therapeutics, embracing a generalization of the action of remedies, an accurate description of the physiological effects of each, a just idea of their therapeutic influence, and a knowledge of the condition for employing them, we are little in advance of our predecessors thirty years ago."

In such a sweeping confession of the feebleness and stand-still character of the science which affords you a "chair," you might under ordinary circumstances gain golden opinions, but with the public prepared to weigh the value of it, you have merely proved that "a silk purse cannot be made from a sow's ear." The illustration, I admit, is coarse, as most old saws are; but it fits the subject to a hairsbreadth, so I shall not expunge it. But had the confession above quoted been followed up by a statement that within the last fifteen years (a period only embracing half the time you specify) so rapidly and steadily had the consumption of drugs of all kinds decreased, that not a half of the amount then used passes now through the excise department annually, you would have thereby afforded the graduates some guide at least as to the retrogression of therapeutics in so far as substance is deemed of importance. But when it is remembered that this rapid extinction of the drug trade points significantly to the ultimate annihilation of your therapeutic chair, I am compelled to identify your interests as bearing a more intimate analogy to the "vendors of universal medicine," than any which characterises the homœopathic physician, although you, with little taste and no correctness, class them in the same category. Hence your attachment to a cause which, even according to your own showing, is hopeless indeed.

I conceive that the forty-five graduates of 1851 owe you a debt of gratitude, for having put them to some extent on their guard against trusting to your therapeutics. Armed with the confidence your doctrines must afford them, they may well go forth with fear and trembling. But your candour will benefit the public health, and open still wider the public eye. To my knowledge, three of the forty-five have already commenced the zealous study of another system of therapeutics more highly recommended to their notice by those who profess a knowledge of them.

Studiously avoiding all mention of homœopathy, or the law of specifics, perhaps from a feeling of consistency with your acknowledgment of its truth on a former occasion, you tackle the knotty point of infinitesimal doses; but when you say, in allusion thereto, "this creed, in no respect perhaps more repugnant to common sense than that it involves the disregard and annihilation of the entire therapeutic experience of twenty centuries, has taken root in every country in Europe, has obtained a footing in the palace as well as in the cottage," you certify that it is a great fact; and although you mistake the number of its votaries, and have characterised the influence possessed by them by the word "poisoned," a word more useful to you and your system than to me and mine, I receive the omen as a bright pledge of the future.

You say that "all true discoveries have made way first among the votaries of the science most immediately concerned with them," and the first example by which you endeavour to support your assertion, and by far the most important one, is the "antivariolous property of vaccination." Passing by your omission of its homœopathicity, I deeply regret you have made so unfounded a statement, which all historical evidence so emphatically disproves. I cannot think of insulting a man of your reading by referring you to the career of Jenner, but I

Hosted by Google

recommend the graduates to whom your words were addressed, to make themselves familiar with it. That which applies to one profession applies equally to every profession. Thirty years have scarcely elapsed since an individual of talent, yearning to advance himself and benefit his fellow-men, boldly struck out the idea of navigating the ocean by steam. He was a landsman, and he urged his problem of iron, and fire, and water, in direct contravention of the views of men who had passed whole lives upon salt water. But the clear-headed mechanician held out, and certain points in river navigation were gained. References were made to navy boards, and naval committees were formed from the House of Commons. Trinity boards were set by the ears, and the men of masts and canvas felt themselves insulted collectively and individually; masts and canvas had stood the test of forty centuries, since the good ship Argo unfurled her topsails and tripped her anchor in search of the golden fleece. But not the less, rivers have been stemmed, and coasts tracked, and broad oceans furrowed, by vapour-impelled keels. The landsman beat the seaman upon his own element; the masts and canvas of forty centuries gave way in less than forty years; the therapeutics of twenty centuries may fall in twenty years.

But, Sir, can you explain to me that most extraordinary feature in the condition of modern medicine, the total want of all argument on your side? Before you can continue to exact implicit confidence from the patient, you must show your system to be worthy of it. Has it escaped your notice that the world turns round, and will scarcely linger at your therapeutic pace? The orthodox word "legitimate," when applied to medicine, looks imposing; it is conservative both of beauties and flaws, but when looked for to compare it with heresy, it cannot be found, for each medical authority has a "legitimacy" of his own. The Coroner for Middlesex and his very worthy deputy thought they had it, and made a grasp at the phantom, but found it to consist of air; their legal studies had evidently not carried them into "Glassford."

In the nineteenth paragraph of your address you most justly hint that the forty-five graduates still require some instruction as to the points in your Protean science worthy of acceptance, or deserving of rejection; and as you in a former paragraph told them that "there can be no physician without physic," one might naturally expect that you were at length about to solve the great problem; that having for four sessions taught them what you show to be of such doubtful value, you were ready to make the *amende*, and tell them something really worth knowing. But, alas! "instead of bread you give us a stone," in a string of mawkish sentimentalisms.

You have left them to learn by *ex cathedrâ* means that that magnificent instrument of diagnosis the microscope (which you lament can do nothing for the advancement of your therapeutics, owing to their bulk) is perfectly applicable to homœopathic therapeutics, that metallic triturations can be traced down to their twelfth dynamization; and if the detection can at present go no further, it is the fault of the instrument, for the metal is still in existence. You may, perhaps, shrink at this application of the searching lens, but, Sir, it can only reach materialism after all; it cannot divulge the subtle influence that telegraphs the sympathy between mind and matter. Could He who poised great spheres, and sent them rolling in thousands in a waste, and all under the control of general and special laws, frame no more perfect law of healing for his ailing creatures than that of getting rid of one ailment by the artificial production of another?

In conclusion, I congratulate you on your third and unerring guide by which to keep clear of sins against professional etiquette, that sin of deepest dye, the premature advancement of any hard working man; it is such a scientific and literary production, that I shall quote it. "Should these characters be not enough to enable you to distinguish the true from the false in therapeutic innovation, there is yet a third criterion remaining. No upright physician ever attained great success in practice on a sudden, or at an early age. For the success of such a one, experience is a necessary condition, and for experience, time. No physician ever found himself immediately raised from obscurity into great employment by either inventing or adopting a novelty in therapeutics which has subsequently stood the test of inquiry and of time. When, therefore, you may chance to see a professional brother swimming swiftly into fame and fashion on the current of some new popular dogma, I trust you may not even envy him for his prosperity." Certainly! knock him down, and kick him when down, for his presumption, for he has no business to get in before you. This suggests to my memory the good old-fashioned coach in which you have professionally rolled, in contradistinction to the railway whizz of your obstetric contemporary, whose ten

Hosted by Google

thousand a year will enable him to bear the taunt, I doubt not.

I have the honour to be, Sir,
Your very obedient servant,
Sept. 12, 1851. SIGMA.

CHOICE OF DILUTIONS AND REPETITIONS OF MEDICAMENTS.

Communicated by DR. ROSENSTEIN.

(*Continued from page* 111.)

IV. REPETITION.

SHOULD we repeat, or wait? The answer to this question has an importance, and a greater influence upon the success of the treatment than the determination of the potency.

The partisans of the low potencies often repeat; those of the higher very seldom, never immediately. In admitting a certain influence to the species of the disease and to the duration of action of the medicament, repetition is less requisite in chronic affections and with therapeutical agents of slow effects, and *vice versâ*.

Hahnemann rejected in the origin all repetition, admitting it only for the remedies with alternating effects, when the expected amelioration was slow, or when an aggravation was manifested in the symptoms. He thought that many remedies permitted the repetition better than others. Before a second dose is administered, a new examination of all the pathological symptoms should be undertaken; when, if the symptoms have simply diminished in intensity, without any other change in the state of the disease, and consequently the amelioration has ceased to make progress, then another therapeutic agent should be chosen.

Before the invasion of the cholera, many had expressed a doubt as to the sufficiency of a single dose. Hahnemann afterwards published a memoir on the treatment of cholera, in which he advocated repetition of the requisite doses.

From that period the repetition of the doses has been abused. The necessity of repeating the doses, in many cases, has led to the admission of the proposition of Ægidi, the dissolving the medicament in a great quantity of water, and in that manner renewing its use. It has been considered that the toxic effects of the frequent repetition might by these means be neutralized. Hahnemann strongly approved of this mode of use, which offers great advantages to the physician and to the patient. It has this inconvenience, however, that in the summer the solution decomposes easily, when it stands any length of time. It is still doubtful whether the medicament produces a different effect in solution or in dry globules, the difference is not very great; the solution is, in many cases, highly to be recommended.

The so-called advocates of specifics, *specificists* (specifiker), who made themselves masters of the theory of the doses and low potencies, courted the approval of the old school, and wished to effect a union between these and the old theories; but this is altogether a mistaken view.

It was then that Gross, and subsequently other physicians, recommended the repetitions of the high potencies, generally in aqueous solution, administering them for a few days only, and then waiting the consecutive effects. This procedure differs essentially from the uninterrupted repetition. This method was not generally approved, the common method being considered preferable,—administering a dose and then repeating it, according to circumstances. Perhaps we shall succeed in laying down a general rule in the following propositions:—

24. There exists no rule which can be adopted in all cases; we must often rely upon the judgment and the spirit of observation of the physician. Here, again, it is better to individualize than to generalize.

25. *The degree of elevation of the potency, and the repetition of the dose, complete themselves mutually.* There exists between them the same relation as between space and time.

26. I have an intimate conviction that the *first action* of a medicament *is the strongest.* Completely strange to the organism, the remedy acts upon it as a new impression upon the senses, or a new idea upon the mind, whilst stronger impressions and ideas, often renewed, have but little or no effect, owing to habit. Every therapeutic agent, frequently employed, submits easily to the influence of habit; it becomes more and more inert in its action on the sensibility, unless it serves as an antidote, as many practitioners pretend. Every observer free from prejudice, and who does not wish to confuse pure observation, seldom repeats; he is convinced that the first dose produces a more penetrating action than the second and the third. For instance, *Aconite* 1, calms the pulse and the over-excitement of the sensibility, whilst the subsequent potencies act comparatively slower; if one repetition has been useless, it should be avoided as much as possible.

27. The *prompt repetition of doses increases the effect,* but to a certain point only, beyond which it is impossible to go.

Hosted by Google

28. Therapeutic agents of a prompt and short action demand and admit more frequent repetition, such as *Ipecacuanha, Chamomilla, Coffea*, etc., than those of a penetrating action, as *Silicea, Causticum, Sepia*, etc.

29. A similar relation exists between the lower and higher potencies. The former, when they are indicated, may be oftener renewed, and with more advantage than the higher. For the latter, the intervals should be more distant, and more time allowed for the exhaustion of their action.

30. With respect to diseases, acute affections allow a more frequent repetition than chronic maladies. We should, on the contrary, restrain the repetition when the maladies called acute are not entirely owing to a transitory morbific influence, the organism being otherwise healthy.

31. There are slow tenacious maladies, generally characterised by a small number of symptoms, as for instance, the affections of the reproductive system, the bones, the skin, the glands, which are very difficult to extirpate. It is necessary in these cases to repeat only at long intervals, if we wish to obtain good results.

32. There are other affections which manifest themselves periodically, the patients seeming healthy in the intervals, as epilepsy, etc. These require repetition at long intervals, in order to prevent relapses.

33. In observing the course of a disease after the action of a dose, the physician will positively know if he should wait or repeat. Whilst the amelioration continues, viz., as long as the progress of the disease is satisfactory in the limits of possibility, the repetition is useless; in acute affections it is even injurious, and retards the cure in chronic phlegmasies.

34. The practitioner ought carefully to distinguish the effect of each *fractional division of the dose*, the use of which he should continue until reaction manifests itself, *repeating the dose* even when the effect is produced, or when it begins to subside. The prompt repetition in the first period of the use of a remedy, viz., the division of a dose, provided the receptivity of the disease be weak, is useful, and sometimes necessary, when the organism does not manifest reaction. This is a new technical procedure, whose value is appreciated by good practitioners. But here we must pay attention to the nature of the disease, its inert and insensible character, or its violent and painful character. A wart and a prosopalgia both constitute chronic affections, but very dissimilar; they may exist for years. One, so to speak, without inconvenience and without increase; the other causing excessive pains, alternating in mild and violent paroxysms, and thus undermining health.

What we have said relative to these two forms of disease, is more or less applicable to all the others. A minute examination, distinguishing periodical remissions from real ameliorations, and a scrupulous observation of the natural course, are the only means to avoid confusion and precipitation. We may, for this reason, in the first period of the use of a medicament, repeat the higher potencies several times, without approving of this procedure afterwards.

35. The repetition of the doses, at an ulterior epoch, and during the general improvement of the symptoms, often hinders the cure; perhaps an antidotal relation is here also manifested between the doses administered before and afterwards.

36. If the amelioration stops, or follows a retrograde course, and the signs of the disease remain the same, not in intensity but in point of form, then the *repetition is necessary and salutary;* however, it seems also suitable to change the potency, either higher or lower. The periods cannot be fixed in an absolute manner, seldom less than eight days; they might often be prolonged with advantage until three and even four weeks. It is in this manner only that obstinate maladies of the bones, skin, etc., are cured. Of course, these intervals of repetition are often limited to some hours in acute affections.

V. Summary.

1. The high potencies (from the 12th to the 30th) are, in general, the most suitable; in the majority of cases, they often replace the others.

2. The lower potencies correspond in preference with affections of a recent origin which are locally manifested.

3. The very high potencies greatly excel the lower in chronic deep-rooted maladies.

4. It is indispensable in acute affections to repeat the dose. In *chronic maladies* we must wait some time, so as to permit the remedy *to produce its action;* they do not, however, absolutely resist all repetition, sometimes they demand it, but at longer intervals.

5. *The duration of action of the medicament* depends principally upon the *particular character* of the disease, the *force* of action, the nature of the medicament, and the height of the potency. It is particularly the latter which determines the greater or lesser degree of penetration of the therapeutic agent.

REPORT OF A MEETING OF HOMŒOPATHIC PRACTITIONERS IN MANCHESTER.

A MEETING of homœopathic practitioners and their supporters was held on Thursday morning, in the Homœopathic Dispensary, Bloom Street, for the purpose of taking steps to second the efforts now making in London to procure a charter of incorporation, and thus to put the homœopathists on the same footing as the Colleges of Physicians and Surgeons in respect to the granting of diplomas. Mr. W. R. JOHNSON presided.

Mr. E. PHILLIPS, in proposing the first resolution, briefly sketched the history of the proceedings which had rendered the proposed step necessary. He spoke of the treatment which Dr. Henderson and Dr. Ransford had received in Edinburgh, of the tyrannical bearing which had been exhibited towards Dr. Hale, of Norwich, by the University of St. Andrew's, and towards Mr. Pope, by the University of Edinburgh, the governing bodies having shown the most determined hostility to homœopathic treatment, and having persecuted those of its practitioners with whom they could deal. The *Lancet*, which had been the spur in all these matters, had at last succeeded something nearer home, and within the last week or two the Medical Provincial Association had passed resolutions similar to those which the College of Surgeons had sanctioned; and within the last week the Medico-Ethical Society of Manchester had become enlisted in the matter, and had memorialised the College of Surgeons on the subject in very harsh terms. This was coming near to each individual, and it therefore behoved them to consider what should be done to meet their opponents. Dr. Bardsley, and the other gentlemen who had signed that memorial, seemed willing to pander to the low desires of the profession, and the homœopathists felt called upon to raise their protest in some way. He therefore proposed—

That this meeting views with regret the course adopted by the colleges and other bodies to put down homœopathy, and denies and protests against the right of any corporate body or association constituting but a minority of the medical profession to dictate to others what course of treatment should be adopted in their practice.

Mr. W. ARMITAGE seconded it. He conceived that in an age when there was free trade in food, there should be free trade in the practice of physic. He had tried both systems; he had been satisfied with the old one, but he was much better satisfied with homœopathy; and he conceived that every confidence should be placed in those who practised it.

The Rev. R. DURNFORD, rector of Middleton, supported the resolution, because he was one of the oldest believers in the system in England, having had the advantage of a personal acquaintance with the illustrious founder. He supported it also on another ground, because it was in opposition to an uncalled-for and tyrannical proceeding. At a time when the principles of liberty were so well understood, it was strange that the medical profession should seek to put out a new light. He should be ready to assist in any measures to secure homœopathy from the attacks of its enemies, whether open or concealed.

The resolution was then put and carried.

Dr. WALKER proposed the next resolution, in a brief speech, from which we make the following extracts:—As a member of the medical profession, it is, I confess, peculiarly painful to me, to find that a question which ought, by our opponents, to have been treated on purely professional and scientific grounds, should have been by them thrown *extra limites*. It is not, as a general rule, the mode in which any scientific question should be discussed, nor is it, perhaps, the manner in which any great scientific truth can be settled; but as the feeling of the allopathists is so decidedly that of a desire to extinguish us—to lop us off as dead branches from the tree of legitimate medicine, it behoves us to throw aside all rules of professional etiquette, conventional formulæ, etc. which restrict professional men in their intercourse, and to fall back upon that great moral code, which, so long as we do no evil, not only justifies but moves and pushes us on to defend our principles and ourselves, when unjustly and cruelly attacked. The words have gone forth from their colleges and associations, to the effect that we have forfeited our position as men of science and morality, that we are ignominious and degraded, and that we should be scouted as the Pariahs not only of medicine but of society itself. All this, were it confined to mere words, might be borne, and like any other *brutum fulmen*, treated only with contempt: but when to the hard words, which break no bones, are added acts and deeds that strike at the right of private judgment in medical matters, it is high time we should declare that we have rights and opinions which, if attacked, we are prepared to uphold and defend. But we are prepared to go even further than this, and say to our adversaries, "If you possess rights which you abuse, and employ the circumstances which your position give you to oppress us, we shall cease to be simply defensive, and put ourselves into an aggressive shape, and with more energy than you have, and equally determined with you, not cease our active warfare, nor rest satisfied until we have destroyed your effete institutions, encumbered with the relics of a barbarous age, and eradicated all your old world's notions and murderous ideas with respect to the treatment of disease." Such is the position which I, as an individual, am prepared to take in the coming conflict of opinions, and, on looking around me at the medical gentlemen here present, I venture to say that they hold the same opinion with myself, and are ready, heart and hand, to unite not only in the dissemination of homœopathic doctrines, but in a bold effort to destroy those bodies whose conduct but too well justifies the remark of an eminent writer, that they are but the black rocks in the river, which obstruct the stream, move not, but show by the

Hosted by Google

surging of the waters around which way the current of knowledge tends. It is clear that the public, as a body, have no guarantee of even a minimum amount of medical knowledge in a man to practise his profession, unless he be possessed of a diploma or licence from one of the seventeen corporate bodies. A demand at present exists everywhere for practitioners who practise in accordance with the principles inculcated by Hahnemann. The Universities have set their face against conferring their diplomas, unless the applicant shall pledge himself not to practise homœopathy. Various bodies are taking legal advice as to how they may deprive those already holding them of their diplomas. Medicine is an honourable profession, which many who are unworthy strive to enter into. Unless some remedy be devised, the demand for practitioners, exceeding the supply of those qualified, will lead men of no medical attainments at all to seek to creep into the ranks of the profession, whose excuse will be, and none can contradict them, that they have been refused admission in consequence of their homœopathic opinions, and thus obtaining the sympathy of simple individuals, will bring disgrace upon the cause of homœopathy, and, from their ignorance, do serious mischief to those who put themselves under their care. It appears to me, to obviate this state of things, which must inevitably happen, that the homœopathists should either obtain a royal charter or a legal enactment to put them on a level, in the eyes of the public, with their allopathic enemies. Such a charter would not only secure us against the intrusion of illiterate and designing men, but it would do more—it would show that the individual possessed, beside the knowledge of the ordinary modes of treating disease, a correct acquaintance of the great therapeutic principle of "*similia similibus curantur*" in disease. For even now, with the diploma of our adversaries, the mere fact of a physician saying, "I believe in the truth of homœopathy," is no proof that he is able to practise it. Such a college as the charter or enactment would give us would thus secure to us a constant supply of well-qualified, enthusiastic, young men, to whom we, the 150 or 160 now existing, might safely leave the Cause for the benefit and instruction of the next generation In conclusion, to my medical friends now present I would say, that whatever the amount of provocation we may receive from those in this town, we should never forget that we are men of education, of breeding, and representatives of a great principle—that we are gentlemen, and that we leave to the leadiug physician of Manchester and his worthy *confrères* the congenial task of vulgar abuse and impotent reviling. Dr. Walker resumed his seat, after proposing the following resolution:

That the course pursued by the Universities, etc., towards homœopathic practitioners and students of medicine, leaves them no other means of redress than the seeking to obtain a charter of incorporation of a college, which shall be empowered to confer degrees, and grant licences to practise medicine.

Mr. HENRY DIXON being deeply indebted in his own person to homœopathy for the removal of a disease of four years' standing, and being convinced of its truthfulness by six years' study, together with the experience he had had in the Dispensary in Manchester, had much pleasure in seconding the resolution. He did not regret the course the allopathists were taking—it was only the natural one, if homœopathy was true, for error invariably sought to crush truth, if it could not be got rid of in any other way. This dispute was one of some moment to the old practitioners, for the homœopathists were curing patients whom they had had long under hand, and thus were taking away the confidence which hitherto had been placed in them.

The resolution was put and carried.

Mr. W. P. HARRISON proposed the next resolution:

That a branch of the General Association for the Protection of Homœopathic Students and Practitioners be herewith organized, and that the following gentlemen be requested to act as a committee, with power to add to their number:—Mr. E. Phillips, M.R.C.S., chairman of committee; Dr. Robert Walker, L.R.C.S. Ed., Dr. J. M'Dowall, Mr. W. P. Harrison, M.R.C.S., L.A.C., Mr. W. Scholefield, M.R.C.S., Mr. C. C. Tuckey, M.B., M.R.C.S.I., Dr. Knowles, Mr. A. Pope, Mr. W. R. Johnson, Mr. G. Wildes, Rev. R. Durnford, Rev. Canon Slade, Rev. R. Fletcher, Ald. J. J. Parker, Rev. J. Gwyther, Rev. C. F. Smith, Rev. A. A. Bagshawe, Mr. W. McCall.

Dr. TUCKEY, M.B., seconded the motion, which was carried.

The CHAIRMAN, before vacating his seat, said, that an association had been formed in London, about six weeks ago, to take up this matter, and he had no doubt the result would be that a college would be established, with power to grant degrees.

The SECRETARY (Mr. Turner) announced some pecuniary details, and the Rev. R. Durnford having taken the chair, a vote of thanks was passed to Mr. Johnson for his conduct in the chair, and the meeting separated.

At a meeting of medical practitioners held the same day, it was resolved unanimously:

1st. That the memorial signed by Dr. Bardsley, and purporting to come from the Manchester Medico-Ethical Association—wherein the members of the Royal College of Surgeons, who practise in accordance with the homœopathic principle, are stigmatised as ignominious and degraded—is unfounded in fact, and grossly insulting to its members.

2nd. That as it is notorious that the Medico-Ethical Society of Manchester is not constituted of a majority of the members, nor possesses the weight of talent or respectability of the profession of Manchester and its vicinity, its resolutions are as unworthy of consideration as they are gratuitous and insolent.

3rd. That the homœopathic practitioners of Manchester lament that their adversaries should be so deficient in argument as to have no better weapons wherewith to carry on their opposition to homœopathy than vulgar abuse and personal invective.

(Signed)
EDWARD PHILLIPS, M.R.C.S.
ROBERT WALKER, M.D. and L.R.C.S. Ed.
JOHN M'DOWALL, M.D.

THE
HOMŒOPATHIC TIMES.

SATURDAY, SEPTEMBER 27TH, 1851.

"WHEN rogues fall out, honest men are likely to come by their own." The verification of the old adage seems in a fair way of being confirmed with regard to homœopathy. The allopaths, when quarrelling among themselves, as they are very freely doing at this moment, let facts escape which must sooner or later tend to destroy the basis of the fallacious system they are endeavouring to support at the expense of truth and suffering humanity.

A curious letter appeared in the *Times* the other day, on the subject of the strength of certain medical preparations as used on the authority of the several pharmacopœias issued under the sanction of the Colleges of London, Edinburgh, and Dublin. According to the respective volumes, that which may be administered as a useful and effective medicine on the theory of the London allopathic profession, may, if prescribed in the manner directed by the schools of Edinburgh and Dublin, cause results of the most serious character. Indeed, under such a course of practice, "killing" would be considered "no murder," since the authority of the pharmacopœia would be sufficient to nullify any charge of negligence that might be preferred.

The writer of that letter did a great and essential service to the public, when he announced the discrepancies existing in this particular between the practice of the three allopathic schools. How the heads of the Colleges will relish the exposure, bruited as it has been through the extensive circulation of the metropolitan press, we shall not stop to inquire. The fact has become patent to the world, and it will remain for them to explain it away. It has, however, very opportunely transpired, because it will present in a clear and impartial light the fallacies that even an acknowledged "M.D." has found in the prescribed formulæ of his own profession.

Such glaring inconsistencies have only to be every now and then made known to those who suffer daily and hourly from the false doctrines propagated through allopathy, to induce them to give homœopathy and its principles a proper investigation, and the contrast, once attempted, will bring with it an immediate refutation of the slanders cast upon our system.

All these disputes tend to one culminating point, viz., the advancement of homœopathy. The true and devoted disciples of Hahnemann see and feel this, and hence the small concern expressed at what would under other circumstances be regarded as the dangerous onslaught of enemies whose power was feared, and whose protection was sought after.

But the opposite is fortunately the true view of the case. Homœopathy will and must advance, despite every exertion to arrest its progress. If allopaths will not confess the error of their way, and conform to the revelations made by Samuel Hahnemann, then must they be content to find themselves rejected as bigots, and proportionately ridiculed. Homœopathy is destined to absorb allopathy, not alone because it is more lofty in its scientific, but also because it is more lofty in its philanthropic aspirations.

ALLOPATHIC THERAPEUTICS.

WE invite the attention of our readers to a letter to Dr. Christison, of Edinburgh, in our communications of this week. This very over-rated toxicologist, who has privily ploughed with other men's heifers, and enjoyed the fruits of their labours, without a due and fitting acknowledgment of his obligations, delivered a short time ago (the 1st of August, 1851) what is absurdly called an "Inaugural Address" to the graduates of Edinburgh, of the present year.

Let us consider a few points of this very Christisonian address.

I. Our orator exhorts the newly-capped graduates to cultivate the *practice of medicine* as the main occupation of their lives. He insists on the necessity of paying diligent attention to pathology and *therapeutics*.

Hosted by Google

"There can be no physician without physic, no medicine without therapeutics. The only true end of medical knowledge is the cure of diseases. But there can be no cure without remedies. Neither can remedies be of any use unless you know them, and how to give them, and what effects to look for from them *in health* and in disease." *Nota bene*, Hahnemann was the first to *prove* medicines, by giving them to persons in health; and no British school of medicine has yet thought proper to follow the example of Hahnemann and his disciples. Remark again, that Professor Christison has not had the honesty to acknowledge in his inaugural address that the homœopathists do what he recommends to be done.

II. Our orator, the famous professor and teacher of *Materia Medica*, says of therapeutics, "of all the medical sciences, it is the most unsettled and unsatisfactory in its present state, and the least advanced in its progress." But he makes no honourable mention of homœopathy, which is not unsettled nor unsatisfactory, and which has already made great advancement in its onward progress.

III. After confessing with the most amiable simplicity, that his own kind of therapeutics has made no progress in the last thirty years (he might quite as truly have said that it has made no real progress since Hippocrates, that is, for some two thousand years, for it admits of proof, that all good allopathic treatment is on homœopathic principles) after denouncing the inventors of some Universal Remedy—inwhich denunciation we join him — after disentombing the forgotten memory of St. John Long, and throwing a dart at the water establishments, our orator thus speaks of homœopathy:—"Wildest of all, and widest in its epidemic range, because most cunningly disguised in the borrowed trappings of science, a practice has lately arisen (it dates from 1796), which demands belief in the assumption that all curable diseases may be cured by remedies so inconceivably minute, that no sense, no balance, no microscope, no chemical analysis, no human means whatever, can discover the slightest trace of them in what is administered,—that you can never have any surety of their presence, or any well-grounded assurance of their absence, that they defy the finite faculties of man to form even a distinct conception of them, either with the aid of figures and the eye, or with the help of a vivid imagination. Nevertheless, this creed, in no respect perhaps more repugnant to common sense than that it involves the disregard and annihilation of the entire therapeutic experience of twenty centuries, has taken root in every country in Europe, has obtained a footing in the palace as well as in the cottage, and has in the end poisoned the faith even of a few votaries of medicine."

When Professor Christison shows by measure and balance, by microscope or chemical analysis, the miasms that generate pestilence, the *semina morbi*, seeds of disease, he may sneer at the minute doses of the homœopathists with more propriety. When he tells us that he has *fairly tried* them in the treatment of disease, his opinion will be of more worth. Professor Christison has, heretofore, acknowledged his belief in the homœopathic law; and he knows right well that the dose is a thing apart from the law. His admission of the progress homœopathy has made is valuable; but his arithmetic is at fault. From 1796 to 1851 not less than 4,000 medical men have practised homœopathy in every part of the world; upwards of 1,000 practise it in the United States at this day:—we think he cannot call such a number "a *few* votaries of medicine."

IV. The audacity of the professor's assertion, that "all true discoveries have made way first among the votaries of the science most immediately concerned with them, and have become matters of faith and interest with the public at large only in the second instance," is so utterly ridiculous, that we are surprised at his venturing on it.

Bark made its way very slowly among medical men, and was long known as Jesuits' Bark, because priests not doctors used and introduced it.

Hosted by Google

Inoculation was introduced into England by a lady, Lady Mary Wortley Montagu, and the practice was at first *resisted* by the profession.

James's Powder was introduced by an individual, and the use of it was long resisted by the profession.

Vaccination was long and fiercely resisted by the profession, and the testimony of Jenner himself is, that no physician "after forty" received it.

Harvey's doctrine of the circulation of the blood was very long resisted by the profession.

A lady of France translated for continental Europe Newton's Principia, and a lady of England translated for the English the great work of La Place,—showing that astronomers required to be taught the value of Newton and of La Place. These instances might be easily multiplied.

The Medical Faculty of Edinburgh, the Royal College of Physicians of that University, and —— Professor Christison, have now pronounced against homœopathy. They do our Cause justice in the importance they attach to it; and they show how important they deem it to be by their savage hostility, which partakes more of the character of reckless despair than of the deliberate judgment of reverend doctors, pharmaceutical sages, and sober Galenists.

Edinburgh, St. Andrew's, and Aberdeen have pronounced against homœopathy. Which of the other Medical Universities, Colleges, and Halls will follow their example?

Professor Christison, one of the great authorities on the subject, has fully acknowledged that allopathic therapeutics is worth little or nothing, as may be seen by those who choose to read his "Inaugural Address" in this month's number of the *Monthly Journal of Medical Science.*

Review.

A Letter addressed to Dr. Rose Cormack. By the Rev. T. R. Everest. William Headland, 15, Princes Street, Hanover Square.

This is a setting of thorns for the Rose of Putney.

Dr. Rose Cormack has stated that he had never known any patients who had been under homœopathic treatment, who had not been *allopathed* by their homœopathic practitioners. This gentleman has made himself conspicuous for his zeal in behalf of allopathy, and for his savage hostility to homœopathy. It has been stated of him,—whether truly or not, he knows—that up to the time of his recent *manifesto* against homœopathy, he had been wasting his sweetness on the desert air of Putney, for that he had only had one patient in that neighbourhood, and that patient had been withdrawn from him, and placed under homœopathic treatment. We hope his anti-homœopathic fury has brought some grist to his mill.

He has met with an awkward customer in the Rector of Wickwar, who, it is hoped, will write another, and another, letter to Dr. Rose Cormack.

As most of our readers and a large body of the public will read Mr. Everest's letter, we content ourselves with two extracts.

"Once upon a time, it is said, there lived in Dorsetshire an eccentric old farmer whose name was Cawse. The rooks used to give the old man a great deal of annoyance alighting on his wheat-fields and committing great havoc there; but he was rather indolent, and bore the annoyance as patiently as he could for some time. At last, one morning the rooks had gone what the Irish call "beyand the beyant," and Farmer Cawse could stand it no longer; so he seized an old gun, crept slily along the hedge, and fired, not at any individual among them, for he was a humane man, but "promiscuously into the lot," as he said. The rooks rose as one bird cawing very loudly, on which the farmer was heard to say with great exultation, "Ah! Cawse! Cawse! indeed. Thee mayst call me what names thee do plaze, thee mischievious rascals, it do do my heart good to hear thee, vor I do learn vrom thy chattering as I have peppered zum on ye, and vrightened all the rest."

"You will say, perhaps, Sir, that the story is a stupid one and quite out of place here. It may be so; I will not defend it. You say I am everything that is base and bad and vile and shocking. I am very sorry for it and hope I may mend by and by. You say the homœopathic doctors are quacks and impostors. Let it be granted. And you say that all the archbishops, bishops, peers, members of parliament, clergy, and in short, all those who believe in Homœopathy—who you tell us are many in number—are knaves and fools. Very well, Sir. I will concede to you, if you like, that all those children born into the world who may be suspected by their mothers' vigilant obstetric attendants of any leaning to Homœopathy in the *paulo post futurum* state, should have their necks twisted in infancy, so that Allopathy may have a

Hosted by Google

chance of being left at peace. But we cannot bring about this same desirable wringing of necks. And there is a great Public which cares neither for you nor me and merely says, when it reads your well-flavoured Philippic, "Pooh! it's only another case of 'Farmer Cawse!' the doctors abusing those who have been peppering and frightening them." Don't you think, Sir, you would produce more effect on this great inert Public, if, instead of calling me names, you were to do that which you have been taunted, provoked, and dared to do, over and over again for forty years past, and which I now again dare you to do, that is, publish an account of the experiments you have made with homœopathic medicines on homœopathic principles?"

We have heard of the operation of skinning eels; we fancy Dr. Cormack after reading Mr. Everest's letter must have felt very much as we may suppose a skinned eel to feel.

"Such is your system, Sir. It stands like a milking-stool, on three legs; each leg is a mere theory, and a mistake in any one of your theories upsets the poor patient. Hahnemann followed a different plan. He collected the changes of which a patient complained and chose that agent which produced similar changes in the healthy. If the doctor knows what that is, and will apply it in right doses, he has done all that medicine can be made to do. You have no law of cure at all. Tom told Dick, who handed it over to Harry, that cod-liver oil was good in phthisis! Jenkins informed Robinson, who told it to Brown, that he had heard from the celebrated Stiggins, that dandelion was a fine thing in dyspepsia! How can you go to sleep, Dr. Rose Cormack, with such a miserable assortment of rubbish in your head? Is it in such terms as these that Nature's laws are enunciated?

"The consequences of all these childish hypotheses are most terrible. Medicine, or treatment, which has reference to an imaginary state, and it is imagined will be serviceable in that imaginary state, is prescribed in sad reality. Symptoms caused by that treatment ensue; the patient gets an accession of suffering; he sees and knows nothing of that magic relief so often communicated instantaneously by dynamic remedies when properly selected. No one can distinguish between the symptoms caused by disease and the symptoms caused by the doctor's treatment; the patient dies, or recovers after a long convalescence. But the worst part of the story is quite unknown, which is this, that a treatment which has no reference to the complaint, always sows the seeds of future malady; and he who might have passed his life without any need of medical aid if he had never called in a doctor, having once had the misfortune to do so, imbibes disease from those hands at which he sought cure, and must call in a doctor again at some future day.

"You seem to imagine, Sir, that it is a sufficient answer to all these things to abuse me and call me naughty names. I tell you of facts. Try them if you like, and give us the results. But how are these facts altered by calling him who speaks of them a naughty name? Do you think, Sir, that by pelting with mud him who is sowing good seed, you can prevent that seed from germinating?

"You *dare* do it, I have no doubt; indeed, why should you not? nobody minds your naughty names; the bumble individual who is now addressing you the least of all. But there is one thing you dare not do; that is, make experiments to disprove Hahnemann's facts and deductions, and publish the results. THAT you dare no more try than you dare try conclusions with a locomotive."

We conclude our notice of this pungent letter with the Rector's excellent motto from dear old Burton:—

"With all the rhetoric thou hast thou canst not so recall him but he will persevere in his dotage. It is

'Amabilis insania et mentis gratissimus error.'

Tell him what the event will be—no persuasion will take place, no counsell, say what thou canst. Demonstrate—he is irrefragable still: bray him in a mortar, he will be the same; shew him his several follies and absurd fopperies; force him to say veris vincor, make it as clear as the sun, he will err still. He says, 'I will doe as I have done, as my predecessors have done, and as my friends now doe.' Say now, are these men mad, or no? Heus, age, responde? Are they ridiculous? Are they sanæ mentis? Have they common sense?—BURTON, *Anatomy of Melancholy*."

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—In compliance with the wishes of those warmly interested in the new truths unfolded to mankind in the present century, I solicit the attention of *mothers* in particular to the pain and sorrow inflicted by large doses of medicine, causing the most melancholy results to the infant constitution, when the administration of homœopathic doses would have been attended with the most beneficial effects, without the risk of injury to the little sufferer. Notwithstanding my inadequacy to describe the cases submitted, I am led to do so, in the hope of attracting the attention of young mothers.

A boy, named Slater, about ten months old, backward in teething, and in consequence suffering intensely from fits, which medical practitioners on the old system were unable to arrest, came under my notice.

On reference to the invaluable work of Dr. Epps on Domestic Homœopathy, I was induced to try the indicated remedy—*Belladonna*, one quarter globule every four hours. Its success was almost immediate, and by a few days' perseverance, the fits entirely disappeared.

The mother of this child some time after-

Hosted by Google

wards was afflicted with large swellings on both sides of the throat, very painful, and reducing her to a skeleton. She became an out-patient of the Derby Infirmary for two months, without deriving benefit. On application to me, I gave two globules of *Aconite*, dissolved in eight teaspoonfuls of water, of which she took two doses, with an interval of eight hours. The inflammation decreased, but the swellings remained the same. I then gave four globules of *Belladonna*, one every four hours. One of the swellings disappeared, and the other considerably decreased. I then tried two globules of *Ignatia*, which did much good; still the swelling, pain, and difficulty of swallowing continued obstinate. Afterwards *Nux Vomica*, which nearly cured her, and two globules of *Mercurius* entirely effected it, and she has now better health than she has enjoyed for years.

George Picher, about thirty-eight years of age, met with a severe accident by being crushed between two carriages at the Railway Station, Derby. He was severely bruised externally, and appeared to be so internally. The pain was such, that he was unable to sleep or extend his arms in any direction. A medical man of talent treated the case allopathically, for some days, without success. A domestic acquainted me with the circumstance. I sent him two globules of *Arnica*, to be taken, and *Tincture of Arnica* to be applied externally. The globules were continued for six doses, and the man's sufferings entirely removed.

I enclose my name,

August 21, 1851. And remain, etc.," M. E. F.

To the Editor of the Homœopathic Times.

Wickwar, Gloucestershire, Sept. 1, 1851

Sir,—I enclose some cases selected from my note-book; not as possessing any peculiar interest for their phenomena, or the mode of treatment, but to show you that the homœopathic system is making way in this remote rural district; and that the *poor*, who are by no means slow in appreciating anything that benefits them, come in crowds to my weekly gratuitous consultations, and eagerly seek, as they cheerfully and gratefully acknowlege, the good they get from the treatment. I usually see over forty patients gratuitously every Wednesday.

I remain, Sir, your obedient servant,

Adrian Stokes.

CASES.

Caroline Webb, aged 17, tall, full bust, blue eyes, fair hair and skin, became the subject of typhus fever, caught by kissing the corpse of a young girl who had died of it a short time before. I saw her on the 22nd of November, 1850; she had been ill a week, and presented the following symptoms:—Looks stupid; the eyes are dull and heavy, and staring; the head is heavy; tongue dry; urine red and scanty; bowels confined. She is thirsty; has little sleep, and is delirious at night.

Bellad. 6, 3 gl. in pulv., hod.; repet. cras.

24th. Faculties much disordered; she screams and struggles, and tries to escape.

Tra. Hyos. gtt. ij, in ʒvj aq.; coch. parv., 3a hora.

The medicine quieted the alarm and fear; the tongue is loaded; head heavy; bowels confined.

Bry. a. 6, 3 gl. h. s.; rep. mane.

27th. The alarm and agitation, with screaming, and struggling to escape, have increased to a great degree. The breath is quite spent in her efforts to get away; the limbs are in a state of tremor; there is subsultus of the tendons at the wrist. She knows me when I rouse her, and asks to get out to the chair. *Bryonia* relieved the bowels and the ardor urinæ. Tongue dry and brownish; pulse weak and 130. Talks nonsense; wags her had from side to side; no sleep; all night delirious, and tossing about.

Rhus tox. gtt. j, in ʒvi aq.; coch. min. j, 4ta hora.

28th. Her aspect is alarming; fatuity is stamped on the features; the head, limbs, and body are in continual agitation, and the lower jaw is moved convulsively and rapidly up and down. She lies on her left side, the head driven into the pillow; the eyes closed; nose sharp; a few red spots like fleabites are on the right arm; the mother says there are more on the body. Passed urine, but no stool; subcrepitous râle on both sides of the chest; dry cough.

Rhus tox. 6, 3 gl. in aq. ʒvj; coch. min. j, 6ta hora.

29th. Agitation greatly subsided; had a quieter night; opens her eyes, shows her tongue steadily, and answers questions. Right cheek flushed, the left pale; tongue dry; bowels open. The spots have disappeared from the arm, and some have come out on the lower part of the back. There is a dark, angry-looking spot on the point of left elbow, surrounded by pimples; less oppression of breath, but more wheezing, with expectoration of thick frothy mucus.

Cont. med. 8va hora.

30th. Has had some naps of sleep, of an hour each; the agitation has nearly subsided; the head is clearer; the wheezing diminished; the cough frequent, but loose, and the expectoration of frothy mucus is free; the bowels are rather confined, and grumble; sweats much at night during sleep.

Phosph. 9, 3 gl. in ʒvj aq.; coch. min. j, 6ta hora.

Under this the cough got better, the sweats diminished; but on the 2nd of December there was tympanic condition of the colon, with dark fluid fetid motions; pulse 120, strong.

Phosph. 12 ut supra.

This medicine rendered the abdomen softer, and on the 4th a gentle, soft perspiration appeared over the whole body. Is rather deaf; bowels no longer purged.

6th. Has been disturbed by cough the last two nights; had a motion this morning, firm. Ecchymotic patches on the ends of the fingers, beside the nails; one of them has the epidermis raised by sanious fluid.

Mercurius sol. 6, 3 gl. in aq. ʒvj; cap. coch. min. bis die.

13th. For three days had an aggravation of

Hosted by Google

cough, with expectoration of thick, white, sticky matters, streaked with blood, and patches of rust-coloured sputa. Tongue clean and moist; bowels open; skin moist and supple. After the three days this state subsided, and a sore red spot appeared on the extremity of the coccyx. For this she had *Secale;* afterwards *Arnica* internally and in lotion. The sore sloughed, and retarded her recovery for six weeks. She took no medicine for it, but was well fed, and had *Ung Cetac.*, with an occasional application of *Arnica* to the sore.

It is easy in this case to trace the progress of the disease from its commencement in the brain, through the lungs and bowels.

On the 27th and 28th of November the nervous symptoms had attained their greatest intensity, and presented a very unfavourable aspect. I found, on reference to the Materia Medica Pura, that *Rhus* covered the symptoms very closely, and was convinced of the propriety of my selection by the aggravation it produced. Here I fell into the doubt and distrust of dynamic remedies which some occasionally experience whose faith wants the confirmation of long practice, but I saw and acknowledged in the aggravation that took place the truth of the principle "*similia similibus;*" and acting on that other principle laid down by Hahnemann, that medicines in their dynamic form counteract the effects of the material doses of the same remedy, I gave the 6th dynamization of *Rhus*, which removed speedily the severe symptoms produced by the tincture. The *Phosphorus* carried her very safely over the affections of the lungs and bowels, and there was no difficulty in the case afterwards. When she recovered from the tedious ulcer on the coccyx, she was well; there were no medicinal maladies to subdue, and the convalescence was short and pleasant.

William P. Carpenter, aged about 54; thin, sallow, sober, serious, of melancholy temperament, with grizzled black hair, eyes black, and their lids very bushy; was seized on the night of January 8th, 1851, with vomiting and purging, chills, giddiness, intense frontal headache, aggravated by moving the eyes, which are dim, and half closed. The face is pale; the tongue white and loaded; the voice very weak; thirst; and pain in stomach and bowels. Pulse quick and weak, 120.

12 noon, 9th January *Bell.* 6, 2 gl. in a wineglass of water, a teaspoonful every hour.

3 p.m. Passing again by his house, I looked in, and found him weaker; the tongue brown, dry; face and skin pale; thirst; great prostration; stools liquid and frequent.

Ipecac. 4, 3 gl. in ʒiij water, a teaspoonful every two hours; after which *Bry. alb.* in like manner.

The vomiting and purging were aggravated at first by *Ipecac.*, and after the second dose relieved. The *Bryonia* brought out a rash of red miliary character on the legs; stools frothy, pale, and thin. Can only take water, which runs through him directly.

Merc. sol. 6, 2 gl. in ʒiij water, a teaspoonful every four hours.

11th. Head better; voice stronger; slightly delirious last night; tongue getting moist; the efforts to vomit are abortive; abdominal tenderness, especially about the ilio-colic valve; tenesmus; stools frequent, without pain, sometimes brown or yellow, preceded by rumbling in the colon. Pulse 120, weak; considerable thirst for cold drinks, but he fears to drink, because it increases the purging.

Acid. Phosph. 9, 3 gl. in ʒiij water, a teaspoonful three times a day.

13th. Only two stools since the evening of the 11th; they were firmer. Tongue moist, cleaning from the point; is less thirsty, and feels better. Awoke this morning, and called out for some mutton, vowing he "would'nt stand the slops any longer." Pulse 100; skin cool and soft.

Cont. med.

17th. Had a small hard motion after four days' constipation; head a little swimming; voice weak; appetite returning; less thirst; sleeps pretty well. To have mutton-broth and rice for diet.

Acid. Phosph. 12, 6 gl. in six powders, one every morning.

23rd. Better and stronger; is pretty well, but for feeling weak; has a pain in both legs, at the upper part of the tendo-achillis, worst in the left; it hinders him in walking.

Lycopod. 6, 3 gl. in ʒiij water, a teaspoonful twice a day.

Feb. 14th. Has been improving in strength and appetite; bowels regular. Has ridden out, and walked a mile out and back; this made the legs so sore, that he was knocked up for some days, and he took the crotchet into his head that the "nasty water-cure" had driven the fever into his limbs; whereas, had it been well physicked out of him, he would have been "all right;" consequently, he refused any more *water-cure*, and got pains in his arms, for which he applied to allopathy, and did not fail to abuse me heartily for *my* pains. But I take the liberty to think, that had it not been for this same "water-cure," as he called it, which cut short his disorder on the fourth day, he might hardly have fared so well as he did. The great remedy in this case was *Phosphoric Acid.* It was most clearly indicated by the state of the bowels on the 12th of January; and it was so admirably fitted to the character of the individual as well as to the symptoms, that I felt regret at not having hit upon it at first. Immediately after the first dose of it he got relief; there was a check put to the progress of the case at once; and this attack of fever, with its severe gastric complications, was hurried through its course, and stopped in four days. The opponents of the homœopathic system would say it was a case cured by Nature on a critical day. I am willing to concede so much as this; I never saw a case cured that was *not* cured by the powers of Nature; for if the organic forces be insufficient for the prompt suppression of an attack of disease, it either becomes chronic, or the patient dies. But I feel assured that homœopathic remedies, properly chosen and rightly dosed, can so aid and assist the efforts of Nature, as to enable her to get rid of disease

Hosted by Google

in a manner resembling very nearly her own processes. The constitution of the patient is not oppressed or injured by large doses of drugs, and the stimulus of the properly-chosen homœopathic remedy being no greater than what is necessary to rouse the system to the point required for the suppression of the symptoms, the patient gets well far sooner than if he were tormented with large and frequent doses of violent medicines. This may be particularly observed when you can see the case at its commencement; and before the disease has made much head. It is then easy to shorten its course, and render it mild and safe; whereas, if once it be developed, the most we can do is to conduct it to its termination without bad result.

Another case of fever which I attended this summer was even more favourable than the above, inasmuch as the man (a labourer) was able to resume his labour after only a fortnight's confinement to the house. I fortunately saw him the day of invasion, with a red face, and in tears. The first medicine given was *Acon.*; then *Bry. a.* and *Rhus t.* At the end of the week he was convalescent, and the aching of the limbs that remained was removed by *Lycopod.* I wish the homœopathic public to remark these cases; they will see how important it is to have medical assistance at the outset of an illness, and not to wait, as too many do, until the disease is fairly rooted. The two cases of fever last mentioned were cut short, and the convalescence was, so to speak, null. The case of C. Webb was not seen until the girl had been ill a week, and then all that could be done was to steer her through with as little damage as we could.

I would call the attention of masters and the friends of benefit societies to these cases; they may see what *can* be done by homœopathic treatment, and what an amount of time and suffering is thereby spared to the poor man, and what a saving is effected in the benefit funds. The attention of the poor-law authorities, too, might be worse bestowed than on a consideration of them.

Ellen Davis, aged 12, temperament nervous, lymphatic, and sanguine. Hair brown; eyes hazle; sensitive disposition. Has been a year under homœopathic treatment. Was suddenly taken with giddiness, chills and vomiting at noon of the 15th of February, and has been sick every day since. Was ill a week before I saw her; vomited green matter; was worse after anything taken into the stomach. Has had *Castor Oil* and *Tra. Rhœi* given by her mother. Complains of pain and weight in stomach; tongue coated with white fur.

Feb. 15th. Head very heavy; pains across forehead; bowels open. Rather thirsty. Has lost flesh.

Arsenic 9, three powders, two globules in each; one night and morning.

23rd. Vomiting less severe; the mucus ejected is stringy. Head heavy; she dozes and mutters deliriously; tongue white, with red edges; pulse strong, 100. Cough coming on.

Hyoscy. 4, three powders, two globules in each; one night and morning.

25th. Has been delirious; eyes are dim, and upper lids half closed; stomach less painful; tongue cleaner. Bowels loose; the motions are ejected suddenly, are yellow; still vomits. Diet of toast-water. Does not urinate without a motion.

Hyoscy. 7, as above.

26th. Head less heavy, eyes less dull; weight in stomach, and distension with wind; still vomits, but very little. Is thirsty. Bowels loose; no pain on pressure. Temper irritable.

Coffea 3, three globules in the morning, each day.

29th. Cough severe; vomits everything but toast-water, and that begins to disgust her. Bowels loose, without pain. Great thirst.

Phosph. 5, three globules in ʒvj water; one teaspoonful twice a day.

31st. Cough increased; large mucous râle extensively heard; expectoration commencing. Head and stomach better. Bowels open six times in twenty-four hours. Yesterday evening passed urine for the first time without a motion. Gruel, rice.

Cont. med. 4ta hora.

March 1st. Yesterday being the seventeenth day of the fever, a rash came out in the evening; it seems under the skin, and feels rough.

2nd. Cough better, bowels less open. Is much better.

Cont. med. bis die.

6th. Goes on improving. Bowels more firm; skin dirty, and inclined to peel.

Phosph. 6, in ʒvj water; 1 tsp. bis die. Broth and meat.

13th. Has been down stairs three days, a short time each day. To-day frontal headache severe, with vomiting and great thirst. Skin peeling; a little pustule on back of right hand.

Bryon. a. 15, in ʒvj water; 1 tsp. ter die.

15th. Head and stomach soon relieved by medicine. Continues improving. Takes a little mutton. Some little pustules about thumb of right hand.

After this she rapidly proceeded to recovery, convalescence being remarkably short and free from unpleasantness. In a fortnight her parents removed from the place, and I have not seen her since.

Miscellaneous.

LAUGHTER.—Laughter is a most healthful exertion; it is one of the greatest helps to digestion with which I am acquainted; and the custom prevalent among our forefathers, of exciting it at table by jesters and buffoons, was founded on true medical principles.—*Professor Hufeland.*

ALLOPATHY AND HOMŒOPATHY COMPARED.

By a Progressist.

(*Continued from page* 82.)

What has been said on the subject of purgatives* will in a great measure apply to emetics.† Emetics may be said to act in two ways: first, by the ejection of bilious or mucous matters contained in the stomach by the efforts of vomition; secondly, by the *shock given* to the *whole system.* The præcordial anxiety that precedes and accompanies the retching soon reacts on the principal organs. Independently of the bilious matter thrown up, vomiting augments the secretion of mucus from the bronchi, as well as the secretion from the kidneys and skin; a slight or even an abundant perspiration generally succeeds the cold sweats, leaving the patient, almost invariably, in a state of weariness and debility; although tranquillity, sleep, and a feeling of comfort may be, for a short period, experienced. Who has not observed the violent perturbation and exhaustion caused by vomiting? Now, I can affirm that it is possible to produce the same effects without fear of consequences by homœopathic medicines.

To observe facts with care, and to generalize with caution, is the grand law of sound medical practice; but when facts abound, and they all call for the same construction, we ought to learn to profit by the lesson. It is neither easy nor safe to prescribe emetics in the heroic doses given by the "old school." Have we not all observed, after the use of these remedies, extreme irritability of the digestive organs, protracted diarrhœas, cerebral congestions, an attack of apoplexy, the rupture of some of the large vessels of the thorax, spitting of blood, the sudden formation of a hernia, or strangulation, where such had already existed. The stomach will not tolerate the large doses prescribed by the allopathic school. Less than the suitable dose produces no effect; a large dose occasions great irritation, which may terminate in inflammation of the peritoneum; and "in cases of frequently-occurring chronic nausea, he (the old-school physician) produced, with a view of furthering the intentions of Nature, copious evacuations of the stomach by means of powerful emetics—never with a good result, often with bad, not unfrequently dangerous and even fatal consequences."*

To cases based on pathological grounds, the observations I have made sanction my admitting that in the greater number of them the homœopathic method may be substituted for emetics, calculating the effects we want to produce. The old system of giving emetics has been frequently practised and much abused, although they require for their administration as much practical acumen and pathological knowledge as any other class of medicine. I would have a man treat himself to an emetic, that he may know the inconvenience occasioned to the patient. I recollect reading in an American journal an anecdote of a doctor calling upon a gentleman who had been some time ailing: he put a fee into the patient's hand, and took the medicine he had prepared for the sick man. He was not made sensible of his error till he found himself getting shockingly ill, and the patient getting rapidly better. He was an undoubted "regular."

I beg, Mr. Editor, your permission to leave this sickening subject, and to make a few remarks on what is going on in the medical world. The bigotry of old physic appears even stronger than it used to be; but "the time has passed away when the oil from kittens boiled alive was considered an admirable application for wounds; when toads roasted alive were administered for asthma, and the hairs of mad dogs for hydrophobia; when the powdered thigh-bone of an executed felon was considered a spe-

* "Saline aperients are given to allay febrile excitement, but their exhibition requires great discrimination. While purgative medicines preserve a regular state of the body, care must be taken that they do not aggravate the debilitating effects of fever."—*Dr. Hamilton on Purgative Medicine.*

† Determining the *blood* to the *surface* has led to the administration of emetics in the early stage of fever, which have been employed where blood-letting is considered unnecessary.

cific in dysentery,* and ointment was applied to the inflicting weapon in order to cure the wound; when physicians placed confidence in phylacteries, and watched with intense anxiety the influence of black and white days, and the aspects of the stars; and when they hurried their unfortunate patients to an untimely grave, in attempting to quench the fires of fever and inflammation by diligently feeding the consuming flame." The time of the doctrinaires is gone past. The age is more practical and less theoretical than it was twenty or even ten years ago; and the people are far more interested in the great question of homœopathy, which appears more at large in all men's eyes as the paramount question of our time. The College of Physicians of Edinburgh may reject their fellows, the members of the Provincial Medical and Surgical Association may prate, but homœopathy must advance—truth will predominate. At a meeting of the members of the Provincial Medical and Surgical Association at Brighton, on the 13th and 14th of August, Dr. Malden (a physician more celebrated for his puns than his practice) addressed the meeting, and got heartily laughed at for endeavouring to throw light upon, or to bring into ridicule, a subject on which he appears profoundly ignorant. It has been said—

> "The wise man examines before he judges;
> The fool judges before he examines."

We read in the *Brighton Herald*, August 16th: "On the return of the members to the Music-room, Dr. Malden delivered a most amusing lecture on empiricism, and by the unmerciful lashing he gave the "watermen," hydropathists, and mesmerists, he kept the assembly in a roar." Now ridicule is a weapon whose point rankles and festers wherever it alights, and if there be one thing requiring a greater degree of moral courage than another, it is to bear to be laughed at and to be accounted an easy dupe. Ridicule (a weapon the doctor usually fights with) is never employed in a good cause, though it is the common resource in a bad one. Medical men are aware of the rapid strides made by homœopathy, and are fully conscious that if they cannot impugn it, and convey to the minds of the public some dishonesty on the part of its professors, the system is likely to make vast inroads in "old physic," if it does not annihilate it altogether.

> "Different men have different opinions;
> Some likes leeks and some likes *inions*,"

are words often quoted by a Worcester physician, and we are inclined to believe by the gentleman "who kept the assembly in a roar" with his tiny witticisms "and more absurd abuse" against homœopathy. In the lines just quoted, the doctor allows different opinions and different likes. He, too, most likely would claim his right of selection without interference, and as an allopath, would choose the leek as the more powerful plant of the two; then upon what grounds does he crack his jokes at those who choose the milder of the two, namely, the onion? A physician once said to his neighbour, who practised with nostrums, "How is it that you get so many more patients than I? I have laboured hard to acquire a knowledge of my profession, and am indefatigable in the pursuit of it; but where I get one patient you get a hundred." The nostrum-monger, to please the vanity of the doctor, said, "I tell you how it is: in every hundred persons there are ninety-nine fools and one wise man; the wise man you get, the fools come to me." Wise men are more abundant than in those days, and they are on the alert; the ninety and nine have advanced with the improvement of the age, and the time is not far distant when the truth of homœopathy will shine forth as bright as the sun at noon-day. It is a work of the Almighty, not to be smothered by a few wretched puns.

There are no set of men so fully alive to manœuvre as medical men. It would be pronounced *infra dig.* to advertise that Dr. So-and-so may be consulted, etc.; but, to get over this difficulty, Dr. So-and-so publishes a book, condemned or not, he advertises his book, and does not omit to state that it may be obtained at his residence. This is not advertising oneself,—it is merely advertising one's book, and considered fair play. Dr. Cormack, perhaps, feeling himself somewhat in the shade by the side of the Thames, makes a violent attack on homœopathy at the meeting of the members of the Provincial Medical and Surgical Association at Brighton, not forgetting to propose that the resolutions shall be inserted in the *Times* newspaper, the *Morning Post*, the *North British Advertiser*, *Saunders's News Letter*, and all the British and Irish medical periodicals;—an extensive manœuvre to inform the public that Dr. Cormack lives at Putney. "The worst part of homœopathy, in my opinion," says Dr. Cormack, "is the dishonesty of those who live by it. I think it is that this fashionable quackery is so susceptible of adaptation to the most contradictory prejudices of *shallow men and women*, as to have become a sort of Protean deceit and a

* The great philosopher, Lord Bacon, believed in the virtues of charms and amulets; and the celebrated Mr. Boyle seriously recommended the thigh-bone of an executed criminal as a very powerful remedy.

Hosted by Google

distinct medical heresy." After this he says, "the homœopathic dogma has, as far as I can judge, no adequate basis to rest upon; and the doctrine of infinitesimal doses is immeasurably beyond the grasp of my intellect." Now I do ask upon what grounds Dr. Cormack calls this a "medical heresy," when he admits he is so "thick in the clear" that he cannot conceive the basis on which homœopathy is founded. Dr. Cormack may, with equal propriety, pass judgment on the power of a piece of machinery of which he knows not the principle, or give an opinion on a book he has not seen. But he confesses it is "beyond the grasp of his intellect:" all, therefore, he may bluster forth will pass by us as the idle wind that we respect not.

Dr. Charles J. B. Williams, at the same meeting, "entered into some statements showing the utter absurdity of infinitesimal doses, and deplored that the wealth and influence of the rich (ah, there's the rub!) and the lives of the poor are sacrificed to uphold a monstrous fraud, *the prevalence of which has made it so notorious.*" Dr. Charles J. B. Williams has gained some celebrity for the use of the stethoscope, and were the doctor to apply this instrument to the chest of a patient who had been treated homœopathically, the sound would surely be found to be—"No more of your Protean doses for me. Dr. Williams, look about you, put your house in order; homœopathy is no 'monstrous fraud;' it must and will prevail. No more cod-liver oil to make me fat:* I will get fat upon something more agreeable. I will improve my constitutional power by homœopathic measures, and throw your physic to the dogs."

It is most true that, with the exception of those who run away with the cream, medical men are engaged in a perpetual struggle to maintain themselves in their proper station. The law of self-preservation will be uppermost, and there will be a prejudice against everything that may lessen the means of subsistence. It is impossible not to admit that this argument must bias the minds of many against any change that may endanger the hope of their gains, and that tend in any degree to supersede their orthodoxy.

All these reasons are operating, not so much against homœopathy itself, but against the inquiry into its principles and efficiency. It is for this reason we are anxious to promote investigation. "It is somewhat strange," said Sir William Knighton, "that though in many arts and sciences improvement has advanced in a step of regular progression from the first, and we look back to ancient excellence with wonder not unmixed with awe, medicine seems to be one of those ill-fated arts whose improvement bears no proportion to its antiquity, although anatomy has been better illustrated, the Materia Medica enlarged, and chemistry better understood."

To return to the meeting at Brighton and to the Music-room, where Dr. Malden is amusing his hearers. Dr. Malden continued, "that it was neither rational nor honest for men like the homœopathists to pretend to have secrets." They do not pretend to have secrets; their profession is to have no secrets; and as a proof of this, all medical men, friend or foe, are invited to their hospitals, that they may see and investigate their practice. The term of humbug, empiric, or quack certainly cannot attach to the homœopathic practitioner while he explains the principles upon which he moves physiologically, supports his theory on the amount of his experience on the most rational grounds, lays down in plain terms the plans he means to pursue, conceals nothing, and has no private opinions. Those who have ventured to move out of the beaten track, or soared beyond what is called the acknowledged practice of the day, who have devoted their time to investigate homœopathy, have been stigmatised by such offensive appellations. The meaning of the word "humbug" is to cheat, or one who cheats by a fictitious character. The meaning of the word "quack" is that of a boastful pretender to arts which he does not understand, an artful tricking practitioner in physic, one who keeps from the world the knowledge of the component parts of his nostrums. It is scarcely less humiliating than it is surprising, to reflect that the mind of man, with all its aptitude for carrying out the general designs of the Creator, should allow that universal failing, "interest," to have dominion over his judgment. Common sense and common honesty are qualities no more universal among the "faculty" than elsewhere. I do not hesitate to say, there is not a homœopathic physician who would not say to this facetious doctor, "who kept the assembly in a roar,"—Let us take two cases as much alike as possible in their general character; take one, Dr. Malden, and give me the other, and see which will be most benefited in the shortest time. These are the facts we wish to introduce. These

* Dr. C. J. B. Williams remarks that "it (cod-liver oil) is a highly nutrient material, and it is admitted by all who have used it that it possesses, in a remarkable degree, the property of fattening those who take it for any length of time."—*Homœopathic Times*, No. 106, p. 6.

Hosted by Google

are the proofs the "orthodox school" shrink from.

No wonder that allopathic physicians generally are active in waging warfare against homœopathy, when such a heavy blow is to fall on their lucrative practice. Allopathic physicians may frighten their patients about the supposed dangers of homœopathic poisons; but while two-thirds of their patients die, two-thirds of those treated homœopathically recover, evidently showing that homœopathy is one-third more advantageous *to patients* than allopathy.

Oh, reader, if you be afflicted, let me entreat you, as you value your life and happiness, give up those enormous and ruinous doses of drugs! I am confident you will be blessed with health. Are you suffering under chronic disease, the sooner you resort to homœopathy the better. It is hardly possible for you to imagine the extent of the sufferings which result from large doses of medicine. The whole system of allopathy is one of *weakening*. We are still labouring under the accumulated prejudices of ages on this subject; but surely the time will come when science shall cease to perplex and confuse, and the object of all study will be the discovery of truth. This is not a fanciful conclusion, but a rational sequence—an inference, in the present period of improvement, that any one may draw. Doctors have now proved themselves the most staunch bigots we have. There are many and noble exceptions, but it is a general rule nevertheless. They still advise the "blue pill and black draught." Depend on it, this opposition to homœopathy will do great good. It will cause the people to think, and it will cause them to change rapidly from the belief in heroic doses of medicine, and pay more attention to the laws of life which God has put into our bodies.

The welfare of the nation—the lives of our fathers, mothers, and children are vitally interested in this subject. Let us inquire who are the parties at present making this outcry against homœopathy? The answer presents itself: the parties whose interest it is to oppose it. Ask a doctor how many patients he has killed; ask a lawyer if he ever told a lie; ask a fish-woman if her fish are stale: neither one nor the other would admit the fact. The cause of humanity compels us to speak out, and direct the attention of patients to the safe and simple system of therapeutics discovered by the immortal Hahnemann, and set it before the eyes of a wondering world; and when people shall have become a little wiser, the principle "similia similibus curantur" will be universally regarded as the greatest blessing to suffering humanity.

It would be highly praiseworthy in medical men to cease from objections suggested by ill-will, inspired by interested motives. Let the opponents to homœopathy give themselves the trouble to dive into its principles and merits; let them watch the treatment, and they would soon abandon their reproachful aspersions. Medical men have very generally refused to examine what they have prejudged, and they have branded with obloquy all those who have professed to practise or to believe the principles of homœopathy. Yet by so doing they place themselves in a false position. It is to be lamented that they are so opposed to it, the largest ground of which is, doubtless, the interference with their pecuniary interests; for in proportion to the merits of homœopathy and its success, so is their opposition. This is the bad part of human nature. All those who thrive by the practice of physic, directly or indirectly, physicians, surgeons, consulting-surgeons, apothecaries, chemists, druggists, etc., decry homœopathy.

Bacon said, "The human mind is always governed, not by what it knows, but by what it believes; not by what it is capable of attaining, but by what it desires or fears." Bacon also said, when he wrote, that "science could hardly boast of a single experiment which had served to increase the power, to diminish the suffering, or to augment the happiness of mankind." Were this great philosopher now to return to the earth, he would have the satisfaction of seeing vast changes. Bacon was the first philosopher who laid down plans for extending knowledge of universal application; who ventured to assert that all the sciences could be nothing more than expressions or arrangement, and that the first step towards the attainment of real discovery was the humiliating confession of ignorance. That such an innovating discovery as Hahnemann's should not meet with the immediate popularity and patronage of medical men, is not wonderful, when we consider the slow progress of all reforms in established forms, whether material, social, or political.

It is not so many years ago, and yet to be forgotten, that the government introduced the system of roads that will long perpetuate the names of M'Adam and Telford. About four thousand district Acts of Parliament were obtained for the improvement of turnpike-roads, and yet the broad-wheel road-waggon, the stage-coach, and the post-chaise have given way to the all-

Hosted by Google

powerful locomotive. In the year 1825, when the plan for the Liverpool and Manchester line was brought before Parliament, evidence was given on the capabilities of the locomotive engine then in use, in which a speed of three miles and a half, four miles and a half, and even seven miles per hour was attained, with a load varying from forty to seventy tons gross weight—a capability which the counsel for the opposition appeared to regard as somewhat visionary. Between 1825 and 1849, some millions have been expended on railways, and a speed of thirty miles an hour, inclusive of stoppages, has been maintained, and traffic in many instances has more than trebled. The same power has been applied to ships, and nothing is thought now of crossing the Atlantic Ocean, 3,000 miles, in nine or ten days. To understand how to produce so much power, it requires the study of the laws of nature in regard to the waves' motion, derived from general experience, and the mechanism to render this power effective for the vessel's propulsion; all which is fully proved to be adequate to the purpose of moving the same forty miles an hour, be it by steam or any other power.

Medicine, like all other sciences, has gained more from individual discovery than from centuries of theory. Its history, resembling that of other systems, contains a striking illustration of the ignorance of mankind dispelled by the master-stroke of genius, a detail of human passions, prejudices, fluctuations, and imperfections, at one time degenerating into mere dialectics and book-learning, fostered only by ignorant monks and women—at another period blending in the lofty abstracts of the Platonian philosophy. The system of Galen, which fell in the sixteenth century, was speedily followed by Harvey's great discovery of the circulation of the blood. This naturally led to a complete revolution in the opinions of men, and since that time numerous medical systems have arisen, whose several partisans have sought to claim for their various dogmas the title of pre-eminent.

It is not our object to discuss the merits of these numerous pretenders; we only seek for the theory we advocate an impartial investigation and examination of our principles.

We most ardently wish that Dr. Justus Liebig, Professor of the University of Giessen—a name which stands at the very head of the ranks of modern scientific philosophers; a learned and practical physician; honoured by his Prince; one of the most distinguished men of the present day; who has published works which have been greatly commended by all the learned societies in Europe; few men have led such a life of scientific industry, or shown so much ardour in the pursuit of knowledge, which no difficulties could repress; there is scarcely a branch of physical or chemical science to which he has not contributed some important discovery; he has made a vast number of analyses and experiments; his works on animal and vegetable life are splendid instances of great acuteness, profound judgment, and untiring, well-directed labour: it is impossible in this brief mention of his name to recapitulate a tithe of his philosophical labours—we wish, we say, this enlightened and polished philosopher had examined and investigated before he made use of the following words: "Can we wonder that men wholly ignorant of physiology and chemistry, although in other respects rational, should adopt the absurd notions of Hahnemann, that his doctrines should prevail in Germany, and find disciples in all countries?" We think, had he investigated the system fully, we should not have received this condemnation of absurdity, and I think he would have admitted that they harmonise with that nature which in his writings he describes so eloquently.

Hahnemann says, "it is indispensable that every practitioner of the healing art should be a chemist." A physician must not only know scientifically the composition of his drugs, but he must also make himself acquainted with the causes wherefore they are beneficial. There are schools of chemistry springing up in many directions, and it is fitting to allude, whilst on the subject of these schools, to the laudable courage and perseverance of Dr. Sheridan Muspratt, a pupil of the illustrious Giessen Professor, and Professor of the Liverpool College of Chemistry, who, after suffering the most narrow-minded opposition from the Company of Apothecaries in London (or, as that most accomplished gentleman, editor of a medical journal, that was conceived in distress, born in poverty, reared in scurrility, and matured in abuse, would designate them, "the Old Hags of Rhubarb Hall"), they having refused to accept Dr. Muspratt's certificates—a gentleman prepared by nature, by edueation, and by his habits of study, for effecting such an institution for the benefit of his fellow-townsmen—succeeded in carrying out his able plans, and has established a College of Chemistry in Liverpool, that gives promise eventually to surpass its envious oppressor. Unity is strength. If we persevere, we shall have our College.

(To be continued.)

LETTER TO ROBERT CHRISTISON, M.D., V.P.R.S.E.,

AND PROFESSOR OF MATERIA MEDICA IN THE UNIVERSITY OF EDINBURGH.

No. II.

SIR,—The concluding paragraph of my last letter, inclusive of criterion and deduction, illustrate the flimsiness of the partition separating the trading from the scientific features of the profession; such intricacies were safely kept from the public gaze, until a bold-hearted physician, some ten years ago, dared to lay bare the wheels and pinions composing the moral machinery of the profession. Mankind owe that physician a deep debt of gratitude, although he somewhat unscrupulously built a system of his own upon the Hahnemannian doctrine, and christened it by a new name. Such trifles are so common in the profession as scarcely to be deserving of notice, indeed the plagiarism might be called "strictly professional;" for example, from Mesmer's discovery we derive "hypnotism," "electro-biology," "odyle;" and from Hahnemann's discovery we derive "chrono-thermalism." The process, you will observe, is exceedingly simple; merely coin a name (it *must* be from two or more Greek words), apply it to any doctrine or thing already known, but be prepared to insist on its perfect originality, and the thing is done. You will observe that the manufactures above quoted have been successfully carried out by members of your party, partisans, if not believers, in allopathic therapeutics. Nay, the trade in "marvels" may "bend the noble nature" of one man as easily as the "trade in books" may "bend the noble nature" of another. You see, therefore, what a beautiful problem medical morality is, and how little it differs in allopath and homœopath, in hydropath and mesmerist. Alas! human clay is human clay, very little above brick-making, or "stopping a bung-hole," and science puts but a thin glazing over it, after all; it is much the same whether within or without collegiate walls, and if now and then a little may be found of porcelain purity, how rarely can it be mistaken for Dresden or Sevres!

But your inaugural address is far from uninstructive; it gives the graduates undoubted evidence that they have not got what they were in search of: but with instruction it combines amusement, for the repeated offers of friendly assistance in that barren, untrodden arctic circle of therapeutics having led us on, and on, and on, in hopes of better things, you say, "I am afraid I can add nothing farther to encourage you, in the brief time allotted me in these observations. But I may perhaps aid some of you to avoid, in your inquiries after truth, the snares of imposture and by-ways of delusion, into which in these days, perhaps more than at any prior period, the young physician is apt to be betrayed. Do not, however, overrate my capabilities in this respect. Your time will not allow me, though I were *able* otherwise," etc. Now, with many thanks for this kind offer (which, when we remember that the graduates are all "polished off" and licensed to practise their trade, and have no intention of attending any more "*courses*," may be considered "as all in my eye," etc.), there is no chance whatever of any one overrating anybody's capabilities in developing therapeutics into a healthy science. You need not be in the least afraid of such an occurrence, the thing is literally impossible. Nor is it any detriment to you who have so justly earned a permanent station among men of science as a toxicologist and analytical chemist, that you are as feeble as any other man when you touch upon a science which is no science at all; which has arrived at the most humiliating position in the estimation of all medical men above mediocrity in intellect and acquirements. No man knows this better than you do, and knowing it, you would do well to pause ere you use so unsparingly such terms as "knavery," "imposture," and "delusion" to any innovation, how little soever such innovation may square with your notions of probability; for how easily may the innovator cast back the retort, if it pleaseth him, "Every man is the best keeper of his own conscience."

You think it necessary, however, to account for the non-advancement of therapeutics, by saying it is simply on account of its "difficulty," "the unsatisfactory condition of the subject," "and the seductions of simpler and more promising pursuits."

Can "difficulty" be assigned as a cause for this? Why, eighteen hundred years before the Christian advent, the Hindoo in his hamlet, the Chaldean in his watch-tower, could gauge great globes and calculate dread comets; and eighteen hundred years after that era, a medical philosopher cannot expound the intrinsic value of a five-grain pill. It *may be* neglect of the subject "for more promising pursuits," and I believe *it is so;* but if from being on a wrong path we get on no faster on our journey than we have done during the twenty centuries you boast of, the public may get tired of waiting, and they are tired of waiting. How comes it, then, that one man of science, the astronomer, can predict to a nicety the advent of

Hosted by Google

a star, a planet, a comet, an eclipse, centuries before it does come; nay, that he could do so three thousand years ago, and that in 1851, the accumulated therapeutic knowledge of as many years cannot span with any certainty the period of action of a scruple of jalap? Simply because the astronomer bases his calculation on an unerring law—a fact—whilst the therapeutist scorned a law, because he could not discover one, and remained ill-contented with a fallacy.

I now come to the analysis of a most important portion of your address, wherein you point out the few triumphs, the few great truths, that must still keep the wreck afloat; and what do we find? that you despatch them as summarily as if you were truly ashamed of them. It reminds one of the Irish cabman's "keeping a bit of raw for dashing through the town." But again, what do we find? "vaccination." Alas! poor Jenner, look up, if only for a moment, and record the fact, even with a tear! "Scurvy," "alkaloids," "delirium tremens," "stimulants and opium," "quinine!" Whisper it to the shade of Samuel Hahnemann! "*Calomel* and *Opium!*" bear witness, ye patients with spongy gums, and perforated skulls, and nightly aching limbs, to "*Calomel* combined with *Opium.*" It is the best thing for you imaginable; please to be helped to a little more; it will take down your inflammation, if you have any; it is strictly antiphlogistic, according to schools. But, above all, we find, as the crowning triumph, the "modern treatment of the calculous diatheses"—for which, in the very next edition of the "Dispensatory," we expect to find a universal elixir worthy of Paracelsus, and far more valuable than Cleopatra's extravagant draught (a shocking sign of the druggists of those days), which dissolved pearls, whilst the modern one can dissolve a stone in the human bladder. But until the next edition does come out, let us see what therapeutics can do for the calculous diatheses. Admitted, then, that with the assistance afforded by the present condition of therapeutics the solution of a calculus has not been arrived at; it may still be hoped that the diathesis or tendency to the disease can be arrested. Can you name a drug or a combination of drugs that (irrespective of baths and other hygienic means) can increase the secretion of urea, or limit the secretion of that substance when in excess? Can you control, by any drug or combination of drugs, the elimination of uric acid for one single week after the discontinuance of alkalies? Can you convert oxalic acid into sugar, or sugar into oxalic acid—the chemical difference, as you well know, being quite infinitesimal already, not worth mentioning? Can you name any drug that can remove cystine from the renal secretion, or render it soluble? Can you, for a single day, render alkaline urine acid? If you can do so by drugs, give it out to the world, and witch us all with it; for as it is, "the modern treatment of the calculous diatheses" is the grossest specimen of palliative hocus-pocus. But, Sir, I can tell you a secret worth knowing, if you will promise not to divulge it; these diatheses, with the exception of the phosphatic, are all frequently and permanently cured, without medicine of any kind, by those men whom, according to your address, the "auri sacra fames" has tempted "to preside over these "Neptunian mysteries" of hydropathy: your contempt for their system cannot possibly exceed their contempt for yours. An upright conscience is the only nobility of professional nature, and what save this can enable each "innovator" to wage successful war with such unequal numbers? but estimating the science of therapeutics exactly at the value assigned to it in your inaugural address, it gives rise to grave thoughts indeed, when we are reminded that the appraiser so lately participated in a professional and official demonstration against his own colleague, because he valued it as lightly, and did not trust to it in his private practice. If, therefore, by your address to the graduates, and your participation in the professional intolerance of the day, you have roused a most just recrimination, be assured that it is not to detract from the estimable points of your scientific, much less of your private reputation, to both of which I and my party are all ready to do full justice. But, Sir, if, as it has already been, we must needs keep our hands upon our weapons to protect our own, be assured we have already made far too good a fight to give in now; for so firm is the belief of every homœopathic convert in the truth of his law, and so constantly is his faith confirmed by daily results, that not a man of them but will say in its defence—

"lay on, Macduff;
And damned be him that first cries, *Hold, enough.*"

I have the honour to be, Sir,
Your very obedient servant,
Sept. 25, 1851. SIGMA.

DIPLOMAS; A CHARTER; AN EXAMINING BOARD.

By Dr. Fearon.

THE Northern Colleges have by their recent acts brought into an acute state

Hosted by Google

that contest between the two schools which had been hitherto proceeding in a semi-active manner, and for this all good homœopaths ought to be especially thankful to them; as we may now hope that we shall be freed from the danger of a mongrel practice—a species of medical Puseyism—increasing in our ranks. The blow, however, which the Edinburgh University has aimed at us, will very probably recoil with fatal effect upon itself. In seeking to extinguish us, it is not unlikely that the professors will find, in the course of a few years, that they have put an extinguisher upon themselves as an Examining Board; for if we establish an efficient Examining Board of our own, as homœopathy progresses, students may go to Edinburgh for some courses of lectures, but the chances are that the majority will prefer being licensed by the Homœopathic Board of Examiners. Having compelled us, for safety sake, to enter into an investigation of our respective positions, the Northern professors may find that they have aroused in us an analytical spirit which will not be contented until it has thoroughly examined all the machinery connected with allopathy, and thrown aside or re-cast all those parts which are not in keeping with our altered circumstances. I believe that even in our own ranks scarcely any one has yet comprehended how complete a change, not only in its practice, but even in its very machinery, the profession has been destined to undergo by the enunciation of the doctrines of *similia similibus curantur* and of small doses.*

It was recently stated by Dr. Strong, in the *Homœopathic Times*, that we did not appear to have made out a sufficient case to warrant an application for a charter, supposing us to wish for one. Now I think that he and others, who may be of the same opinion, have fallen into this error in consequence of their not having sufficiently considered our position. The very fact of our being engaged in promoting so radical a change in the practice of medicine as we are, forms of itself a sufficient reason that we should establish a school for teaching our doctrines, and an Examining Board for ascertaining whether those students who intend practising as homœopathists have first taken the trouble to acquire a proper knowledge of the system.

It seems to me that for some time past the homœopathists have been pursuing a course which was extremely likely in the end to bring diplomas into disrepute, while Edinburgh and St. Andrew's have unwittingly come forward to their rescue. To understand this, we must take into consideration the nature of a diploma.

A medical (or surgical) diploma is a document granted by certain authorized parties to a student, in testimony of his having gone through *all* those studies which are considered necessary to qualify him for practising his profession, and of his having passed through a satisfactory examination in ALL the branches of the healing art. Under such circumstances, the existing medical diplomas of this country are, in the hands of a homœopathist, more ridiculous than the tragedy of Hamlet with the part of Hamlet left out by particular desire; since in the examination to obtain them, *two* principal parts are omitted, viz., those of the Homœopathic Materia Medica and Practice of Physic. If a diploma thus obtained after only half an examination is to be considered, in the hands of a homœopathist, as of equal value with the diploma in the hands of an allopathist, obtained after a *full* examination in the line of practice which he adopts, where are we to stop? Is there not a danger that the public will come to question the use of diplomas—to ask why, if an examination can be dispensed with in the two principal branches of study, it should not be also dispensed with in the minor ones? and may they not come to the conclusion that diplomas are merely upheld by the profession in order to create a species of monopoly? Such a conclusion, however erroneous, would yet be warranted by the circumstances of the case.

For my part, considering that a homœopathist with no other than an allopathic diploma is a "doctor" only according to the letter, but not according to the *spirit*, of the law, I should refuse to give him that title, if he demanded it as a right, and should only accord it to him as a matter of courtesy: and this remark is applicable, not merely with regard to the minor diplomas of St. Andrew's and Aberdeen,—scorned as they generally are by even the allopaths,—but also to the higher class ones of Edinburgh, etc. In fact, the only diploma of an allopathic college which can, in the possession of a homœopathist, be considered as a *perfect* diploma, and as having lost nothing in value by the change of creed of its holder, is that of the *London* College of Surgeons, since that college alone does not profess to examine in the Practice of Physic and Pharmacy. Its very imperfectness as an allopathic diploma

* Wherever there has been a false creed, a degree of faultiness and imperfection will be found to pervade all the means which have been devised for its propagation.

Hosted by Google

renders it the less objectionable when held by a homœopathist.

If additional reasons for establishing an Examining Board of our own are desired, we may derive one from the consideration that the present plan of compelling the student, who has become convinced of the truth of our system, to get up all the trash of allopathy, and to pass an examination in it, before he can be allowed to devote himself to the study of homœopathy, is no small hardship upon him; and the hardship becomes a very serious one, in the case of those students whose pecuniary means are just sufficient to enable them to go through the ordinary curriculum of study, but are insufficient to allow of their devoting an extra year to the study of a new system before obtaining employment.

A short time back I urged a student, to whom I had lent some books upon homœopathy, and some of whose relatives I had attended, to continue his investigations into the system. His reply was that he had already a strong suspicion of its truth, but did not yet wish his faith in it to become more confirmed, as it would be some time before his studies were completed, and he should then have to pass an examination in allopathy, and were he previously to become quite convinced of the truth of homœopathy, he should lose all feelings of interest in studying the allopathic Materia Medica, and his mind being no longer in his task, it would become a disgusting drudgery to him, and would consequently cost a far greater expenditure of mental effort than under ordinary circumstances. I felt the force of his objection, and ceased from urging him further.

The term "trash," as just employed, may seem a harsh or even unjustifiable one; but rightly understood, it is not. There were many forms which the Pantheists considered it necessary to be gone through in order to be made one of their priests, but which, when viewed in connection with Christianity, were simply "trash:" there are many likewise which may seem essential to Roman Catholics, but which to Protestants are "trash." So also there may be various items of study which the allopaths may consider absolutely necessary for their mode of practice, but which, in relation to our more advanced and purer one, are mere "trash."

A convert to homœopathy, who was possessed of a surgeon's diploma, once intimated to one of our well-known homœopaths, who is himself an M.D. of Edinburgh, that he intended to return to that place for a season, in order to obtain a physician's diploma. The reply was, "You have already a legal diploma—why not be content with that? to obtain the other you will have to learn a quantity of trash, which will be of no use to you in your future practice, and which you will be glad to forget as soon after your examination as possible."

I cannot understand how any one, who is already in possession of a legal diploma, can suppose that he will acquire any additional title to the confidence of his patients by going to St. Andrew's or Aberdeen, and getting himself tested and stamped by the professors of a creed opposed to his own,—a creed too which he is endeavouring to undermine, and which he daily proclaims to be false and dangerous. Such diplomas can only be obtained in one of two ways; either the candidate deceives the examiner by leading him to suppose that he will treat diseases in a mode in which he does not intend to treat them, or, the examiner being desirous to obtain the graduation fees, and the candidate to obtain the diploma, there must be a tacit understanding that each shall shut his eyes to the facts of the case; and thus there will be a collusion between them to humbug the public. A diploma of this character seems to me of no more value than waste paper.

Another reason in favour of an Examining Board of Homœopathists is furnished by the fact that it would much increase the chances of his becoming a good practitioner, if from an early stage of his studentship the student had his mind fixed exclusively upon the mode of practice which he intended to follow, instead of upon that which he meant to ignore. There can be no question that a much superior body of homœopathists would arise, if students were required first to learn the system, and then to give proofs, by an adequate examination, that they had learnt it, before they started as homœopathic practitioners, than is likely to be the case at present. They would then start from a point of knowledge which is now only arrived at after the practitioner has groped his way by means of experiments upon patients during the first year or two of practice.

Should there be any difficulty in obtaining a charter, or should the obtaining of one involve any large expenditure, I can see no reason why we should not dispense with it, and proceed as soon as we can to form a school and appoint a Board of Examiners of our own. True, the diplomas granted by such a board would have no legal value, but that would be a small matter, providing we succeeded in inspiring

Hosted by Google

the adherents of our Cause with a respect for and confidence in them. It must be borne in mind that we are medical dissenters, inasmuch as we dissent from and wish to reform the hitherto existing medical practice. Now what have other dissenting bodies done? what course did the early Christians pursue? Did the Apostles, dissenting as they did from the established religion of their day, advise the Christian communities to wait until they had a charter from the governing powers, before they ventured to examine the eligibility of candidates for admission into their body? They, indeed, knew that they were in possession of a truth from on High, and therefore needed not government sanction for adopting all requisite means for its propagation. But we also know that we are in possession of a heaven-ordained truth. Why then should we, more than they, remain in listless inaction, until government, "for a consideration," should be pleased to put a stamp upon us, just as it, as a *quid pro quo*, puts its stamp upon the compounds of Morison, Holloway, and Co.*

Look at the history of the different modern dissenting sects, the Independents, the Baptists, the Quakers, and the Free Church of Scotland. Did they pretend that it was necessary to wait for a charter before they could teach their systems or examine students and ordain ministers? Their unorthodoxly-ordained ministers are ineligible for government places, and for livings in the state church, and in like manner our unchartered diplomas would be *for a time* ineligible for the army and navy and other government appointments; but surely we could bear such exclusion as well as they do.

All we have to do to ensure our diplomas being respected and valued, is to take care that such a body of examiners be chosen as would be calculated to obtain the confidence of the homœopathic public, and this could be done as well without as with a charter; for I do not suppose there is any peculiar mesmeric virtue in the latter to ensure an infallible state of clairvoyance on the part of those who would have to select the examiners. For my own part, I believe that truth in medicine, as well as truth in religion, will be found liable to become incrusted with error, and its progress to be retarded by state connection and government patronage.

* Physicians with only Scotch diplomas cannot now legally practise within a certain distance of London, and are ineligible for election to some of the metropolitan hospitals, and, if I am not mistaken, throughout England Scotch diplomas have no legal value, and would only be recognised in a court of law through courtesy.

If we had a council for the homœopathic body, similar to that which I some time ago proposed, the arrangements for forming a Board of Examiners and the selection of the latter would naturally devolve upon them. This project of a council I have not dropped, but intend shortly to take some further steps regarding it.

The University of St. Andrew's having *peremptorily* demanded back the diploma which it had conferred on Dr. Hale, that gentleman was of course precluded from complying with the demand at the time it was made; but I should certainly now advise him to offer to return their diploma, if they will return his graduation fees. He will be virtually not a whit less of a "doctor" without it than with it, it being, in fact, of no practical value to him, as he was previously in possession of a legal diploma. Should it be returned, he can perfectly well continue to style himself "doctor," the designation being merely employed as a notification of the line of practice (that of a physician) to which he intends to devote himself.

THE
HOMŒOPATHIC TIMES.

SATURDAY, OCTOBER 4TH, 1851.

"THE homœopathic Cause must flourish." So said a friend of ours the other day, when recounting the success of the past five years; and in this sentiment our readers as well as ourselves will doubtless agree. But the exertions used, which have brought us indeed to this favourable position, must not be relaxed; on the contrary, they ought to be quadrupled, if possible, to put to blush and to shame our adversaries, who, knowing our progress, endeavour to treat us with undeserved scorn, and to repudiate our principles.

Nothing is easier, the allopaths think, than to ridicule homœopathy, believing that in this manner they can stifle the truth. As yet they have monstrously failed in doing so, and the future, if we may judge from the past, presents even a less cheering aspect in this particular. Racked to their wits' end, they have used up nearly every available argument; and now, unfortunately

Hosted by Google

for them, they discover that they have made less impression upon the public than in days gone by. Having studiously palmed off all descriptions of assertions, and having condescended to manufacture lies, they have been caught in their own snare, and are now proportionately distrusted. They have truly grown lean upon our good fortune, and vent their spite through every channel at their command.

All this, however, should be accepted by the disciples of Hahnemann as an assistance to the development of the philosophy which they have come forward to promulgate. The interference of their opponents is the key-note of success. In whatever shape or through whatever source it may transpire, they may rest assured that it arises from the appreciated movement making by homœopathy. Allopaths feel it and see it daily, and fearing to acknowledge the prejudices which surround their own system, they are unprincipled enough to deny the feasibility of the reform sought to be established.

It will not suit them thus to dally with the pure truth evolved through homœopathy. A tardy recognition of the humanising influence it exercises on the world at large may perhaps come when it is too late. The public are already alive to the benefits to be derived from the extension of this mode of practice, and, examining for themselves, will decide accordingly.

Review.

THE GENERAL HOSPITAL, BIRMINGHAM. *The Crisis; another Warning addressed to the Governors.* By THOMAS GUTTERIDGE, M.R.C.S.

WE have received a pamphlet bearing the above title. Its contents are evidently directed against what is alleged to be the mismanagement of the General Hospital in Birmingham. With the views of the author, sound though they may be, we cannot altogether coincide, because they fail to interest us in their practical development. From an allopathic administration in hospital affairs, we can very well understand how mismanagement and lavish expenditure may go hand in hand, and we have no doubt that in this and other establishments of the kind, there is plenty of room for reformation, if the public themselves would set about correcting existing evils. Until that period shall have arrived, we fear little good will be effected.

Correspondence.

To the Editor of the Homœopathic Times.

DEAR SIR,—I have read with pleasure various communications from the pen of Dr. Rosenstein in your valuable journal, and regret that I must beg to differ with him as to the sentiments and assertions contained in his article (in No. 108) on Allopathic and Homœopathic Quackery; although my remarks may appear to be impregnated with the odour of the Pharmacy Homœopathic, I trust, should you think proper to insert them, you will give me credit for sincerity.

I intend commenting slightly on each assertion or sentiment, and conclude with proposing what in my opinion would advance the cause of homœopathy.

In the Doctor's opening paragraph, he aludes to what he has been pleased to call the excess of freedom in this country, by the people of all classes being allowed to patronise patent medicines; to the mercenary views of the Chancellor of the Exchequer, and of the vendors.

On referring to the Austrian Government returns of the mortality in cases of cholera in Vienna, the Doctor will there see that of those who suffered from that disease, and were treated allopathically, or by what is still by the majority considered the legitimate mode, 30 per cent. died, of those treated homœopathically, only 8½ per cent. died; and at Wishney Wolotschok in Russia, those treated allopathically and those who were left to Nature and their own caprices were on a par; so that those without medical treatment stood as fair a chance of recovery as those who were treated by the practitioners of the old school. Now as Rome was not built in a day, neither is it possible that all the world can be supplied with qualified medical men of homœopathic principles in our generation. Still, although the people have not the evidence of these returns before them, they have the *great fact* that they have as much chance of recovery without the assistance of the practitioner of the old school as with him.

The Doctor then asks why the Government allows this patent-medicine vending, and why these vituperations are heaped on homœopathists? This is begging the question, for the patent medicines are secrets, or are supposed to be; the homœopathic chemist has no secrets, even in the case of the *Euphrasia* referred to: or else the Doctor does not understand the character of the English people; the government of a free people not having the power to say at what price or in what manner eternal life shall be bought, much less what means shall be adopted to restore health. Then again it is admitted, on all sides, that persecution tends to make converts; for the reason that the public inquire into the subject, or the reason that persons are persecuted, and the greater the question at issue the greater will be the reaction.

The Doctor then, in a minor key, tells us

Hosted by Google

"the medical man has much to contend with;" if truth is his cause, so much the more glorious the battle. Still it is my opinion that the patient has, under certain circumstances, *much more* to contend with; for such is my confidence and that of many of my lay friends in homœopathy, and the horror I have of the after-effects of *Calomel*, bleeding, etc., that rather than be treated according to the old practice, I should think "to do nothing" by far the best policy.

He then alludes to the mischief arising from taking patent medicines. In answer to this, I think I have just shown that the mischief is as great by taking allopathic doses prescribed by legitimate practitioners as by Morison's pills or any other patent medicine.

The successful treatment of a child by Dr. Rosenstein is then introduced. Of this few if any of your readers will doubt. After this comes a desperate onslaught on the works on homœopathy and those who use them; and something about a lady who bought a bottle of Eyebright (*Euph.*) of a chemist. This, I think, will not interest either your lay or medical readers, so I shall pass it over, reserving to myself as to who was most to blame, the lady or the chemist.

We then come to the question as to the right of the chemist to prescribe, and as to what they know, and with what the Doctor thinks they ought to be content.

As to their right to prescribe, if they are competent to do so, none but those who think they ought to have free trade in every trade but theirs could object; but for the policy, I think it *decidedly bad*, more particularly if there is a practitioner at hand; and as to what they know of this or that, I say it is a mere assertion on the part of the Doctor to say, "they know nothing." But with reference to what they ought to be content with, this is a matter on which the learned Doctor may be able to be enlightened; and to this end, I would merely ask him to add to what he has paid his chemist within the last twelve months the amount he would have allowed his patients to have expended with the chemist (if it had been under his control), multiply that by the number of homœopathic practitioners, and divide by the number of chemists, he will then be able to form an opinion of what a chemist ought to be content with, instead of jumping at conclusions, under the idea that they do things so much better in Germany.

In reference to the attenuations, which I am informed by qualified homœopathic practitioners is *still an open* question, the Doctor has clearly shown that the veriest tyro could not have been more at fault than to have selected an attenuation that "did not produce the least effect."

The protection afforded by the Governments of Germany stands high in the Doctor's estimation. This, I think, does not accord with the views of Englishmen; and, for the information of your readers, I will endeavour to show how *effectually* the Germans are *protected* by the Governments from every description of quackery. By their antiquated arrangements, they require that every person intending to establish himself in his *trade or profession* (*or to marry*) shall have served his apprenticeship, travelled for three years, served two years in the army, and given other proofs of his capabilities. These are some of the reasons why so many are met with in other countries, from which they are liable to be recalled at a short notice; failing this, or not returning at the proper time, they forfeit their rights. The moral or religious effects of this it is not my intention to discuss, but it is my opinion that they do not tend to the desired end, in support of which I would cite the progress of homœopathy in America.

My object in thus noticing Dr. Rosenstein's remarks, is not with the presumptuous wish or intention of attempting to alter his views (he as one of the great family having a right to his opinions), but to endeavour to spread the Great Truth which the Great Architect of the universe in his wisdom has communicated to man, and to this end I would propose that course which is only now becoming practicable, that our qualified medical practitioners should prescribe instead of giving the medicine, this I consider would give increased confidence; and as society tolerates the hanging out of the sign of the chemist, only there the information is to be sought, he would be at liberty to speak of the advantages of homœopathy, and to hand a list of the homœopathic practitionera in his own and other localities.

Yours truly,

Sloane Street. CHARLES LANE.

To the Editor of the Homœopathic Times.

SIR,—I did hope, for the sake of that internal peace which is so essential to the success of homœopathy, that the hackneyed question of the union of the two London Homœopathic Hospitals would be allowed to rest in undisturbed oblivion; and I think that Dr. Fearon has betrayed a sad lack of judgment in reviving the subject at the present juncture, and still less good taste in the manner of doing it. His letter shows how indiscreet it is for a person to write about matters which he does not understand. I happen to be in a position to know that the "Layman" to whom he so pointedly and unwarrantably alludes, has, from first to last, most scrupulously abstained from interfering in the affairs of the London Homœopathic Hospital, and that he exercises at the present time no more control over its management than Dr. Fearon himself. Besides, the idea of this gentleman exerting "a sort of mesmeric" (or any other) influence over the Board of Management, "so as to make them act in a manner not consonant with their better judgment," is abundantly refuted by its own absurdity.

But, apart from all personal considerations, there are many good and sufficient reasons why the two hospitals should not be united. Dr. Fearon himself, furnishes an excellent one. Without informing us of his reasons for changing his opinion, he admits that he was, in the first instance, in favour of two hospitals on a

Hosted by Google

small scale, in preference to one larger, "thinking that the species of rivalry which would exist between them might have a wholesome effect in urging each to increased exertions."

Has he been disappointed in his expectation? Does he believe that without this rivalry the homœopathic public would have been so closely canvassed as it has been—that such festivals would have been celebrated—such funds collected, or that at the present time we should have possessed a single hospital affording accommodation to as many patients as the two separately? If he believes this, I do not. On the contrary, I am persuaded that it is to this rivalry and the stir in the homœopathic world, to which it has given rise, that we are mainly indebted for the sudden elevation of homœopathy to its present commanding position, and the consequent dismay in the ranks of our opponents. This rivalry, which, whatever may have been its pristine character, is now assuming a generous and honourable tone, if not injudiciously interrupted, will continue to exercise the same wholesome influence; preventing that apathy and indifference which a monopoly too often engenders, and keeping alive that vigilance and activity which are the natural offspring of competition.

Again, the influence of these institutions being rather *moral* than physical, that influence necessarily increases in proportion to their number. Nothing is easier than to get up *one* institution in connection with almost any quackery or professional hobby. Of this there are numerous instances in this metropolis. But there is this distinguishing mark about them, that originating for the most part in, and being sustained by, the determined perseverance of a single individual, they generally expire with their authors, and have therefore no power of multiplying. Not so with those institutions which, like our hospitals, represent a broad principle in science. The multiplication of such institutions is one of the strongest proofs of the soundness of the system from which they spring, and of the firmness of the hold which that system has upon the public mind. Let one of our hospitals fail, or the operations of the two become curtailed by an amalgamation, and it would instantly be construed, and fairly so, into a sign of hollowness in the homœopathic system, and of a corresponding failure of public confidence in its healing powers. However desirable therefore it might have been in the first instance to have but one hospital, now that the two have commenced a separate existence, they must stand or fall separately.

One word concerning the cry which is so constantly raised for large hospitals. I think this cry very unreasonable. The time has not yet arrived for large hospitals. Homœopathy itself is but in its infancy in this country, and our hospitals, small as they are, representing fairly and honestly the actual condition of the science, are quite as large as the circumstances of the times warrant us in expecting them to be; and are much more likely to be permanently successful, if allowed to grow and expand *pari passu* with the extension of homœopathy, than if they are forced up into an unnatural, precocious, and inconsistent maturity.

Permit me, in conclusion, to suggest to Dr. Fearon, whether he might not more profitably occupy his time and attention in urging the homœopaths of Birmingham to establish a hospital, than in tendering gratuitous advice to his metropolitan brethren, who thus far, at least, have shown themselves quite equal to the management of their own affairs.

I have the honour to be, Sir,
Your obedient servant,
London, Sept. 17, 1851. LONDINENSIS.

To the Editor of the Homœopathic Times.

SIR,—The subject of homœopathic chemists prescribing has been already alluded to in the *Homœopathic Times* (Nos. 108 and 110), by Dr. Rosenstein and J. Brown, Esq.

I quite agree with those gentlemen that homœopathic chemists ought not to prescribe, it being distinctly the province of the physician; and it were well if the same law which confines physicians and chemists to their respective departments in Germany had force in England.

Would it not be *wise* to take *this* into consideration, as well as the protection of homœopathic medical students? An exception in favour of the physician in very acute cases, where delay would be dangerous, of course must be made. It would be a means also of preventing unqualified persons from assuming the title and occupation of "chemists."

Chemists would then be supported by the prescriptions of the physician, and not dependent on selling "shilling bottles of medicated globules." Moreover, homœopathy itself would thereby be greatly augmented.

OMEGA.

To the Editor of the Homœopathic Times.

SIR,—The following instance of orthodox rage occurred an evening or two ago, and may be worth recording, both as a subject for laughter and as exemplifying the spirit of the present day.

A gentleman, a stranger in the neighbourhood, and moreover an entire stranger to homœopathy, was recommended by a friend to supply himself at my shop with a small quantity of *Tincture of Arnica*, to apply to his corns; on approaching my establishment, and not being aware that there was war between the two systems, he made bold te enter the enemy's camp, *i. e.*, the shop of an allopathic chemist (who by the way also writes himself Doctor and Surgeon and Accoucheur), for the purpose of asking the whereabouts of the homœopathic chemist, innocently supposing he was committing no intrusion. He civilly inquired of a lad behind the counter if he could tell him where the homœopathic chemist's was, somewhere in the neighbourhood. The boy stood confused for a few seconds, not knowing what to reply, when suddenly there darted from behind a desk, foaming with rage and fury, a gent, who sputtered, "What business had he to put his foot inside his door to ask such a question?" Quoth

Hosted by Google

he, "Am I, a legally-qualified and many-years' established member of the orthodox profession, to be insulted by inquiries about that damned humbug, the grossest fraud and deception of the day?" The astonished gentleman remonstrated with the man of pills, and demanded how he could behave in such a manner to a stranger to the neighbourhood, for asking a simple and a civil question; nevertheless, the anger of the pilulist rose higher and higher, the violent motions of his arms indicating that it would be a relief to him, if he only dared, to pitch into the stranger; fortunately the counter of the pilulist separated them, or the poor gentleman might have received striking proof that there is some great difference or other between allopathy and homœopathy; however, he took the hints which were thundered at him to leave the shop *instanter*, marvelling as he went, whatever could have raised the dander of the doctor, who had treated him so *unfairly*. The Wakleyism and Billingsgate he had encountered, however, produced this remark, when he told me of the above passage of arms a day or two afterwards. "I now see," said he, "that the shoe must pinch very hard indeed, to have such an effect as to cause a man belonging to a liberal and gentlemanly profession to descend to use vulgar abuse, and put himself into a violent rage at the mention of the word homœopathy; but what I have just encountered convinces me there must be something in it worth examining, and I shall therefore turn my attention to it." This is not the only case that has come to my knowledge of converts being brought over to homœopathy, simply by the abuse and scurrility heaped on it by people who call themselves gentlemen. I know of at least one medical practitioner who has been converted to homœopathy within the last three months, only by reading the incessant attacks made on it by the *Lancet*, which induced him to inquire a little, and this brought him in contact with homœopathic physicians, and enabled him to see the success of their practice, which has resulted in his becoming a medical heretic himself, and now he is a hopeless and incorrigible homœopath.

I send you my name and address, and am,

Yours, etc., P—

HOMŒOPATHIC CHEMIST.

Miscellaneous.

PANIC AMONG THE DOCTORS.—In consequence of the panic exhibited by the members of the Provincial Medical and Surgical Association, at Brighton, from their loss of patients and practice, and their failure to check the progress of homœopathy, hydropathy, and mesmerism, by sophistry and slang, it is suggested by a friendly homœopath that they should join those of their alarmed brethren in London who may be too old or too prejudiced to learn, and, with Punch and his wise dog Toby at their head, present a petition to her Majesty the Queen, praying for a suspension in their favour of the laws of freedom of thought and liberty of opinion. Something like the following would embody the feeling and speeches of the assembled association:—

"May it please your Majesty, etc.

"We, Mr. Punch, Toby, and the undersigned members of the Provincial Medical and Surgical Association, pray for a monopoly in physic and for protection. Homœopathy, hydropathy, and mesmerism are seducing and curing our patients.

"We are all liberal and tolerant, but we have one toleration for ourselves and another for other people; and we consider all who differ from us dishonest rogues and unprincipled blackguards.

"We have consulted General Haynau on our case, and he is of opinion that, if we are weak in argument, and cannot stand the array of facts against us, we should use the strong arm and put down this revolutionary medicine.

"But may it please your Majesty, homœopathy has more than 3,000 medical converts, 'traitors from our ranks,' and we shall be done for without Haynau logic.

"We deny that men have a right to think and act for themselves in medical matters, and we would request that you will have every lady whipped who refuses the lancet and blue pill.

"We pray that Mr. Wyld be directed to erase from the face of the earth a place called Malvern—that hotbed of reform in medicine: our chronic patients are to us as Chancery suits in law; they sing songs of praises in that strange land, and sometimes hang their hereditary crutches on the trees thereof.

"We would express particularly our horror at those little books and boxes that prevent our being called in—we tell our people that they are nonsense and powerless—in the same breath we declare the globules to be deadly poisons—all in vain! it is true we know nothing about them, except that they look small, and, without protection, your petitioners will look so too.

"At our time of life, it is too hard to be called on to learn new systems. What if people don't live quite so long under our way of treatment, the world is populous enough! What if the new system injure fewer and cure more than the old one! The public has no right to think this of importance; Haynau says so.

"We would further request that your Majesty will graciously respect our antiquity and our prejudices, and then

"Your petitioners will ever pray, etc."

Should this petition be unattended to, the friendly homœopath can only recommend one other way of proceeding, and that is that the members of the Provincial Medical and Surgical Association should make themselves at least tolerably acquainted with the practice of the new systems before they attempt to abuse or refute them.—*Worcester Herald.*

Communications.

LETTER TO ROBERT CHRISTISON, M.D., V.P.R.S.E.,

AND PROFESSOR OF MATERIA MEDICA IN THE UNIVERSITY OF EDINBURGH.

No. III.

Sir,—When you favour me with a satisfactory answer to my queries in reference to the allopathic treatment of the calculous diathesis, I shall then, but not till then, be willing to designate your boast of it, by a more gratifying term than the *idle twaddle* I can prove it to be; but having disposed of it, let us carry the investigation into an analogous department, and endeavour to arrive at the true value of a very large class of drugs, which in dispensatories are asserted to possess a power termed "diuretic." Medical students are informed by all allopathic books of the diuretic properties of these; and therapeutic lecturers, to be consistent, must stand by the dispensatories that represent them. Now you know well, indeed no man knows better, that there is no such thing in existence as an allopathic diuretic, yet no change takes place in text-books to warn the student against such fallacy. Can you name any one drug in the long column composing this misnamed class, that can increase the elimination of solids in the renal secretion by a grain; its density by one degree upon the urinometer scale? Until then you have no diuretic; and until then the retention of the term in medical works is only a deception, for it leads the young medical man to think that he has a power over disease which his teacher knows does not exist; and it leads the hoodwinked patient to trust in him. But the assertion that such totally fabulous effects belong to allopathic diuretics, tallies well with the discrepancies of the various dispensatories in point of dose and preparation, so ably illustrated by late articles in the *Times*, and other public prints. I pray you, consult Glassford upon these points, for the latter comes strictly within the pale of forensic inquiry. It must startle the nervous portion of the public to be informed that a dose of a drug, which taken according to the London or Dublin authorities is supposed to be harmless or curative, if taken according to the quantity advised by the Edinburgh volume, is only just inferior to a round of grape or canister-shot in its *certainty of action*. In the very first case in which I am invited to a coroner's court, I shall inquire, with deep contrition for my homœopathic sins, which of these great authorities is most to be depended upon; perhaps some of the local Glassfords may throw some light upon a matter which appears at present to be in a state of *inconvenient* darkness, to say the least of it.

Consideration upon these points forces me back to one of noted interest,—the morality of physic. A veritable Janus! double visaged! one mask of the most noble features, browed with benevolence, conservative of confidence in the midst of families, peerless in principle, proud in its purity; in these attributes justly valued, and in them not one whit surpassed by him whose still more elevated calling it is to teach frail man to soar even above these. Turn round the lay figure, and behold the other mask. Faugh! Are there here any failings to counterbalance those noble traits which I would fain not lose sight of? Bear with me, Sir, and go a masking. Let me conduct you to the great Babylon of our day; we will step into this carriage-beset door, and consult Dr. Smalltalk, whose spoke of the professional wheel is at present uppermost; let us parade our old prescription. If no curled-up lip or shrugged-up shoulder betrays the failing of professional nature, the *Rhubarb* and *Soda* of his recipe will at least denote the retrograde movement of therapeutics to a most becoming and harmless point of simplicity. Have citrates, muriates and sulphates, iodides, proto-sulphates, proto-iodurates, super-sesquinitrates, and bi-meconates been at last replaced by *Rhubarb* and *Soda?* Go to! Dr. Smalltalk, thou art verily an old lady, albeit thou hast "Oxon" after thy name. It is plain thou knowest nothing of the great science of therapeutical chemistry. Alas! poor iron, can such an expenditure of thee be thought of in these days of

Hosted by Google

"rails?" If she only knew it, each china-faced young lady with transparent lips, requires as much of thee as would make a locomotive, leaving out the brass.

Let us ask for Dr. Smalltalk's views on medical morality, and draw him out upon the subject of Scotch Universities, and hear what he has got to say on the obstetric value of chloroform, and the relative merits of the tractor. If an anatomist, as he doubtless is, perhaps he can tell us the systolic and diastolic action of that man's heart, who, when his only child was in peril, trusted its precious life to *homœopathy* in the hands of a brother professor, and trusted not in vain, but who, nevertheless and thereafter, graced with his august presence a meeting of the Faculty, called for the purpose of persecuting the practitioner whose aid he had invoked. Did that parent get up to defend him? Did he strike one blow, even — only one? We have not heard of it, if he did; but this we do know, that the "resolutions" against the practitioner were "*unanimous*." Go forth! Professor Henderson, go forth! and battle for the cause you have so chivalrously defended; a great truth has armed you in a panoply of steel, a clear conscience covers you with a trusty buckler. Go forth! and again, and again, and again save the life of that child; it *may* hereafter repay the debt of gratitude its parent has refused you; the moral odds between the systems will soon be equalized. Let Dr. Smalltalk review the *Monthly Journal of Medical Science*, and begin at the very beginning, the wrapping-sheet. Lo! that "galaxy of talent," the absence of which in the neglected therapeutic field you so deeply deplored in your inaugural address, has at last found an object on which to concentrate its gigantic energies. Does it require six such leviathans in science to keep the chin of a two-shilling periodical above water? No wonder that a homœopath fights a winning fight against any numbers. But it is no difficult matter to weed from among them those who are supported by, from those who support the lavish expenditure of type and printer's ink. To the "six" we throw out a suggestion; resolve yourselves into a committee for the investigation of therapeutics; let any three overhaul each drug in their Materia Medica; let the remaining three make experiments in homœopathy, and publish them; re-name the *Monthly Journal of Medical Science*, convert it into the *Quarterly Journal of Therapeutic Inquiry and Homœopathic Experiment*;" the names will make it sell, if it were not worth a maravedi. You would thus shine forth as worthily occupying the neglected field of therapeutics; but leave out such bright gleams in the horizon of medicine as are betrayed by the easy and friendly terms upon which we find (at page 301 of your September issue) that the two most prominent surgeons of the Modern Athens live within the same half mile. Keep these men asunder; they will fight until nothing is left save the coxagral bones. Nor would the two-shilling natural proportions of the "Journal" bear stuffing with the whimpering letter of a vanquished man of science, who, having burnt his fingers, most unaccountably administers to himself a conscience-stricken castigation. A gratuitous self-sacrifice we can conceive no man making, whose judgment in such matters exceeds the elevated standard of a gosling's.

I fear I have been a heavy affliction to you, but the times demand it. But one word on "consistency," the want of which has been laid to the charge of Dr. Henderson, because he retained his Chair of Pathology, his therapeutic principles having undergone a change. Placed in juxtaposition with the professor on the point of consistency, I think your "inaugural address to the graduates of 1851" will render the therapeutic chair a somewhat trying seat to sit upon, for with open war formally declared against us by the faculty to which you belong, and your department embracing the point at issue, we are not likely to permit you to remain as one of those

"Gentlemen of England, who sit at home at ease,"

for with all our faults you will admit that we are rather plucky fellows than otherwise. For my part, I shall watch with deep interest the advancement which therapeutics make before 1852, and I promise you a few remarks thereon; never mind the "difficulty," but put your shoulder to the wheel, and let us see what you can make of it, for, according to your address, none of the "galaxy" have tried as yet, the subject being so uninviting, which is rather a pity, as sick men have been waiting, and you would forget the discrepancies of the "dispensatories." Meantime, having settled our "drug account," I shall regularly peruse the *Monthly Journal of Medical Science*; but keep your weather eye open, for being at war, by your own manifesto, I shall pitch into you and your University without the least ceremony, that moment you leave a therapeutic opening.

I have the honour to be, Sir,

Your very obedient servant,

Oct. 4, 1851. SIGMA.

CLINICAL OBSERVATIONS ON THE USE OF ASTERIAS RUBENS, A SPECIES OF ZOOPHYTE.

By Dr. Petroz.

Communicated by Dr. Rosenstein.

Dr. M. Petroz, the well-known homœopathic physician, has lately given us the pathogenesy of this valuable remedy in the *Journal de la Société Gallicane*, 1850, which I hope to communicate in the next number of the *Homœopathic Times*.

M. M—, a general officer, aged seventy-four, suffered from the fatigues of the Egyptian campaign, being subject to vertigo and violent shocks in the head; his face was very red; the pulse hard and frequent; appetite good. He suffered from extreme constipation, twelve or fifteen days passing without alvine evacuation, and when it took place it consisted of very hard matter, round, and of the size of an olive. The patient suffered during the day from muscular contractions of the lower extremities, great agitation in the night, enjoying but little sleep. His walk was unsteady; the contraction of the muscles seemed difficult, resisting the will; influenced by the state of the brain, and still more by that of the stomach, his sight became impaired, through the excess of contractility of the iris; the pupils were completely closed.

Asterias, 12th dilution, one drop taken every six days, caused a cessation of the congestive state of the brain; the liberty of influence rendered to that organ made the alvine evacuations easier and more regular, which occurred every second day; the cramps in the lower extremities were diminished; sleep became more tranquil and longer; the sight remained in the same state. The general health has now continued good for more than a year.

Experiments on the healthy body easily give, and sometimes in excess, the symptoms which characterise the derangements of the functions; but never to the extent of showing the alterations of the tissues, not even the first signs. We must then resort to clinical experiment, on the results of which, when confirmed by repeated experiments, we can rely.

A woman of Franconville-la-Garonne, aged forty-eight, of a soft lymphatic constitution, suffered during many years from a scrofulous ulcer on the left side of the neck, extending from the commencement of the growth of the hair to the clavicle. Its size was at least five centimetres. The edge of this ulcer, and some parts of the skin in its centre, were hard; the skin was without elasticity.

This woman, the mother of seven children, accustomed to much fatigue, badly fed, had received no medical assistance. When she asked my advice, I mitigated her sufferings by the ordinary means, but could not remove the evil until I thought of *Asterias*, 12th dilution, of which I prescribed one drop twice a month, and I had the satisfaction of effecting a complete cure with this remedy. For the last two years this poor woman has been able to bear the greatest fatigue, exposing herself to the inclemencies of the weather without the least inconvenience.

"Drawing pains towards the internal part of the chest, from the front to the back, under the left nipple; this pain extended from all the internal parts of the arm to the extremity of the little finger.

"The whole of the left side of the chest was painful; movement increased the uneasiness.

"A sensation as if the left breast were drawn inwards."

These symptoms and the preceding observations led me to make the following trial:

A country woman of the Valley of Montmorency, aged fifty-six, of a dry constitution, as most women are who labour in the fields, had on the left breast a scirrhous tumour, adhering at its base to the chest. *Belladonna*, *Carbo animal.*, *Cicuta virosa*, *Silicea*, etc., were prescribed, with little or no result.

The patient, discouraged, discontinued the treatment, but she returned seven or eight months after, and told me that a dark red speck had formed at the point of the tumour, from which, on removing it, blood had flowed for several days. In this manner commenced the cancerous ulcer, which at the time I saw the patient already occupied the whole breast. This ulcer had then a circumference of about twenty centimetres, discharging a very fetid ichor; the edges were of a pale colour, raised, mammillated, and hard. The patient experienced lancinating or smarting pains, particularly at night, which prevented her from sleeping; she had no appetite; the constipation was very great; the skin dry, and of an earthy colour; the glands in the armpit were swollen and hard; the skin covering the sternum was tumefied and painful; the right breast was becoming scirrhous; and there was extreme emaciation; in fact, the whole character of the cancerous cachexy indicated that the woman was approaching her end.

Hosted by Google

I ordered *Asterias*, 15th dilution, one drop every eight days. Its first effect was marked by a diminution of nocturnal pains, which permitted the patient to enjoy a little sleep; she could also take some nourishment. A second dose of the medicament, given six days after the first, improved her general health; the skin lost its dryness; the face had its natural colour, and she improved in strength daily. After the third dose, a remarkable change in the ulcer could be perceived; its edges had lost their sensibility, and the ichorous discharge was without fetidity; it was thicker, and had more of the nature of an ordinary suppuration. Cicatrization soon followed, and the ulcer healed rapidly.

A lady, aged sixty, of a strong constitution, had a tumour on the left mammary gland, the date of its commencement she could not remember. This tumour existed when the patient became a mother, and had not been modified by pregnancy and frequent lactations. The tumour was of the size of a newborn child's head; it was insensible to the touch, very hard, angular round the nipple, which was retracted; the skin was smooth. Upon a point of its surface a bluish spot could be discerned, denoting the commencement of the formation of the fungus hæmatodes of Hay, which is one of the distinctive characters of the progress of scirrhus to cancerous degeneracy.

The patient, whose health generally was good, only experienced at times shooting pains in the tumour. She took *Asterias*, 18th dilution, one drop every eight days. Under its influence, in the course of a few months, the gland diminished in size, but the varicose spot, which still presented greyish points, became of a deeper colour, extending over the surface, excoriated, and blood escaping from time to time. This excoriation had not the aspect that we usually find in the hæmatoid tumours; the base was smooth, being formed of a tissue of sanguineous capillaries, and varicose. The patient did not feel any pain; there was no ichorous fetid discharge, such as generally succeed effusions of blood. From this circumstance it is to be hoped (the tumour having been removed) no relapse will follow.

A lady, aged forty-eight, of a nervous-sanguine constitution, had been ailing more or less since the age of puberty; at a more advanced period she had an engorgement of the neck of the womb, which was cured, but left the fear of degeneracy; since then she has not had good health. A twelvemonth afterwards an engorgement formed itself on the right breast, in which the whole mammary gland was comprised; it was hard, unequal, presenting a point of adhesion with the nipple, which was retracted. The patient felt shooting pains there, which commenced at the vertebral column about the fourth dorsal vertebra. This part was so painful that the slightest pressure was insupportable. In the tract from the spine round to the breast, was a knotted cord, tender to the touch. On the external side of the tumour, which increased in size daily, a fungus hæmatodes, as in the preceding case, formed itself, which soon projected about two centimetres. An abundant hemorrhage ensued, and some days afterwards a fetid ichorous discharge. The engorgement extended from the breast to the glands of the armpit; the disease advanced rapidly. *Asterias* was employed, without result. If we take into consideration that the experiments made with this medicament developed its symptoms mainly on the left side, the failure of the remedy employed for the disease on the right side may, perhaps, be accounted for.

A young woman, aged twenty-two, of a delicate lymphatic constitution and very irritable, had suffered since the age of twelve years from headache, and a feeling of strong pressure upon the anterior part of the brain, extending below the eyes. This pain was one day so violent that she fell down, and remained a few minutes without consciousness; her countenance was pale, and her jaws locked. Such was the first attack; after which she felt great fatigue, with a sensation of anguish in the epigastrium. Similar attacks returned at more or less distant intervals, which varied from ten to twenty days; there were convulsive movements in the extremities; the attacks returned at the commencement of a meal at the close of the day, and were readily brought on by any emotion, particularly a contrariety, and generally after three o'clock in the afternoon.

In the hope that the period of puberty, which was approaching, would terminate this disease, treatment was considered unnecessary. The first menstruation took place, however, without any change being produced; the patient remained feeble and looked pale. Under the influence of a treatment, the basis of which was *Sulphur, Calcarea, Belladonna, Cicuta, Hyoscyamus*, etc., the patient was relieved; the attacks were less frequent, and the health generally better, notwithstanding the continuance of the attacks. At the commencement of August, 1850, a dose of *Asterias*, 24th dilution, was employed every five or six days; from that time the attacks ceased

Hosted by Google

the face lost its paleness, and her general health was restored.

A person from Atis-Mons, aged fifty-six, of a plethoric constitution, accustomed to sedentary employment, had suffered for eight years from epilepsy. The first attack being mistaken for apoplexy, bleeding was resorted to; the second followed in the course of a year, the subsequent attacks within three and two months, and then every fifteen days; the attack was ushered in by trembling over the whole body. During four or five years there had been no loss of consciousness, but hallucinations, dreams; the patient thought he was away from his home amidst strangers; he heard voices which interrogated him, and to which he answered. The attacks were characterised by a deep blue colour of the face, foaming from the mouth, with convulsive shocks in the extremities. For the last two years there has been a loss of consciousness. Since the end of September, the patient has taken four doses of *Asterias*; there has been no fit for ten days; the trembling has returned, but has not been followed by an attack; the general health is good. *Asterias* is continued.

FULMINATIONS AGAINST HOMŒOPATHY.

(*From the Spectator.*)

THERE must be some truth in the homœopathic doctrine of the efficacy of minute doses. In Edinburgh, the favourite haunt of medicine and medical practitioners, there are only five homœopathic doctors—a number scarcely to be detected by microscopic inspection among the swarms of licentiates who jostle each other in the streets; and yet, it appears from a batch of pamphlets recently sent to us from the modern Athens, their presence has excited a consternation among the orthodox medicos, the effects of which might supply worthy matter for the pen of a Swift, or a Molière, or a Rabelais—who was himself a physician.

The first fulmination against the homœopathic heresy in Edinburgh emanated from the College of Physicians. These learned Thebans, in full divan assembled, passed a series of resolutions, in language such as has rarely been adopted by an anteprandial meeting. After premising that no person could be ignorant of the light in which the College regards homœopathy, they declared that all fellows who become homœopathic practitioners "endanger the reputation of the college," that they become "merely nominal fellows," "and hold a false position and spurious credit." They further protested, that all such renegades from the true medical faith "must necessarily be alien to the other fellows and to the profession at large," inasmuch as "no fellow of his College, or any other physician, can by any possibility, without derogating from his own honour and the honour of the profession, meet professors of homœopathy in consultation, or co-operate with them in the other common duties of professional life." The practical application of these dogmas was a broad hint to the black sheep against whom they were levelled, that they ought forthwith to resign their fellowships. The Council of the College were directed to transmit copies of the resolutions to all known offenders; and their secretary, catching the peculiar spirit of courtesy that inspired them, subjoined to the name of Dr. Henderson, in the copy transmitted to that gentleman, not his legitimate title of "Professor of Pathology in the University of Edinburgh," but the designation "Practitioner of Homœopathy"—which the Doctor, without any desire to disclaim it, might warrantably object to, on the ground of the *animus* which dictated its selection.

Fielding's Colonel, mad on the point of honour, with his favourite phrase of "the immortal dignity of man," is thrown into the shade by the more than Castilian punctilio of the Edinburgh physicians. These gentlemen, it appears, would hold it degrading to assist a fellow-being struck down by apoplexy, if a homœopathist held him in his arms. And Fielding's Mrs. Slipslop could not have emphasised the words "low creatures" more felicitously than the secretary to the College did the title "practitioner of homœopathy." Judging by their anti-homœopathic resolutions, and forgetting for the moment their many real claims to respect, one might fancy the Edinburgh physicians to be a cross breed between a Brahmin with all his pride of caste and a lady's maid with all her airs and *minauderie*.

But the Faculty of Medicine in the University of Edinburgh were resolved to outdo their neighbours of the College of Physicians. Soon after the latter had promulgated their resolutions, a student of medicine, suspected of homœopathic leanings, underwent the examinations preliminary to the obtaining of a diploma. The professors expressed themselves satisfied with his answers, till it occurred to one of them to ask him whether it was true that he intended to practise homœopathically. The candidate for medical honours replied, that he could not give a decisive answer till he had studied the subject; which, he added, he had determined to do. He was then asked whether, in the event of his becoming convinced of the truth of homœopathy, he would burn or return his diploma. He replied, that considering the diploma a mere attestation to the amount of medical knowledge he had attained, he saw non ecessity for doing so. He wss then given to understand, that the Faculty would not pass him until he became convinced of the fallacy of infinitesimal doses. Habit has reconciled men to the practice of exacting from licentiates of theology solemn declarations, not merely that they believe but that they will always continue to believe, certain doctrines; but the Edinburgh Faculty of Medicine is, we imagine, the first that has exacted from a candidate for a diploma a vow always to believe in a certain medical theory and adhere to a

Hosted by Google

certain mode of medical practice. The professor could afford to smile at the impertinence of a College who had no power to remove him from his chair; but the luckless student was deprived by the Faculty of that diploma which he had fairly earned by industrious and intelligent study. The College could only show their teeth—the Faculty could bite.

The position assumed by the medical Canutes of Edinburgh is ludicrous. They are endeavouring by a new test act to arrest the rising tide of medical inquiry and experiment. They would deserve to be laughed down—the only treatment adapted to their case—even if their proceedings affected homœopathists only. For, whatever those gentlemen may think, homœopathists are quite as much entitled to fair play, and the common courtesies which gentlemen of education practise in their intercourse with each other, as allopathists or any other pathists. But the mock-heroics and oppression of the Edinburgh doctors have a wider range of application. The artillery they have been playing off against homœopathy might be turned upon any other doctrine or practice against which they happen to be prepossessed. The progress of medical science can be retarded, if not arrested, by allowing corporate bodies to exact promissory vows against entertaining any new opinions. But *cui bono*, even to the obstructors? In our parallel theological experience, enforcement of tests has best served to thin the established churches.

HOMŒOPATHY AND ALLOPATHY.

From the Christian Times.

POPERY is not confined to Rome or to Oxford, it being, in fact, an apotheosis of self, and self-possessing, in this great free kingdom of ours, a *copiosa felicitas* of putting on as many dresses as there are characters in the mighty masquerade of human life, it pervades all the departments of social existence. In our Senate, it represents a patriot bowing his neck with graceful reluctance to the patronage and emoluments of office; in the Church, it sighs "*nolo episcopari;*" even in the various spheres of philanthropy it sometimes surreptitiously presides over those orbits in which revolve other interests besides "refuges" and soup tickets; while in the severer and higher regions, such as those which this empire boasts, of physic and of law, it assumes the shape of public spirit, and enters its indignant protest against the unreasonable demands of those who think that, in the one, justice concerns itself exclusively with securing the rights of the community; or, in the other, that a patient can presume to recover by any treatment, or any scale of doses, except those prescribed by the London and Edinburgh Pharmacopœia. Such is self—ever constant, and yet ever Protean. It flourishes now in units, and, anon these units, multiplying and reproducing themselves, grow into the thriving corporation of a many-headed *ego*—but whatever or whoever is its exponent, it is always true to the description of it in Sacred Writ: "There is one, and there is not a second."

But our readers will naturally ask, What has all this to do with homœopathy or allopathy? We will tell them. Everybody knows that, within the last dozen years, a medical practice has been creeping into notice, asserting the pretensions of a legitimate science, but undertaking that department commonly called "therapeutics," in a manner so entirely different from what has been regarded as appertaining to the ordinary privileges of prescriptive authority, that many of the affiliated and dependent allies of the old system have taken just alarm lest the hereditary consumption of drugs should be abridged, and thus the craft by which many rise to wealth should be endangered. The heavy shot of the prerogative battalions have been found, in various critical skirmishes, to be no match for the quiet, unpretending, and yet matchless skill with which their guns have been answered and silenced by the pigmy pieces of the new school. The Cowes Yacht Club have done "*koutow*" to the lines of the "saucy" America, and Messrs. Bramah have honourably, though under protest, paid forfeit to the great Yankee picklock. In these cases the vanquished were foolish enough to let our cousins from the United States have English fair play, that is, a fair stage on which to beat them if they could; and this they did, incontinently, unmistakably, much to their credit; and we, for ourselves, congratulate them on their laurels, only wishing they may challenge us again, and be as manfully met again. But *verbum sapienti*—the old medical school are not thus prepared to put on a green livery; they know better; and accordingly instead of taking up the gauntlet thrown down by the followers of Hahnemann, and choosing umpires to decide on the merits of their respective systems, they have, with a proper pride which is refreshing, and entitles them to the gratitude of every dispensary in the kingdom, from "Savory and Moore" down to the "Galen's Head" at the *ultima Thule* of the land, not only ignored their pretensions, but have determined to cut the whole community dead, and absolutely to scout even their personal acquaintance—

> "Now this is noble, and bespeaks a people proud
> And jealous of their honour"—

yes, the Medical Faculty of the Universities of St. Andrew's and Edinburgh, backed by the Royal College of Physicians, have resolved to refuse the degree of Doctor of Medicine to all students who will not pledge themselves not to practise homœopathy, and the Provincial Medical and Surgical Association of Brighton assembled for the purpose of promoting the interests and advancing the science of their profession, deliberately issue a manifesto, which is declared to have been adopted unanimously, wherein they state, "That homœopathy, as propounded by Hahnemann, and practised by his followers, is so utterly opposed to science and common sense, as well as so completely at variance with the experience of the medical profession, that it ought to be in no way or de-

Hosted by Google

gree practised or countenanced by any regularly educated medical practitioner;" that "it is derogatory to the honour of the members of this Association to hold any kind of professional intercourse with homœopathic practitioners;" and wind up by declaring that, "in proposing these resolutions," "they are actuated by a strong sense of the importance of the subject in its relation both to humanity and morals." How people dare to be cured of long-standing maladies by such a set of empirics, is for them to settle with the old doctors; nevertheless, the new school are not altogether satisfied with this proceeding, and, indeed, we ourselves cannot help thinking, perhaps simply enough, that it would have been more generally acceptable, and more in accordance with the idle prejudices of the English character, if the M. D.s had done what the Yacht Club and Messrs. Bramah did—that is, summoned their rivals to a fair trial, and let the public see who were right. However, this they have not done, and we think that the pretenders have got up a case of which at present we cannot foresee the end; but we somewhat surmise that, after all, this heresy may succeed, for that it is making formidable progress is notorious; and it is within our own knowledge that a family recently at Brighton, wishing to consult one of the misguided leaders of the proscribed sect, was told that his hands were so full that he could not make an appointment without a day's notice. This is disheartening to the cause of the "real old original XXX" Esculapian College. Moreover, the homœopathists are arrogant enough to say that they will have a charter of their own, and are daring enough to put their pretensions into a plausible shape as follows:—

"Medicine, as a science, includes the anatomy and physiology of health—the chemistry, natural history, and botany of the Materia Medica—the anatomy and physiology of disease, and the theory of therapeutics, or the operation of remedies; and, as an art, it consists of rules for distinguishing diseases, and for the selection of remedies appropriate to each. Now, of this category, the first *seven* contain facts and doctrines quite as valuable, in the eyes of the homœopathist, as in those of the common practitioner. There is, then, but one department of the *science* of medicine, in which the two systems can be at variance. And, in the *art*, of the two sections into which it is divided, the distinguishing of diseases and adaptation of remedies, the former is common, in all its details, to the two systems—the latter alone can be the subject of any controversy."

With such specious arguments as these, we may well tremble lest homœopathy may be palmed upon society, just as vaccination and gas-lighting have been, notwithstanding, from historical recollections which we published in a former number of our journal, we showed that *they* also were proved by *most respectable* authority to be—what the same kind of authority has predicated of homœopathy—"utterly opposed to science and common sense."

But we must stop. We hope our readers will excuse this trifling on our part; but we really have no heart to treat the subject in any other light than as one that is to be laughed at for its effrontery; while at the same time we feel convinced that this senseless crusade is calculated to do immense good to the cause which it designs to crush. The earth *would* go round in spite of the Pope; and we may be sure that if pain and human woe are relieved by homœopathy, the emancipated sufferers will persist in preferring heretical ease to orthodox anguish. The successful system *will* circulate round the centre of truth, whether it be in physic or in phy sics.

NOTHING LIKE IMPUDENCE.

A BAKER'S dozen of phlebotomizing Guernsey allopaths have gladdened the heart of John Rose Cormack, Esq., M.D., by some congenial nonsense, which that worthy gentleman, who "is thankfu' for sma' mercies," has inserted in the *Lancet;* and on the strength of which it is given out that "homœopathy is repudiated in Guernsey." These sages are great masters of style, as well as dealers in drugs. Their epistle, short as it is, is rich in inflated absurdities strung together by threes.—"In our humble opinion, the principles of truth, honesty, and morality were elucidated, the science of medicine vindicated, and the injurious tendency of homœopathy — its hollowness, absurdity, and dishonesty—demonstrated by clear, comprehensive, and irrefragable facts." "Having throughout firmly, advisedly, and conscientiously resisted all attempts to hold intercourse with homœopathic practitioners, or to countenance a system, the offspring of quackery, the refuge of imposture, and the nursling of dupes." How very fine! Verily, this beats the Welsh triads all to sticks! They are masters of impudence, moreover; nor is it surprising, as it requires some impudence to be an allopathic practitioner, each man's *nostrum* being scouted by his fellows. They hope that those wicked homœopaths, who "pertinaciously shelter themselves under the *ægis* of medical institutions, will ultimately be exposed and repudiated!" Here is Satan rebuking sin with a vengeance! Who would ever dream that nearly one-fourth of that small band of high-minded moralists are men who "shelter themselves under the *ægis* of medical institutions," (we thank the Jews for teaching us that word,) by taking the imposing title of M.D., though guiltless of anything like a University education? What would the parsons say, if the theological associates of King's College (whose two years' course is allowed by some bishops, instead of a bachelor of arts' degree) were to dub themselves doctors of divinity? And these laborious hammerers of triads "are now calmly waiting the course of events," hoping, as it seems, that something in the chapter of accidents may turn up in their favour. This is the old story:—

"Rusticus expectat dum defluat amnis; at ille,
Labitur et labetur in omne volubilis ævum."

THE
HOMŒOPATHIC TIMES.

SATURDAY, OCTOBER 11TH, 1851.

THE GREAT EXHIBITION.

THIS affair is at an end. The Crystal Palace may stand awhile, but its contents are about to be dispersed to the four quarters of the globe. Its princely originator is said to have thought that his scheme carried out, as it has been, would produce a disposition to perpetual peace.

Whatever its peace-inspiring effects may be on "furious Hun, and fiery Frank," on Sclave and Scandinavian, on Italian and Iberian, on Jew and Gentile, on Turk and Infidel, on Anglo-American and Cuban, on Rome and Tahiti, we know not; but it has not smoothed the ruffled plumes of the allopathic opponents of homœopathy, it has not acted as a lenitive to their choler; the *Lancet* is not less rabid, and the *Medical Times* is crowing a little crow.

Professor Simpson is not tamed; Professor Syme is not less bellicose; *Auld Reekie* is in fumes; St. Andrew's is like "the painted chief with pointed spear," ready to slay; long-slumbering Aberdeen is roused to rage by the utterance of her Fyfe; and Glasgow is the "last of the Mohicans" in his war-paint.

But the year of the Great Exhibition will be memorable in the annals of British homœopathists: the princely originator of that *big bazaar* has this year had his stud treated homœopathically, and it is said that one of Her Majesty's best horses has also been just successfully treated in the same manner, and cured of an illness that was thought to be mortal: four Universities have anathematised homœopathy; Dr. Rose Cormack has shed some of his virtuous indignation on it; Mr. Kingdon's picture has been removed from the library of Bartholomew's Hospital; Mr. Pope has been refused his diploma, because he professed an intention to inquire into homœopathy; divers are thought worthy of being published as homœopathic martyrs: and there are abundant signs of fierce war against "*globulism*"—"homœopathic quackery"—"homœopathic delusions,"—and so forth. Ah! gentle German Prince, your Exhibition *has not* produced universal peace—as yet.

THE homœopathic public must be prepared to support the Cause they have espoused in the most enthusiastic manner, if they wish in reality to find it prosper. It is not because our system has made progress, that we are now to relinquish our endeavours, and imagine our task completed; on the contrary, we shall be required more than ever to exercise a vigilance over our proceedings which shall not permit our adversaries to gain the least advantage.

They have struggled long enough to find weak points in our principles and practice, and with all the astuteness they are possessed of, they have done the best to damage the reputation of Hahnemann and his disciples. But, unfortunately for themselves, they have not succeeded, in a manner which can afford them encouragement, and hence we have not become alarmed at the high tone of vituperation assumed. Homœopathists, lay and professional, have only to be true to themselves, and they will be sure to surmount the difficulties which have been thrown in the path of their progress.

Allopathy is doomed beyond doubt to encounter a speedy discomfiture. The fallacies abounding among its practitioners are every day rendered more apparent. The spread of homœopathy, under such circumstances, cannot fail to be proportionate, and therefore the greater our exertions to promulgate the truth, the sooner will the reward be secured. It is manifest that the public are alive to the beneficial influence arising from the development of our system, otherwise we should not be so repeatedly called upon to furnish evidence of our success, neither would homœopathic publications command so ready and increasing a market.

Hosted by Google

The spirit of inquiry evoked is one of the most unmistakable recognitions of success. As the watch-cry formerly was "agitate," we now find the appeal, "investigate," fully sustaining us in our onward career. Their combination, now that the allopathic profession have opened a rampant persecution, may with due decorum be urged, since with agitation on one hand, and investigation on the other, the seed once sown will assuredly produce a harvest.

To achieve a success worthy of our illustrious predecessor we must work with becoming zeal. Our opponents themselves already are acquainted with the kind of people they have to meet. They were barely prepared for such steady adherence, such inflexible conduct on the part of those who have arrayed themselves under the standard of homœopathy; and they are less likely than ever to remove them from their colours. Once more, we have only to recommend perseverance and zealous co-operation to strengthen us in the struggle in which we are now engaged.

Review.

The Lesser Writings of Samuel Hahnemann. Collected and translated by R. E. Dudgeon, M.D. London, Wm. Headland, Princes-street, Hanover-square.

(Communicated.)*

The grammarian line, *Nemo mortalium omnibus horis sapit*, is not more true of Hahnemann than of every author who has written much, than of many an M.P. whose speeches stand recorded against him in *Hansard*; and yet (so lofty was the ideal standard we had assigned him) our first impression, in glancing at the volume before us, was one of regret that these "Lesser Writings" should have been published in their entirety. But as we advanced, and scanned the various papers and essays—at one time viewing them *en masse* as a catalogue *raisonné* of the sequence of ideas by which a mind of might arrived at a grand result; at another, smiling at the bright and playful style in which some of his earlier visions are expressed, or at the deep earnestness that of itself may carry conviction along with it; anon shading down into grave melancholy and bitterest sarcasm, as he became convinced of the disappointment, contempt, or opposition that awaited him. As these reflections evolved themselves, we began to agree cordially with the translator's very judicious remark, that "to form a just estimate of the genius and learning of Hahnemann, and of the gradual and laborious manner in which he developed and perfected his great Medical Reform, it is necessary to study not only his more finished and larger works, the *Organon*, the *Pure Materia Medica*, and the *Chronic Diseases*, but also his miscellaneous medical writings, here collected into one volume." Lively episodes are interspersed here and there, such as the amusing account of Hahnemann's "strengthening balsam (the composition of which was kept secret) for the treatment of old sores and indolent ulcers," mentioned in the translator's preface, as the circumstance that has given rise to the accusation, magnified by transmission through a host of eager calumniators, of his having sold a *nostrum* for all diseases. We may fairly look upon it as one of the old mercantile customs of the period, long before the *Lancet* had sprung into existence, or its sharp point had persuaded divers professionals into being gentlemen, who were not such previously by inclination or by habit. Towards the close of his career, it is averred that Hahnemann again manifested a *soupçon* of reserve to at least some of his pupils; and while exemplifying in the most lucid manner his admirable method of examining the patient, the order of the symptoms, etc., he latterly declined telling what particular medicine he ultimately made choice of. Pointing to his work on the *Materia Medica*, he was wont to say, "You will find everything fully detailed here."

A paper on "Canine rabies," published in 1792, and headed by a droll figure of a dog, will serve us as a barometer to gauge the exact height of professional orthodoxy at which our author then stood. In discussing the treatment of the bite of mad dogs, caustic potash, he says, should first be applied to the wound; he then insists that we should do "all in our power to comfort and console the patient, and tranquillize his circulation. A moderate bloodletting in plethoric individuals, or a glass of wine given to persons of an opposite constitution, will suffice for this purpose. If this frightful disease can by any means be prevented, it is by such means; but *not by any internal medicine* hitherto known.

* We have not ourselves reviewed this book, as the publisher has not sent us a copy of it.

Hosted by Google

The part of the skin which, although not broken, may have been wetted by the saliva of a dog which has become suspicious from having bitten others, must be diligently rubbed with potash, and washed continually for an hour with a solution of the alkali. If a blister be afterwards applied to the spot, then all danger will be more than warded off."

Imbued with such prejudices of theory and of old-school lore as these, well may we of the present day mark with admiration and profit the throes, painful alike to his intellect and to his *morale*, that must have attended each successive disentanglement from the maze, until at length, the fetters of his mind reft and cast away, he stood forth a free and emancipated hero, fully prepared to cultivate those broad fields of science which had already become his own by the unimpeachable right of conquest.

The first article in this series (published in Leipsic, in 1789) bears a presumptuous and offensive title, "INSTRUCTION FOR SURGEONS RESPECTING VENEREAL DISEASES;" presumptuous—for he was then only in his thirty-fourth year; but in his style not a whit less oracular than the more meritorious expressions in the Organon that we have long been reconciled to, such as, "I have taught my followers," "I have explained the doctrine," etc. Much more modest and befitting his true vocation or position, is a paper written seven years later, and containing the precious germ of his marvellous discovery; it is thus headed, page 296, "SUGGESTIONS FOR ASCERTAINING THE CURATIVE POWER OF DRUGS."

The sublime bust and pure intellectual profile of the great Hahnemann have been not inaptly placed in comparison with that of a lamented and highly-gifted statesman, the late Sir Robert Peel; but, probably, many more and closer points of resemblance may be disclosed, in collating the arrangement and composition of this Essay (of course making abatement for the disparity of the subjects treated of) with those of some of his senatorial speeches. Traces of a methodical mind are strikingly conspicuous on both sides. The breadth of ground on which Sir Robert invariably took up his first position, the numerous and varied classes, whether of persons or articles, to which he appealed, or on which his arguments were founded, the astounding enumeration of advantages comprehended in his proposed measures, and his well-known ponderously involved sentences with episode of practical application fresh and new, winding up with statistical slips of paper ready prepared, in his side pocket, and enforced by true and elegant language—all these are equally characteristic of our Hahnemann.

It may be added, that a devotion to the public good, and a noble disregard of ostentation and honours, complete a comparison honourable to both of these eminent individuals.

We shall cite from this Essay an example or two of the peculiarity of style just alluded to. Having defined the very limited extent to which chemistry first, and then botany, are likely to guide the physician to a knowledge of the medicinal powers, he proceeds:—

"As regards this method also (botany) therefore, we come to the conclusion, that it cannot be considered as a sure principle to guide us to the knowledge of the medicinal powers of plants. Nothing remains for us but *experiment* on the human body. But what kind of experiment? Accidental or methodical? The humiliating confession must be made, that most of the virtues of medicinal bodies were discovered by *accidental, empirical* experience, by *chance;* often first observed by non-medical persons. Bold, often over-bold, physicians then gradually made trial of them.

"I have no intention of denying the high value of this mode of discovering medicinal powers—it speaks for itself. But in it there is nothing for us to do; chance excludes all method, all voluntary action. Sad is the thought, that the noblest, the most indispensable of arts is built upon accident, which always presupposes the endangering of many human lives. Will the chance of such discoveries suffice to perfect the healing art, to supply its numerous desiderata?" * * * * "Such a precarious construction of the most important science—resembling the concourse of Epicurean atoms to make a world—could never be the will of the wise and most bountiful Preserver of mankind. How humiliating for proud humanity, did his very preservation depend on chance alone. Now it is exhilarating to believe that for each particular disease, for each peculiar morbid variety, there are peculiar directly-acting remedies, and that there is also a way in which these may be *methodically* discovered."

And now, as our limits are nearly reached, let us turn to a lighter passage, both for the sake of the contrast and to show how well the artist has executed on English canvas a copy of a German masterpiece.

"There have been till now but three current modes of treatment (the *treatment of diseases* having apparently not yet been discovered), viz., *the treatment of the name, the treatment of the symptom, and the treatment of the cause.*" *

"*Treatment of the Symptom.* (A portrait.)—In ordinary every-day practice, however, it is not required that we should trouble ourselves with anxiously attending to single

Hosted by Google

symptoms. When once we have got over the first irksome years incidental to young beginners—years they undoubtedly are of irksomeness and care, when we are still anxious to discover the adequate, the helpful, the best for our patients, and when the tender conscience of youth gives us much trouble—when once we have got over these pedantic years, and have got some way into the period of divine routine, then it is a real pleasure to be a practical physician. Then we have only to assume a dignified mode of carrying the head, speak in a tenor voice, so as to inspire respect, give great importance to the movements of the three first fingers of the right hand, and present a certain authoritative something in the whole management of the voice and attitudes of the body, in order to be able to exercise perfectly in all its details, the golden art of the *savoir faire* of the routine physician. Of course, the smallest details of the attire of the equipage, of the furniture, and of the array of servants, must be all in harmonious keeping.

"If our whole thinking power and memory during the four-and-twenty hours of each day are completely absorbed in such matters, this renders us all the more successful as physicians. Our whole practice, be it said between ourselves, consists in two or three innocuous mixtures, well known to the chemist, in as many compound powders adapted for all cases, in an expensive *tinctura nervino-roborant*, a few juleps, and a couple of formulas for pills, either for acting on the blood or the bowels (*nostrums* and *routine remedies* if you will), and with these we get on capitally. My steaming horses rattle up to N's door, I descend from my carriage, assisted by the respectful domestic, with helpful speed, but with an air of deep thought and a dignified mien. The attendants of the patient throw open both wings of the door of the sick-room. In silence, and with abased head, stand esteem, confidence, and semi-devotion, in a row, to allow the deliverer to approach the sick-bed. 'How did you sleep last night, my good friend? —your tongue! your pulse! The powders ordered yesterday may be discontinued. The mixture prescribed here is to be taken alternately with the pills indicated below, followed by the julep every half hour.' Taking a pinch of snuff with an air of profound gravity, seizing my hat and stick, and making a practised bow, the degree of which is regulated for every one in particular according to his supposed importance or rank, this constitutes the whole of the important comedy (shall I call it business?) for which we are paid as a consultation, and which we repeat as often *per diem* as the serious looks of the surrounding friends seem to render it necessary; for they are the barometer of the danger, since we have neither time nor inclination to ascertain it for ourselves in all our cases. 'And how many visits of this sort do you pay in one day?' 'Do you imagine, you simpleton, that I can keep up my establishment with less than several dozens of visits in a forenoon?' 'What Herculean mental labour?' 'Ha! ha! ha! to scribble down on a long strip of paper one of the eight or ten routine prescriptions that I can reckon up on my fingers, and can seize on in the dark without a moment's thought, the first, the best that occurs to me at the moment, without the least reflection; do you call that mental labour? It is a much more difficult matter for me to find a pair of handsome bays to supply the places of my used-up afternoon horses! *hoc opus, hic labor!*'

"I have just now also much difficulty in thinking of the appropriate dishes of the sixth *entrée* of the entertainment we are to give tomorrow fortnight, so that it may be distinguished for its rarity in respect of the season of the year, for its suitable elegance, and for its brilliant tastefulness. *Et hoc opus et hic labor!*"

We have no doubt but this entertaining collection of Essays will command a large sale eventually, and find a numerous body of readers.

* Observations on the three current methods of treatment. From *Hufeland's Journal*, published in 1809.

A TRIP TO LEIPZIG.—THE HAHNEMANN JUBILEE.

By Discipulus.

From the Edinburgh News.

[Although neither our readers nor ourselves may choose to burn incense upon the altar of homœopathy, or bow the knee to the image of Hahnemann, yet they will not object to accompany our spirited correspondent in his visit to Germany, that they may see the fashion in which our cousins there do honour to one of their accredited heroes.]

After having done duty, like other provincials, for two days at the Royal Bazaar in Hyde Park, we started for Dover to make the most of our brief holiday. Arriving there at half-past eleven o'clock at night, we encountered a scene of indescribable confusion. A multitude of porters contended fiercely for the luggage, and the victorious party having piled a cartload on a large barrow, set off, with a speed and noise of a fire-engine, to the quay. The event showed we had need of all our speed, for the boat was already off; we hailed it, and seeing what a multitude we were, it put back to within a trunk-throw of the edge, the porters pitched the luggage on board and we followed in its wake, and in a few minutes we were on our voyage. Being midnight, we asked for beds, and were directed to the cabin. On descending, we found it filled by successive layers of human beings, quite a model for a slaver; perceiving an unoccupied crevice above the third tier, we picked our steps, amid a polyglot of execrations from the half-awakened mass of sleepers, to the edge of a sofa, where in profound sleep lay an exhausted Sclav or Teuton, and making a pedestal of his chest, we reached our dormitory.

Passing through Belgium, by way of Ostend and Liege, we hastened on to Cologne, and were soon upon the berhymed river. It is always a pleasant variety floating on the Rhine, not so much on account of the scenery, which has always appeared to us much over-

Hosted by Google

rated, but for the abundance of amusing scenes the steamers afford. The dinner on deck is a great treat. The sharper with his large moustache, his low brow, keen eye, wide trousers, and polished boots, brushing his hair before the engagement with his pocket brush, and adjusting his whiskers at the looking-glass on the back of it; then the resolute German, pleased at the prospect of a good long uninterrupted *edification;* next the London party—the pursy old gentleman, out of all patience at the sour wine, weak soups, and endless succession of anonymous and unintelligible fractions of fish, fowl, and flesh, while his interesting daughter does her best to keep him in good humour, and tries to speak German, learned specially for the occasion, to the *garçon*, who, supposing it English, pertinaciously replies in the Rhine dialect of that tongue. But we forget that most of our readers are probably familiar with such scenes. Our objection to the Rhine is its want of a background; you see at once all that is to been, pretty headlands and picturesque ruins, but nothing grand. The Danube is far finer. There we have always to the picture a frame of snowy-peaked hills, which are delightful to the eye from the contrast of light, and are a sort of stepping-stone to the imagination into the remote unknown they bound and barrier.

We left the Rhine a little way from Frankfort, and proceeded next day to Baden Baden, *en route* for Switzerland. But it was otherwise determined. The evening of our arrival was calm and beautiful, but soon we felt the deadening sensation of an approaching storm. The clouds lay like large slates upon the sky, and for some hours vivid flashes of lightning leapt from edge to edge without any thunder. As night closed in we returned to our hotel, and had scarcely reached it when the rain came down like a tropical waterspout; it continued, along with thunder and lightning, all night, and in the morning the roads were impassable. A small brook, a mere burn on the yesterday, was today a tumbling roaring river like the Rhone. The kitchen of the hotel was filled with water, tables and chairs were floated away, trees soon began to come down, and heaps of firewood. One hotel (the English) was surrounded with water—its inmates had to be removed in carts; streets had become canals, and invalids were carried on men's shoulders to the higher parts of the town. What where the inhabitants about all this time? Most of them wrapped in huge cloaks, with umbrellas over their heads and pipes in their mouths, were contemplating the work of havoc, and perhaps speculating on the laws of hydraulics, only doing nothing. It was a strange contrast to such a scene at home, exhibiting so strongly the little power of self-help in the German character, and it might well suggest an anxious thought of how this great people were to work out their freedom. What can be done for a nation without a history and without a faith? Is it not regeneration it needs; it has never been born. The German nation is an agglomeration of atoms bound together by pressure from without, not a constellation arranged by forces acting from within; and yet great even in its present chaos! a huge leviathan unconscious of its might, on which two-headed vultures strut, guzzle, and flap their regal or imperial wings.

So much for Baden, the most agreeable lounge and most dangerous hell-trap in Europe, where gambling goes on from night to morning; and under the gayest and most fascinating surface there trickles incessantly a black rill of crime and misery.

Our Swiss tramp being knocked on the head by this unsought water-cure process, for the roads and railways were destroyed, we had nothing for it but to make for Leipzig with all the expedition in our power. In our way thither we spent a night at Cassel, lately so famous for its bold assertion of constitutional freedom. It has suffered much by the quartering of so many troops upon it, and it tells us the sad lesson that a little state cannot be free unless isolated by sea or mountains—a lesson which we fear Hungary likewise teaches. We spent the following night at Halle with one of the most distinguished theologians in Europe, and one of the most popular professors in Germany. He corroborated the observation we had long ago made, that Protestant Germany was probably the most irreligious country in the world. And it is in some respects the worst kind of irreligion, as it presents nothing offensive to the taste of the moralist. Sentiment, morality, and mesmerism are equivalent to religion there; they neither believe nor disbelieve "anything beyond the teaching of Goethe, that noble dome lighted from beneath."

On entering the Blumenberg Hotel at Leipzig, on the morning of the 8th of August, we found some of our English friends already there, who had come for the same object as ourselves. The day was spent in visiting old acquaintances whom we had known some ten years ago when studying here; and in the evening we had our preliminary meeting. The following day was the chief diet of this strange general assembly. The hall of meeting was spacious, and tastefully ornamented with trees and garlands; and the company assembled, to the number of about one hundred and thirty, presented a curious appearance to an English eye. They had come from all parts of Europe. To begin with the most remote, there was Dr. Nunez from Madrid, physician to the Queen of Spain, decorated with a broad blue ribbon, besides many orders, quite the courtier in air and figure. Then we saw an ardent disciple from Copenhagen, who looked rough and tough, and fit for service in the hard north. From Rome had come a German by birth, who had won a large reputation in the Eternal City. Our neighbour, Hanover, had sent a polished deputy—physician to the Crown Prince. Besides the representatives of the large cities, who formed the bulk of the assembly, there were also men with huge beards from the inland provinces of Hungary and Bohemia; and seated beside some pale, studious Northern German, might be seen a gay and debonair inhabitant of the south, whose dark moustache and easy

Hosted by Google

carriage would hardly have squared with our idea of professional decorum. This motley multitude were all attentively listening to an interesting paper which was being delivered from the reading-desk, when a sudden explosion was heard. The speaker stopped, most of the assembly rose. Another louder than the first, and again another and another! The president thundered with his hammer, and entreated them to remain, to no effect. A rush was made to the door, and those who stayed anxiously speculated on the cause. Some said it was a new revolution; others that it was a gunpowder plot to blow all homœopathists into "sparables" in the twinkling of an eye. At length the tide rolled back again, and it turned out to have been the igniting of some powder canisters and fireworks in the next house. One person had been wounded, but the timely aid of thirty homœopathic physicians prevented alarming consequences from the incision in the thumb, and this Guy Fawkes is expected to do well. After the *sederunt* terminated, the meeting broke up into little groups to give and get reciprocal intelligence of the good Cause. This was highly encouraging and satisfactory. In some places, as Madrid, it is almost the prevalent method. The court physician is a homœopathist, many professors are so; there is a regular homœopathic clinique, and students may take their choice as to the system they wish to pursue. In Vienna it is also very strong. There are two or three homœopathic hospitals, and a thoroughly equipped school for teaching it. The homœopathic practitioners in Vienna are probably the most highly cultivated physicians in Europe. The physician to the King of Bavaria, too, we understand, is a disciple of Hahnemann's, but he was not at the meeting. In short, in many parts of the Continent the homœopathic practitioners are so numerous that in announcing the arrival of a physician, in an hotel for example, if he is not a homœopathist, he is called an allopathic doctor. This we have seen in a newspaper. It was fixed that we should meet on the following day at ten o'clock. The ceremony was to be at noon.

Accordingly, we all reassembled, dressed for the most part in grave professional attire, as proper for the ceremony we were about to celebrate; and after hearing an oration and certain odes, we formed into a procession four deep, and headed by the president, emerged from the vast hotel into the street.

Leipzig is an old-fashioned picturesque town; the houses are as lofty as those in our High Street, and the streets about as wide. It is surrounded by beautiful promenades, somewhat like our Meadows, formerly fortifications. Down one of those streets, lined by a dense crowd in their holiday attire, every window a cluster of eager faces, the sable stream rolled on, till we arrived at an open space, where stood a statue, muffled in sackcloth covering, surrounded by a strong paling, outside of which the whole population of Leipzig had gathered. Arrived within the barrier, a full instrumental band played a solemn anthem, and then a chorus of boys took up the chaunt and sung a hymn in honour of Hahnemann. The chief magistrates of the town then stepped forward, and the president of the Congress delivered to them the deed of gift of the statue, and made an oration to the assembled multitude, and received a grateful reply from the burgomaster. At the end of his speech he gave the word for removing the veil, and in a moment the statue stood revealed.

Hahnemann sat there, as if surprised and interrupted at his work. On his left knee, and held in his left hand, is a book, in his right hand a pen. He is looking up from occupation, with an air of quiet serenity, which suits well his massive and symmetrical head; one might suppose him perplexed somewhat at being thus recognised, and almost fancy a slightly sarcastic smile played on the lip, at the acclamations of respect and joy from the crowd beneath him, the inhabitants of that city where he had wandered many a day disregarded—that city which expelled him for the deed which they now honour. But the smile is ours, not his; he is gone where this posthumous honour will be of no avail. It is the old story—they stone the prophet and build his sepulchre. Had any of the garlands that they hung so thick around his statue been awarded to him by his (almost) native town when he was struggling with his foes, his writings might have been less rancorous—his reformation less turbulent.

With the unveiling of this statue the object of our visit ended, although once more we reassembled at a grand banquet, where toasts were proposed between the courses, so that it lasted for four hours, enlivened by brilliant music and songs, in which the whole company, not less than one hundred and fifty, joined. So terminated this memorable festival—memorable on any hypothesis of Hahnemann's character. There has lived no man in this century who could attract from so great a distance such a band of mourners round his tomb—men of every nation in Europe, of every variety of mental development. The spirit of Hahnemann is likely to prove more than a match for our medical bodies. "For *thought* is more powerful than parks of artillery; and were it yesterday, or were it a thousand years ago, writes and unwrites Acts of Parliament, moulds the world like soft clay." The thought of Hahnemann will outweigh the deeds of his opponents. It will run the same course here as in Germany—be neglected, patronised, opposed, reviled, partially accepted, and after this generation has passed into silence and oblivion, universally adopted.

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—Amongst the lessons furnished by history, two admit not of dispute. First, that persecution seldom fails to injure the cause of the persecutors; second, that persecution seldom fails to advance the cause of the persecuted.

Allopathy has turned persecutor, homœopathy

Hosted by Google

is its victim, We are, then, in a favourable position; let us see that we lose not the advantage our position presents. And in order to this, we must calmly consider the exact state of affairs, and mark the courses that are open to us to adopt.

The Scottish Universities have resolved on refusing medical degrees to homœopathic candidates.

Persons practising without degrees are liable to prosecution.

Now the first thing suggested by these considerations is, that we should seek to obtain charters for our hospitals. But until this privilege be secured is there any occasion for our remaining inactive? I think not.

Two courses are, I apprehend, open to our would-be practitioners. One, to take legal proceedings against the university refusing the degree; the other, to practise without a university degree, and run the risk of legal proceedings being taken against them. And I cannot for a moment suppose that if any man of standing were to announce in your columns, that he was prepared to adopt the former course, or that the latter course had been taken against him, that funds would be wanting to meet the necessary expenses. But be this as it may, I will not believe that the martyr spirit is in this age so dead, that there is not a man to be found unflinching enough to risk whatever consequences the trial might entail.

Now let us imagine the first of these courses adopted, and the result—a mandamus commanding the refractory university to grant the degree. The moral effect of this triumph would be inconceivably great. Let us next imagine the mandamus refused, homœopathy would be in no worse position than at present.

The second course would now be open to our hero. Let him practise without *a university* diploma. I do not say, let him practise *without a diploma;* for here I would suggest to our homœopathic practitioners that it would be their duty, after ineffectual recourse had been had to the legal tribunals of the land, to select from amongst themselves men duly qualified by their attainments to examine candidates for the profession, and to grant them some such diploma as this—C.P.H., Certificated Practitioner of Homœopathy.

And can we conceive the individual or the association bold enough to prosecute such a practitioner? If not, our Cause would be triumphant. But let us now take the worse possibility; let us suppose the practitioner tried, condemned, incarcerated. Within one month from the date of that incarceration, I do not hesitate to predict the walls of the House of Commons would ring with plaudits drawn forth by some champion of freedom, our hero being the subject; within two short months homœopathy would have a chartered school of medicine, and long ere this our hero would be again breathing the free air of heaven, having earned for himself a name amongst the martyrs of England. In whatever light, then, our position is regarded, there is abundant evidence for believing that the day of our triumph is at hand.

I have been compelled, from want of time, greatly to condense the thoughts which the consideration of this important subject suggests. I do hope, however, that it will be taken up and enlarged upon by those who have time at their command, in a manner and with an eloquence worthy of the theme.

I am, Sir, your obedient servant,
F. J. Smith.

Miscellaneous.

Dr. James Esdaile, will long be remembered as the father of painless surgery amongst us. Amidst a storm of ridicule and derision, Dr. Esdaile, some five years since, commenced systematically to practise surgery on patients rendered insensible by mesmerism, and continued in this way to perform the most painful and difficult operations with perfect success. To satisfy the general scepticism which prevailed on the subject, a committee of inquiry was appointed, and ultimately a mesmeric (government) hospital established, where painless surgery was practised with much more uniformity and success than it had ever been under the influences either of ether or chloroform, and with entire exemption from the dangers attendant on the administration of drugs. Dr. Esdaile leaves India in the prime of life, to resume, we trust, in his native country, the career of honour and of usefulness he has hitherto pursued in Bengal.—*Bombay Times, June* 24.

Conscience.—The good or evil we confer on others very often, I believe, recoils on ourselves; for as men of a benign disposition enjoy their own acts of beneficence equally with those to whom they are done, so there are scarce any natures so entirely diabolical as to be capable of doing injuries without paying themselves some pangs for the ruin which they bring on their fellow-creatures.—*Fielding.*

Early Rising.—There is no time spent so stupidly as that which inconsiderate people pass in a morning, between sleeping and waking. He who is awake, may be at work or at play; he who is asleep, is receiving the refreshment necessary to fit him for action; but the hours spent in dozing and slumbering are wasted, without either pleasure or profit.—The sooner you leave your bed, the seldomer you will be confined to it, for early rising conduces to healthfulness. When old people have been examined in order to ascertain the cause of their longevity, they have uniformly agreed in one thing only, that they "all went to bed, and all rose early."—*Family Friend.*

LECTURE

Delivered on October 9th, at the London Homœopathic Hospital, in the presence of the British Homœopathic Society, and of several of the Lay Supporters of Homœopathy, the Earl of Belfast, Mr. Sampson, Mr. Hallett, Swein, etc., and several Allopathic Practitioners.

By Dr. Quin, President.

The subject to which I am desirous of directing your attention this evening, gentlemen, is pregnant with the most important results to science. It will, I feel convinced, not only open a wide field for inquiry and investigation into numerous phenomena which, till now, have only been matters of conjecture, but will lead to the elucidation of many of the hitherto hidden secrets of nature. I trust I shall also be able to demonstrate to you that the beautiful invention and brilliant discovery which I am about to describe, involves the confirmation of the numerous facts connected with our doctrine, which have been questioned, up to the present time, by the great majority, of the medical public.

For the great good which will inevitably arise from this important discovery, we are indebted to a gentleman of great scientific acquirements and experience, Mr. Rutter, of Black Rock, Brighton, who is the inventor of the instrument I am about to describe, which demonstrates the different currents of electricity that pass through various parts of the human frame, when in contact with the earth, and under the influence of terrestrial electricity. By means of this instrument, the inventor has been enabled to discover not only the various normal effects of the different electrical currents which exist in the body, but likewise a variety of modifications and changes which these currents undergo, when the hand of the operator is brought in contact with the thumb, index, or hand of another person; with inanimate matter, with a variety of different metals, with vegetable and animal substances; also the alterations which different medicinal substances produce upon these currents. Mr. Rutter is not only able to demonstrate, in the most satisfactory manner, the polarization of our bodies, and those parts where the north and south poles are situated, but likewise the alterations which take place from change of position, from the vertical and sitting position to the recumbent, as also those which take place from other circumstances hereafter to be mentioned.

He is also able to demonstrate most clearly the difference between the male and female currents; and that the latter are generally in an inverse or antagonistic state to those of man; also, that certain positions of the arms and hands arrest the effects of these currents upon the instrument.

Dead animal matter, brought into contact with the hand of the operator, or with any person, or any number of persons forming a chain by holding one another by the hand, the one nearest the operator holding his hand, and the dead matter being put into the hand of the person most remote from him, almost immediately stops the movements produced on the instrument by the electric current. Mr. Rutter has, however, carried his discoveries still further; for he has ascertained, and is able to prove most unerringly, that nocuous matter, whether animal or vegetable effluvia, or miasms, or mineral or vegetable poisons, in fact, all substances capable of producing death, have the same power of stopping the action of the instrument, as I have just described dead matter to have. All the experiments were conducted in the most simple and unpretending manner, and were explained in the most lucid and unequivocal language. They were repeated over and over again at the wish of several of the persons present, and the results were each time unvarying and unerring, so as to carry conviction to all who witnessed them, even the most sceptical.

Mr. Rutter, who is a man, as you may suppose, of great scientific knowledge, leaves no loophole for scepticism; the beautiful series of experiments made by him all tending to corroborate and affirm one another. The instrument is so subtle, and the demonstration so clear, whilst the experiments are at the same time so delicate and exact, the same cause

Hosted by Google

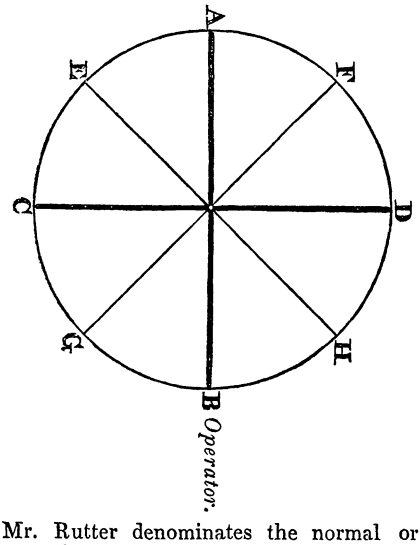
repeated invariably producing the same effect, that no one can resist the positive evidence of the undeviating action of this scientific and truly philosophical instrument. To prove that the effects produced upon the pendulum are the result of terrestrial electricity, influencing the instrument through the body of the operator, he first sets the instrument in action whilst standing on the ground; he then, after it is in full motion, insulates himself by standing upon a stool with glass legs, when the action of the instrument immediately stops. One hand is then put in communication with an electric machine, when the action is immediately resumed; the communication is again cut off, and the action ceases. A person standing on the ground is then desired to touch the hand of the operator, when the movement of the instrument recommences; the hands are separated, and the motion again stops. A piece of silk thread is then put round the wrist of the operator, and the other end or the ball of silk, of which the thread round his arm is part, is allowed to be upon the ground, forming a communication with the terrestrial electricity, and the motion of the instrument is immediately again set a-going. On the thread being cut or unwound from the wrist, the motion ceases, no vibration or oscillation is perceptible; but immediately on the operator descending from the insulating stool, and coming in contact with the ground, the instrument feels his influence, and the motion commences. I shall now proceed to give an account of some of the very interesting experiments which I witnessed, in addition to those I have just narrated to you; but before doing so, I will endeavour to give you a brief description of the instrument, and although this description is very imperfect, it will enable you better to understand the following experiments, which took place in my presence. Two ladies and five gentlemen, besides the operator, were present, all eagerly and carefully watching the movements of the instrument, and starting objections and difficulties, all of which were most satisfactorily answered and explained by Mr. Rutter, whose clearness, patience, and courtesy are beyond all praise. The perfect good faith with which the experiments were conducted was apparent to all, and must be to every one, before he is ten minutes in the room with Mr. Rutter.

I must, however, explain that Mr. Rutter is devising a new instrument specially for the purpose of exhibiting the phenomena which have been the result of his investigations. The instrument I am now about o desc ribe is the first one he has experimented with. It was roughly constructed of various loose parts of some electrical apparatus, which he had at hand. A pillar of wood fastened in the centre of a large circular stand, is carefully screwed to the table; the upright pillar has a brass top, about the same circumference as the wooden pillar; from this projects outwards, at right angles, a rod of brass, this ball terminating at the extreme end in a small forceps, from which is suspended, by a very slight thread of silk, a small elongated piece of sealing-wax, much in the shape of a common clock lead-weight. Around this pendulum of sealing-wax and half-way up the silk is a glass shade, much like a lamp glass; this stands upon a round piece of glass, over a diagram, somewhat like the one here described, the object of which is merely to protect the pendulum from the current of the room and the vibrations of the air caused by people moving around the instrument. The point marked B on the diagram, is placed opposite and nearest to the operator; the line from B to A being in the same direction as the brass rod from which the sealing-wax pendulum is suspended. It may not be quite irrelevant here to state how I am enabled to lay before you this evening the interesting experiments of Mr. Rutter's exquisitely subtle instrument, the more so, as the presence here of my noble friend the Earl of Bedfast is very significant; for it is to his kindness I owe the pleasure of Mr. Rutter's acquaintance, and the extreme happiness of having witnessed the various experiments which I am about to detail to you. It is true, that in August last I was informed by an allopathic professional friend of mine, that he, with several colleagues, had seen Mr. Rutter's instrument, and was very much interested by some of the experiments performed by that gentleman in proof of the electrical currents passing through the body; but it was not till after my return from Paris, that my mind was thoroughly awakened to the importance and bearing of Mr. Rutter's discovery. On hearing the interesting and elaborate account given to me by Lord Belfast, I eagerly embraced his kind offer to introduce me to Mr. Rutter, and lost no time in going to Brighton.

With these preliminary observations, I shall now proceed to describe the experiments and the mode of operation of the invention. The manner in which the operator is put in communication with the instrument, is by placing his finger and thumb one on each side of the brass top of the stand, and slightly holding it. In a very few seconds, the pendulum, or weight

Hosted by Google

attached to the silk thread, is seen to have several oscillatory movements, till it finally moves round in a circle from left to right, or in the direction on the diagram of from B round to H. This circulatory motion



Mr. Rutter denominates the normal or natural action of the electric current when not disturbed by extraneous causes. The pendulum continues to go round in a circle from left to right as long as the finger and thumb are in contact with the instrument. If the operator's index is alone left in contact with it, the thumb being removed, the circulatory motion almost immediately ceases, and the weight takes the motion of a clock pendulum, moving in the direction of from D to C on the diagram. Then if the thumb of the operator is alone left in contact with the instrument, and the index removed, the weight changes its direction, and makes a direct cross with the movement last described, and moves in the direction of from B to A; this motion continues as long as the thumb alone is touching the instrument. Then if the forefinger is closed against the instrument, and it is held slightly between the thumb and finger, the normal rotatory motion from left to right, or from B round to H, again takes place, and continues to move in the same direction as long as the operator holds the instrument between the index and thumb. I was then requested by Mr. Rutter to put my index on his left hand, when the rotatory motion began immediately to change into the pendulum action, as from D to C. When this action was well established, I was requested to place my thumb on his left hand, he all the time holding the instrument between his forefinger and thumb, when the pendulum motion changed, making a cross with the movement last described, and passing to and fro from B to A. My whole hand being then placed on the left hand of the operator, the weight immediately changed and moved from F to G. When my thumb was placed on the left hand of the operator, he holding his right thumb in contact with the instrument, the action was neutralized.

Another curious and interesting phenomenon was now demonstrated by Mr. Rutter. If a person of the female sex puts the index or forefinger on the operator's hand, the pendulum, instead of moving as when the index of a male is in contact with the hand, from D to C, moves from B to A. When the female thumb touches the hand of the operator, instead of moving from B to A, as in the case of the male thumb, the pendulum immediately moves from D to C; and when the whole hand of a female is placed on the hand of the operator, the movement becomes circulatory in the direction of from B round to G, that is, from right to left, the exact reverse of the normal motion.

The next experiment was one of great interest, and exemplified in a beautiful and indisputable manner the experiment to which I alluded in a former part of the evening, viz., the instrument being stopped by the operator when put in contact with dead animal matter. After having put the instrument in full normal action by applying the finger and thumb of the right hand a dead fly being put on his left hand, the motion of the pendulum immediately ceased; on the fly being taken away, the motion recommenced. A chain of several men, holding one another by the hand, was formed; a female placed her hand on that of the man most remote from the operator; the motion of the instrument was immediately reversed, the circulatory motion being from right to left. A dead fly was then put upon the left hand of the female, and the motion immediately stopped.

A wire of copper, 500 feet long, encased in gutta percha, was then added to the chain of men—the one farthest from the operator held one end of the wire, and the female the other end; the female influence was immediately sent through both the wire and chain of men, and a corresponding action was again set up; which was again stopped immediately by the dead fly being put upon the other hand. Similar experiments were made with other dead matter;

Hosted by Google

even merely by holding the hand over or near the dead matter, the aura of which equally stopped the motion.

When Mr. Rutter wishes to stop the motion of the pendulum, so as to pass to another experiment, he usually takes a piece of ivory in the left hand, and stops the motion immediately. If a person of the female sex merely breathes upon the hand of the operator, it immediately changes the current to the female; if a man breathes upon her hand, her other hand being in contact with the operator, the male influence is immediately perceived on the pendulum. If a hair of a female is placed on the hand of the operator, or the hand of the last of any number of men in contact with him, the female current is immediately produced. The same phenomenon is produced by a pocket-handkerchief worn by a lady.

The next set of experiments performed by Mr. Rutter were to prove the polarization of the body. This was beautifully and most satisfactorily demonstrated, by placing a permanent steel magnet upon the table in the direction north and south. On placing the hand over the south pole of the magnet, the normal current was produced, and when over the north pole, it came to a dead stop. If the hand is then put within the sphere of the magnet, but to the left or west, the pendulum moves from F to G, and when put on the right or east, it moves from E to H, and again put to the north pole, the instrument stops.

Then, if one hand of the operator is put to the back of the head of a person standing near him, the current is normal, but if put to the forehead, the motion immediately ceases, proving the south and north poles to be in the back and fore part of the head. If the hand is then put on the right shoulder, the action is normal, but if to the left shoulder, the action is reversed, and acts as the female current. In the recumbent posture the north pole leaves the forehead, and takes refuge in the diaphragm. Bringing the hand of the operator in contact with the forehead no longer now stops the instrument, but if he places the hand over the diaphragm, the motion immediately ceases.

Another extraordinary fact is, that the magnetic currents are reversed below the pelvis, the right leg having the same action as the left arm, and the left leg the same action as the right. Again, these change when the body is vertical, and when it is recumbent. These experiments were most satisfactorily proved over and over again, on different individuals in the upright and recumbent positions.

We now come to another class of experiments, a class particularly interesting and important to medical men, viz., the effects upon the electric currents by different metals, and I beg you carefully to bear in mind the different actions of the pendulum whilst under each metal.

After the instrument had been put into the normal motion, a considerable piece of *Tin* was put into the operator's left hand, the normal action was immediately changed into the pendulum action from B to A.

The normal action was again set a-going on the *Tin* being taken away, and some *Fluid Mercury* was put into the operator's hand. The normal motion was immediately changed from H to E.

A piece of *Copper* changed the normal action into the female current, reversing the circle.

A large piece of *Zinc* changed it from H to E.

A piece of *Iron* gave an elliptical motion from H to E.

A *Platina* chain changed the motion from B to A.

A piece of *Lead* from D to C.

Mr. Rutter then showed the action of *Chalk*, which produced an elliptical action from E to H, exactly the reverse of the *Iron*, which was from H to E.

A large piece of *Flint* changed the normal motion to one from H to E.

A piece of *Phosphorus* immediately caused a total cessation of the motion.

After the normal action was produced, *Iodine* stopped it immediately.

A piece of *Ammonia* immediately set the normal action going, and increased it considerably above the natural force.

Some *Table Salt* reversed it, giving the reverse current.

The *Ammonia* was again put into the operator's hand, when the normal action in full vigour was again produced. A small piece of horse-dung put in the same hand with the *Ammonia*, immediately counteracted its action, and stopped the motion.

Now, gentlemen, I feel certain that you have perceived that it was not without an object that I requested Mr. Rutter to have the kindness to experiment before me and the persons present, upon the above metals and other substances, the whole of them being materials from which we extract some of our most valuable medicines. *Stannvm* (tin), *Mercury*, *Cuprum* (copper), *Zincum*, *Ferrum* (iron), *Platina*, *Plumbum* (lead), *Calcarea* (chalk), *Silicea* (flint), *Phosphorus*, *Iodium* (iodine), *Natrum muriaticum* (salt), and *Ammonia*, are all homœopathic remedies familiar to most of our patients. No one, whether lay or

Hosted by Google

medical, who believes in homœopathy, could witness Mr. Rutter's beautiful and delicate experiments with the dead fly, the hair of a female, the hankerchief, the aura from dead matter, and other substances, and not immediately feel convinced that he had at the same time, by his brilliant discovery, settled the question of the infinitesimal doses employed in homœopathy possessing influence. So obvious, so self-evident is this, that the Earl of Belfast, the instant he saw an experiment made by Mr. Rutter upon some gold, exclaimed, "Oh! gold is employed in homœopathy. Pray test some globules of *Aurum* upon the instrument." His lordship, who has for a considerable time been a patient of mine, will tell you that he immediately felt that Mr. Rutter had removed the great stumbling-block to the progress of homœopathy. The same idea must occur to you all, as did to every one at all acquainted with homœopathy.

Well, one globule of *Stannum*, of the fourth attenuation, was placed by me in the palm of the hand (that being the most sensitive part) of Mr. Rutter, after he had set the instrument in action. The pendulum went immediately, moving from B to A with as quick and as strong a motion as when the same metal in mass was put into his hand. One globule of *Mercur. sol.* 12, changed the action, and the pendulum went from H to E.

One globule of *Cuprum* 30, reversed the normal action, and produced the reverse current.

One globule of *Zincum* 30, sent the pendulum from H to E.

One globule of *Zincum* 200, did the same.

One globule of *Zincum* 200, dissolved in one ounce of water, and a drop of this solution put into Mr. Rutter's hand, produced exactly the same result, both when the instrument was in repose and in action.

One globule of *Ferrum metallicum* 6, gave exactly the same elliptical motion described above as produced by the *Iron* in mass. (*Sulphate of Iron* was also tried in mass, with precisely the same result.)

One globule of *Ferrum aceticum* 3, gave the same elliptical motion, only rather a stronger movement to the pendulum.

One globule of *Platina* 3, moved the pendulum in the direction from B to A.

Plumbum 30, one globule, caused it to move backwards and forwards from D to C.

Calcarea carbonica 30, one globule, gave the reverse of the elliptical motion of *Iron*, and moved it from E to H, as the *Chalk* did above.

One globule of *Calc. carb.* 200, had exactly the same effect.

Silicea 30, one globule, changed the motion to one from H to E. This experiment with the homœopathic infinitesimal quantity of *Silicea* greatly gratified Mr. Rutter, as he had only that very morning experimented upon *Flint* for the first time.

Phosphorus 30, one globule, immediately caused a total cessation of the motion of the instrument.

Iodium 30, one globule, produced the same effect as *Phosphorus*.

One globule of *Ammonia* 30, increased the normal action visibly.

Natrum muriaticum 30, one globule, reversed the normal action, and gave the reverse current just as the *Table Salt* did.

I then proceeded to place other homœopathic preparations upon the operator's hand, and the following were the results, only one globule of each medicine was used:

Arsenicum, the instrument stopped.
Dulcamara, motion from B to A.
Opium, motion ceased.
Arnica, reverse of normal action, or reverse current produced.
Nux vom., stopped the motion.
Ignatia. reverse current.
Acid. hydrocyanic., stopped.
Belladonna, ditto.
Sulphur 30, reverse current.
Sulphur 800, exactly the same both in direction and in force.
Pulsatilla 12, stopped.
Bryonia 30, reverse action.
Non-medicated Globules, no change upon the normal influence of the operator.
Ipecacuanha 3, reverse current.
China 6, ditto.
Rhus 30, ditto.
Stramonium 6, stopped.
Drosera 3, ditto.
Kali hydr. 30, ditto.
Spongia 3, ditto.
Ledum palustre 12, ditto.
Capsicum 3, ditto
Cayenne pepper, same effect exactly.
Colocynthis, reverse current.
Digitalis, stopped.
Cannabis, reverse current.
Hyoscyamus, stopped.
Lycopodium, ditto.
Filix mas, ditto.
Euphrasia, reverse current.
Ruta 3, stopped.
Sabina 6, reverse current.

Some experiments were performed upon several other medicines, but I shall reserve them for another lecture. In a former part of the evening I mentioned the fact of the two thumbs neutralizing each other's

Hosted by Google

effects. In the same manner, two metals having the same action upon the currents, being brought in contact with the operator at the same time, neutralize each other's action, and the normal current is restored. Two vegetable medicines, having similar effects upon the normal current, when experimented upon separately, if brought in contact with the operator at the same time, also destroy one another's effect, leaving the normal current to go on, if it was in a state of action when the experiment commenced, or bringing it to a full stop, if it was in a state of repose when the first of the two medicines was applied. Dr. Madden, who I believe was the first homœopathic practitioner who witnessed Mr. Rutter's beautiful experiments, has recorded in the *British Journal of Homœopathy* for this month, among other experiments, the action of *Mercury* and *Bismuthum* upon each other.

I believe, gentlemen, I have now brought before you the leading points of the truly beautiful experiments of Mr. Rutter, and I feel confident that you will agree with me, that science has made a gigantic stride by the philosophical instrument and important discovery of that gentleman, and that homœopathic practitioners especially are greatly indebted to him for having proved the physical action of our remedies in infinitesimal quantities upon the human body; and that you will join with me heartily in doing honour to him for the great impetus he will be the means of giving to our Cause. The only reason for sorrow is, that our revered master, Hahnemann, is not alive to witness this triumphant proof of his own great discoveries. I have probably explained very imperfectly some of these interesting experiments, but I shall be happy to answer, to the extent of my knowledge, any queries that may suggest themselves to you, and I am sure Lord Belfast will corroborate the statements I have made to you respecting these experiments, and will at the same time assist me in solving any difficulties you may have, which he is well capable of doing, from the careful manner in which he has watched and examined these experiments.

At the close of the lecture, which was listened to with great interest, and received with much applause, a very interesting conversation took place on the importance of Mr. Rutter's discovery, in which Dr. Chapman, Mr. Vardy, Mr. Kidd, Mr. Reynolds, and Mr. Yeldham, took part, and the Earl of Belfast corroborated, in some observations, the account given by Dr. Quin of the results of the experiments.

LETTER TO ROBERT CHRISTISON, M.D., V.P.R.S.E.,

AND PROFESSOR OF MATERIA MEDICA IN THE UNIVERSITY OF EDINBURGH.

No. IV.

SIR,—I believe I was right when I said I should prove a heavy affliction to you, but the war is of your own seeking; as ye have sown so shall ye reap; now gather in your harvest—public opinion. Glean it from the columns of the *British Banner*, the *Witness*, the *Spectator*, and the *Christian Times*. Is the draught refreshing? are you not inclined to exclaim with the poet—

"Give me back, give me back the wild freshness of morning ?"

I say again, gather in your harvest—garner up the bruised feelings, the blackened hearts, the damaged reputations, the broken gallipots; convert them into medicated pillows, and serve them out to your wearied heroes to sleep upon.

The imprudence that led your University to the contest is only equalled by its lack of courage in the *mêlée*. You have been signally defeated in three short months upon a battle-field of your own choosing. Your University charged headlong, "like a bull into a china-shop;" you followed this wild leader, in your capacity of examinator; a tyro in homœopathy rode roughshod through your ranks, and bowled you down like ninepins. There are many *Mr. Popes*—equally stout-hearted as that noble youth was, equally honest as he, and who are ready enough to make your ears tingle with honest convictions; convictions that *must* have due weight with you, for they have forced you into a position which for a long time you supposed to be ours—a conscience-stricken one, veil it as you may. You no longer feel the death of a patient so lightly as you once did. "*All has been done that can be done*," is not heard so often in the chambers of death. The battle is over, and we look o'er the field, and of all the vanquished who fought in your ranks, saving yourself, we find none, no not one, worthy the ink that has been spilt upon him.

Next time you aggress, enlist better soldiers; have a gathering of your clans, and summon the *real* names in allopathy to your aid, and if they hang back, denounce them. Is he who, in his secretarial capacity, prostituted his official pen to the clandestine transmission of a private insult on his own account, a fitting partisan for *you?* Can the heart of such a comrade in arms as the big-letter paragraph-writer

Hosted by Google

of the *Lancet* throb in sympathy with yours? Are you satisfied with such a compeer as the man who lately "ran a-muck" at Brighton, and chose a philanthropic clergyman as the *safest* point of attack; who tastefully and most truthfully premised (what might have been hoped might prove a scientific discussion) by lamenting his own deficiency of brains, his own leadenness of comprehension. God knows, no one doubted it, but he was under some apprehension lest it might be doubted; for he insisted upon proving it by mounting a broken-kneed hobby from the allopathic stable, a stubborn, foul-mouthed, ill-bred, hard-bitted brute, which, as Putney had no gift of equitation, bolted with him *instanter*. He rode like a sack of corn, and, as might have been expected, soon pitched upon his skull; but as he had told his friends there was nothing in it, and it was known to be pretty thick, no one was alarmed, and the more so, as his hobby was but a donkey. He must have taken up some confused idea of having lived in the times of the "*Roses*," for a voice somewhat fainter was heard begging to be favoured with *an ass*. "An ass, an ass, my practice for an ass!" passed through the assembled three hundred.

Whether it was that the very liberal offer of the practice, or the mere impulse of instinct, or in illustration of the axiom that, "unlooked-for circumstances are always sufficient to bring out minds capable for the occasion," I know not, but at this juncture appeared upon the stage Dr. Malden, of Worcester, who, perhaps feeling himself peculiarly fitted for the post, kindly offered to accommodate the Putney man, and to a crowded audience of ladies and gentlemen he performed the part in a manner so truthful, that many of them doubted its being au imitation at all. Caps and bells! a physician's "charivari." We wager this worthy has acted his part of Punchinello for the last time; if not, we have a rod in pickle for him.

In repulsing successfully such men as these, we take no merit to ourselves. But with you it is different; we have a respect for you, although you have joined *them* in denouncing us as "*illegitimate practitioners*;" and the term naturally leads us to inquire into the *integrity* of our *professional fathers and mothers*: but "legitimacy" is as inapplicable to your side as its converse is to ours. You brought Glassford to prove it; the Coroner for Middlesex has frequently put on his gown and wig to prove it; and Mr. Justice Maule stereotyped it in the sensitive parts of Thomas Membury Wakley, on the 8th of October, 1849, a day that functionary will not readily forget. Last of all, you have proved it in your October number of this year (p. 398). So totally inapplicable are the forces and subtleties of the law to medical cases, wherein no criminal intention forms the basis of procedure, that a conviction could not be got against a poaching greengrocer, whose Pharmacopœia contained one remedy, "*Composition Powder*." Even with the greengrocer's case we have a little admixture of science; for after being indebted to the *candour of the accused* for the information that bayberry bark and hemlock-spruce bark formed the most active of the ingredients, the analytical department is confided to Dr. Letheby, whose aid carries us no further than "*cayenne pepper and ginger*," vegetable compounds being quite as inapproachable by chemical analysis as homœopathic globules; yet there was bulk enough to *kill*, and chemistry could not detect it. The "composition powder" proved a "*powerful stimulant*;" judge, jury, witnesses, lawyers, and lookers-on saw that day it was a "*powerful stimulant*." Hold up thy head, thou vile greengrocer, and hear thyself convicted of administering a powerful stimulant! But stay; let us just turn up the pages of the Edinburgh Dispensatory. Have we no "composition powder" here, no "powerful stimulants?" All is as mild as maternal milk. We back the arsenial solution, the prussic acids, the corrosive salts, to say nothing of the Dispensatory "*discrepancies*" in certain preparations, to produce occasionally the same effects in the hands of a green doctor that the "composition powder" did in the hands of a greengrocer; the danger to the public is much on the side of the Pharmacopœia; for *green* doctors are to be had in every street, whilst a practising greengrocer is a comparative rarity.

You condescend to give us Dr. Coffin's formula; we have seen it for the first time through your periodical ink, and see no right an allopath has to complain of it; it is quite as good as many in your Dispensatory, and a great deal better than some I could quote from it. Dr. Coffin has proved himself a true allopath; but he has a moral advantage over most of the allopathic school—his name alone affording a warning of approaching danger, such as we wish preceded the approach of every qualified man who prescribes gross substances; and if it be asserted that the doctor has no merit in the name bestowed upon him by his male parent, we say he has, for he might have repudiated it, and taken one instead that offered no warning.

Hosted by Google

But the greengrocer's sin consisted in administering a combination, the ingredients of which he did not know; an undoubted misdemeanour, if not a crime, but not surpassing the qualified man's, when it pleaseth him to prescribe a dose of James's powder. In so far as moral turpitude was concerned, all charge was abandoned by the men of law, for there was no *intention;* and this mountain of iniquity resolved itself into the *greenness* of the greengrocer, who unwittingly killed his man. In point of therapeutic principle, the difference between the administration of "composition powder" and "James's powder" does not amount to a thistledown; to draw a distinction would savour strongly of straw-splitting. We assert, therefore, that the greengrocer only did without a degree that which the *green* doctor occasionally does with one; but the former poached upon the latter's *preserves*, or rather *reserves; ergo*, the Editor of the *Pharmaceutical Journal* would have hanged him as high as Haman.

But we homœopaths have cause to complain of the greengrocer's practice, for it recalls many a case of inflammation of the bowels, and many a "*powerful stimulant*" to our memories; and we would not have been sorry had a conviction followed on a moiety of the charge; but neither judge nor jury would listen to it for a moment. There must have been a strong influence acting upon the judge, a powerful spell hanging over that jury. It was the Englishman's characteristic (when untrammelled by corporations), a love of fair play, which, rather than forego, they somewhat overstepped; it was the influence of professional persecution, so eminently distinguishing the medical body, and so ineffably disgusting to the people's common sense, that acquitted the man Stephens. Must we then legislate anew? Must the Lycurgus of law and the Solon of physic lay their heads together? Perhaps it were as well: they have some work before them. They may begin by equalizing the doses of the *Dispensatories*, and that most serious point settled, let them decide upon the *smallest dose a physician may prescribe without criminality*.

Alma Mater! thou art now a granddame; tottering, feeble, addle-pated, we volunteer thee instruction in our young philosophy; conning thy bitter task, bitter even as when thy grandchildren first presented it to thee, how doubly bitter hast thou made it to thyself; 'tis a lucky thing for thee we deal in globules instead of black draughts, for many a dose we shall compel thee to swallow. "The battle is not always to numbers, the race not always to the swift;" but fully contented with what we have done, we are ever prepared to do more.

I have the honour to be, Sir,
Your very obedient servant,
October 11, 1851. SIGMA.

THE
HOMŒOPATHIC TIMES.

SATURDAY, OCTOBER 18TH, 1851.

THE mercenary motives dictating the opposition of the allopathic phalanx is beginning to attract the attention of the public. It is perceived, by all who take the least notice of the vituperative attacks to which homœopaths have lately been subjected, that they mainly spring from those who have more at heart the question of pounds, shillings, and pence than the true elevation of medical science.

Loudly as these gentlemen may proclaim against the advance of quackery, the progress of jobbery, and the conceits of wild-brained enthusiasts, few are so prone as themselves to damage the cause which they have unfortunately espoused, since their steady perseverance in rejecting everything new, shows they are not prepared to admit the least change in antiquated customs or opinions. The result, therefore, is their condemnation by all sound and well-thinking people, which, sooner or later, must terminate in their defeat.

But as to their endeavours to check the career of homœopathy, they are positively futile. Our principles and our practice possess inherent recommendations, which it is impossible they can overthrow. The attempt may again be made, but it cannot possibly succeed. The disciples of Hahnemann now comprise an associated body, numbering some of the highest and best-educated in the land. Lay as well as professional members work with an ardour worthy of the conflict in which they are engaged—a conflict for the pre-eminence of truth as arrayed against falsehood and dogmatic precedent.

Hosted by Google

The prosperity of homœopathy has been essentially tested by this late crusade. Instead of finding the enemy disturb our ranks, we are gratified by discovering that they have gained an accession, and in some cases, even at his expense. How mortifying this must prove to the promoters of the movement! Doubtless, it was thought that it merely required a little skirmishing to drive us from the field, but this has been the grand mistake. The debatable ground has been assumed in a becoming spirit, and it must be contended for inch by inch, if Hahnemann is to be adequately represented, and his philosopy popularized.

The period has in reality arrived when allopaths must be taught to discern that in the struggle between themselves and homœopaths, the only method of satisfying the public, with regard to the merits of the respective systems, will be by a full and fair inquiry into the principles advanced by their opponents. If they can, with any show of justice, refute these, then homœopathy must meekly submit and bare the neck to accept the merited disgrace. Already, the world at large is acquainted with the basis upon which we rest our reputation, and by such a process we are willing to be judged.

We invite the attention of our readers to the Resolutions of the British Homœopathic Society, which appear in our advertising columns.

THE NEW MAGNETIC INDICATOR.

Most of our colleagues are by this time aware that Mr. Rutter, of Black Rock, Brighton, has recently invented an instrument, which, besides its vast importance to the science of magnetism in all its forms, holds out the means of *demonstrating* the fact that the homœopathic medicines do act on the human organism. This is a discovery which would have gladdened the heart of Hahnemann, had he been in the life of th e body: this instrument, which affords the means of proof of a fact the opponents of homœopathy have always rejected without inquiry, has been discovered at a most opportune time. We suppose Professor Christison will now change his opinion of homœopathy, and, having changed it, will lose no time in avowing that he has done so.

Drs. Quin and Madden are entitled to the best thanks of all who are interested in the progress of homœopathy, for having brought the subject of this important discovery before the homœopathic practitioners. It is our pleasant duty to announce it to the homœopathic public. The experiments with this instrument, in proof of homœopathy, can be made, when Mr. Rutter has made it public, as well by non-medical as by medical men, provided always they have the necessary patience and knowledge. The investigation conducted by non-medical inquirers wonld add great weight to the testimony of medical men. We trust Faraday will take the subject up; and that every chemist, who deserves the name, will do likewise.

It is Dr. Madden's good fortune to live at Brighton; and of the homœopathic practitioners, he was the first to see Mr. Rutter's instrument and experiments.

The Earl of Belfast, a friend and supporter of homœopathy, no sooner saw the instrument and some of the experiments, than he also at once saw its applicability as a test of the homœopathic doses of remedies; and it seems that any one, medical or non-medical, who sees the instrument and some of the experiments, cannot fail to discern at once that applicability.

We heartily congratulate Mr. Rutter on his happy discovery and brilliant invention; and we trust that he will as soon as possible publish his intended book on the subject. All persons interested in magnetic science, and in homœopathy, will eagerly look for its appearance.

This has, indeed, been a very important year for our Cause. Before the close of it we may be in possession of Mr. Rutter's own description of his instrument, and detail of his experiments.

We commend the subject to the hopeful consideration of our colleagues, our readers, and the homœopathic public at large. An

Hosted by Google

excellent lecture on it by Dr. QUIN will be found in another part of our present number.

THE Editor of the *Lancet* of last week is at his wits' end. The poor creature is floundering in the Stygian depths of an unenviable *limbo*.

We rejoice to find, from his authority, that another Professor of the University of Edinburgh, Dr. GREGORY, has proclaimed himself a homœopathist. In the ebullitions of his irrational fury, he absolutely proposes the Lynch law! We remember when the Editor of the *Times* recommended *brick-bats* to be used to the Duke of WELLINGTON. This *liberal* editor of the *Lancet*—this *Coryphæus* of the allopaths, recommends Lynch law for the homœopathists! "Lynch law is not confined to the backwoods of America." A nice expression this for a man who never did set—the Thames—on fire. He absolutely gloats over the memory of poor EDMUND KEAN, a man of genius, of whom it would take innumerable editors of the *Lancet* to make an infinitesimal portion.

This nice boy, rollicky Tom, riding on his Bellerophon (*Billy-Ruffian*, as the sailors say), absolutely tries to stir up the Edinburgh students to rebellion against their teachers.

He makes valiant war against all progress in therapeutics. "*Stare super vias antiquas*" would be his motto, if he ever read Scripture. He is in a terrible rage; his own son does not disavow homœopathy—in fact, has said that in his private practice he uses it.

"Oh matre pulchrâ filia pulchrior"—
Oh Tom much better than the father Tom.

Where will this huge absurdity end? There was never a smoke without fire. There surely must be something in that dread thing homœopathy, when for months together the Editor of the *Lancet* assails it, week after week. "*Væ victis*" was the cry of the heathen over their vanquished: "Repent and live" is the better saying of a better religion. Let the Editor of the *Lancet* repent; let him shrive himself; let him wash and be clean. There is a great deal of coarse, rude vigour in the fellow. We rather like him: he is a fine specimen of the animal. Let him be intellectual, moral, spiritual—if he can.

WE said in our last number that the *Medical Times* was crowing a little crow—how very small a crow it is our readers may judge for themselves, for we reprint the editorial leader on homœopathy. We only wish the crow was louder, the voice more articulate, the oracle more distinct. The slip-shod of the *Lancet* is reproduced; assertion follows assertion without any attempt at argument or proof. The absurdity and quackery of homœopathy are asserted, and the want of personal integrity is imputed to the homœopathic practitioners. All this has been done before, and done more vigorously. It is plain to us that this task of writing down homœopathy is not congenial to the Editor of the *Medical Times*: he cannot fail to have some misgivings that he may be wrong now, as he was two or three years ago, when he asserted that homœopathy was extinct in the metropolis.

But in the article we are about to quote, he says, from personal knowledge, that he has seen some of our medical body needy practitioners, and therefore did not wonder at their secession. It is not improbable that both in homœopathy and allopathy there are men who have been needy practitioners. We know there are some who never had any practice at all; and doubtless there are others who do not find the practice of medicine their vocation, and who might say—

"My poverty but not my will consents,"

as the starved apothecary said, when he gave poison in exchange for money. There are probably hundreds of general practitioners who loathe what they feel to be the necessity that is laid on them to make a living by selling drugs to their patients. Why do not the Editors of the *Lancet* and the *Medical Times* take up the cause of the general practitioners, and encourage them to change their bad and indeed un-

Hosted by Google

warrantable practice of getting themselves paid, not for their skill and time, but for the medicines they dispense? It only requires a little moral courage, and the *consent* of all of them. Let them *agree* to be paid for *their time*, and not for their drugs; and they will be happier and more respectable men.

This is a reform and an improvement in their condition, however, which homœopathy will effect for them. The homœopathic practitioners are only paid for time and skill, and never for medicines. This practice will prepare the public for a change in the way of remunerating the general practitioners throughout the country.

The Editor of the *Medical Times* writes: "We have seen you transferred in a single night, in some cases, into practitioners of a system which boasts of the study it requires, and the patient investigation which it demands, and we marvelled at your audacity." So do we, if such persons there be; but we know them not, and we should be glad to be told who they are. Till then, we do not believe our contemporary's assertion.

He says he has watched some of our practitioners, and found them ready to be a bit of everything to please their capricious clients. We do not know whom he means. The few who sometimes use homœopathic remedies, sometimes allopathic,—and they are but very few,—do it to their great disadvantage; but they do it openly and conscientiously. They show they have not entered into the spirit of homœopathy; that they are content to rest in the outer court of the temple amid the cattle and the litter, and have not pushed forward even into the ante-chapel of that glorious health-temple.

If the Editor of the *Medical Times* can show that any one of our body practises dishonestly, let him do so: we have no wish to screen such an one.

Let him give us argument, and we will try to answer it; proofs or alleged proofs of his assertions, and we will sift them; attested failures in conduct of any of our body, and we will examine into the testimony; downright *Lancet-like* abuse, and we will reprint it;—but our readers will find that nothing, so far, has been said, which has not been said before. He promises to deal no longer in mere *generalities:* we shall look for his specialties with great interest.

"OUR RELATIONS WITH THE HOMŒOPATHISTS.

"To associate with men whose characters you traduce; to use all arts to gain admission to a body, and thereafter to vilify and affect to despise it; to profess certain opinions in order to acquire a professional status, and, whenever you have done so, to ridicule and denounce them; to swear adherence to a profession that you may acquire the right to practise, and thereafter to embrace a medical heresy, that you may the more successfully pander to the follies of the rich and fashionable; to adhere neither to the one nor to the other, but to practise either, as the absence of all principles admits, and the whim and caprice of a patient demands;—these are the achievements of modern philosophy,—these the triumphs of homœopathic morality.

"To heap abuse, impute vile motives, and denounce in every possible way, during years of mistaken forbearance, the members of an honourable profession, and yet to raise the cry of persecution, when the pretended bond of union is severed; to print whole volumes, and to circulate journals to prove that regular medicine and homœopathy are diametrically opposed and can never be brought to agree in any one point whatever, and yet to complain of injustice when medical men, acting on this information, decline to be parties to deceiving the public by allowing them to suppose that a regular and a homœopathic practitioner have aught in common; to call in a surgeon to cure intractable external cases where the powerlessness of your pretended treatment can be the more readily observed, and then to denounce surgical appliances as cruel, barbarous, and unnecessary;—these are the characteristics of a science which comes, as one of its eloquent advocates affirms, having as 'its errand, mercy; its means, love; its object, peace; its emblem, hope.'*

"If you believe homœopathy to be true, we do not blame you for practising it; but we call upon you to take your stand on the merits of your new system, and not to support yourselves on ours, like the parasite which clings to while it injures the noble tree. We have no objection to your sharing with the Morisons, the Gosses, and the Perrys of the present generation, the fruits of fashionable folly or popular credulity; nor do we forbid your eclipsing the glories of Doctors Solomon, St. John Long, and Greatrex of the past; but we do declare, that you shall not do this in the guise and garb of the regular practitioner, or that he shall, in any way what-

* Sermon preached in aid of the Hahnemann Hospital, by Rev. Thomas R. Everest, Rector of Wickwar.

Hosted by Google

ever, give the sanction of his name and character to the means by which you seek advancement.

"We do not, we cannot object to your founding colleges which shall rival the 'British College of Health,' or even to your becoming colleagues of the illustrious 'Professor Morison;' but we do denounce this monstrous absurdity,—that any of your number shall hold professorships in any of our colleges, shall teach there doctrines which he cannot believe, or he would not practise as he does, and shall have the audacity to defend this incongruous union, this outrage on all morality.

"We have seen you as needy practitioners, outstripped in the race for legitimate practice, your hearts doubtless sickened with hope deferred and long-delayed success, and we did not wonder at your secession. We have seen you again, in some cases, transformed in a single night into practitioners of a system which boasts of the study it requires and the patient investigation which it demands, and we marvelled at your audacity. We have watched you yet further, and have observed in you the obsequious servants of fashionable caprice, trimming your sails to suit each breeze that blew,—now homœopathists, now hydropathists, now anything else,—and we were not surprised at your success.

"You may load our tables with 'clever' pamphlets, you may talk of 'New Test Acts,' and 'recent conspiracies;' your two philosophers, Henderson and Ransford, may publish to the world cases, before which *Professor* Holloway must hide his diminished head, and Lord Aldborough's leg no longer walk the course without a rival;—but there are certain broad principles of common sense and common honesty which have been violated, which must be proclaimed, and these, not all the talent of your legal advisers shall succeed in concealing beneath the flimsy cobweb of ingenious sophistry.

"Hitherto homœopathy has been the toy of the fanciful, when the disease was slight and likely to cease spontaneously, and its victims have lulled themselves with the hope, that if serious disease did attack them, they could fall back on the appliances of legitimate medicine; now this delusion must be dispelled, and they must be taught that their alliance with this quackery is for better and for worse, and that if while it subsists, the ordinary treatment is required, it must henceforth be administered by those bastard homœopathists who practise indifferently either way.

"In the name of our profession, we have accorded our thanks to those medical bodies, who, roused from the lethargy of years, have acted a noble and independent part. All honour to the Colleges of Physicians and Surgeons of Edinburgh, the Faculty of Glasgow, and our own Provincial Association. But what are the metropolitan colleges about? Why do they allow others to lead when they must eventually follow? Are they emulous of the character of being the only practitioners who consult with homœopathists? How long will they, spaniel-like, lick the feet of the men who abuse them? How long will they consent to blind the public to the fact, that between regular medicine and homœopathy there can be no alliance, that every man must now decide for himself how he is to be treated, but that from henceforth, when the new system fails, he is not to seek to engraft upon it the old.

"We confess ourselves utterly at a loss to understand the immobility of the metropolitan colleges. Have they no duties to discharge to the profession and to the public? Is there no responsibility laid upon them to give an utterance in regard to this modern heresy? What is their office, and why were they instituted? Are they the public guardians of professional character, or are they not? These are questions which are every day put, and which must, sooner or later, be answered. Mere *vis inertiæ* will not now avail; a great opportunity was thrown away when they refused to lead the van in this movement against quackery; now they must be content to bring up the rear. Often and justly has the profession at large been offended at what they have done; let them not add to their past transgressions new grounds of offence, and give us occasion to remind them of what they have left undone.

"But, whatever apathy may affect certain public bodies, however sloth may overcome, or indolence oppress them, however the personal success of their individual members may render them indifferent to the interests, and far more to the character of the profession, enough has already been done to vindicate both. By now acting, they will scarcely add weight to the movement, but they will remove a grievous stain from their own character. The clear and distinct deliverances of the Northern Colleges and Faculties, the determined and manly attitude of the Provincial Association, above all, the ability of the speeches at the Brighton meeting, the separate publication of which we gladly hail, are amply sufficient to vindicate the profession as a body, and to free it from all charge of homologating the absurdities of quackery, or battening on the garbage of error.

"As a body, the profession are done with all tampering with homœopathy, and have renounced all intercourse with its professors. Individual exceptions may occasionally occur, for which we would prefer to seek an excuse rather in ignorance than in cupidity; but let those who have now deliberately recorded their opinion of this gross imposition remain true to the principles which they have voluntarily professed, and these exceptions will soon disappear. Let them act on the opinion they have declared, that there are three classes of men with whom they can have no friendly dealings: first, Real homœopathists; second, Bastard homœopathists; third, Those who on any pretence meet either of the former in consultation,—and the separation will be effectual and complete.

"Let homœopathists secure what amount of practice they can. A certain proportion of our race are born to be the victims of imposition, and it matters little whether they receive it at the hands of Dr. Goss or Dr. Ransford, Professor Holloway or Professor Henderson. But *we* must have no alliance with *them*. The grounds

Hosted by Google

of our renunciation are clear and distinct. No new code of medical ethics is invented to supply them; no 'New Test Act' is framed to provide them; they rest on the acknowledged foundationss of common honesty and common sense.

"We shall deal no longer in mere generalities; our duty, alike to the profession and to ourselves, demands that we should sift this question to the bottom, expose the shallow sophistries by which it has been ingeniously perplexed, and exhibit the solid foundation on which the resolutions of those various bodies who repudiate homœopathy and the homœopathists are based.

"The time for indifference is past; further forbearance would be thrown away; we proclaim open war; our ethics admit of no accommodation, no compromise whatever.

"If homœopathy is to continue to exist, as a bitter and permanent satire on the folly and credulity of mankind, let it have schools and colleges, diplomas and professors of its own. One thing we must declare; our licenses shall not be given to cloak imposture, our right hands shall not be stretched out to encourage quackery, and still less shall our youth continue to be tampered with, and their principles undermined by the ridiculous folly, loose morality, and contemptible meanness of the men who, to the disgrace of those in authority be it said, occupy chairs in our Universities. True, they may not have courage to teach what they profess to believe; but this subterfuge shall not avail them: true, they may have dishonesty enough to teach what they profess to condemn; but this palpable immorality shall not shelter them. Their very presence in such situations must be injurious to the minds of ingenuous youth. If they speak what they believe, they instruct in error; if they are silent, they instruct in deception."

Review.

The British Journal of Homœopathy, No. XXXVIII. London; Highley, 32, Fleet-street.

THE October number of this quarterly is full of interesting matter. Those who take an interest in the history of medicine will read with great pleasure Dr. Scott's lectures on that subject, of which we have the second in this number of the journal. The incidental confirmations of the well-known fact that the ancients had *glimpses* of the homœopathic doctrine, are very interesting.

Those who appreciate the philosophic spirit, enlightened by a large catholic benevolence, will read Dr. Russell's oration with pleasure.

Mr. Sharp's "Inquiry into the Truth of Homœopathy" has been reprinted from this number of the journal, and should obtain a large circulation. Mr. Sharp is a man of science, a man of remarkable endowments and attainments; and his acceptance of the homœopathic doctrine and practice is a matter of congratulation to all those who are interested in our Cause.

We have next a paper on Typhilitis, which we have not yet had time to read.

The "Persecution of the Homœopathists" is the next article. This paper has also been reprinted, and should be largely circulated by all the well-wishers to homœopathy. To show the supineness and indifference of those to whom it belongs to push the circulation of such papers, we may observe that we have not seen any advertisement either of Mr. Sharp's "Inquiry," or of the "Persecution."

The Clinical Notes by Professor Henderson are resumed. There is a very interesting case, furnished by Dr. Black.

Amid a variety of interesting "Homœopathic Intelligence," there is a communication in the form of a letter from Dr. Madden on Mr. Rutter's new *magnetic indicator*, which is likely to be so valuable in affording a demonstration of the fact that our doses do act on the human organism.

In the account of the Homœopathic Congress at Paris, the writer does not mention that Drs. Quin, Curie, Dudgeon, Ackworth, D. Wielobycki, and Mr. Reynolds represented the homœopathists of Britain; nor does he mention the compliment that was paid to the British homœopathists, as well as to himself, in the election of Dr. Quin as general president of the Congress. Dr. Petroz was the president in ordinary, and Drs. Davet and Nunez were the vice-presidents.

The *British Journal of Homœopathy* is now, we believe, the *oldest* medical quarterly published in these kingdoms. It represents the medical science of the day, as well as the scientific aspect of homœopathy, and we should like to see the *Lancet* and the *Medical Times* enter on a dissection of it. Let it be one of the *specialties* that claim the attention of the *Medical Times*.

The following extract, showing the condition of homœopathy in France, will be read with great interest:—

"The state of homœopathy in France, as far as we could ascertain, is extremely satisfactory. The behaviour of the Faculty of Medicine in Paris towards homœopathic students, presents an agreeable contrast to that of sundry Faculties in our own country, of which we have had occasion to speak very freely. Our readers are aware that it is no unusual thing for a student to write and defend a homœopathic thesis before the Faculty of Medicine in Paris; we have already had occasion to mention several instances of this sort, and a thesis of this character is now before us, which was presented this

Hosted by Google

year by a graduate, Dr. A. Leboucher. It is entitled, '*From the action of medicines on the healthy person, how far may we form conclusions respecting their therapeutic application?*'"

Such a thing as rejecting a candidate on suspicion of his homœopathic leaning is utterly unknown in France, and the recalling of a degree on account of the holder practising homœopathy would never be dreamt of. As regards this thesis, we may mention that a student cannot be sent back for that, whatever be the subject he chooses to write on; and an excellent safeguard against *plucking* candidates on account of homœopathic tendencies lies in the fact of the examinations being conducted publicly. The same is the case with the examinations in Germany, therefore it is that we never hear of such an enormity taking place either in France or Germany as that which happened to Mr. Pope in Edinburgh. We feel convinced that it is the secrecy with which their examinations are conducted that inspires the Edinburgh magnates to the commission of such Star-chamber acts as the rejection of Mr. Pope; and we believe it would be for the interest and advantage of homœopathists in particular, but also of all candidates and of the public, that the examination of all the licensing bodies should be conducted here, as on the Continent, in public. "They order these things better in France," and so they do also in many other countries that are immeasurably behind us in other respects, but where such inquisitorial proceedings as we witness here are not tolerated.

"The number of the homœopathic practitioners is rapidly increasing in France, and they are being reinforced by some of the most intelligent and distinguished amongst the rising generation of medical men; several of this year's converts are young men who have obtained the highest distinctions during their medical studies, and have acted as *internes* to some of the most distinguished professors of the old school.

"We paid a visit to Dr. Tessier's hospital. He has 100 beds, which are generally all occupied, and the arrangements of the hospital pleased us very much. The wards are airy and high, and the hospital is well situated and well served. Two English practitioners were attending regularly the practice of Dr. Tessier while we were there, and we doubt not this will become a seminary for the education and instruction of inquirers. Dr. Tessier is a man of the greatest talent, courteous and communicative, and thoroughly skilled in all the learning oi the old school, a first-rate pathologist, an admirable speaker, and with an engaging simplicity of manner. He informed us that he had never met with anything but uniform kindness and respect from the Central Bureau of Hospitals, although at various periods there have been medical men among them, and such is the case at present; not the slightest opposition has been offered to him in the change that he has carried out in the medical treatment of his patients. This behaviour of the directors of the hospital towards Dr. Tessier presents a striking contrast to that of the managers of the Edinburgh Infirmary towards Professor Henderson. In fact, in every phase of the homœopathic campaign in this country we have encountered an amount of narrow-minded bigotry and intolerance, that is without parallel in any part of the Continent, even in those countries where freedom of opinion on other points is attempted to be extinguished altogether, and ultra-conservatism and hatred of change is the ruling passion amongst their governors."

Miscellaneous.

On Tuesday next, October 21, the Hahnemann Medical Society will hold its next meeting.

Washington.—Washington has no resemblance whatever to Napoleon. He was not a despot. He founded the political liberty at the same time as the national independence of his country. He used war only as a means to peace. Raised to the supreme power without ambition, he descended from it without regret, as soon as the safety of his country permtted. He is the model for all democratic chiefs. Now you have only to examine his life, his soul, his acts, his thoughts, his words; you will not find a single mark of condescension, a single moment of indulgence, for the favourite ideas of democracy. He constantly struggled—struggled even to weariness and to sadness—against its exactions. No man was ever more profoundly imbued with the spirit of government, or with respect for authority. He never exceeded the rights of power, according to the laws of his country; but he confirmed and maintained them, in principle as well as practice, as firmly, as loftily, as he could have done in an old monarchical or aristocratical state. He was one of those who knew that it is no more possible to govern from below in a republic than in a monarchy—iu a democratic than in an aristocratic society.—*Family Friend.*

A cheap but good Tooth Powder.—Cut a slice of bread as thick as may be, into squares, and burn in the fire until it becomes charcoal, after which pound in a mortar, and sift through a fine muslin; it is then ready for use. I can answer for its *efficacy*, having used it *continually*, for upwards of *eight years*.—*Family Friend.*

INAUGURAL LECTURE

Delivered at the London Homœopathic Hospital, Thursday, 23d October,

By Dr. Quin.

In almost all ages the creations of the man of genius have been preceded by certain approximations to the truths involved in his discoveries. These approximations, however, generally lead to no results. They again lie dormant and reappear, at different epochs, in other but still imperfect forms, until his master mind, disdaining the beaten track by which experience slowly arrives at the attainment of truth, soars beyond all competitors, anticipates the knowledge of future ages, and grasps, as it were by a spirit of divination, some deep and long-hidden mysteries of nature. The discoveries are no longer barren in results. The wand of genius disencumbers them of their earthly envelope; experiment succeeds experiment, induction follows induction, until a system arises conveying knowledge and benefit to mankind.

Of the many approximations which preceded the great discoveries of our revered master, Hahnemann, the most curious, and perhaps the most nonsensical, are the notions of Crollin, a physician of considerable celebrity in his day. He was a disciple of Theophrastus Paracelsus, and flourished in the middle of the sixteenth century. He had a strange manner of interpreting the axiom of Hippocrates, *similia similibus curantur*, which Hahnemann adopted as the motto of his discovery and doctrine; for Crollin entertained the idea, that those substances in nature which resemble most closely the symptoms of diseases in external appearance, colour, and smell, are the most suitable for their cure. Strange and absurd as this may appear to us, there is no doubt that it is an approach towards homœopathy. Had he spoken of an internal similarity in the effects of the remedies, instead of an external resemblance, he would have been nearer the truth.

According to his scheme of treatment, *Gamboge* would, I suppose, have been employed in jaundice, *Digitalis* in purpura hæmorrhagica, *Agaricus Muscarius* in some pustular eruptions, and *Lycoperdon Bovista* in some round tumours. It is, however, worthy of remark, that some of our strictly homœopathic remedies are physiognomically such as he would have prescribed. Those remedies, in fact, where the internal or homœopathic similarity is accompanied by an external likeness in colour or form to certain signs of diseases. But the point where he approached still nearer to Hahnemann's discovery, was his condemnation of the practice of using large doses. He contended for the superior efficacy of very small quantities in the treatment of disease. He says, in the German edition of his works, "The soul, or the proper form of each substance, has more numerous and more powerful effects than the body and its matter can ever have; this is because the nature of everything depends upon its form. Many advantageous consequences follow this; as, firstly, because the sick can much more easily take and use a small quantity of medicine, seeing that many declare they would rather die than swallow whole cupfuls of coarse and dark-coloured potions; in the second place, because, by the repeated use of such small doses of medicine, the stomach is not injured, seeing that in consequence of their efficacy they meet with no obstacle."

It is interesting to reflect how near Crollin was to making the discovery upon which Hahnemann, two centuries later, founded his system of medicine. Had he not confounded the soul or dynamic power of the medicines with their external form, and had he tried them upon the healthy body, and watched and recorded their pathogenetic effects, there is reason to believe that a system of treatment somewhat similar to that now practised by us would have been discovered two centuries before Hahnemann brought it to light. Again and again, in the interval between Crollin's publication of his "Basilica Chymica" and the advent of Hahnemann, did scintillations of the truth appear, which required but the breath of genius to fan into a flame of light. In the works of Van

Hosted by Google

Helmont, Sydenham, Hoffmann, Stahl, Boerhaave, and Haller, isolated foreshadowings of Hahnemann's discovery occur; but the author who has approached nearest in his presentiment of the truth of the homœopathic law is Dr. Stahl, a surgeon of a Danish regiment, who wrote, in the middle of the last century, "that the rule adopted in medicine, that diseases ought to be cured by opposing remedies (*contraria contrariis*), was altogether false and incongruous; that he was convinced that, on the contrary, the disease ought to be conquered by a remedy which would have the power of producing a similar state of suffering (*similia similibus*); that it was in this manner that burns were cured by approaching the affected part to the fire; that frozen members were restored by the application of snow or the coldest water; that inflammations and contusions were cured by distilled spirits; and that it was by following this law that he had cured the tendency to acid upon the stomach, by prescribing small doses of *Sulphuric Acid*, whilst other physicians employed in similar cases a number of absorbing powders without success." Hahnemann quotes the above observations in his Organon, and likewise Hippocrates, Boulduc, Dethardding, Bertholon, Thoury, and Stoerk, all of whom had some suspicion of the homœopathic law. He also quotes the practice of the common people to apply warmth to burns, and cold to frozen limbs.

In the works of men of genius in different ages, will be found allusions to precepts similar to those inculcated by Hahnemann. Cicero, Bacon, Shakespeare, and many others, have passages indicating a presentiment, or proving a knowledge of the homœopathic law to exist in their time. Cicero, in the "Tusculanes," among instructions given to cure a young man madly in love, recommends change of place, and the destruction of the old love by inspiring a new one, on the principle upheld by some, that one nail drives out another; in Cicero's own words—"loci denique mutatione tanquam ægroti non convalescentes sæpe curandus est: etiam novo quodam amore veterem amorem, tanquam clavo clavum ejiciendum putant." Shakespeare's knowledge of the homœopathic law *similia similibus curantur*, or "like cures like," is familiar to you all. In the comfort given by Benvolio to the lovesick Romeo, he says—

"Tut man! one fire burns out another's burning;
One pain is lessened by another's anguish;
Turn giddy, and be holp by backward turning;
One desperate grief cures with another's languish;
Take thou some new infection to thy eye,
And the rank poison of the old will die."

Thus, it is evident, that in different epochs, in ancient as well as in modern times, men of all countries, and of all classes and occupations—the orator, the philosopher, the physician, the poet, the peasant—had some presentiment or foreshadowing of the existence of the great law which guides the practice of the homœopathic physician, so often were men on the threshold, without entering the temple of truth. It was reserved for Hahnemann to discover *this universal law in its fullest scope*, and to found upon it a system of therapeutics, the most complete and the most beneficent. From all that he has done to perfect this system of medicine, it is evident that no other single mind could have accomplished what that of our great Master did: no one but he could, in the span of one man's life, have brought his discovery to such an advanced state. When one contemplates the innumerable experiments performed, and the various works published by him; when we reflect upon the incalculable blessing conferred on mankind by him, we know not which most to admire, the transcendant genius which produced the discovery, the unwearied industry with which he carried his researches into nature, the wonderful powers of observation which characterised all his investigations of disease, the ardent disposition and enthusiasm which bore him through all the difficulties that beset his path, or the high intellectual faculties and moral qualities, great fortitude and undaunted courage which enabled him to promulgate his doctrines throughout the universe, and found on an imperishable basis his system of medicine.

And here it becomes my painful duty to allude to those unjust and uncharitable attacks with which the memory of this great and good man is assailed, for his constant efforts to enlighten and benefit mankind, and to record my protest against the impediments which are thrown in the path of his followers to carry out his practice, and promulgate his doctrines. It is, however, but the repetition of the persecution which has attended upon most innovators and benefactors of their species; but the day is fast approaching when justice will be rendered to him.

The discovery of another man of genius will do more to induce those who have been opposed to his doctrines, to study and investigate the system of medicine he has bequeathed to us than all that his disciples can say or write,

The great barrier which has prevented the majority of the members of the medical

Hosted by Google

profession from inquiring into homœopathy, has been their repugnance to entertain, for a moment, the idea that the exiguous doses of medicine administered by homœopathic practitioners can have any effect whatever upon disease. This barrier is now broken down by the brilliant discovery and beautiful invention of Mr. Rutter. No conscientious physician, whatever may be his preconceived opinions, who once witnesses the continuous stream of interesting experiments upon masses of different medicinal agents, and upon the homœopathic and infinitesimal doses of the same medicinal agents upon the human frame, by Mr. Rutter's instrument, will be justified in delaying the trial of homœopathy as a means of alleviating and curing the sufferings of his fellow-creatures. Mr. Rutter's instrument will, by opening the eyes of our professional brethren to the power which infinitesimal doses have upon living matter, I repeat, do more to hasten the investigation and adoption of homœopathy as a system of medicine, than years of efforts on the part of Hahnemann's followers, prejudiced as their allopathic colleagues are against them. They forget the old Latin philosophical axiom—

"Tota in minimis existit natura."

Mr. Rutter's discovery will recall it to their memory, and force conviction upon them.

How beautifully prophetic of the discovery of Hahnemann, and of the confirmation afforded of that discovery by the beautiful instrument invented by Mr. Rutter, is the observation of the Swedish philosopher, Swedenborg, who was born sixty-seven years before Hahnemann. He says, "It is a constant law of the organic body, that large, compound, or visible forms exist and subsist from smaller, simpler, and ultimately from invisible forms, *which act similarly to the larger ones, but more perfectly and more universally, and the least forms so perfectly and universally*, as to involve an idea representative of their entire universe."

Now, gentlemen, permit me to draw your attention to some more experiments with the instrument of Mr. Rutter, which have been made since I had the honour of addressing you last. They took place in the presence of twelve gentlemen, who accompanied me to Mr. Rutter's. Three of the twelve are non-professional, three are allopathic physicians, not believers in homœopathy, and the remaining six are homœopathic colleagues, medical officers of the two homœopathic hospitals. All the various experiments described in my last lecture, in relation to the modifications upon the normal current produced by the operator's left hand being touched by the index, thumb, or whole hand of a male, and by the forefinger, thumb, and whole hand of a female, etc., were repeated. And here I may remark, *en passant*, that in an excellent lecture delivered by Dr. Madden on Mr. Rutter's instrument, the night before last, I understand from a gentleman who was present, he took exceptions to what he erroneously supposes I stated in my lecture of the 9th of October respecting the difference between the effects of the male and the female upon the normal currents. Every one of my observations had reference solely to the effects of each sex through the hand of the operator, and not upon the instrument itself independent of the operator, as a more careful perusal of my lecture will show. There is no mention whatever in it of the *normal* currents of the male and female being different.

I understand that Dr. Madden also pointed out a discrepancy between the account of the effects of *Belladonna* and *Aconite*, and other medicines, as recorded by me, and those observed by himself. Whether the difference is owing to some idiosyncrasy I cannot at present determine, but future experiments will clear this up; meanwhile there is no doubt that the effects recorded in my lecture were produced by *Belladonna* and *Aconite*, not once, but over and over again, in the presence of several of the gentlemen now present. I have witnessed several hundred experiments upon Mr. Rutter's instrument, and I have never found it vary once; the same cause repeated invariably produces the same effect. Try the instrument as you will, it never errs; it has all the certainty of a mathematical equation. If any variation does occur, it is not the fault of the instrument, but arises from some influence upon the operator foreign to the experiment under investigation. When this influence is detected and removed, the instrument immediately responds to the proper influence of the substance experimented upon; the variation furnishing additional evidence of the truthfulness of the instrument.

After Mr. Rutter had gone through the series of beautiful experiments, of a purely physical and philosophical kind, he requested me to take the direction of the medicinal experiments (if I may so call them), for the satisfaction of myfriends present. Experiments with the seven following substances gave the following results, it being understood that the pendulum always was started in the normal action before each experiment.

Hosted by Google

Some *Silver foil* placed in the hand of the operator changed the normal circular motion to the reverse circulatory movement, *i. e.*, from B round to G.

Platina foil changed the normal motion to the pendulum movement from B to A.

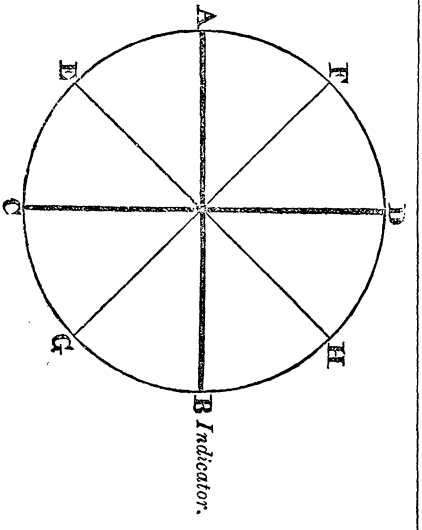
Gold leaf changed the normal circular motion to the reverse circular motion.

Copper foil gave the same direction as *Gold.*

Iron, in bar, changed the normal circular motion to an elliptical motion from H to E.

Zinc plate produced the pendulum motion from H to E.

Flint, in mass, gave pendulum movement from H to E.



When the above six metals and the *Flint* had been experimented upon, and the effects noted down, I delivered to the three allopathic physicians seven bottles, each bottle containing globules of one of the substances just experimented upon, viz., *Ferrum, Argentum, Cuprum, Aurum, Zincum, Platina*, and *Silicea*, and requested them to test, one after another, the seven different substances, by putting one globule in the left hand of the operator, and not to let either Mr. Rutter or myself know what globules they tried in succession, but to be careful to observe the effect of each globule upon the instrument, and compare it with the effects just produced by the larger quantities of the same metals.

One globule of *Platina* 6, placed in the hand of the operator, changed the normal current to the pendulum motion from B o A.

Cuprum 12, one globule, reversed the normal current.

Argentum 6, one globule, ditto.

Ferrum 30, one globule, produced immediately the elliptical motion from H to E.

Aurum 12, one globule, gave the reverse current.

Silicea 30, one globule, when placed upon the hand of the operator interfered with the normal current, but did not produce the same action as the *Flint*; but on being dissolved in a wineglass of distilled water, and a drop of the solution being placed on the hand, the normal motion was immediately changed to the pendulum movement from H to E, as had occurred from the mass of *Flint.* Mr. Rutter, who had shown the effects of the different poles of the *Flint* earlier in the experiments, explained why the globules undissolved did not act properly until dissolved. I understood him to say that he had discovered that all substances capable of being crystallized gave their special action from their base; and the solution of the globule in water, resolved it into its base, and its special action was immediately produced from H to E.

Zincum, one globule, immediately changed the normal to the pendulum motion from H to E.

Some of these experiments were repeated, and the result was the complete conviction on the part of the three allopathic physicians, of the undoubted action of each of the globules in changing the currents in precisely the same direction as the larger quantities of the metals and the *Flint* had done.

In corroboration of this conviction I may state, that one of the allopathic physicians then present has already recorded in print his opinion of the power of infinitesimal doses. He says: "The experiments were now conducted, in a great measure, with the view of testing the truth of homœopathy, or, at least, the power of infinitesimal doses, and I am bound to declare, as one perfectly free from bias, that whilst the experiments were of the *most searching character* that we could all devise (whether disciples of the school or not), they eventuated in every case in proving the power of the infinitesimal agent. Mr. Rutter, I should observe, is no homœopathist. There was not a single failure, although, as I have said, all our ingenuities were taxed to raise difficulties. Dr. Quin produced some globules which had been in his possession twenty-five years; their effects were perfect."

Some *Fluid Mercury* was put in the operator's hand, and the normal was changed to the pendulum motion from H to E.

Hosted by Google

One globule of *Mercurius solubilis* produced precisely the same effect.

Two higher attenuations of *Mercurius solubilis* produced the same effect.

Black Oxide of Mercury ditto.

Strontian in mass gave pendulum motion from F to G.

One globule of *Strontian* 18, gave precisely the same action.

One globule of *Baryta carbonica* produced the same motion as the *Strontian*.

Black Oxide of Manganese, in powder, reversed the normal current.

One globule of *Manganesium* 28, gave precisely the same action.

One globule of *Arsenicum* 30, put in the hand of the operator, gave reverse circular motion, evidently an effect of the *Manganese*. Operator washed his hands.

Another globule of *Arsenicum* was tried, and gave pendulum motion from H to G, not the proper action of *Arsenicum*, which was prevented probably by the effect of the *Soda* in the soap with which the operator had washed his hands. Other globules of lower attenuations were tried, but the proper action was not produced; the hands were again washed, but in plain water, and one globule of *Arsenicum* 30, was placed on the back of the hand where no previous medicine had been put, when the pendulum came immediately to a dead stop *i. e.*, the proper action of *Arsenicum*.

One globule from each of three other very high attenuations of *Arsenicum* was put on the back of the hand, and the pendulum each time instantly came to a dead stop.

Some *Potash*, in crystal, was placed on the hand, and gave the reverse normal current.

One globule of *Causticum* 30, gave the same action.

One globule of *Arsenicum* 6, placed on the hand, brought the normal current to a dead stop. Some *Carbonate of Iron* was put upon the hand, the globule of *Arsenicum* still remaining; the normal current was restored. On the globule of *Arsenicum* being removed, the elliptical motion of the *Iron* was then immediately set up.

You remember the effect which dead animal matter produced upon the instrument, as exemplified by a dead fly, when put upon the operator's hand, bringing the pendulum to a dead stop. I was desirous of ascertaining how far a globule of each of the animal substances employed as remedies in homœopathy would coincide in effect with the influence of the dead fly.

Accordingly, one globule of *Lachesis* 30, was placed on the operator's hand, the pendulum having at the time the normal circular motion; the effect was to stop it immediately.

One globule of *Sepia* 30, had the same effect.

One globule of *Castor* 12, ditto.

One globule of *Cancer fluviatilis* 3, ditto.

One globule of *Oleum animale*, ditto.

One globule of *Cochineal*, ditto.

One globule of *Oniscus asellus*, ditto.

You will observe, that all of the above animal medicines had exactly the same effect as the dead animal matter, in bringing the instrument to a stop.

But now follow experiments with other homœopathic medicines extracted from animal matter, where the results were different.

One globule of *Cantharis* 30, (the Spanish fly), reversed the normal motion, causing the pendulum to go from B round to G.

One globule of *Aranea diadema* produced the normal action.

One globule of *Carbo animale* caused the pendulum to pass to and fro from F to G.

One globule of *Moschus* caused the normal circular action, but very feeble.

These last four experiments have only been performed once each, and as the experiments with all the above medicines followed one another in rather quick succession, they will require to be repeated several times before we shall be authorized to conclude that they are all quite correct.

I shall now point out to you some expements of the greatest possible interest to the homœopathic physician, which demonstrate in the most triumphant manner the correctness of Hahnemann's wonderful observations upon the powers of certain substances to antidote the effects of various medicines upon the body. I shall confine myself this evening chiefly to *Camphor* and *Coffea*, which, as you are well aware, are the antidotes most frequently recommended by Hahnemann against the action of many vegetable, and some mineral and animal substances.

We will first examine the influence of *Camphor* upon the motions produced upon the instrument by those medicines, against the effects of which it is employed as an antidote in homœopathy; and then test the influence of *Coffea* upon the effects of those remedies against which it is used as an antidote. You will bear in mind that *Camphor* produces normal rotatory motion, and *Coffea* a diagonal motion from H to E.

Upon *Cantharides* being placed in the left hand of the operator, the normal circular current from left to right is, as I have already shown you, reversed and moves from right to left; upon *Camphor* being placed with the *Cantharides* in the hand, the motion of the pendulum is stopped.

Acidum nitricum, one globule, causes the reverse circular motion; on *Camphor*, one

Hosted by Google

globule, being added, the normal action is produced.

Acidum phosphoricum, one globule, causes the pendulum to stop; on *Camphor*, one globule, being added, the normal action is produced.

Ammonium carbonicum, one globule, produces the normal action; on the addition of one globule of *Camphor*, the motion immediately stops.

Arnica, one globule, produced the reverse rotation; on *Camphor*, one globule, being added, the motion is stopped.

Baryta carbonica, one globule, changed the normal action to pendulum motion from F to G; on *Camphor*, one globule, being added, the normal action was immediately produced.

Bryonia, one globule, produced reverse rotation; *Camphor*, one globule, being also placed in the hand, brought the motion to a dead stop.

Drosera rotundifolia, one globule, produced the pendulum motion from H to E; on *Camphor*, one globule, being added, the motion stopped.

Lycopodium, one globule, produced a very uncertain action on the instrument; conjoined with *Camphor*, the normal rotation immediately set in.

I will now point out to you the influence of *Coffea* upon the action of medicines to which it is an antidote.

Phosphorus, one globule, brought the normal action immediately to a dead stop; conjoined with one globule of *Coffea*, the normal rotation was produced.

Belladonna, one globule, arrested the normal rotation, and brought the pendulum to a dead stop; on being conjoined with *Coffea*, one globule, the normal rotation immediately commenced.

Chamomilla produced an immediate stop upon the normal current; on one globule of *Coffea* being placed in the hand along with the *Chamomilla*, the normal rotation immediately commenced.

Nux vomica, one globule, stopped the instrument; on *Coffea*, one globule, being added, the normal rotation was put in motion.

Valeriana caused the normal motion to cease; and when conjoined with *Coffea*, the pendulum took the normal rotatory motion.

In one of the above experiments, one globule of *Belladonna* seemed to produce no change upon the normal action, but upon the same globule being dissolved, the motion of the instrument was immediately brought to a dead stop; after which, on *Coffea*, one globule, being added, the normal current came back again; and on the *Belladonna* being taken away, the pure action of the *Coffea* developed itself, and the instrument moved diagonally to and fro from H to E.

One globule of *Coffea* was put in the hand, whilst the normal rotation was going on, it immediately changed it to a diagonal motion, from H to E, and on one globule of *Pulsatilla* being put on the wrist, the normal current was restored; afterwards one globule of *Arsenicum* was placed on the hand, and the pendulum immediately stopped.

Another circumstance connected with these curious and beautiful experiments is worthy of being mentioned to you. Several of these experiments were performed with homœopathic medicines, some very recently prepared, and others which I have had in my possession 2, 4, 12, 16, 20, and 25 years. Some of them were made by myself, others bought in Leipsic, Dresden, Vienna, Naples, Paris, and London; and none of them failed in producing each its characteristic influence upon the motion of the instrument.

The different experiments which I have laid before you, and the many modifications which, I have demonstrated to you various medicines have upon one another, illustrate, in a most remarkable and beautiful manner, the soundness and correctness of one of Hahnemann's discovery, that the virtues of medicines do not depend upon the quantity in which they are prescribed. No sensible difference has as yet been detected between the effect produced by a substance in a large mass, and the same substance in the minutest homœopathic dose.

In recording the various experiments which I have brought before you, I must hold Mr. Rutter entirely free from any responsibility for any errors which may have crept into my description of the powers of his beautiful instrument. I have mentioned, at an earlier part of the evening, that many of the experiments were made in very rapid succession, and future experiments, more carefully and deliberately made, may possibly prove some of the results to have arisen from the lingering effects of the substance immediately preceding the one under experiment; but in the present stage of the discovery, any slight errors of description do not in the slightest militate against the extraordinary powers of the instrument. The essential and paramount fact at present is that, thanks to Mr. Rutter's discovery, there exists a means of proving that the most infinitesimal quantities affect the human frame in a most visible manner. In a future lecture, I shall have a variety of other interesting facts to bring before you.

THE
HOMŒOPATHIC TIMES.

SATURDAY, OCTOBER 25TH, 1851.

THE MAGNETOSCOPE.

THE inventor of this instrument has called it "magnetoscope." The interest attached to the experiments made with it to prove that the homœopathic remedies, in the minutest doses given by homœopathists, do act on the human organism, is of the most intense kind.

Our readers will find another excellent lecture on the subject by Dr. QUIN in our present number.

On Tuesday evening Dr. MADDEN delivered to a crowded audience a very excellent lecture, before the Hahnemann Medical Society. He showed a great variety of most interesting experiments with the Magnetoscope. Nothing could be more clear and perspicuous than his language, and no experiments could be more beautifully performed than his were.

It would be very difficult to overrate the importance of the Magnetoscope. It is quite clear that Mr. RUTTER has not only invented the instrument, but that he discovered the action upon it of small particles of matter, and also the magnetic condition of all bodies, in the investigation of which he has no doubt been ably assisted by Dr. MADDEN, who naturally directed Mr. RUTTER'S attention to experiments with homœopathic preparations. No one can see the experiments of Mr. RUTTER or Dr. MADDEN without seeing the applicability of the instrument as a test of the homœopathic remedies, of the fact of their acting on the human body. But it is also clear that the full credit is due to Dr. MADDEN of having immediately instituted an elaborate series of experiments to ascertain the value of the instrument to homœopathy in particular. He has had the start—was the first on the course, and has brought to the task qualities and attainments which admirably fit him to conduct and systematise such experiments. But the field is so large that there is plenty of room for all to work in it, who have the necessary time, patience, perseverance, and other qualifications. Honour to whom honour is due: let every one who works have the praise due to him. While therefore we give Dr. MADDEN full credit for having at once seen the value of the instrument with respect to homœopathy, and for having at once instituted his series of careful and most satisfactory experiments, we are very glad to see Dr. QUIN actively engaged also in experimenting with the Magnetoscope; and we know that others will be soon engaged in like manner.

NOTHING but sheer impertinence can give force to allopathic persecution. Day by day and week by week, we find the advocates of the old school of medicine raising objections to the reformed principles sought to be introduced through the disciples of Hahnemann, not on tangible grounds, but on the mere shallow pretexts which arise from prejudice and well-accredited vindictiveness.

The certainty that these self-constituted logicians have set themselves up in judgment on a question which they cannot appreciate, is evidenced by the circumstance that they refuse to test what is propounded for their edification, according to the ordinary rules of scientific investigation without endeavouring to explain away the principles which have been so successfully evolved through the homœopathic treatment of the last few years; they, despite the astonishing cures performed, or the amelioration produced upon suffering humanity, revile them as being the representatives of a new species of quackery, and brand those who practise in the school as "globulistic impostors."

Now, would it not be better, with the view of setting the public right upon the question at issue, to pursue some calmer and more philosophic mode of inquiry. Vile invective and unhesitating misrepresentation will never achieve a result such as allopaths desire to bring about. It can only be after a laborious and patient inves-

Hosted by Google

tigation of the character by which medical knowledge has been previously built up, that any individual can be permitted to call in question the truth of the doctrines of Hahnemann. If the allopathic professors will accept the challenge thus offered them, all who have embraced homœopathy will, we are assured, be delighted to afford them an opportunity for following out the inquiry.

It is not creditable to the parties who take upon themselves the conduct of publications associated with the progress of medical science, to adopt a one-sided view of the struggle now excited between allopathy and homœopathy. All individuals connected with the former must be "true and honourable" in their profession; the latter (because they are homœopathists) can only be "black sheep" and the "perpetrators of a sham." Would it not be more charitable in those who apparently possess so much knowledge, to endeavour to demonstrate to their less intelligent *confrères* the fallacies which they so loudly protest against, and which they announce to be so self-evident? Every such attempt would be received with becoming consideration; whereas the contrary course merely causes derision at the expense of those who have assumed the high office they have not been called upon to fill.

Waiting patiently for some fresh manifestation of the gall-and-wormwood bitterness of our antagonists, and remaining contented *ad interim* with the steadily increasing prosperity of our Cause, we shall be prepared to bide our time, and attend the issue of coming events.

EXTRACTS FROM THE LANCET.

"It goes well," as the French say. In the following leader of our amiable contemporary, it is made to appear that Dr. Francis Hawkins, registrar of the College of Physicians, has been a party to making Dr. Sydney Hanson, one of our colleagues, eligible to the office of physician to the Leicester Infirmary: and Sir Henry Halford, M.P. for Leicestershire, and son of the eminent physician, so long Court physician, and president of the aforesaid College, has been another party thereto. In another place will be found the correspondence between Mr. Newman and *Parisius*, the present president of the College.

"In the month of April, 1851, we expressed a determination not to refer unnecessarily to the past, but to publish every case in which physicians and surgeons of repute allowed themselves to be mixed up with the doings of the homœopathic quacks. Since that time our promise has been faithfully kept. Various anonymous writers have charged one or two parties high in the profession with homœopathic meddlings and consultations, and we have been accused of partiality because the accusations have not been published. The answer is, that they have not come before us with the authenticity of the accusers, and therefore but one course has been open. On the present occasion it becomes our duty to state some almost incredible circumstances respecting a physician whom position and connection should have kept far aloof from all dealings with globulists, or irregular practices of any and every kind. We shall hail with pleasure any refutation or explanation, but we are bound to say that the following circumstances are related on the statements of gentlemen of undoubted character and veracity.

"Some time since it was proposed at the Leicester Infirmary that the physicians who might be candidates for office in the institution should be legally qualified to practise; that is, that they should either be doctors or licentiates of Oxford and Cambridge, or graduates of other universiti , and fellows or licentiates of the College of Physician of London.

"It is known that the late Sir Henry Halford, when Dr. Vaughan, practised in Leicester, where his family had, and still has, considerable influence. The present baronet has also represented that county for several years. To this proposal respecting the eligibility of physicians, an amendment was moved by Sir Henry Halford, to the effect that any person qualified to practise as physician in any part of the three kingdoms should be eligible for election, which really meant any man having an English, Irish, or Scotch degree alone. Although there are some degrees of the United Kingdom of no great value, we could hardly quarrel with this liberality, had no censurable motive worked behind. Still it was hardly seemly for the son of the late president of the College of Physicians to make an indirect attack on a body, who, in the person of the late Sir Henry Halford, conferred the chief honour of which his family can boast. This is explained, however, by the accident that the present baronet has become a prey to the homœopaths and their fooleries.

"But we now come to the reason lying at the bottom of these proceedings. In the event of a vacancy at the Leicester Infirmary, the only person practising as a physician, and eligible under the proposed regulations, is Sydney Hanson, a person possessing a Glasgow degree, and busily engaged in the practice of globulism. It was to render this man eligible that the amendment was proposed, and it is believed that the Halford interest would be strong enough to

SUPPLEMENT

Hosted by Google

carry such a candidate into office. The most extraordinary part of the history still remains to be told. The amendment given in by Sir Henry Halford was, we are assured, in the handwriting of Dr. Francis Hawkins, registrar of the College of Physicians, and one of the elects of the College. Dr. Hawkins is, we believe, related by marriage to Sir Henry Halford. We are aware that the College of Physicians has no provincial jurisdiction. But in any case, he should have been the last person to act against the spirit of the College of which he is one of the chief officers. That he should have been aware of the purpose which the amendment had in view is incredible. We make this publication with great pain, for we are loath to give the enemies of regular medicine such a triumph as that which it necessarily involves; but it is an absolute necessity in the present state of things to place such matters on public record.

"Our columns are open to Dr. Hawkins, and we shall hail with pleasure any satisfactory explanation of the matters we have referred to. We may mention, in conclusion, that on more than one occasion our correspondents have inquired how it comes that Dr. Hawkins can retain the post of physician to the Duchess of Gloucester, when it is well known that that noble personage is herself a globulist, busily engaged in the patronage and dissemination of this vile form of quackery."

We cannot omit another exquisite testimony to our progress, from the columns of the same unfriendly friend, the *Lancet*. It seems, then, that after all his blustering, the College of Surgeons has not yet been bullied into an official condemnation of homœopathy. Alack, for the poor *Lancet*. The steel instrument is condemned to rust with the lance of Don Quixote, and the spear of Thersites; and the medical journal may pass away into the land of the forgotten. Is all thy vigour, is all thy athlete-like hardihood come to this, mighty Editor?

"The meeting of the Council of the College of Surgeons on Thursday last has not led to any very satisfactory results. While the condemnation of globulism and the tricks of globulists was unanimous, the Council decided that they would wait to see what steps the censors of the College of Physicians were disposed to take, the council feeling that in such a matter the *medical* authorities should be the first to act. We believe the legal advisers of the College of Surgeons, aided by some of the members of the Council, were directed to frame an answer to the gentlemen who have memorialized the College, embodying this opinion, and at the same time conveying the most unreserved condemnation of homœopathy.

"In our last week's number, we mentioned that the president of the College of Physicians had summarily refused to examine a homœopath for the license of the College. We believe that on Tuesday the president and censors met, to revise the list of fellows, licentiates, and extra-licentiates. We trust they have resolved to omit the names of Dr. Mackintosh, of Torquay, and Dr. Smart, of Scarborough, both extra-licentiates, and both figuring in the *Medical Directory* for 1851, and in various homœopathic documents, as homœopaths. We believe these parties to be the only persons connected with the College avowedly practising globulism; It cannot be supposed, that if they have the power, the present censors will be delicate about the expurgation of the College list, and this, with an enforcement of the laws of the College respecting consultations with improper persons, would be a sufficient precedent for the College of Surgeons. The Council of the College of Surgeons have now thrown the responsibility of tolerating homœopathy upon the College of Physicians, and we trust the latter body will act promptly and decisively in the matter."

EXTRACTS FROM THE MEDICAL TIMES.

"The Medical Society of London has resumed its meetings. It has done so by endeavouring, as far as in it lay, to put down irregular practice, especially the leading delusion of the day, homœopathy. We are glad to see this. It is a step in the right direction, and we hope the Society will obtain that support from the profession it at present so much requires."

It seems the fellows of that Society are not in that happy accord on other subjects, which they enjoy in reference to their denunciation of homœopathy.

"It was stated by one of the officers of the Society, that the funds of the Society would not allow the publication of its anti-homœopathic resolutions. Several members expressed their readiness to come forward with their subscriptions to promote this end! When they are officially published we shall be glad to give them circulation."

The Editor of the *Medical Times* takes notice of the experiments of Mr. Ceely and Mr. Badcock to reproduce the *vaccine* disease in the cow, by inserting into the animal the small-pox virus. We have always known that this disease in the cow was derived from small-pox in the human subject. The Editor of the *Medical Times* shows his unfitness to appreciate the doctrine of Hahnemann by his assertion: "the question of the essential *identity* of the two diseases is determined." The origin of the cow-pox disease has been determined; but it is a *similar*, not *identical* disease, when compared with small-pox. The disease of the human subject has been modified by the constitution of the cow. We hope Mr. Badcock will publish his experiments with the series of daguerreotypes.

"Oh, John Bull! verily thy simplicity is

Hosted by Google

great, thy swallow is large, thy maw capacious! Puff them well, advertise them widely, and you take at the same time, and with equally implicit confidence in their virtues, thirty-two puncheons of 'effective ingredients,' three million of bottles of the 'remedy,' and globules of charcoal diluted to the decillionth degree, Warburg's pyramids of physic, and Hahnemann's invisible drug! in your eyes Warburg and Hahnemann are both equally virtueful, especially Master Hahnemann."

The Editor boasts that he extinguished Warburg by an article; why has he had to try so many articles on Hahnemann?

In one of his notices to correspondents, the Editor says: "Minute doses of *Belladonna* have been prescribed as prophylactic of scarlatina, with great apparent advantage, years before the disciples of Hahnemann were in *esse*. It has remained for an Editor of the present day to claim the writers of such prescriptions as participating in their delusion" (that of the homœopathists). We do not know who claimed Sir James Clarke and Dr. Locock as homœopaths, because they prescribed small doses of *Belladonna*, as a preventive of scarlatina. These eminent physicians, it may have been said, had derived that practice from the homœopathists, and were so far using homœopathic treatment. The assertion of the Editor is a rash one, that *Belladonna* was so used years before the disciples of Hahnemann were in being,—before Hahnemann declared its prophylactic virtue. Let him name author, language, edition, volume, and page. We give him the whole sweep of medical literature, from Hippocrates to Hahnemann. But where are his promised *specialties?*

DR. MADDEN'S EXPERIMENTS WITH MR. RUTTER'S MAGNETOSCOPE.

(Communicated).

Dr. Madden, of Brighton, delivered a lecture before the Hahnemann Medical Society, on Tuesday last, on the observations he has been engaged with for the last three months, in reference to the action of medicinal substances on the Magnetoscope. The meeting was very numerously attended both by members and others, as these observations have created no little sensation amongst those interested in homœopathy.

Dr. Madden began by stating that in the early part of August, his attention was directed by Mr. Rutter to the action of common salt upon the motions of the pendulum attached to the Magnetoscope, which action Mr. Rutter supposed to be due to the crystalline arrangement of that substance. He (Dr. Madden) surmised that this action might be owing to something else, and he immediately commenced a series of experiments with various medicinal substances, and found that they each produced an action on the direction of the pendulum, in most cases differing widely from each other. He thereupon called Mr. Rutter's attention to this remarkable fact, and since that time Mr. Rutter and Dr. Madden have been engaged in earnest in carrying on an extensive series of experiments; some of the most curious of which Dr. Madden exhibited before the Society.

The first indications of the effects producible by the magnetic currents existing in our bodies upon the pendulum, were given by Dr. Mayo, in a work of his that appeared in the early part of this year, wherein attention was directed to the old and familiar experiment of a gold ring suspended in a tumbler from a silken thread, and held as steadily as possible betwixt the finger and thumb; immediately commencing a pendulum movement, which gradually attained to such a height as to cause the ring to stick against the sides of the tumbler. Dr. Mayo applied this old experiment to the discovery of the *od* or *odylic* force in bodies, and ascertained that he could thereby detect the axis of a crystal which had been cut. Mr. Rutter, who was a gentleman of the highest attainments in physical science, had immediately commenced a series of investigations on an instrument, which he invented for the purpose, which secured much greater accuracy than the original pendulum held between the fingers. Dr. Madden exhibited all his experiments upon an instrument so contrived that the operator could not voluntarily influence the movements of the pendulum. He showed that, when he grasped the brass knob with the finger and thumb, a circular movement in the same direction as the watch-hand on the dial-

Hosted by Google

plate was produced, which was called the direct motion. When he touched the knob with the forefinger only, the pendulum vibrated across the table of the instrument, say from north to south (though the points of the compass have nothing to do with its vibration); and that when he applied the thumb only, the vibration was from east to west, or at right angles to the former. A female, on touching the instrument in the same manner, produced exactly the same motions of the pendulum; but what was very remarkable was that, on a male setting the pendulum a-going in the normal direct manner, if a female grasped his hand the motion was instantly reversed. The same extraordinary circumstance took place, if the pendulum were set a-going in the normal direction by the female influence, and a male grasped her hand.

The male influence was shown to exist in a letter written by one of that sex several weeks previously, when laid upon the operator's hand the current was immediately roused. Sleep, Mr. RUTTER had discovered, roused all the currents, and a letter written by a somnambulic female in the sleeping state, when put into Dr. MADDEN's hand, without his knowledge of the circumstances under which it was written, had no influence in rousing the current.

Some substances acted by stopping all action in the pendulum, such were *Bone*, *Arsenic*, *Opium*, and when the operator stood upon the isolating stool with glass legs, the motion was equally stopped; but Dr. MADDEN showed that when he took two of these stopping agents into his hand at once, as *Bone* and *Arsenic*, the normal current was instantly restored; or when he stood on the isolating stool, and took a piece of *Bone* into his hand, the normal current was at once set up, hence Dr. MADDEN infers that the agency producing the motions is not telluric. In this phenomenon Dr. MADDEN differed from Mr. RUTTER; for when the latter stood on the isolating stool, *Bone* held in the hand produced no action; but if he took both, *Bone* and *Arsenic*, or *Opium*, the normal current was at once restored. This power of *Arsenic* in stopping the normal current was exhibited as well by a single globule of the 40,000th dilution as by a quantity of the first trituration. *Sulphur* in substance, in the 30th dilution and in the 7,000th dilution, had equally the effect of reversing the natural current. To exhibit the effects of trituration, Dr. MADDEN took some untriturated *Lycopodium* into his hand, which had no influence on the pendulum, but a portion of same *Lycopodium* in the first trituration produced an immediate effect. To illustrate the principle of *similia similibus*, Dr. MADDEN showed that whilst *Arsenic* and *Opium* separately stopped the motion, when taken together into the hand the normal motion was immediately set up. Dr. MADDEN then created much amusement by exhibiting what he called the principle of *contraria contrariis*. *Belladonna* and *Cantharis* both cause an elliptical pendulum motion in the north-west direction; but the one causes the direct motion, the other the reverse. When both were placed in the operator's hand, there was at first a long pause, and, at length, after an apparently painful struggle of currents, resembling the convalescence under allopathy, the normal current was feebly restored. Dr. MADDEN exhibited many other most interesting and satisfactory experiments, which excited great admiration, and called forth repeated bursts of applause. He called attention to the circumstance that in Dr. QUIN's lecture there were numerous and most important errors, probably occasioned by the hurry with which it had been composed. He showed that out of sixteen actions of medicines recorded by Dr. QUIN, the actions of twelve differed from those produced by the same medicines on himself, and though the motions produced by several of the medicines differed, according as they were acting through Mr. RUTTER or himself, he had since ascertained that the actions, as described by Dr. QUIN, were in many instances not the same as those actually produced on Mr. RUTTER. Dr. MADDEN said it was much too soon to lay down any rules as regards the actions of the different me-

Hosted by Google

dicines on the pendulum, as a great many anomalies presented themselves which required explanation, and different individuals, in many cases, produced a very different influence on the actions of the medicines.

In conclusion, we may observe that every one was highly gratified by the eloquent lectures and interesting experiments of Dr. MADDEN, and whilst the sole honour of the discovery of this wonderful instrument belongs to Mr. RUTTER, to Dr. MADDEN incontestably belongs the credit of having directed Mr. RUTTER's attention to the different actions of medicinal substances, and particularly homœopathic agents, and of having indefatigably and unremittingly pursued, for near three months, daily investigations upon this point, which is so interesting and important to the homœpathists. We trust that Mr. RUTTER and Dr. MADDEN will continue to pursue the researches they have so auspiciously commenced; and we anxiously look forward to the time when their experiments and investigations shall have been so perfected and matured, which can only be after long months of careful assiduity, as to enable homœopathy to derive all the advantages which we anticipate will accrue to it from this valuable discovery.

[We request our readers to suspend their judgment and opinions concerning the anomalies and discrepancies in the experiments heretofore made with the Magnetoscope, by Mr. RUTTER and Dr. MADDEN. The field is so vast—what has yet been done so little in comparison with that vastness—that we must pause, and watch and wait.—ED.]

THE MAGNETOSCOPE OR "ODOMETER."

To the Editor of the Homœopathic Times.

SIR,—The further we advance in knowledge and science, the more does it appear that there is "nothing new under the sun" (not even homœopathy itself), as the adage hath it. In common with most of your readers, I felt, on witnessing Mr. Rutter's marvellous experiments, so clearly described by Dr. Quin in the *Homœopathic Times*, 18th October, 1851, that phenomena calculated to impress us more and more with awe had been only just discovered. It was my good fortune, however, to hear Dr. Madden's admirable lecture delivered before the Hahnemann Medical Society, on Tuesday evening last, as well as to witness the beautiful experiments so neatly and scientifically arranged by him. It flashed across my mind, at the mention of Dr. Mayo's name, as the writer by whose recent work Mr. Rutter had been stimulated to prosecute the inquiries which promise such boundless results to science, that I had read a description of some experiments very similar to those I had seen performed by Mr. Rutter and Dr. Madden. The next day I had a search in my library, when the very work alluded to, and which I read last June, came into view.

The title of the work is, "ON THE TRUTHS contained in POPULAR SUPERSTITIONS, with an account of MESMERISM; by Herbert Mayo, M.D., formerly Senior Surgeon of Middlesex Hospital; Professor of Anatomy and Physiology in King's College; Professor of Comparative Anatomy in the Royal College of Surgeons, London, F.R.S., F.G.S., etc."—Second edition.

No doubt your professional readers are well acquainted with the philosophic attainments of Dr. Herbert Mayo, who, when about to reach the zenith of fame, was, through ill health, obliged to retire from London practice to sojourn on the banks of the Rhine, where he now superintends a water-cure establishment, and where, it would appear, he still luxuriates in philosophic investigations. Dr. H. Mayo does not himself claim the discovery; but he shall tell his own tale. It seems probable that the discovery, like many others, no doubt, resting upon the dusty shelves of our libraries, may have been overlooked, from the announcement being the twelfth and last letter but one of the second edition, and not contained in the first, yet I have just been informed that *Chambers's Journal* took notice of the experiment with the ring some time back.

He commences thus:—

"LETTER XII.

"THE DIVINING RING; OR, THE ODOMETER.

"Qualis ab incepto" shall be the motto of this twelfth letter, the materials of which were undreamt of by me, when some three months ago I remitted the new and corrected edition of 'the Letters' to England. The occasion which led me to the knowledge of the facts I have to mention, and their bearing, tally curiously with what has gone before.

"For it is again winter, with its long solitary evenings, against the tedium of which I had to seek a resource; and I bethought me, this time, of occupying myself with looking into the higher mathematics. Accordingly I sent to Herr Caspari, professor of mathematics in the gymnasium at Boppard, to solicit him to give me the instruction and assistance which I needed; and he obligingly came, in the evening of the 31st of December, to sit by my bedside and converse with me. And I went over preliminarily my schoolboy recollections of the elements of mathematics, and was pleased at finding the remembered difficulties vanish before the explanations of my well-informed tutor. And I learned, to my vast delight, that the inability

Hosted by Google

under which asymptotes labour to touch hyperbolas is a purely arbitrary one, like the legislative prohibition not to marry with one's deceased wife's sister; but that, unlike the latter, it can be evaded; inasmuch as an asymptote, by changing its name and forfeiting its properties, may at any time unite itself with the object to which it had before been infinitely near. Again, I found my boyish distrust and disbelief in sines and cosines replaced by an intelligent and well-satisfied acquaintance with them. And I even obtained a glimpse of the higher analysis itself, pointing with its unerring finger to the exact height, else unmeasurable, at which my candle should stand in the centre of my round table, to shed upon it its maximum of illumination.

"A liberal hour being over, and my dolphin-like recreation ended, my new friend entered into desultory chat, and asked me, among other things, if I had not written something on the divining-rod. I replied to his question by giving him the copy I had of 'the Letters;' and promised, as a New-Year's gift for the morrow, to present him with the implement itself. And I lent him Von Reichenbach's book on Od, with which he was unacquainted. Then he told me that there were two or three experiments, possibly akin to trials with the divining-rod, with which he had been familiar for years, and which he had shown to many without receiving an explanation of them. He said that as far as he knew they were original and his own; and that he would willingly show them to me. He wanted only for that purpose a piece of silver, a gold ring, and a bit of silk. These were easily found. And he attached the silk to the ring, which he then held suspended by the silk over a silver spoon, at a distance of half an inch.

"Shortly the ring shaped its first vague movements into regular oscillations in a direction to and fro, or towards and from Herr Caspari. I will call such oscillations *longitudinal*. It was evident to me, that this phenomenon must be akin to the motion of the divining-rod.

"Then, at Herr Caspari's suggestion, I summoned the maid, who was directed to place her hand in Herr Caspari's unengaged hand. On her doing so, the oscillations of the ring became *transverse*. How pregnant was this fact! An Od-current had been established between the two experimenters; and the apparent influence of the two metals on each other had been modified.

"Herr Caspari told me that, as far as he knew, these experiments would only succeed when made with silver and gold, and a bit of silk. But he said that he had still another experiment to show me, which he did the following day. He said he had a little pea-like bit of something, which he had been told was *schwefel-kies*, that exhibited another motion: when held suspended by silk over either of the fingers, it rotated one way; when held suspended over the thumb, it rotated in the contrary direction.

"Herr Caspari left me, after agreeing to assist me in the further examination of these phenomena; and the New Year coming in found me in busy thought how to elicit, through variations of Herr Caspari's experiments, some important physical evidence as to the reality and agency of Von Reichenbach's Od-force, which its discoverer now holds to be the same with the diamagnetic influence.

"In ten days we have succeeded in disentangling the confused results which attended our first experiments; and as I see no likelihood of extending them at present in any new direction, I present them to the reader now, as complete as I can at present render them. I have used the term 'divining-ring,' partly because I have a vague idea of having seen Herr Caspari's first facts adverted to in some publication under that name; partly because it is really thus far deserved:—if you place a piece of silver on a table, and lay over the table and it an unfolded silk pocket-handkerchief, you can discover where the silver lies by trying with a suspended ring each part of the surface. The ring will only oscillate when held over the silver. But now I have to substitute another name for the sake of precision.

"A fragment of anything, of any shape, suspended either by silk or cotton thread, the other end of which is wound round the first joint either of the forefinger or of the thumb, I will call an *Odometer*. The length of the thread does not matter. It must be sufficient to allow the ring, or whatever it is, to reach to about half an inch from the table, against which you rest your arm or elbow to steady your hand. If there be nothing on the table, the ring or its equivalent soon becomes stationary. Then you test the powers of the odometer by placing upon the table under it what substances you please. These I would call *Od-subjects*.

"I have armed the odometer with gold, silver, lead, zinc, iron, copper; with coal, bone, horn, dry wood, charcoal, cinder, glass, soap, wax, sealing-wax, shell-lac, sulphur, earthenware. As od-subjects I have likewise tried most of the substances above enumerated. All do not go equally well with each odometer. For example, an odometer of dry wood remains stationary over gold; while it oscillates with great vivacity over glass. The respective habitudes of different odometers to different od-subjects, is one of the simplest points of investigation, which the facts I am narrating suggest.

"A gold ring with a plain stone in it was the first odometer which I employed, and it is one of the most largely available. And gold forms in general the most successful od-subject. Sulphur likewise displays very lively motions in the odometer. But the material which I finally employed to verify the following phenomena was shell-lac, a portion a full inch long, broader towards the lower end, then cut to be lancet-shaped. The odometer moves more sluggishly with some than with others, and in the same hand on different days; and doubtless is capable of manifesting a greater variety of effects than I have yet elicited from it. I can only pledge myself to the certainty of my being

Hosted by Google

always now able to obtain with the shell-lac odometer all the results mentioned in the XXVII. experiments which first follow. Over rock-crystal, however, the shell-lac odometer acts very feebly; but a glass odometer moves with brilliant vivacity. I would besides advise the reader to try a gold-ring odometer, in preference, for experiments X., XI., XII., XIII.

"Then here are the results:—

"I. Odometer (we will suppose armed with shell-lac) held over three sovereigns heaped loosely together to form the od-subject; the odometer suspended from the forefinger of a person of either sex. *Result*—Longitudinal oscillations.

"II. Let the experimenter, continuing experiment I., take with his or her unengaged hand the hand of a person of the opposite sex. *Result*—Transverse oscillations of the odometer.

"III. Then, the experiment being continued, let a person of the sex of the experimenter take and hold the unengaged hand of the second party. *Result*—Longitudinal oscillations of the odometer.

"IV. Repeat experiment I., and, the longitudinal oscillations being established, touch the forefinger which is engaged in the odometer with the forefinger of your other hand. *Result*—The oscillations become transverse.

"V. Repeat experiment I., and, the longitudinal oscillations being established, bring the thumb of the same hand into contact with the finger implicated in the odometer. *Result*—The oscillations become transverse.

"VI. Then, continuing experiment V., let a person of the same sex take and hold your unengaged hand. *Result*—The oscillations become again longitudinal.

"VII. Experiment I. being repeated, take and hold in your disengaged hand two or three sovereigns. *Result*—The oscillations become transverse.

"VIII. Continuing experiment VII., let a person of the same sex take and hold your hand which holds the sovereigns. *Result*—The oscillations become longitudinal.

"IX. If the odometer be attached to the thumb instead of to the forefinger, it oscillates longitudinally; but on approaching the thumb so as to touch the forefinger, the oscillations become of course transverse.

"X. Repeat experiment I., but let the Od-subject be a double row of five sovereigns, each disposed longitudinally from you, and hold the odometer over the middle of the double row of sovereigns. *Result*—Longitudinal oscillations, but the excursions are inordinately long. Still, on touching the forefinger with the thumb, the oscillatioos become either transverse, or the odometer moves in an ellipse, of which the long axis corresponds with the axis of the double line of sovereigns.

"XI. Dispose ten sovereigns longitudinally from you in two parallel rows, an inch and a half apart, and hold the odometer over the middle of the interval. *Result*—Longitudinal oscillations.

"XII. Modify experiment XI. by holding the odometer not midway, but nearer one of the rows of sovereigns. *Result*—Oblique oscillations.

"XIII. Dispose ten sovereigns heaped in a short longitudinal group, and hold the odometer over the table half an inch to one side of the middle of the heap. *Result*—Transverse oscillations.

"From the latter experiments and their modifications, it became evident that the magnitude and shape of the Od-subject have each a direct influence on the result. A greater force of attraction evidently exists towards the greater mass.

"XIV. Odometer held over the northward pole of a magnetic needle contained in a compass-box under glass. *Result*—Rotatory motion in the direction of the hands of a watch.

"XV. Odometer held over the southward pole. *Result*—Rotatory motion in the direction contrary to the motion of the hands of a watch.

"XVI. Repeat experiments XIV and XV., with the difference of touching the forefinger implicated in the odometer with the thumb of the same hand. *Results*—The rotatory motion, observed in the two experiments referred to, become exactly reversed.

"XVII. Hold the odometer over the centre of the needle. *Result*—Oscillations at right angles, or transverse, to the axis of the needle.

"XVIII. Hold the odometer over, and half an inch to one side of, the centre of the needle. *Result*—Oscillations parallel to the axis of the needle.

"XIX. Repeat experiment XIV. Then, during its continuance, place a pile of three sovereigns on the compass-box, in front of the northward pole of the needle, and about an inch from it. *Result*—Direction of original rotatory motion reversed.

"Then follow experiments with results exactly parallel to the preceding, having the greatest physiological interest.

"XX. Hold the odometer over the tip of the forefinger of your disengaged hand. *Result*—Rotatory motion in the direction of the hands of a watch.

"XXI. Hold the odometer over the thumb of your disengaged hand. *Result*—Rotatory motion against that of the hands of a watch.

"XXII. Hold up the forefinger and thumb of the disengaged hand, their points being at two and a half inches apart, Hold the odometer in the centre of a line which would join the points of the finger and thumb. *Result*—Oscillations transverse to the line indicated.

"XXIII. Modify the preceding experiment by holding the odometer half an inch to one side of, and over, the middle of the line indicated. *Result* — Oscillations parallel to the said line.

"XXIV. Modify experiment XXII. by approximating the ends of the forefinger and thumb of the disengaged hand, so that they touch. *Result*—The odometer no longer moves.

"XXV. Forefinger and thumb of the disengaged hand held upwards and apart, sustaining a short file longwise between them. Odometer then held over the last joint of the finger. *Result*

Hosted by Google

—Odometer stationary. Odometer then held over the last joint of the thumb. *Result*—Odometer stationary. Odometer then held over the middle of the file. *Result*—Oscillations parallel to the long axis of the file. Thumb of the odometer hand then applied to the finger that sustains the odometer, and experiment continued. *Result*—Transverse oscillations.

"XXVI. Odometer held over the northward pole of the magnetic needle, and its consequent rotatory motion in the direction of that of the hands of a watch established. Then advance the finger, or the thumb, either alone, towards the odometer. (The odometer should be held in these experiments half an inch above, and a little wide of, or before, the apex of the needle.) The finger, or the thumb, is then to be brought as near to the odometer as is consistent with not touching it in its rotation. *Result*—Direction of the rotation reversed. Then join the finger and thumb, and hold the two thus brought into contact in the same proximity to the odometer. *Result*—The rotation returns to the former direction; that is, to the direction of the motion of the hands of a watch.

"XXVII. Odometer held over the radial (or thumb) edge of the wrist. *Result*—The same as when held over thumb. Odometer held over the little-finger edge of the wrist. *Result*—The same as when held over either of the fingers. This difference in result extends a third the length of the forearm, over the middle of which the odometer becomes stationary.

"XXVIII. A portion of rock-crystal five inches long, about two wide and deep, placed on the table with its long axis transverse to the operator. Glass odometer held over the middle of the upper plain surface. *Result*—Oscillations parallel to the axis of the crystal. Position of the crystal shifted, so as to make its axis point *from* the operator. *Result*—Oscillations as before parallel to the axis of the crystal, but lougitudinal to the operator. Then the thumb applied to the forefinger. *Result*—Transverse oscillations.

"XXIX. Glass odometer held suspended over one apex of the crystal. *Result*—Rotatory motion in the direction of the hands of a watch. Odometer held over the opposite end. *Result*—Rotation in the direction contrary to that of the hands of a watch.

"XXX. The last experiment repeated. The forefinger of the operator's unengaged hand brought near to the odometer in each of its two varieties. *Result*—The previous rotatory motion reversed. Then the point of the thumb brought into contact with the odometer finger. *Result*—The original rotatory motion re-established.

"I will add, in reference to the first and simplest experiments, that the interposition of several folds of silk between the od-subject and the odometer renders the motions of the latter less brisk.

"The development which I have thus given to the few, isolated, and long-hoarded experiments of Herr Caspari, was not so simple an affair as it may seem to be. For several days I was in doubt as to the genuineness of the results, so capricious and contradictory were they. It was only when I had discovered, that approaching the thumb close to the other fingers of the odometor hand had the same effect with bringing it into contact with the odometer finger, that I succeeded in obtaining unvarying results. The interest of those experiments is unquestionably very considerable. They open a new vein of research, and establish a new bond of connection between physical and physiological science, which cannot fail to promote the advancement of both. They contribute a mass of objective and physical evidence to give support and substantiality to the subjective results of Von Reichenbach's experiments. They tend to prove the existence of some universal force, such as that to which he has given theoretical shape and form, under the designation of Od. And such an universal force—to be just even to a charlatan, if he was one—what other can we deem it to be than the long-vilipended influence of Mesmer, rendered bright and transparent and palatable by passing through the filter of science?

From the foregoing, it would appear that the clue to these wonderful and pregnant phenomena (if not the *discovery*) is due to Herr Caspari.

In the concluding and thirteenth letter, Dr. Herbert Mayo gives what he calls "the solution" of these phenomena, and alludes to many beautiful experiments, which I have not yet seen performed either by Mr. Rutter or Dr. Madden. Dr. H. Mayo is unequivocally of opinion that the agency "is neither more nor less than Von Reichenbach's od-force;" and it seems to me, that the experiment so satisfactorily illustrated by Dr. Madden, would tend to prove this: from the fact that *Bone*, which arrests the normal current when the operator stands on the ground as effectually as when he stands on the insulating stool, sets the current in motion when grasped in the hand, the operator being on the insulating stool. According to Dr. Madden, when Mr. Rutter is insulated, the *Bone* has no influence in setting agoing the current until he holds another substance, such as *Arsenic* or *Opium* with the *Bone*. There is here something like a proof that, under circumstances apparently disconnected with telluric influence, an agency is set free, by whatever name it may be called.

Dr. H. Mayo's solution is intensely interesting, and will amply repay deep study, if not tend to explain many "*abnormalities*," which seem already to have arisen with different experimenters.

Dr. Mayo illustrates his solution by eighteen diagrams, and furnishes an explanation of the circulars or "*clock-rotation*," similar to that given by Dr. Madden. The following points seme quite clear at present:—

Baron Von Reichenbach discovered odylic force.

Herr Caspari seems to be the *discoverer* of what I would call *odic polarity*.

Dr. Herbert Mayo has, through a philosophic genius, given these discoveries something like a definite form.

Hosted by Google

Mr. Rutter has *invented* a fixed instrument to measure or explore the unknown (Od) force, and has called his wonderful and delicate instrument *magnetoscope*, which is not a new name, bye-the-bye, as Sir W. S. Harris speaks of a similarly-named instrument to explore magnetic currents. Were Mr. Rutter to satisfy himself that the new force belongs to Reichenbach's (Od) force, then I really think "*Odoscope*" would be a more appropriate name, seeing that the instrument infallibly *explores*, while it does not, in the strict meaning, *measure* the force.

Mr. Rutter, being deeply versed in physical science, and a cautious, persevering philosopher of a very high order, has, as was naturally to be expected, already made, and will no doubt continue to make, many important discoveries, and in no direction more fruitful than to homœopathic science. Dr. Madden, since he saw the applicability of the instrument to the proof of our most infinitesimal particles of matter influencing the human frame in health and disease, has exerted himself experimentally in a most praiseworthy and scientific manner.

To Dr. Quin's scientific energies in the way of demonstration and propagandism, the profession must feel much indebted. Other experimenters will, no doubt, rapidly multiply; and in order to enter upon their task fully equipped, it would seem desirable that all should make themselves acquainted with the literature of the subject.

Brook Street. Faithfully,
D. Wilson.

Review.

The Cure of Chronic Diseases by Movements. By Dr. Roth. London: Churchill.

This is altogether a novel but valuable addition to our medical literature. To raise gymnastic science out of the crude and often injurious practice of empiricism, and on the basis of a sound physiological anatomy to found a definite treatment by certain predetermined movements, each having a beneficial aim in view, was certainly a task well worthy the suffrages of a thankful profession. Such was the task which it occurred to Ling, the Swedish originator of this system, to essay; and with how great success the publication before us will show. The most prominent feature of the present system is its extension beyond the limits of ordinary gymnastics to diseases other than spinal curvatures, club-foot, contractions, etc.: in the present work we find indications given for its application in asthma, incipient consumption, contracted chest, and many diseases of internal organs, which are affected by the transmission of vibrations from the surface, and, if we may form any opinion from the cases which are here recorded, with more success than at first we should feel disposed to expect. We think, notwithstanding, that in many of the diseases to which it is here proposed to apply it that the treatment by movements must, after all, form but a useful adjunct to more certain and direct medical treatment.

Dr. Roth deserves our best thanks for the publication of this system for the first time in an English dress, thereby opening up a novel and very important branch of professional knowledge to our study. As a system it was early spread over the Continent, after its first promulgation in 1814, by royal ordinance, under the auspices of the Medical Association. In Russia, the Superior Medical Board made a very favourable report respecting it last year, by order of the Emperor. In all these countries its success has more than satisfied the warmest expectations of its supporters.

The fundamental principles of Ling are stated as follows:

"First. To strengthen and cure the body by movements acting on the system of blood-vessels, by promoting and regulating the reproductive processes.

"Secondly. To strengthen and cure the organism by movements acting on the nervous system, by promoting and regulating the nervous activity.

"Thirdly. To strengthen the organism itself, and cure by movements acting on the blood and the innervation, which is but another expression of the physiological principle that life can be preserved and cured only by life itself."

"The movements which we use to cure diseases are, as well as the pharmaceutical substances, not prescribed by chance, but according to the diagnosis of the disease, and the constitution of the patient; they are are put in a certain order, and form a prescription of movements, which is to be followed exactly, and not changed, excepting the medical man find it necessary to do so during the treatment."

In order to show the mode of action of an external (movement) agent on internal parts, he says:

"Whatever exists in our body, either as a part of it or as a foreign substance, must at a certain moment have a definite shape; therefore every change of the space in one part necessarily produces a corresponding one in the surrounding tissues—a change that is thenc propagated to the most remote parts of the body and which depends, with respect to its form upon the amount of the alteration produced by the first movement. However inconsiderable may be the angle produced either by the position of the body itself or by an external agent upon a vessel, nerve, tendon, muscle, etc., a change is necessarily produced in the parts ad-

Hosted by Google

joining, which diminishes in the more remote tissues, as undulations from any cause, in air or water, finally disappear. Usually, if this angle happen to be originated in the more important portions of a nerve, muscle, etc., the corresponding change will be greater according to the largeness of the angle, which becomes more sensible after every shock, or external force, directed upon elastic parts: all others, being inelastic, do not permit the external forces to form an angle which is directed inwards; they receive the immediate shock and break, because at the same time they resist, the external force. Experience teaches that different trades and arts act differently as well on the internal as external being of those who are engaged in them. Many trades have power to change the bodily proportions of those who learn and execute them; and this even though the workman have ceased growing before he enters upon the occupation. Commonly there is developed a hypertrophy of single muscles, bones, textures, whole limbs, and even of such internal organs as are principally exercised by the trade; while such parts as are kept continually during the occupation of the trade in a state of inactivtty become emaciated, and begin by degrees to waste away. Partial movements, repeated thousands and thousands of times, increase the reproduction in single organs, and thereby produce the greatest changes, even the most perfect metamorphoses in external and internal organs. If, on the contrary, the state of rest is too long protracted, the absorption in the inactive organs is predominant, and the reproduction ceases either for the most part or entirely. Hence it follows, as a natural consequence, that when a limb has become crooked from a partial exercise of its muscles, the curvature would be cured, if the weakened antagonists are exercised as often and to the same amount as the preceding, which must now rest for a period proportionate to their former exercise. A healthy organ daily exposed to continued pressure emaciates and atrophies. So it is very natural that parts which by disease have become hypertrophied, will also by the same means lose their increased volume. The least pressure upon a nerve irritates it, if increased it becomes painful, one still more intense benumbs it, and if the pressure be very violent and sudden, the nerve is paralysed. If this were not the case, a violent shock, stroke, heaving, etc., could not become fatal, but would only destroy the nearest tissues.

"The mechanical agent has also an extensive (quantitative) influence; for too early or excessive exercise, that is, more than the body can support according to its age, constitution, etc., puts a stop to growth in the youth, and causes weakness. Our general custom of doing all with the right arm produces a greater development of its bones, whilst those of the unused limbs become weaker. Therefore, only right and well-used movements are really beneficial; while those used improperly and misapplied, as at present in most gymnastic or orthopœdic institutions, as well as neglect of movement or inactivity, are each in the same manner followed by bad consequences."

The difference between this system and the orthopœdic is that, in the latter, that which is accomplished by mechanical instruments is in the present effected "by the living organism itself."

"In the first, the vital reaction is not generally taken into consideration, while in the latter, this becomes the basis of the treatment, which the external influence is but the agent to provoke. Thus it is that generally in the common orthopœdic treatment, no cure can be effected without injuring, more or less, another organ. We feel it our duty to call the attention of the professional and lay readers to this subject, because, without denying the successes of orthopœdic treatment, the question is, whether by exchanging one disease for another, which is so often worse, we do not pay too dearly? In the treatment by movements we make only a momentary use of any external apparatus, and never employ in diseases of the trunk stretching-instruments; these are sometimes employed only as accessories in contractions of single muscles of the extremities, and even then not constantly. The subjects of orthopœdic treatment by instruments are principally those curvatures of the spine and limbs which result from a contraction of the muscles on one side, with relaxation of those on the opposite."

And again he asks—

"How can we suppose that such vigorous changes, not merely of external form, but also of muscular structure, bones, and all other organs, are to be cured by the purely mechanical action of an apparatus, which can only repress the prominent organic parts, and forcibly extend the contracted muscles, without permitting the development of the curative reaction of the vital power. The treatment by apparatus alone can therefore be useful only in very small curvatures of the limbs existing but for a short time, because the muscular relaxation is not largely developed, and therefore the extension of the contracted muscles (although but little affected by the apparatus) still allows to the weakened antagonists, in some degree, a more vigorous contraction, which, continued for a longer period, may possibly have some effect. But when a change of texture in the muscles, bones, and internal organs has taken place, particularly if there is a substitution of fat and tendinous masses, no cure can be effected by the use of machines alone. Thus we see that many of those patients who undergo the torture of lying horizontally upon stretching-beds for years, or of wearing the different pressing-girdles, after all, still retain their curvature, which is diminished, if it be so, at the expense of some other organ."

The system becomes divisible into two well-defined parts: the hygienic—including the management of the nursery and boarding-school, and the superintendence of healthy development by means of suitable exercises—and the therapeutic, in its divers

Hosted by Google

applications to disease. On this subject the author gives the following indications:

"The general indications for the treatment by movements are the same as for any other treatment.

"1st. We must know what is the object of the treatment, and

"2nd. What is its aim.

"The special indications for the treatment by movements are—

"1st. Restoration of the right shape and form, as for instance, for curvatures, etc.

"2nd. Restoration of the right position and direction of the parts, as for instance, of ruptures, etc.

"3rd. Restoration of the mobility of the parts, as for example, incomplete anchylosis.

"4th. Removal of solid and liquid matters, and foreign bodies from the cavities and textures of the body.

"5th. Restoration of nutrition, assimilation, and reproduction of the whole body or single parts.

"6th. General change of substance, principally of the muscular fibres.

"7th. Increase of the activity of the skin, lungs, heart, liver, etc.

"8th. The diminution and increase of the activity of the nervous central organs.

"9th. The alleviation of pains.

The pathogenetic effects of movements and frictions, occasionally alluded to, would have formed an appropriate and pleasing introduction to the work; and we should have been pleased had Dr. Roth pointed out, as he described them, the undoubted homœopathicity of many of the movements. The hackneyed blacksmith's biceps; the well-known forms of the jockey, the weaver, and artisan bending over his long work through sixteen hours in the day; the sailor, soldier, tailor, etc., and the effects of training upon the pugilist—all form excellect illustrations of the pathogenetic effects of gymnastics.

"According to the particular constitution, sitting gives rise to many diseases, varying with the occupation; the student who works more with the head, who reads or writes near the table, suffers, besides the immediate consequence of the continual pressure produced by the angles on the nerves, vessels, and other organs of the abdomen, from bad digestion, bilious disorders, ... constipation of the bowels and other abdominal diseases; he is liable to excitability, melancholy, headache, giddiness, singing in the ears, bad temper; the head hangs forward, because the continual extension of the muscles of the neck produces weakness and less contractility; therefore such persons cannot keep the head erect; the chest becomes narrow, the breathing difficult and asthmatical, the shoulders come forward, the trunk is stooping, the legs emaciated, stiff, and inflexible; the skin dry and rough. This is in general a mere outline of bookworms and other learned men, who neglect their physical development, either through idleness and ignorance of these bad consequences, or through their being entirely absorbed by their intellectual studies. People who sit continually and work also with their arms, like weavers at the loom, often become disposed to many diseases of the organs of the chest, as hæmoptysis, phthisis, palpitation of the heart, etc., diseases generally of a congestive or inflammatory character, produced by the artificial stagnation of the blood in the abdomen, and the activity in the chest increased by the movements of the arms. If only one or the other arm is exclusively engaged in the trade, deviations of the spine, with or without any disease of the chest, undermine the general health, which nothing will remove, except change of occupations; needle-women, copiers, drawers, etc., belong to this unhappy class."

That strong active movements of the arms produce hypertrophy of the heart is deserving of attention, but we think also, of further research and observation: the statistics of certain trades would soon establish the result.

We had marked several passages for further extract, but our limits restrict us to an exceedingly sensible article upon dress, which we heartily commend to the attention of our fair readers, assuring them that the very general exposure of the ill-effects of the present corset is leading to its gradual disuse.

"The stays impede the activity of the intercostal muscles, the expansion of the thorax, and consequently of the lungs; they produce many diseases by the mere mechanical pressure ..... The narrowness of the thorax is followed by dislocations, distortions, and curvatures of the ribs, chest-bone, and vertebræ; by curvatures of the spine in all directions, round back, high shoulders, the adhesion of the parietes of the thorax with the internal organs, asthma, short breathing, cough, irregular circulation of the blood ..... blood-spitting, ulcers of the lungs, empyema, general emaciation, phthisis, hydrops, etc. The secondary symptoms of this vicious state of the circulation are congestions to the head, headaches, giddiness, lethargy, apoplexy, inclination to fainting, pains of the eyes, bad sight, humming in the ears, hemorrhage from the nose, etc.

"By the inward pressure of the ensiform cartilage of the chest-bone, and by the compression of the abdomen, the activity of the stomach is deranged, the digestion is bad, the appetite is deficient, cardialgia, eructation, nausea, sickness, vomiting of blood and food, flatulency.....are developed. The continual pressure of the short ribs of the right side on the liver produces inflammation of that organ, induration, bilious disorders, an impure yellow colour of the skin, increased nervous sensibility, bad humour and irritability, jaundice, ascites, etc.

Hosted by Google

"The pressure on the short ribs of the left side produces inflammation, induration, and ulceration of the spleen. The pressure on the dislocated tender muscular parts and of the crooked spine is followed by diseases of the kidneys..... inguinal hernia, irregularities .....hysteria, uterine epilepsy, etc.

"Dr. Ludwig, of Leipzig, observed the impression of the busk of the stays on the forehead of a newborn infant."

We trust the rapid sale of this highly scientific volume, which must be deeply studied by all who would appreciate its merits, and the philanthropic aims which the author has in view, will induce him shortly to favour us with a handbook of movements for general use, which would prove a valuable supplement to Dr. Roth's larger and more scientific work. The illustrations are cleverly executed, and the work admirably got up.

Correspondence.

To the Editor of the Homœopathic Times.

SIR, — In your impression of Saturday, October 11th, is an article extracted from the *Christian Times*, in which the writer alludes to a trial between allopathy and homœopathy being desirable, instancing the cases of the American yacht beating all our English yachts, and the American gentleman picking the impregnable lock of Messrs. Bramah and Co.

Now, Sir, I should wish the public to know that that is just the position which we homœopaths assume. We challenge them (the allopaths) to a trial, nay more, we defy them; we will take their very best men, and their very worst cases, and beat them as surely as that the "America" did beat all her competitors, or that Mr. Hobbs did open Messrs. Bramah's celebrated lock. Nor do I think we should require thirty days to accomplish the feat, but might manage it in about as short a time as it took the "America" to win her prize.

But, Sir, your readers should know that they (the allopaths) will not come to the trial; they dare not, because they know that they would most assuredly be beaten.

It happens that in Madrid they have a professor of homœopathy, Dr. Nunez, Physician to the Queen of Spain, being the gentleman who holds the appointment. The Editor of the *Lancet*, commenting upon this fact, informs his readers that it was brought about by the "regulars" foolishly consenting to a trial; of course they were beaten; the result was the above professorship. We all know that it is not those who have justice and right on their side who object to go to trial, but those who fear that by a fair trial their long-cherished and blindly-followed dogmas would be scattered to the winds. They will not trust themselves into the hands of an intelligent jury; they say they might meet with another Justice Maule, who did so dreadfully maul the rising son of the *Lancet's* Editor in a recent trial. No, say they, "We have a law, and by our law homœopathy *ought* to die. It is, however, a consolation that they are just able to perform what their celebrated "*ought*" stands for—viz., nothing.

Your humble servant,

F. W.

82, Old Broad Street, City.

To the Editor of the Homœopathic Times.

SIR,—Having been educated among scientific allopathic practitioners, you may imagine it was not without considerable reading and experience that I have become *so truly* a homœopathic convert.

Among various other topics of interest, I may mention a work I obtained lately at Tunbridge Wells, "A Medical Topography of Tunbridge Wells, etc. By Robert Hutchinson Powell, M.B., M.D., etc. etc."

A few extracts may serve to show that, however unwittingly, allopathy *does* testify to the wonderful truths of homœopathy.

"A reaction sometimes follows, denoting a *critical* tendency to re-establish the balance and tone of the system; if judiciously selected and adapted to the individual case, it need not alarm; but should distressing symptoms ensue, the water should be discontinued or used with appropriate medicine." (Page 3.)

"To prescribe them (the mineral waters) with success, it is, therefore, not sufficient to be only superficially acquainted with their general action, but we must possess a thorough knowledge of the specific effects of every spring, not only with reference to disease, but also to the state of every variety of constitution and temperament," etc. etc. (Page 4.)

"Dr. Ure (Chemical Dictionary) observes;—'It appears to me that the peroxide and its combinations are almost uniformly irritating, causing heartburn, febrile heat, and quickness of pulse. Many chalybeate mineral waters contain an exceedingly *minute quantity* of proto-carbonate of iron, and *yet exercise an astonishing power* in recruiting the exhausted frame. I believe their value to be derived simply from the metal being *oxidized* to a *minimum*, and diffused by the agency of a mild acid through a great body of water, in which state it is rapidly taken up by the lacteals, and speedily imparts a ruddy hue to the wan countenance.'" (Pages 16, 17.)

"Mr. Amsinch says:—'Certain it is that the mineral waters produce a more powerful effect than is observable from any artificial preparation of iron; whether this arises from the *minute division* with which chemical bodies are united to water, so as to render them more diffusible over the whole system, and more active in the stomach, or that the acids of the stomach are more capable of acting upon the ferruginous principle when so diluted, I will not attempt to prove. Nice is the accuracy of the modern chemist in investigating the component parts of mineral waters, yet analysis is not so

Hosted by Google

far to be depended upon as to supersede the experience ofeffects.'" (Pages 19, 20.)

"Again, Sir C. Scudamore (Analysis of the Mineral Warers of Tunbridge Wells) remarks: 'Some persons, I know, when in perfect health, have made trial of the water, and not finding from it any notable effect, *have most unjustly undervalued its powers*, which ought not to be expected in any very marked manner, unless on the invalid. An exception, however, presents itself to this observation, as I can assert from experience, that all persons in *full health cannot* make free use of the water with equal impunity. A plethoric habit, with vessels easily excited to strong action, might find it to be a very injurious stimulant.'" (Page 24.)

"Dr. Granville jocosely questions the efficacy of what *he terms* the homœopathic quantity of 'oxide of iron,' in the spring, citing Mr. Hutchinson's steel treatment of tic douloureux, in which as much as 80 grains of *the oxide* of iron have been given; and he perverts Dr. Scudamore's expressions, which, far from sanctioning, were evidently intended to anticipate and refute such scepticism." (Pages 23, 24.)

"Dr. Joy (Lib. Pract. Med., vol. v. p. 293) says: 'The tonic effects of chalybeates appear, however, in a great proportion of cases, to be most *satisfactory* and *permanent* when administered in *moderate* quantities, as well as in a *very soluble and dilute form.*'"

"It is worth noticing, also, that Dr. Granville (Spas of England, vol. iii. p. 415), in his laboured encomiums showered on the Bath waters, deemed it necessary to write nearly a page of precautionary advice to 'such patients as cannot bear the action of steel' in water, which contains, according to Mr. Phillips's analysis, the really 'homœopathic' quantity of one-ninth of a grain in a gallon, or *twenty times* less than the quantity contained in the Tunbridge water. It is on this class of invalids especially that the really admirable compound, presented as a free gift from the cunning laboratory of Nature, exerts its curative action, unequalled by any artificial preparation of iron. The iron is, as it were, smuggled into the circulation," etc. (Pages 27, 28.)

"But it is not the most potent or the most soluble medicines that are the most useful or efficacious." (Page 34.)

"If a proper selection of such cases were made, and all other essentials duly observed, the invalid would gratefully acknowledge the happy change wrought on a feeble system by the chalybeate, even without the intervention of any 'homœopathic' views to assist belief in its sanative properties." (Page 28.)

May we not say, that these are remarkable allopathic testimonies to the truth of that very marvellous system, *homœopathy?* especially as the writer observes (p 12), "To this freedom from all other saline constituents, *the minute quantities existing cannot exert* any influence."

Yours, etc.,

U. M.

In reference to your wondrous paper in the *Homœopathic Times* of last week, shall I send this short extract from Dr. Powell's work?

"Mineral waters are produced by condensed aqueous vapour of meteoric origin, which penetrating the surface and fissures of mountainous districts," etc. (Page 2.)

"Dr. J. Johnson states, that the quantity contained in the Tunbridge Spa, namely, a quarter of a grain of iron, in a pint of mineral water, held in solution, will act more efficiently on the human constitution than *ten times that quantity* taken in pills, powders, or potions, as prepared by the chemists." (Page 26.)

To the Editor of the Homœopathic Times.

SIR,—Seeing that the *Lancet* has pushed forward its "forlorn hope," threatening to storm our citadel, and put to the sword every one of us homœopathic practitioners, it is our bounden duty, or rather it is absolutely necessary, that we, sinking all minor differences, seek strength in union, and present a firm and unbroken front to our unscrupulous adversary. It is true, our system has been too long before the world, and is now too well appreciated to be subverted by any efforts the *Lancet* and its disciples can bring to bear against it. Nevertheless, we should act as though its powers were equal to its will, and rest not till we have reduced our would-be oppressor from a threatening to a defensive condition. If we will not crush the snake, we must at least remove its venomous fangs, and thereby give a clear stage to the medical practitioners, and students who may wish to join our ranks. To effect this, we must first procure a charter, as a legal recognition of our rights—a college will follow in due time; then, and not till then, may we relax in our exertions, and afford to treat with contempt the hostile demonstrations made against us!

I may here state that I was formerly opposed to homœopathy, and that I practised strictly according to the "old system," for many years, with an average amount of success. Having charge of an extensive district, I had ample opportunity of testing the virtues of drugs and depletion, and must confess I was often bitterly disappointed by the result, and ready to exclaim, "There is no balm in Gilead!" Yet, *nolens volens*, I was forced to go on in the old track, knowing no better. A whisper of homœopathy had indeed reached me, but casually and unfrequently; however, understanding nothing of its principles or merits, I was content, with the medical crowd, to set it down as an absurd novelty, whose little day would soon pass by, and to jump at the facile conclusion, that if cures were ever effected by it, they were due, not to infinitesimal doses, but to the strictness of the regimen enjoined. At length, it was my fortune to become acquainted with a lady warmly attached to the new system, and through her strong representations of its efficacy, I was induced to promise that I would give it a trial. I did so, with much scepticism at first, but soon had cause to be astonished at the results of this novel practice. Many acute cases

Hosted by Google

yielded, as if to a charm, so speedily was the relief afforded, and cures were achieved even in some of the most unpromising forms of disease, over which, treated by the old plan, I should have possessed little control.

I was myself, in the course of my investigations, stricken by a febrile attack, and employing homœopathic remedies alone, was happily enabled to resume my duties in a few days. I had opportunities of testing their efficacy on the members of my family, and found excellent results in all cases. I also employed them largely with various patients in my district, and, even under the disadvantage of an imperfect knowledge of the system at that time, effected better cures than heretofore. Let it not be objected, that I worked on the imagination, as my patients, in nearly every instance, were ignorant of my having made any change. Moreover, a large proportion of them were young children. Ascertained facts being, in my estimation, better than any theories, however venerable or antiquated, I could no longer withhold my assent to the important truths enunciated by that great Medical Reformer, Hahnemann, and determined, as a consequence, to adopt them in my future practice

It seems to be inevitable, however unjust and absurd (though we might hope better things in the light of the nineteenth century), that men who change their opinions, no matter how conscientiously, must encounter persecution and hard names from their fellows. Still, I know not whether to admire most the audacity or the ignorance of those individuals who style us charlatans. In the first place, we are equal to themselves in education, and in knowledge of the old system; and, secondly, we have the great advantage over them of being masters of the new, concerning the principles of which they seem to be in utter darkness. It is pitiful indeed to see these persons, either unwilling to institute a fair inquiry, or incapable, through prejudice, of taking any but a distorted view, endeavouring to fix the stigma of quackery on a large body of men, as honourable and well qualified as themselves. It appears, that they charitably attribute to some of us the most paltry and sordid motives. I suspect that the parties who flung this stone themselves live in the thinnest of glass houses, and that their very disinterested solicitude about the public may be resolved into anxiety for their own pockets!

Amidst the splendid discoveries and brilliant innovations of recent times, is the science of medicine alone to remain mediæval?

Following the arguments of our allopathic opponents, all inventors, with their followers, must be quacks and impostors, as well as those who adopt the new system of therapeutics!

I appeal to any candid person, if I, as a conscientious physician, find a better method of healing than I was wont to employ, am I not bound to give my patients the benefit of it, or shoul I I rather sacrifice them to some time-honoured theory, "refusing to hear the voice of the charmer," and consoling myself for an untoward result with the reflection, that I had acted according to the dicta of Hippocrates or Boerhaave? Again, if a patient die whilst under our treatment, no matter how desperate the case, it is, according to them, not even justifiable homicide, but murder!—no laughing matter.

Of course, the men who thus taunt us never meet with grim Death in their practice; their thrice-fortunate clients invariably make good and speedy recoveries. Alas, the registers of mortality tell a very different story! How numerous are they who have cause to deplore the fatal facility of that dangerous little instrument the lancet, too often the last refuge of ignorance, and thus in a reckless make-believe used to spill that precious vital fluid, which can never be renewed in its integrity.

Whatever *our* shortcomings, we at least are guiltless of this blunder. We essay not to steer the shattered vessel through the Scylla and Charybdis of old physic, depletion and mercury. *We do* not impair the vital energies, by prostrating drastic medicines. and never give our patients reason to complain that "the remedy is worse than the disease." But whilst defending ourselves, we by no means claim infallibility. We know that the best-directed human means must sometimes fail, and simply contend that under homœopathic treatment, cures are more frequent and speedy, and effected with infinitely less detriment to the strength and future well-being of the patient.

I believe that many of the heads of the profession, men full of years, honours, and experience, so far agree with us, as rarely to give their patients any, save the most gentle, medicines, trusting almost entirely to regimen, and interfering as little as possible with the healing efforts of Nature.

We fearlessly leave our good Cause, with our characters, in the hands of a discriminating public, confident that they will emerge brighter from the mass of obloquy now so unsparingly flung on them by the more ptejudiced of our allopathic brethren.

"Truth is great and must prevail."

I am, Sir, your obedient servant.

Sept. 27, 1851. M. B.

To the Editor of the Homœopathic Times.

SIR,—I was told some time ago by my former medical friend, who, I believe, meant well when he said it, that I should certainly return, soon or late, to "the good old path;" this was some two years or may be more ago.

I had received for some years, and others with me, many a blessing in sickness from God, through what I, and VERY MANY MORE, believe to be His law, discovered by Hahnemann, now called homœopathy; and among the rest of the benefits, I had found *considerable* relief in severe boils or carbuncles.

I shall state in a note to this, for the benefit of all whom it may concern, how my carbuncles were dealt with homœopathically. Suffice it now to say, that *when the pains came on I took two of the little despised dots* of the kind which I will state in a postscript; according as each kind was indicated, and AS SOON AS THE PAINS RETURNED, which, if I remember rightly,

Hosted by Google

was generally in from three to four hours, *I repeated the little dose*, and invariably found relief n a few minutes.

Formerly I had *two, at the least*, troublesome carbuncles lanced, and one of them lanced (*I well remember*) a second time, by what is called the *crucial* incision, to allow the burrowing slough to escape from the tumour.

Since I began to avail myself of homœopathic treatment, I have had at least three *very* painful boils; at each time I experienced I may say incredible relief under the *treatment*, which I will state below.

I am always very much occupied, but should I have a little time I would send you, if they proved acceptable, further reasons (occasionally in a line or two) than the present for pursuing STILL my last six years' path and more.

I would not intentionally give offence to those who, not having tested the medicines fairly, are not acquainted with their effects in disease, and so they speak against the practice; but should this meet the eye of medical men, editors, or others who know of any cases similar to that which I shall particularise, I should hope at least that they might be persuaded to suggest to the afflicted parties to put to the test these simple means. I need not say that relief is not to be expected from the medicines I shall presently name, unless the symptoms accord.

I lived simply on good, plain, digestible food, as I had been accustomed to do; took but little if any wine; attended to all my occupations as usual; although, in two cases, a friend of mine, a medical man, at each time said, "that is a bad boil; you ought to have it lanced—you must lie up." My friend still smiles at homœopathy, and so do I. He knows that I did not lie up, that the boils were not lanced. He does not examine into it. I receive benefit with others; *at all events thus far, for nearly six years and a half* (of late with the effectual assistance of a neighbouring practitioner), *we have recovered of our maladies, severe or mild*, UNDER THE TREATMENT! I am thankful to God, whose law of healing is assuredly had recourse to, if practitioners understand their business.

As for myself, I sometimes feel it a duty, scorned or approved, to state facts, and they are certainly VERY stubborn things.

If God gives to man a truth, in due time God will assure man that it is a truth that He has given. All opposition is vain when God works. Still He works by his instruments; He may work by this little attempt. At all events, the writer says, His will be done.

Respectfully yours,

H. B. D.

1st. When the appearance of the boil was red, inflamed, and of erysipelatous character,—*Belladonna.*

2ndly. Assuming a more livid appearance, and burrowing and very hard round the swelling, —*Lachesis.*

3rdly. On the formation of matter,—*Hepar S.*

On one occasion I apprehended mortification, and took *Arsenicum.*

The best lint, "Tipton's patent," dipped in water, and applied from the beginning by means of oiled silk or thin gutta percha, with the white adhesive plaster, is pleasant, and prevents rubbing; this I found very desirable under allopathic or homœopathic treatment. Sufferers will find it the lightest, and every way the best poultice.

To the Editor of the Homœopathic Times.

SIR,—I regret that you did not publish in the *Homœopathic Times* the letter which gave rise to your leading article of September 27th. It is true that it has appeared in some of the London papers, but I should have wished, and still hope, to see it recorded in your weekly publication, as "a heavy blow and great discouragement" to allopathy.

That letter proved that, owing to the different strengths of the medicines according to the formulas of the Pharmacopœias of London, Edinburgh, and Dublin, the unhappy patients are always in imminent danger of losing their lives. The accompanying extract from a weekly paper proves that the powerful drugs of the allopaths are not only highly dangerous to their patients, but to themselves.

Who is there that knows the blessed truth of homœopathy, with its small and safe doses, who does not earnestly long to see the time arrive when no doctor shall be able to kill either himself or his patients by administering such potent masses and extracts of poisonous drugs?

I remain, Sir, faithfully yours,

A NON-MEDICAL OBSERVER.

"MELANCHOLY DEATH OF DR. BADELEY, OF CHELMSFORD.—On Sunday afternoon the unfortunate gentleman was suffering from toothache. The pain being intense and without intermission, about four o'clock on Monday morning he went into his study for the purpose of procuring something to alleviate the acuteness of the attack. In doing so, unhappily, he partook of a considerable quantity of morphia. Mr. Bransby Cooper, of London, was immediately sent for by a telegraphic despatch, and all the members of the profession in the town were summoned, but their efforts proved abortive; the unfortunate sufferer lingered until one o'clock, at which hour he expired. The deceased gentleman only a short time since read before the College of Physicians a paper on 'Mind and Matter,' which has since been printed. Dr. Badeley was brother to the eminent barrister of London, and he leaves behind him a family of ten children."

"THE LATE DR. BADELEY.—On Tuesday, an inquest was held on the body of Dr. Badeley, at the Saracen's Head, Chelmsford. From the evidence of the medical gentleman examined, it was clearly demonstrated that the cause of death was apoplexy, that being produced by the morphia or opium which was taken by the deceased. The jury returned a verdict of Accidental Death."

LECTURE

At the London Homœopathic Hospital, on Thursday, October the 30th,

By Dr. Quin,

President of the British Homœopathic Society.

In conformity with the promise given at the close of my last lecture, to bring before you a variety of other interesting facts connected with Mr. Rutter's instrument, and its bearing upon the effects of infinitesimal quantities upon the human frame, I shall, in the course of the present lecture, make you acquainted with some further experiments, which corroborate in the most unequivocal and satisfactory manner many of the observations made by Hahnemann nearly half a century ago. Before, however, entering upon the description of these experiments, I am desirous of calling your attention to the circumstances which led to the invention of the beautiful instrument, and to the discoveries which have emanated from it. I am the more anxious to do this, because I think it but justice to Mr. Rutter that his conduct should be fairly and honestly represented.

It may be in your recollection that in my first lecture I stated that I believed Dr. Madden was the first homœopathic practitioner who witnessed Mr. Rutter's experiments, and I referred to the action of *Mercury* and *Bismuthum* upon each other, recorded by Dr. Madden, among other experiments, in the *British Journal of Homœopathy* for this month; and that in my second lecture, when alluding to some exceptions which he had taken in his lecture of the 21st October, against some experiments of Mr. Rutter's, recorded by me in my lecture of the 9th October, I spoke of Dr. Madden's lecture as an excellent one, and merely added that I could not then determine whether the alleged discrepancies between the account of the effects of *Belladonna* and *Aconite*, as recorded by me, and those observed by him, were owing to some idiosyncrasy, but that future experiments would clear this up, meanwhile that I could not doubt the accuracy of my account of *Belladonna* and *Aconite*; for the experiments upon these substances had been performed over and over again in my presence, and that of several colleagues. In making these remarks, on the two several occasions when I lectured here, I did justice to the priority of Dr. Madden's witnessing the powers of Mr. Rutter's instrument;—and to what I had heard of the excellence of his lecture on the 21st instant.

Since then I have seen, in the *Homœopathic Times* of last week, what would seem to be an authorized communication of his lecture, in which it is stated, that in the early part of August last his (Dr. Madden's) attention was directed by Mr. Rutter to the action of common *Salt* upon the motions of the pendulum, which action Mr. Rutter supposed to be due to the crystalline arrangement of that substance. Dr. Madden said that he surmised that this action might be owing to something else, and commenced a series of experiments with medicinal substances, the result of which he communicated to Mr. Rutter. Allusion is then made, in the account of the lecture, to an alleged experiment of Dr. Herbert Mayo's with a gold ring suspended in a tumbler by a silk thread, whereupon the ring takes a pendulum motion, so strong as to cause the ring to strike against the sides of the tumbler. It is also stated that Mr. Rutter had discovered that sleep reversed all the currents.

Dr. Madden then called attention to the circumstance, that in Dr. Quin's lecture there were numerous and most important errors. He showed that, out of the actions of sixteen medicines recorded by Dr. Quin, the actions of twelve differed from those produced by the same medicines on himself; and he had since ascertained that the

Hosted by Google

actions, as described by Dr. Quin, were in many instances not the same as those actually produced on Mr. Rutter.

A division of honour and credit is then awarded by the lecturer to Mr. Rutter and himself; honour to Mr. Rutter for the discovery of the instrument, and credit of an incontestable character to Dr. Madden for having directed Mr. Rutter's attention to the different actions of medicinal substances, and particularly homœopathic agents, and for having indefatigably and unremittingly, for nearly three months, pursued daily investigations upon this point. I learn from several colleagues, who were present at the lecture, that the communication quoted above is a very faithful account of the lecture, but that Dr. Madden had added, in the course of his observations, that he was afraid, from what had passed at Dr. Quin's lecture, that the merit of the application of the discovery to the different actions of medicinal substances, was due equally to Drs. Quin and Madden, whereas it was due to himself (Dr. Madden). Now, gentlemen, I, for my part, most cheerfully and readily disclaim all pretence to any credit whatever, of any kind; neither in my thoughts, in my lectures, nor in my conversation, have I dreamt for a single moment of assuming any merit. My admiration of Mr. Rutter and his discovery is too deep and sincere to permit me to entertain, for an instant, any notion of pretending to dispute with any one the honour and credit which are due to Mr. Rutter alone. I should as soon think of disputing the discovery of America with Columbus, to whom, I learn, Dr. Madden in his lecture very naturally likened himself. For me to enter into a dispute with Dr. Madden about our respective merits in this matter, would be like raising a storm in a bucket of water on the seashore, near the Black Rock, in which were struggling two small minnows, who imagined themselves great members of the finny tribe in the neighbourhood of a Leviathan, such as Mr. Rutter is, when compared with us, in the broad and deep ocean of science. Gratitude, however, and respect for Mr. Rutter make it necessary for me to state the exact truth concerning this matter, as far as it is at present known to me.

With regard to Dr. Madden's first statement in his lecture, that Mr. Rutter attributed the action produced by *Salt* on the pendulum to the crystalline arrangement of that substance. Mr. Rutter denies that he ever attributed the action of the *Salt* to its crystalline form. Nay, the *Salt* used was finely pulverized, and he dealt with the smallest perceptible particles in the experiments he showed to Dr. Madden. It appears, then, that Dr. Madden must have greatly misunderstood Mr. Rutter.

Mr. Rutter, several months before Dr. Madden had seen his experiments, knew the action of minute doses of *Sulphur*, of *Salt*, and of various medicines; he knew that the hand of a person put in contact with his left hand, whilst he was operating with the instrument, reversed the normal current, that person having taken the day before a small dose of *Calomel*, whereas the hand of the same person, before he took the *Calomel*, gave the diagonal motion usually produced by the male hand. The gentleman who had taken the *Calomel*, did not inform Mr. Rutter of it till after the effect had been tested. This took place two months before he had seen Dr. Madden. Mr. Rutter had previously witnessed similar effects from different medicines and particular kinds of food on members of his own family.

The effect of water, in which a steel magnet was dipped for a second, upon the instrument was familiar to him long before he had seen Dr. Madden; the effect of a dead fly; of ivory held in the hand; of the *emanations* from dead animal matter, and from various substances; of breathing upon the hand of the operator, or upon that of any person, or the last of a chain of persons; even a single hair of a female, of a handkerchief, after it had been held a few minutes in her hand, etc. etc.—all these experiments with medicines, either in the most minute doses, or even from mere *emanations*,—all these effects were shown to a great number of persons before he saw Dr. Madden.

Dr. Madden says, that in Dr. Mayo's work attention is directed to the old familiar experiment of a gold ring suspended in a tumbler from a silken thread, and that the pendulum movement attained such a height as to cause the ring to strike against the sides of the tumbler; now any one who will peruse that work, will find that not one single word is said about the tumbler experiment. It is not mentioned by Dr. Mayo, and, it is likely, was not known to him; if it had been, he would no doubt have mentioned it.

Mr. Rutter disclaims the discovery attributed to him by Dr. Madden, that sleep "*reversed*" all the currents. What Mr. Rutter believes is, that the recumbent posture transposes the polarizing influence of the currents. The circumstance mentioned concerning a letter written by a somnambulic female, is unknown to Mr. Rutter. Mr. Rutter had not heard of

Hosted by Google

of it before, and has never seen a case of somnambulism. With respect to the alleged numerous and important errors made by Dr. Quin in his lecture, and to the allegation that the effects of twelve out of sixteen medicines recorded by Dr. Quin, differed from those of the same medicines on Dr. Madden; and to the statement that he (Dr. Madden) had since ascertained that the actions so described by Dr. Quin were, in many instances, not the same as those actually produced on Mr. Rutter, I have merely to state that Mr. Rutter has been so kind as to read my first lecture carefully over. He cannot discover these numerous and important errors. Of the forty-eight experiments with different globules of medicines. Mr. Rutter has repeated forty-two and has only found two trivial errors. One I find is an error of the printer, and the other a mistake of the transcriber. I am at a loss to know upon what authority Dr. Madden has stated that the actions described by me were not those produced on Mr. Rutter; not, certainly, upon Mr. Rutter's authority. So much for the twelve discrepancies out of sixteen medicines.

The experiments recorded by me were made with medicines, spontaneous and indigenous to the countries whence they were brought, prepared carefully by myself or by Mr. Headland, or by other careful and conscientious chemists in the different countries I named in my last lecture; they all told the same tale when experimented upon. Mr. Rutter has a remarkably healthy, strong constitution, which has never been tampered with by medicine. When one sees such statements put forth by Dr. Madden, of differences between the action of medicines upon the healthy frame of the gentleman who instructed him how to experiment with the magnetoscope, and upon his own body, one is naturally led to inquire from what source does Dr. Madden obtain his medicines, and if one can depend upon his body being sufficiently free from lingering medicinal effects, originating before his conversion to homœopathy.

It would have been wiser and more in consonance with professional courtesy, had Dr. Madden not been so eager to condemn. He has a great advantage in being so near Mr. Rutter, whose urbanity, courtesy, and simplicity make him beloved and respected by all who have the pleasure of his acquaintance. He would have learnt, in addition to all that he has already been taught by Mr. Rutter, and have profited by the knowledge, that from the earliest period of his (Mr. Rutter's) investigations, idiosyncrasies, abnormalities, and irregularities presented themselves, and were justly considered by him as valuable evidence; for, as he correctly remarks, if currents so feeble, set in motion by causes apparently so trifling, pass through and influence the body, is it matter of surprise, if organism, disease, temperament, mental relations with the physical, etc., etc., should affect, control, subvert, or change the direction of these currents? If the breath from the lungs of a bystander be sufficient to reverse for the time the currents, is it wonderful that some are more, others less, susceptible to atmospheric or telluric electricity?

If any person could produce equal results with the magnetoscope, Mr. Rutter most pertinently remarks that he would have less confidence in it, and when it is found that those who most anxiously wish to set the pendulum in motion have not the power of doing it, it is evident that the *will, the wish*, or the *anticipated result* is not an element in the experiments.

In the same number of the *Homœopathic Times*, is a letter written by Mr. Wilson respecting the magnetoscope of Mr. Rutter, in which he reproduces an account from Dr. Herbert Mayo's interesting work on the "Truths contained in Popular Superstitions." This had already been produced in *Chambers's Edinburgh Journal*, No. 375, March 8th, of this year. In this letter of Mr. Wilson's there is a laudable and well-meant endeavour to settle chronologically the merits of the different persons whom he considers entitled to credit for advancing the knowledge of the magnetic currents; but a longer acquaintance with Mr. Rutter, and a more intimate knowledge of his antecedent labours in science, would have proved to him that Mr. Rutter is the last man in the world to allow the merits of his predecessors to be ignored or concealed, and he has too much liberality and conscientiousness, and too much real merit and genius, to think of founding a name by appropriating to himself the discoveries of others. In a lecture delivered by him in a literary and scientific society, last April, he entered fully into the facts which had preceded his. But before I enter more fully on Mr. Rutter's lecture, I will give a brief history of the discovery. It was the tumbler with the pendulum suspended in it, and the analysis of its phenomena, which first revealed to him the law which, he believes, governs all the phenomena.

Dr. Herbert Mayo's interesting experiments did not become known to him till the 2nd of April last, through an article in *Chambers's Edinburgh Journal* of March; there is reference to some of Reichenbach's experiments in the same article. He had not previously seen Baron Von Reichen-

Hosted by Google

bach's work. He only became possessed of a copy about three weeks ago. Dr. Mayo's experiments left him still in the dark. If it had not been for the happy thought about the terrestrial electricity or the polarizing effect of telluric currents, he would not have pursued the subject to its present issue.

Mr. Rutter, in the most liberal manner, has endeavoured to supply information to all who have sought it, and has never refused to show his experiments. Upwards of 400 persons have seen many of them. He has never sought to publish them, and it is only at the intercession of numerous friends, to whose judgment he thought it right to defer, that he has consented to give publicity to his experiments through the press. The work shortly about to appear is intended as an authorized record, and is entitled "*Magnetoid Currents, their Forces and Directions; with a description of the Magnetoscope, and a series of experiments.*"

Most important truths are in process of development by the phenomena which are constantly going on under his observation. It is this conviction, and a desire to forward these truths, which encourage him to persevere and devote his time to making experiments. Hitherto they have absorbed much time, and not a little money.

The lecture of Mr. Rutter in April last, had for subject, "Remarks on certain Electrical Phenomena in connection with Human Physiology." Mr. Rutter "having bespoken the indulgence of his audience, not for science, not for philosophy, but for the feebleness and ignorance of him who now essayed to speak of some elements, which he believed to be truly electrical, and also connected with human physiology," he proceeded, with the humility and modesty ever the characteristics of true merit, to remark "that he was but a gatherer of other men's stuffs," literally but a collector of fragmentary thoughts, putting them in a connected form, so that they might be understood and valued, and that thus he might prevent their being seized by the charlatan, and used as helps to trickery and imposture." After giving some interesting information on electricity, the voltaic battery, magnets, the electric telegraph, magnetic electricity, and thermo-electricity, the leech barometer, terrestrial magnetism, etc., "Don't say," exclaimed Mr. Rutter, "that we don't live in an age of mystery. Mysteries were rising up amongst us every day. We were living in the midst of mysteries, which God was revealing to us for the good of his creatures." He then alluded to the discoveries of Faraday, Snow Harris, and Sir Humphrey Davy. He afterwards spoke of the "remarkable researches which had long been going on by Baron Von Reichenbach." "He (Mr. Rutter) pretended not to say whether all that had been published was correct or not; he knew nothing about it, except what he had read. But within the last few months, a little scintillation of truth had broken out. And he held, that so long as we had that which was substantial truth—true philosophy, true science, a part of Nature's own operations, without reference to opinion or evidence—we were bound to exhibit that truth. Truth was no secret: it was only when attempted to be made a secret, that it was driven among errors and used for base purposes."

"Herbert Mayo, a name well known in literature, had been long in ill health on the Rhine or somewhere on the Continent; among other things, it seemed he wished to refresh his mind with a little touch of mathematics. He sent for a professor, and took his first lesson. Afterwards they began to talk of other things. The professor said he had heard that Mr. Mayo had written on various topics, and, he added, "I have a little thing here I should like you to see." He showed it to Mr. Mayo, who was surprised, but he connected it for the moment with some of Reichenbach's experiments. The wonder was that he did not connect it with something else. He (Mr. Rutter) had carried it further. Mr. Mayo tried the experiment, and he wrote a little account of it, and called it the "Od influence." Reichenbach calls it "Od force." Whilst in one case we had to deal with persons in a certain state, for it seemed a certain state of health or a nervous irritability was required, the case which he referred to seemed common to all, diffused through all nature, the lower animals probably partaking of it as we do ourselves, and yet all apparently bound up in the great band of electric agencies."

After showing a number of beautiful experiments, which made evident the different motions, some direct rotatory, some reverse, some longitudinal, and others transverse, etc.; also the power given to water of causing motion by dipping the magnet for a second in the water; the effect of a hair of a lady producing the same effect as herself; and the positive evidence of the effect of the *aura*, from the finger producing the same effect as contact had done; likewise the fact that breathing or blowing on the back of the hand reversed the motion of the pendulum, and that blowing on the palm, gives a longitudinal motion;—

Hosted by Google

Mr. Rutter expressed his belief, that the human body is really and truly a species of voltaic arrangement; that there is true duality and polarity, except that instead of dealing with metals, and acids, and decomposing substances, we had all the Od things in the world, everything in fact that we touched, tasted, or handled. The subject was, no doubt, intimately and deeply connected with health and disease, the emotions of the mind, the desires of the heart, and the objects which presented themselves every day; and he thought there were some analogies, equally close and compatible with the original motion of electricity, to justify him in saying that the human body exhibited, probably in combination with electrics and non-electrics, and magnetism, enough to warrant the title given to his subject, namely, certain electrical phenomena in connection with physiology. All that he had done and all he professed to do was to present a correct illustration of certain electrical phenomena, the common property of all who were labouring to leave the world better than they had found it. Might he not suggest the magnetic state of the body to have something to do with the action of medicines which had metals for their bases? He had reason to believe that this influence operated on the lower animals."

"The dog always followed his master home; the horse knew his way in the dark, though blindfolded he knew when his master was on his back; pigeons found their way an immense distance; the vulture found the newly-slain on the battle-field, and came hundreds of miles to the spot. It was usual to say that he scented his food, but he came with his face to the wind. He had no more difficulty in understanding how the influence arising from pointing to a lady's hand might lead to the reversal of the motion of an oscillatory body, than how a vulture knew that his meal was prepared a hundred miles off, although the rotundity of the earth must interfere with his vision. One was as inexplicable as the other. His (Mr. Rutter's) object was to strike one scintillation of truth before his audience. Try it, he said, and then draw inferences. Whatever the inference, the facts were true. If it were good, let them get good out of it. He was sure there was no evil in it, because it was one of God's operations."

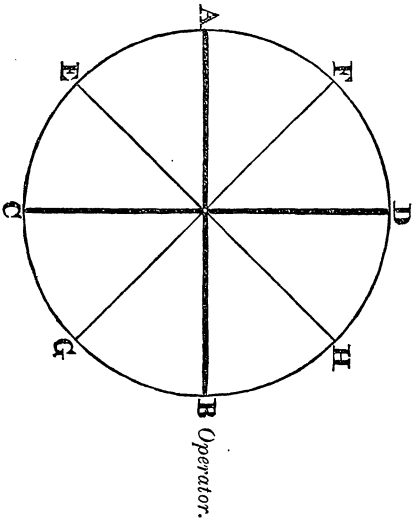
Gentlemen, I have quoted Mr. Rutter's lecture at some length, but I feel assured that you are gratified that I have done so. The practical knowledge, the philosophical research, and admirable sentiments contained, do honour to the head and heart of its writer. Such sentiments and such broad, philosophical, and philanthropical views cannot but elevate the mind to higher aspirations; and I am sure you look forward with the same longing and impatience that I do for the forthcoming work of Mr. Rutter. I anticipate an incalculable amount of good to flow from it on our poor suffering fellow-creatures, as well as that it will be a fountain of knowledge to the philosophic inquirer; and I earnestly hope that every respectable homœopathic practitioner will arise as one man to resist and expose any attempt to appropriate the well-earned credit of Mr. Rutter's discovery, and to do homage to him to whom we owe such a deep debt of gratitude,

I called your attention at our last meeting to the effect of *Flint* upon the pendulum; since then, some admirable experiments have been made by Mr. Rutter, beautifully illustrating the effects of crystalline forms. *Rock Crystal* (a pure form of *Flint*) gives four distinct motions to the pendulum. 1st. When the apex of the primary axis is placed in contact with the left hand, an oscillation takes place from F to G. 2nd. When the base of the *Crystal* (the part by which it had been attached to the rock) is placed in the hand, oscillation from H to E. 3rd. Upon the *Crystal* being laid across the hand, the apex from the operator, reverse rotation takes place; and 4th, when the apex is towards the operator, direct rotation takes place. Now, the extraordinary thing is, that a globule of the thirtieth attenuation, or the decillionth of *Silicea*, displays all these four distinct motions as completely and satisfactorily as the mass of *Rock Crystal* does, by changing its position in the palm of the hand of the operator; but it is of course impossible to predicate what will happen whilst dealing with so small a portion of the substance. The motions can only be obtained by frequently moving the globule, and at every such change of position, one of the four directions is a constant result. When the experiment was tried last, it only required five changes to arrive at the four different motions. When the globule is dissolved in water, a drop of the solution gives oscillation to and from F G. Mr. Rutter attributes this to the polarizing effect of the *Crystal*.

The present explanation will take the place of the observations made by me in my last lecture upon the effects of *Flint* and of a globule of *Silicea*, the result then obtained having been the effect of the base of the *Crystal*, and not of the apex of the primary axis.

Hosted by Google

On some crude metallic *Antimony* being put upon the left hand of the operator, the normal circulatory movement is immediately changed to the reverse current. One globule of *Antimonium metallicum* was put upon the operator's hand; the effect was to change the normal circulatory motionin to the reverse current. *Tartar Emetic*, one globule, had the same effect, being an additional proof to those already furnished, of the soundness of one of Mr. Rutter's discoveries; namely, that all compound substances invariably act in accordance with the powers of their base.



On *Alumina* 30, one globule being placed on the operator's hand, whilst the pendulum is moving in the normal circular action, the reverse circular motion immediately takes place.

Cina 9, one globule, brings the instrument to a dead stop.

Causticum 30, one globule, produces the reverse rotation. On *Coffea* 3, one globule, its antidote, being conjoined with the *Causticum* on the hand of the operator, the normal action is immediately produced. On the *Causticum* being removed, and the *Coffea* left, the special action of *Coffea* sets in, the pendulum motion from H to E.

Cicuta 30, one globule, causes the reverse rotation.

Cocculus 12, one globule, brings the pendulum to a dead stop. When *Camphor* is added, both the *Cocculus* and the *Camphor* being in the hand of the operator at the same time, the normal action is feebly set in.

Colchicum 12, one globule, causes the pendulum to move in the reverse rotation.

Conium 30, one globule, immediately stops the pendulum. On *Coffea*, its antidote, being added, the normal rotatory action immediately commences.

Crocus sativus 3, one globule, produces a reverse elliptical action from E to H. On its antidote, *Opium* one globule, being conjoined, the normal rotatory motion immediately sets in.

Jalappa 3, one globule, produces the reverse rotation.

Mezereum 12, one globule, causes the instrument to come to a dead stop. On its antidote, *Camphor* one globule, being added, the normal rotatory action immediately commences.

Petroleum 18, one globule, gives the reverse rotatory motion. On its antidote, *Nux vomica* 30 one globule, being added, the pendulum immediately stops.

Rhabarbara (*Rheum*) 9, one globule, produces the reverse rotation.

Sambucus nigra 3, one globule, produces feeble normal rotation.

Acidum nitricum 12, one globule, causes the pendulum to take the reverse rotatory motion; conjoined with its antidote *Camphor* one globule, the normal rotation is immediately produced.

Secale cornutum 30, one globule, produces the normal rotation; conjoined with its antidote *Camphor* one globule, the pendulum is brought to a dead stop.

Nothing can be more beautiful and more satisfactory than to witness the results upon Mr. Rutter's instrument of the experiments with the antidotes to these various medicines, indicated by Hahnemann in his works. Our revered master, by dint of long, patient, and persevering experiments upon the effect of various medicines upon the healthy body, discovered a number of antidotes to some of these medicines, and in other instances, only to some of the effects of each medicine experimented upon. In other instances, he corrected many errors into which medical authors had fallen, with respect to the powers of some antidotes. Mr. Rutter's instrument corroborates in the most satisfactory and most beautiful manner the experiments of Hahnemann.

In the course of these experiments of Hahnemann, he discovered that some antidotes had the power of neutralizing *all* the effects of the substances against which they were prescribed. On the other hand, he found that he could not by one single antidote overcome the entire action of some substances, the effects of which he wished to neutralize. He was obliged, therefore, to direct his experiments in such a manner as to discover how he could neutralize by

Hosted by Google

different partial antidotes—if I may so call them, the effects produced upon different organs by certain medicines. Hence we find several antidotes recorded in Hahnemann's works against one single medicine: one, for instance, to neutralize the effect of that medicine upon the brain; another to overcome its action upon the circulation; a third to modify its effects upon the stomach or bladder; and a fourth to calm the irritating or the depressing action upon the nervous system.

Hitherto, I have merely, as far as I recollect, recorded the effect of one single antidote against one remedy. I shall now bring under your notice a few experiments where several antidotes in succession were tried against one single medicine. These antidotes being those indicated by Hahnemann. For example, the two antidotes to *Graphites* are *Nux vomica* and *Arsenicum*.

On one globule of *Graphites* 30, being placed on the operator's left hand, the reverse elliptical motion from E to H set in. On *Nux vomica* 30, one globule, being added to it, the pendulum immediately stopped. On the *Nux vomica* 8, being taken away, the elliptical motion was immediately reproduced. On *Arsenicum* 30, one globule, being added, the pendulum immediately stopped.

The two antidotes indicated against *Helleborus* are *Camphor* and *China*.

On one globule of *Helleborus niger* 12, being put in the operator's hand, the pendulum stopped. On one globule of *Camphor* being added, the normal rotatory motion immediately set in; the *Camphor* was removed, and the pendulum again stopped. On one globule of *China* 30, being added, the pendulum action from E to H immediately set in.

The antidotes to *Sabadilla* are *Pulsatilla* and *Camphor*.

One globule of *Sabadilla* brought the instrument to a dead stop. On one globule of *Pulsatilla* being added, the normal rotatory action immediately commenced. On the *Pulsatilla* being removed, the instrument again stopped. One globule of *Camphor* was added, and the normal rotation immediately set in.

The antidotes to *Senega* are *Arnica*, *Camphor*, *Bryonia*, and *Belladonna*.

The effect of one globule of *Senega* upon the instrument was to bring it to a dead stop. On being conjoined with one globule of *Arnica*, the normal rotatory motion set in. The *Arnica* was removed, and the pendulum stopped. *Camphor* was added, when normal rotation set in. On the *Camphor* being removed, the pendulum again stopped. One globule of *Bryonia* was then added, and the normal rotation again reappeared. The *Bryonia* 30, was removed, and the instrument stopped; and, finally, on *Belladonna* 30, one globule, being added, the reverse rotatory motion immediately set in.

Now, gentlemen, you have of course borne in mind that the globule of *Senega* was during the whole of the last experiment in the hand of the operator; that before the *Senega* touched his hand, the pendulum was going round in the normal rotatory direction, and that the *Senega* brought it to a dead stop. Permit me to recall to your memory, that the natural effect of *Arnica* placed in the hand of the operator, would be to cause the reverse rotatory motion, but its effect, finding the hand already under the influence of the globule of *Senega*, was to produce the normal rotatory motion instead of the reverse. The natural action of *Camphor* is to produce the normal rotatory motion, and in this instance it neutralized the effect of *Senega*, which had brought the pendulum to a stop. The natural effect of *Bryonia* is the reverse motion; conjoined with the *Senega*, however, the normal motion is produced. When the globule of *Belladonna* (the natural effect of which is to stop the pendulum just as the *Senega* does) is added, a different action from any of the three other antidotes is set in, that of the reverse rotatory motion.

I cannot imagine anything more beautiful or more delicate than these experiments. Mr. Rutter, who is no homœopath, is perfectly astonished and enchanted at the additional means which the discoveries of Hahnemann give him (Mr. Rutter) of proving the delicate and truthful action of his instrument.

To us homœopathic practitioners, the beautiful invention and discovery of Mr. Rutter is precious beyond all calculation; as a means of calling attention to, and spreading homœopathy among, our allopathic colleagues. I know not how you feel, gentlemen, but my heart is overflowing with gratitude to Mr. Rutter, for all that his discovery may be the means of doing for our Cause.

He has unconsciously but most correctly described himself in his lecture, extracts of which I have given this evening. He is indeed, one of those "who are labouring to leave the world better than they found it." I cannot close my lecture more fitly than by quoting the beautiful words of Mr. Rutter, so expressive of the character of his own mind—"We were living in the midst of mysteries, which God was revealing to us for the good of his creatures."

LETTER TO ROBERT CHRISTISON, M.D., V.P.R.S.E.,

AND PROFESSOR OF MATERIA MEDICA IN THE UNIVERSITY OF EDINBURGH.

No. V.

SIR,—A weekly editorial writer, a partisan of yours, and co-agitator to Scottish Universities, with that amiable weapon the "*Lancet*," but hitherto much inferior in his Billingsgate department to the noted whipper-in, has just come out with a "perfect burst" of *morality, medical morality!!* His exacerbation of abuse sinks maudlin into tears; he weeps bitterly at the "*vile motives*" imputed by us to the pill philosophy; regrets the long forbearance that prevented him from hanging us all some years ago; and requests to know what right we have to *object to persecution.* This individual, who in a professional lifetime has not added one tittle towards the advancement of therapeutics, but who, nevertheless, from a dire necessity for a perfect devotion to "sixpences," yelps mellifluously at those who have, and who throws off his polished paragraphs so exquisitely refined, that we, brought up in a rugged-school, feel quite "at sea" whilst perusing them—this individual, I say, has, like the frog in the fable, inflated himself to an alarming extent. Alive to the great allopathic principle, that "vile motives" are all on our side, and that *viler motives*, when coming from his own, must be taken for sound arguments, he dives at once, with the tears still undried upon his malar bones, into the *Lancet* vocabulary, and picks out the *choicest* words he can find there. He is *nice* too in his selection, as we might expect from such a man; and favours a portion of us with the gratifying designation of "bastard homœopaths," and as "needy practitioners outstripped in the pace of *legitimate practice.*" He hates homœopathy and homœopaths with that *bitterness* which only an apothecary can realize; but the *bastard breed* is his especial aversion: he curses them in his heart as no one ever cursed but Dr. Slop; and he thus metes out his anathemata proportionally, because he thinks the latter have less chance of breaking down. He never sleeps but a demon sits upon his chest in the shape of a homœopathist; the shades of allopathic patients flit round his couch, and he awakes to the chanting of Io Pæans for the fading greatness of pestle-and-mortarism. When the future rises up before him, and weekly sixpences seem dwindling into fourpenny-bits, the gaunt spectre of starvation rouses him for "*another go;*" but down again, he dreams on and mutters, amid disturbed slumbers—

> "Thou shalt live on thy pain,
> With a fire in thy heart,
> And a fire in thy brain;
> And sleep shall obey me,
> And visit thee never,
> And the curse shall be on thee
> For ever and ever."

He asserts that he has seen instances where men that were allopathic at night have awoke thorough homœopaths in the morning. We have heard of "genuine Macassar," or "bear's grease," or some such pomatum of note metamorphosing a deal box in one night into a hairy trunk, but we have not seen it; but this editor has seen it: let him denounce *the man*, or bear the stigma he has incurred of asserting a falsity.

In applying the offensive term of "bastard homœopaths," he endeavours to bring discredit on any admixture of the systems; he will admit of no scale in homœopathic intellect, no proportion in homœopathic advancement. He forgets how many miles it is from the heights of Giessen to the low swamps of Putney. He calls upon us to stand or fall by the merits of our system; he debars, or would debar, all patients from having any voice in the matter, and hints that henceforward no patient who has once patronised homœopathy can possibly obtain advice from an allopath, for the allopaths have determined not to render it. Could he possibly effect this, it would be a boon to us. Whenever we feel in want of allopathy, we know where to find it; we shall certainly not come to him. When vindictive, invidious, contemptible twaddle like this is foisted upon the public notice in lieu of logic, we may well blush for the venal condition of medicine, rendered respectable through age. When one who conducts what is a professed guide to the condition of medicine in its catholic phasis, says to his patient, "If this don't cure you, you may die, for you shall not try anything else," the question occurs to me whether, after all the resources of allopathy had failed in any case, and you had said, "Now let me see what globules can do," would your conscience, even if they failed, upbraid you for the trial? No good man would; neither do I blame the homœopath who leaves no stone unturned in case of failure. Sir, human life is far too precious to be set upon a dictum. No doubt we can boast of better things than "the modern treatment of the calculous diathesis;" but we are short of what we could wish. We expect, however, to advance far faster than you do, for from the first we had a small bright star shining in our

Hosted by Google

horizon, which, as it advances towards the zenith, is at this moment promising development into a planet of the first magnitude.

The "vile motives," for which this editor sheds crocodile tears, would, taken by themselves, form a severe drag at the end of our moral beam. But as fair a proportion of our ranks are *independent of practice* as in yours; and when we remember those five-barred gates to innovation,—fat practices of many annual thousands, snug official berths, favourable positions before the public, and especially *fears of brotherly kindness and charity from "the profession,"* in the event of secession,—we think the heavier weight is at your end of the beam, and that, in point of courage, we beat you all to "smithereens."

As to bandying "motives," the *Lancet* has taken weekly care always to keep us in his debt. He promised on one single occasion to treat the subject with the "calmness and dignity becoming a great profession"—in other words, to behave like a gentleman; but his very next issue showed how impossible it was for him to act in opposition to his inherent nature: perhaps his weekly sale would have suffered. He could not keep this hastily-formed resolution; and why? Human dross would not permit him; when he made the promise, he forgot how the dire necessity of eating and drinking compelled him (even if his natural inclination did not imperatively order him) to write articles suited to the capacity of several thousand practitioners, whom shame is only slowly emancipating from the elevated function of goading mucous membranes; whose moral feelings have ever been enslaved by remuneration for drugs sold by *quantity*, and the efforts of whose brains were considered by patients, and tacitly admitted by themselves, as not worth paying for.

When induced to allude to such opponents, whose science and logic so beautifully fraternize towards the well-being of their fellow-men, we irresistibly address our pen, ink, and paper in the words of the poet—

"To such vile uses do we come, Horatio."

Pshaw! are you never to have done with "*motives*," and never to commence investigation? We leave these gentry, weekly editors and all, whose classical phraseology lights stale upon our hearts, whose pointless arrows fall blunted from the convex of our shield.

"A thousand archers, with unerring eye,
At once let fly,
And with their hurtling arrows fill the sky;
In vain they fall upon him fast as rain;
He bears a charmed life, which may defy
All weapons, and the darts that whiz around,
As from an adamantine panoply
Repelled, fall idly to the ground."

Let me try to coax you towards science. The subject is quite exhilarating, don't you feel it so? I do; "it makes one feel quite jolly," for we shall have such rare bits of morality; no fear of wearying. You leave to us the proving of our medicinal actions, and we may do so. We leave to you to disprove them, and you have not advanced therein the step of a musquito. We in vain invited you to watch our proceedings, to record our cures and our failures alike, but that was not to be thought of; if we could not prove them according to the Paracelsian theories of the day, we could not be listened to. Would it have been different twenty years ago? I ween not; we should have been called to prove them by the standard for the time, whatever that was. It was in vain, when cures were not believed, that we illustrated our medicaments by the subtle agencies of the various imponderables, the secret miasms in various localities, and the specific poisons of certain forms of disease, and, tired of the dispute, we scarcely thought, in our day at least, any means would turn up to prove to materialists that their heads were as thick as brickbats.

Because our therapeutic views differed, we were denied the use of the microscope; because we scorned your chemistry of digestion, in so far as it afforded any guide to remedies, you said the stethoscope was ignored by us; but we used these like yourselves, and excelled you in their therapeutic application.

We have extended the diagnostic powers of the microscope to therapeutics, which you cannot do beyond simple aggregation and crystallization; nor is there any chance whatever that you will be able to arrive at even this state of therapeutic advancement. So long as infinitesimal doses can be proved to the satisfaction of the public by a more than average amount of cures, it matters little in reality whether a scientific proof of their potentiality can be obtained or not; the days have been for a long time fleeting by when the estimation of medicaments is to be regulated by bulk, and we look forward most wistfully to a cheering season, when the practitioner's brains are held in somewhat higher estimation than his boluses. Alas! that it should have been so tardy hitherto. We must rest our proof of medicinal power on the observation of our patients, on the evidence given by registrars of deaths, who must certify the *nature of the*

Hosted by Google

cases in which our deaths occur. I think science, when applied to therapeutics, is looking our way, and oozing out at your fingers. A late essayist on homœopathy has made use of the following quotation, which being Baconian, and not *his*, you may peruse with *safety to your honour*, which, I can assure you, is as dear to me as that of any young lady's whatever. "The poet that beautified the sect that was otherwise inferior to the rest, saith yet excellently well: It is a pleasure to stand upon the shore and to see ships tossed upon the sea; a pleasure to stand in the window of a castle, and to see a battle, and the adventures thereof below: but no pleasure is comparable to the standing upon the vantage ground of truth (a hill not to be commanded, and where the air is always clear and serene) and to see the errors and wanderings, and mists and tempests, in the vale below: so always that this prospect be with pity, and not with swelling or pride."

The advancement of homœopathy is the therapeutic locomotive of the day. Your lumbering waggon is passed by; the power of persecution cannot upset our engine; and, true to the failings of poor mortals, the "swellings and the pride" come unbidden to her aid, and wing her wheels along the road of science; massive iron indicates her strength; brazen chimneys typify her aggression on your party; whilst your deceptive vehicle is far behind, thirty years at least, by your own showing.

Look then around you! take a survey of our relative positions, and strike a balance for the last three months. Are your hopes greater than they were? Is there one homœopathic practitioner fewer? Have you weaned from their belief one patient, for ten who have joined us from the effects of your outcry? Have you had a single public journal in your favour, save the venal organs of the medical press? I trow not. Have you dared to put your idle boast of expulsion to the test in a single instance? You have not dared, and why? because once more "at sea" on the subject of *legitimacy*, your legal advisers hinted the scrape you would be in. What, then, have you done? Have you set the Forth in flames? Have you squashed homœopathy? Have you made any friends? Have you exalted the dignity of the medical profession in its catholicity? No, you have done none of these; what, then, have you done?—why, rejected Mr. Pope.

I am, Sir, your most obedient servant,

SIGMA.

October 25, 1851.

THE
HOMŒOPATHIC TIMES.

SATURDAY, NOVEMBER 1ST, 1851.

THE inhabitants of Ross, in Herefordshire, are in a fair way of becoming acquainted with the virtues of homœopathy. In another part of our paper will be found a lengthy report of what has recently transpired at a meeting of the Governors of the Dispensary, in consequence of Dr. STRONG's fearless advocacy and introduction of our practice into that Institution.

We are glad to notice that the result of the debate did not turn so much upon the attempted obstruction of homœopathic practice, as it did upon the question of the rules allowing any departure from the old-established custom of the Dispensary. It is curious to observe the modified views of the public upon the vital topic of medical reform. Not long ago any such endeavour would have been scouted with the fiercest anathemas, but now the contrary happily proves the case. The public, as a body, are evidently favourable to an examination of our principles, and would readily adopt them, were it not for the rabid opposition created by professional prejudices.

This was fully evidenced by many of the observations made at Ross. As yet, however, upon a finely technical point the Governors of the Dispensary gained the day; the resolution for altering the rules, so as to permit a continuance of homœopathic practice, having been negatived. Thankful are we to discover that the press shows no backwardness in giving due publicity to proceedings of the kind in question. The *Hereford Times*, from the columns of which we have abridged our report, furnished in detail the debate, and in a spirit of impartiality reflecting credit upon its conductors.

The short address of Dr. STRONG at the conclusion of the discussion will be read with interest. He stood before the audience and clearly explained his position. Possessing a thorough and complete conviction

Hosted by Google

that homœopathy is the right system, he has adopted it, and will carry it out to the best of his ability. Having thus unbosomed himself on the question, none can now attack him for boldly standing up in defence of his principles.

The demonstration at Ross will vastly assist the progress of the philosophy of Hahnemann. It has already made way in the county of Hereford, and its disciples are gradually increasing. Strong testimony was borne by two or three of the speakers to the favourable results of the introduction of homœopathic practice, and the prospect of its future success.

In every town and in every county we trust before long to see practical illustrations of the onward career of homœopathy. We have struck terror into the hearts of our adversaries by our bold and unflinching perseverance. Zealous co-operation on all sides must speedily achieve us a victory, which shall astonish the highest among the allopaths, despite their attempts to crush us under foot, and to bring us and our system into ridicule.

THE MAGNETOSCOPE.

We trust our readers have not been at all staggered by the seeming discrepancies between the experiments made by Mr. Rutter, as recorded by Dr. Quin, and those made by Dr. Madden, with this instrument. We doubt not that these apparent discrepancies will turn out to be "confirmations strong"—of the instrument, and of its virtue.

The Marquis of Worcester evidently, as may be seen from his "Century of Inventions," knew in principle the steam-engine. The renown of Black and Watt and Fulton, is not diminished thereby.

Reichenbach, Caspari, Herbert Mayo, and Rutter are, without doubt, the leaders in this new field of physical science. The rest must be content to follow in their wake. We have seen Mr. Rutter and his experiments. There never was a man more ingenuous, more direct, and more straightforward than Mr. Rutter. In a few weeks we shall have his book, and he will tell us all he has yet known of magnetism, of magnetoid currents, and of odic polarities. We believe that his experiments are fully reliable, and that his so-far interpreter, Dr. Quin, has faithfully represented him.

We are very glad that scientific men like Mr. Sharp, Drs. Quin, Madden, Sutherland, and others, are actively engaged in experimenting with this instrument—the results will be, so far as homœopathy is concerned—"a heavy blow and great discouragement" to the brute opponents, who only see an argument in numbers—and have no notion of any strength but that of physical force. By physical science shall *their* physical force be proved to be 0.

"It goes very well" with us. We are not daunted; there are more for us than against us; for Truth alone is a match for a million of Scythians, and this time Truth is *not at the bottom of a well.*

All may hear who have ears, all may see who have eyes, and all may understand who have any faculties of vision.

We must again, however, insist on the necessity of caution in drawing inferences or any absolute conclusions from the experiments already recorded by Dr. Madden, and by Dr. Quin. Many a little bark coasted the shores before the law of the magnet was discovered, and applied by navigators, and before mathematical science was so brought to bear on navigation, that at last illiterate captains were enabled to "take observations," and "work them out" by printed tables.

"The sweetest and best harmony is, when every part or instrument is not heard by itself, but a conflation of them all, which requireth to stand some distance off:"—so the workers must work, and the observers must watch and wait, while the various series of *facts* are carefully accumulated, digested, and compared, till at length, at the touch of the appointed harmonists, they fall under certain law and governance. Meanwhile hope, and a good conscience, and a spirit of truthful inquiry, and love for mankind, are very good things.

EXTRACTS FROM THE LANCET.

Our contemporary was, in his last week's number, very rich on the subject of homœo-

Hosted by Google

pathy. He has been obliged to whitewash Dr. Francis Hawkins and Sir H. Halford, who are, it seems, quite innocent of any favourable tendencies towards homœopathy.

He denounces, in very coarse terms, Dr. Calvert Holland, who has returned to Sheffield to practise medicine, because he is now a homœopathist. Dr. Holland is well known as a physiologist; and has published two works of very great practical value: "The Vital Statistics of Sheffield," and "Diseases of the Lungs from Mechanical Causes." Of the latter work we have the following praise from our contemporary: "Dr. Holland is an able and experienced writer, whose name has been long familiar to the medical public. It was, therefore, with some curiosity that we opened his work on the mechanical causes of pulmonary disease, as we felt certain that a man of his great medical knowledge and sagacity, located as he has been in the very centre of one of our large manufacturing districts, could not fail to throw great light on the interesting point of hygiene and pathology, which he had undertaken to elucidate; nor were we disappointed in this respect. Dr. Holland's searching and elaborate account of the morbid and hygienic state of the workmen who are exposed to the inhalation of the metallic and petrous dust, created during their grinding operations, is the most complete and the most practical we have ever read. Dr. Holland's directions with regard to treatment are sound and practical." —*Lancet*, Feb. 10th, 1844.

The people of Sheffield will not value Dr. Calvert Holland the less, now that he has returned to them, because he has availed himself of the better light in therapeutics, that shows the therapeutic art is advancing in this age of progress; and will not value him less for the vituperation, nor value him more for the praise of the *Lancet*.

In his leader, he quotes approvingly the profane expression of the royal infidel, falsely called Frederick the Great, "Providence always takes the side of the strongest"—a saying as false, in the sense of the king and the *Lancet*, as it is impious. History has shown that the battle has not always been won by the more numerous battalions, for more than a quarter of a century the tribes of the Caucasus have kept, and still keep, at bay the Scythian hordes of the Autocrat Nicholas. We admonish our contemporary that truth is always the strongest, and that time is the surest interpreter of what is really true; and we advise him to continue his assaults on homœopathy,—if he will, but avoid expressions that right-minded persons consider to be impious. We can only afford space, this week, for one extract from his columns:—

"At a meeting of the committee of the London and Provincial Medical Protection and Benevolent Society, held on Monday last, the following pithy and significant resolutions were proposed, seconded, and adopted unanimously. At all points the globulists are attempting to connect themselves with the regular practitioners of medicine, and at all points they must be met and repudiated as quacks, belonging to the order of knaves or fools, or the two combined.

"'That in the opinion of the committee of the London and Provincial Medical Protection and Benevolent Society, the practising homœopathy by legally qualified medical men is calculated to excite ridicule, and thus to lower the profession in public estimation.

"'As one of the principal objects of this Society is to raise the tone of public feeling towards the profession, the committee feel that, by including among their members professors of homœopathy, they would be directly opposing the objects of the Society.

"'The committee therefore decide, that any member of the profession who professes to practise or does practise homœopathy, is deemed ineligible to be a member of this Society. The committee are further of opinion, that they could not conscientiously employ the power of this Society in collecting moneys from the public for homœopathic attendance, believing, as they do, homœopathic practice to be an entire imposture.'

"The thanks of every honest member of the Society are due to the members of the committee. It would indeed have been a prostitution of the powers of the Society, if they had been lent to enforce upon the public the bills of homœopaths for globules. The step taken was absolutely necessary, for several of the homœopaths had actually, we are informed, sent their globule accounts to the Society for collection."

THE MEDICAL TIMES.

In one of his notices to correspondents, the Editor says: "Let our correspondent lay before us an authenticated case, in which any physician or surgeon, however high his social station, has met a homœopath in consultation, and we, in our turn, will bring it before the profession. No high-minded medical man can meet a quack, and least of all a homœopath."

This is pretty strong. Let us parody for him one of the apothecary's scraps of Latin from Cicero: "There is one class of opponents we cannot tolerate; the awful brood springs from the ashes of S. Hahnemann. At a recent festive meeting of

Hosted by Google

their number, the wretches were unshorn, unwashed, shirtless, aud hose-less: and there was such a roar of dissonant voices! there were gathered together every one that was in distress, and every one that was in debt, and every one that was discontented. Wherefore, my readers, don't be frightened; be calm as we are, and lay aside your alarm, if ye have any."

This is the key-note to the leader of five mortal columns of the *Medical Times*. But as the Editor is strong, why is he not merciful? *Was he never in that cave of Adullam? Was he never in distress, never in debt, never discontented?*

We confess to his good gifts—his talents, his learning, his extent of reading, his literary ability; but we cannot give him credit for his knowledge of homœopathy. He has only dabbled with the subject. He has been among the cattle and litter of the outer court; he has never even entered the vestibule. In this case he merits the poet's advice—

"A little learning is a dangerous thing;
Drink deep, or taste not the Hahnemannian spring."

Such a writer should do something better in the way of argument than he has yet done in his papers, "Our Relations with the Homœopathists." In his No. II, under this title, he addresses himself personally to the homœopathists. We can only afford room for a few gems from this *Phillipic*. "Hahnemann began his career with vulgar and common quackery;" for which he quotes the authority of Dr. A. Wood!—wonderful authority whereon to rely!

"You employ considerably upwards of 200 drugs, and we defy you to point to one of them, of the action of which on the healthy body you have any accurate record."

Rash Editor! We have Hahnemann's "Materia Medica," and "Chronic Diseases," and numerous other books, in which there are authentic provings of our medicines—many of them re-proved lately by a Medical Society at Vienna.

He next proceeds to show that the practice of some homœopathists is not in accordance with the rules of Hahnemann, and with the views of Mr. Everest. The diversities in doses and the repetition of doses depend on *how* men understand and practise homœopathy.

We are sorry that we have not time to dissect this leader. It is cleverly done. We give the closing sentence: "Well may the kind-hearted pity you, the honest despise you, the sarcastic sneer, the indignant condemn, and all united proclaim, in a voice which cannot be misunderstood, that from such a system, whether its professors be the deceivers or the deceived, the upright and scientific physician must for ever stand aloof."

We close with a free rendering of another passage from Cicero, set to the students at the preliminary examination of Apothecaries' Hall.

"There is a law not witten in the books of allopathy, which our Founder won from Nature herself, which we have learned from him, and according to which we practise; and thereby we defend our patients, and ultimately our successors will be able to defend mankind, from lancet and drugging: every way of promoting health and maintaining life is honourable. Therefore we are indifferent to the attacks made on us by a hostile medical press; therefore we care not for the reproaches, and dread not the menaces of our foes: there is none of them we would not help—none of them we do not feel for. We only regret that a better and worthier spirit is not manifested towards us. The public time, and posterity are our judges."

THE EAST *versus* THE WEST.

[The following extract from the *Morning Chronicle* of Calcutta, August 29th, 1851, will not probably improve the digestion of the Editors of the *Lancet* and *Medical Times*, nor improve the temper of the "Faculties" of the Scotch Universities. This is a capital article, and there is a love of fair play in Calcutta touching our medical doctrine, which we should be glad to see in Great Britain. We have the gratifying knowledge that in every part of the British Empire our doctrine is being made, known, and our practice is being adopted. This effect is produced by the weight of testimony, and by the force of experience.—Ed.]

"We have lately had many communications addressed to us on the subject of homœopathy and the practice of globular medicines, and infinitesimal dosing as it is called, but we refrained from publishing them, as we could not well understand the drift of the senders, and thought they were either deluded enthusiasts or ignorant charlatans. We have, however, altered our opinion somewhat on the matter, though not homœopathists either from conviction or practice as yet, and our reasons for listening to the new doctrines are as follow:—Firstly, we have had a series of pamphlets and periodicals handed to us for examination and perusal, which relate to this system of medical practice; and secondly and more forcibly, we have watched attentively for a considerable time the system of persecution and downcry that has been organized at home against the practitioners engaged either as

Hosted by Google

amateurs or as qualified medical men in its spread and dissemination. The perusal of the former has much amused and pleased us, and the consideration of the latter has gradually fixed our attention more and more, until at length it has engaged our sympathy and commanded inquiry. Wherever persecution begins, a sense of right ends on the part of its promoters and abettors, and the mind of an educated person is led to suspect that that person or body of men, or science, which it is endeavoured to hunt down is formidable by truth, a conscientious advocacy of right and reason, and a superiority over the worn-out deceptions of the pack who are hunting down their victim, and endeavouring to cover him with ignominy or annihilate him by falsehood, misrepresentation, and persecution. All these are now at work in England, and to what point? Not to protect the public from empirics, men of bad reputation or broken down in trade, trying to support themselves by delusion and chicanery, but against regularly educated men of the highest grade of qualification, universally respected, and for years distinguished in the medical profession, who, throwing aside the shackles of education and prejudice, have been bold enough to adopt and practise the homœopathic system of medicine, giving up, in many instances, large practices and great emoluments, for what they conscientiously believe to be a better system of medicine, more suited to reason, truth, experience, and the human frame. There can be no doubt that there is a strong and valuable deposit of truth at the bottom of the system of persecution that has been adopted towards these men, conscientiously giving up what they have been educated to look upon as infallible and confirmed in its truth by the practice of ages, and still more conscientiously giving up the large emoluments and high position to which its practice had introduced them.

"The perusal of the Homœopathic Journals above alluded to has awakened in us a lively conviction of the great value of the system of medical practice of which they are the mouthpieces; if not to the extent its most sanguine admirers and practitioners would go, at least so far as to make us wish to see these matters calmly discussed, without abuse, prejudice, or violent language, which it strikes us have in the present instance been all on the side of the old-system gentlemen. People in the medical profession are, it seems, beginning to think, and the public at large are beginning to feel and believe that the old system, and the present system, of dosing human beings with enormous quantities of nauseous and noxious drugs, is a barbarous and a vicious one, and we agree with them and are certain, that if the practice and study of homœopathy should be productive of no other beneficial result, they will at any rate modify the disgusting, hurtful, and savage practice which, as we have said above, is most painful to the patient, sometimes utterly ruinous to the constitution, and not very creditable, even in the most successful cases, as they are called, to the medical practitioner. The expenditure of drugs to an enormous amount, both in value and quantity, has killed many, has very seldom saved any, and must as a system die out, giving way to partial homœopathy, or an entire adoption of that system, if its enemies should persecute it well, and so cause a quicker appreciation of its value in the public mind, than would have been established for a long time had it been treated with the indulgence which is generally the fate of visionary schemes and theories, devoid of truth and built on a shaky foundation.

"It will perhaps be said that the publications to which we have above alluded, are so many impositions, and full of false cases and reports. We don't think so. Their contents are apparently as true as the pages of their rivals and traducers, and they are temperate, calm, and devoid of abuse and ill words, which the others are not; and hence another reason for suspecting that the right is on the side of those who believe themselves best in the contest, and show that they can afford to be good-humoured and calm.

"It may be said that the homœopathic system of medicine is not suited to this country and tropical diseases. This is nonsense. If a system of medicine be founded on truth and reason, it is suited to all climates, countries, and seasons, if not, it is suited to none, and cannot be upheld by its antiquity, wide prevalence, or its powers of persecution, and its readiness to have recourse to them. Certainly the fine old English system of medicine has been doing wonders for the undertakers in Calcutta of late, and has frightened many into an acquaintance with homœopathy, which they never before thought of cultivating, and which has ended in their being entirely convinced of its truth and superiority. We shall give extracts from the journals above alluded to in the course of a few days."

THE MAGNETOSCOPE.

[We have great pleasure in reprinting the following communication from the very able and philosophical physician who was one of the party present at Mr. Rutter's lecture and experiments, on the 16th inst. This gentleman is an M.D. of Oxford, and a Fellow of the College of Physicians. —Ed.]

To the Editor of the Torquay Directory.

Sir,—I have to-day had such an intellectual treat that I cannot help communicating some of the particulars, in the hope that, though I may fail utterly in conveying a just conception of what I have seen, some of your readers may be tempted to take a run up to London and down to Brighton, for a few hours, with an introduction to Mr. Rutter, a gentleman who will, I am sure, open to your mind a new field of wonders and delight, as he has this day done for a dozen of us, who went down by special invitation to witness his experiments with his newly-invented instrument, to which he has given the name of Magnetoscope, as demonstrative of magnetic influence to an extent which might hitherto have been deemed as unattainable.

Hosted by Google

Mr. Rutter, you must understand, is a gentleman who, though statedly occupied in other matters, has given a great deal of attention to magnetic phenomena, and in the course of his experiments has been led into a train of ideas and of practice which must surely immortalize his name, and elevate it into the highest ranks of scientific discoveries. For my part, I cannot hesitate to pronounce what I have seen to-day as the most marvellous of all the marvellous things of the present day which have come under my cognizance, and yet I feel that my poor intellects were unable to take in one-half of the instruction presented to them,—much less, then, can I convey to you any just idea of these novel observations, and I should allow the matter to bide its time, but for the irresistible impulse which I feel to be concentrating my own recollections, whilst I would no less desire to enlist your interest in the matter.

Did you ever hear of an old-fashioned experiment, which is said to be marvellously uniform in its results in a steady hand, viz., holding a shilling suspended by a silken thread between the finger and thumb, the elbow resting on the table, so that the shilling hangs within a wine-glass; under such circumstances the shilling begins to vibrate, and strike the sides of the glass any number of times which may agree with the existing hour. I have never seen this experiment tried, and am only concerned just now with the simple *vibration*. Well, it would seem that Mr. Rutter's experiment sprung from this small origin. His apparatus consists of a stand of wood with a stem, perhaps a foot high, then an arm of glass terminating in a long point of brass, capable of clasping a silken thread, to which is suspended a pendulum of red sealing-wax, which hangs within an elongated bell of glass, with glass bottom, standing on the table. The point of the pendulum is, exactly in the centre, marked by cross lines, to which is added another transverse diagonal line.

As I was unprepared with materials for note-taking, I was content to catch general ideas, without endeavouring to bring away details, which I hope soon to have in the publication which Mr. Rutter contemplates, and hopes soon to have before the world.

To the springing-point of the arm the operator applies his finger and thumb, and at the same time directs his eyes and attention to the pendulum; this very speedily assumes a rotatory motion (from left to right, I think). If now the finger be removed, the pendulum assumes a new motion. If, on the contrary, the thumb be removed, and the finger remain on the instrument, the pendulum moves in the opposite direction. The same results ensue if a bystander places his finger or thumb on the operator's hand; in that case the finger neutralizes the action of the operator's thumb, and the action of the finger remains, and so *vice versâ*. Further, these effects are produced with unerring certainty, if there be a chain of a dozen people holding hands, and one alternately adding the power of his finger and thumb on the hand of the last.

We next arrive at a startling fact: the very reverse effects are produced by the contact or influence of a male and a female, so that if the pendulum be working in any given direction under the influence of a male, it immediately begins to move in the opposite direction under the influence of a female. This was well exhibited by forming a chain of individuals, by the successive and alternate additions of a male and female; on each alternative the pendulum changed its direction. But further, a long chain of males being formed, their influence was immediately neutralized by the addition of a female at the end of the chain, the last link always giving the direction or influence to the whole.

We next turned to the varying influences exerted by different parts of the same body. For instance, the hand of the operator being held near the back of another person's head, the pendulum took one direction, from the forehead it received a different direction, and these corresponded with the movements produced by contact or approach to the south and north poles of a magnetic bar. The hand being placed on the top of the head, the pendulum immediately came to a perfect stand-still.

We next tried a good many experiments with magnetic bars and a magnetic sphere; certain motions of the pendulum being produced by the approximation of the disengaged hands of the operator towards the different parts of the bar or sphere; these motions were modified, reversed, or stopped, by the pointing at different parts of the same agents, by the hand or hands of the bystanders. Not only metallic bars or spheres were thus powerful, but a hazel stick produced no less decided effects, and I may add, that a glass of water, magnetised by one of the company, was no less efficacious. Of course, there are many who would not believe this, but I do not hesitate to affirm it not only as a fact, but as one with which no error, much less deception, could have been practised. Indeed, any approach at deception amongst a company of a dozen, all bent upon investigation, would be an absurdity, for in that case, every man's hand, head, and heart must have been against his neighbour's.

Reverting to the influence exerted by the human body, it was shown, first, that the effects produced varied according as they were derived from the head, the chest, or the abdomen; and further, that the leg and arm of each side opposed each other, and agreed diagonally; and further, that all the influences were reversed, when the individual from whom the operator received them was in the upright or horizontal position.

Such is the faintest possible outline of the experiments which occupied us for about a couple of hours, when we were glad to take a little walk and a little refreshment, and then we returned with increased interest to the *charges*, and the influences indicated by this wonderful though simple medium as resulting from the contact of various metallic and other substances.

I should, indeed, have mentioned earlier that dead animal matter invariably produced a speedy and perfect cessation of all motion. Thus, if a dead fly was dropped into the hand of the last

Hosted by Google

of a long chain of persons, the pendulum, however violently agitated before, ceased to move; hence it was found very convenient to have at hand a piece of ivory, which, taken between the finger and thumb, acted with as much precision and rapidity as the hand applied to the strings of a harp to stop sound. This, in the course of the day, saved us much time in changing from one experiment to another.

Up to this period our experiments had been for the most part isolated, and only calculated to afford grounds for synthetical conclusions; but they were now conducted in a great measure with the view of testing the truth of homœopathy, or at least of the power of infinitesimal doses, and I am bound to declare, as one perfectly free from bias, that whilst the experiments were of the *most searching character* that we could all devise (whether disciples of the school or not), they eventuated, in every case, in proving the power of the infinitesimal agent, and of the correctness of the views entertained of their action, as laid down by the most trustworthy writers on the subject. Mr. Rutter, I should observe, is no homœopathist; in fact, he professes to manipulate, so as to make clear and read off the characters of various matters tested with reference solely to their magnetic powers. I suppose one might look upon him as a Linnæus in his own line.

In the first place, many metals and other matters were examined in the mass, some purified, some native, and especially the following: gold, silver, platinum, iron, copper, zinc, and mercury. Each of these communicated its own peculiar motion to the pendulum, three of them, however, exhibiting the same kind of motion. A very fine silicious crystal was next experimented on, and was found to communicate a different motion according as the major or minor axis was laid on the palm of the operator, and according to the direction of the axis with reference to the poles. All these effects were carefully noted on paper by one of the party. Bottles of globules were now intrusted to my care, as being in the category of heretic and unbeliever. The course I adopted was to place on the palm of the manipulator, in succession, a globule of one of the phials bearing the name of one of the substances the movements caused by which had been noted. No one knew what that was. I then requested the manipulator to declare the direction of the pendulum's motion, and this was compared by all with the previously-noted effects of the mass. The first results were strikingly demonstrative of the efficacy of the globules—the identity of motion was instantly visible. But presently we were all a little staggered—the results were unsatisfactory, and it was only by the unshaken faith of the manipulator and another gentleman that the truth was elicited. We were exactly like a pack of hounds—we had overrun the scent and were at fault; but a little steadiness and perseverance carried us to a satisfactory result in every case, without exception. In fact, the motion had been declared before the pendulum had definitely settled itself, which after the first few experiments required some seconds to accomplish; indeed, at last it was thought advisable that the manipulator should wash his hands—when, *horribile dictu!* matters were found to be worse, until he had washed off the soap he had previously used, and then things went smoothly for a time. At the second check, recourse was had to the back of the hand and the wrist, and then the scent was again breast-high.

Silica in globules gave us the most trouble of anything,—the movements did not tally; but it was found that the motion noted as communicated by the crystal was naturally derived from its major axis, and no one could tell how the particles were arranged in the globule, whilst Mr. Rutter had ascertained that the direction of the axis affected the movements to the extent of the last subdivision of which he could take cognizance. Under these circumstances recourse was had to a drop of water, and when the globule had partially dissolved, it immediately and distinctly communicated the correct motion to the pendulum. Recourse was had to the same means in the case of several refractive globules, and *always* with a satisfactory result; there was not a *single* failure, although as I have said, all our ingenuities were taxed to raise difficulties. Dr. Quin produced some globules which had been in his possession twenty-five years—their effects were perfect. He also produced some lately sent him from the Continent, of an attenuation far exceeding anything hitherto attempted. The motions communicated by them were as distinct as those communicated by the masses. I next requested to try the effects produced by matters said to be antagonistic or rather antidotal; when the motions arising from the contact of *Pulsatilla* being noted, those occasioned by *Coffea* were found exactly to counteract them. In like manner, several substances were found to counteract one another exactly in accordance with the views of the homœopathists, some being tried on myself. *Arsenic*, for instance, invariably brought any and every motion to a stand-still, and again, at my request, motion was recommenced, in spite of the *Arsenic*, by the action of a specific, such as *Iron*.

To one not prepared by full faith founded on experience, nothing could be more astounding than these facts; unto one desiring confirmation and demonstration, nothing more satisfactory and gratifying. I must not omit to add our concluding experiment. Hahnemann, it seems, gives directions for the preparation of a medicine from a certain base; one of the best and most distinguished chemists of the day declares that by the formula it must be rendered perfectly inert. Nevertheless, it was found that the globule thus prepared readily gave results identical with those given by the base.

This is a long communication, but I could not shorten it, nor indeed wish it shorter; remember it results from a sessions of four hours' duration; remember too, that it is not intended (in any sense) to be a homœopathic communication. Immense as the value of the Magnetoscope is as a means of testing and proving the power of homœopathic medicines, to confine or connect Mr. Rutter's discovery with homœopathy or any one branch of science, would be to limit in a nut-

Hosted by Google

shell that which embraces all creation,—air as well as earth and water; for I should have told you of other sensible effects produced by different aurœ or exhalations. P.

THE HOMŒOPATHIC SYSTEM AT THE ROSS DISPENSARY.

(Abridged from the *Hereford Times.*)

As our Ross readers are aware, Dr. Strong, one of the physicians to the Ross Dispensary, having changed his views in medical science, and adopted those of the celebrated Hahnemann, becoming what is generally termed a Homœopathist, has treated his patients in the Dispensary according to the new views he entertains. In a letter by Dr. Strong, published on the 3rd of September last, the following passage occurred:—"It has been introduced into the Ross Dispensary with great success, and to the perfect satisfaction of the Governors of that Institution." In consequence of these circumstances, an extraordinary general meeting of the Governors of the Dispensary was convened by the following requisition, sent to the secretary, J. W. R. Hall, Esq., and advertised in the *Hereford Times*:—"To J. W. R. Hall, Esq., honorary secretary to the Ross Dispensary.—Sir,—We, the undersigned five Governors of the Ross Dispensary, request that you will be pleased to call an extraordinary general meeting of the Governors of the said Institution, in accordance with the seventh rule of the same, to be held at Barrett's Hotel, Ross, at twelve o'clock at noon, on Monday, the 20th day of October next, to consider and decide whether or not the medical officers of the Institution be allowed to treat the applicants for relief under the homœopathic system of medicine, and also to take into consideration the letter of Dr. Strong, which appeared in a Hereford paper, upon the subject, in so far aa it refers to Ross Dispensary.—Edward Prichard, Henry Chellingworth, Charles Richardson, George Garbett, James Barrett.—Dated the 29th September, 1851."—"In compliance with the foregoing requisition, I hereby give notice that a meeting of the Governors of the Ross Dispensary will be held for the purpose therein named, at the time and place above mentioned.—J. W. R. Hall, hon. secretary.—Ross, Oct. 1, 1851."

On Monday last, a meeting of the Governors took place at the Dispensary house, at twelve o'clock, but the room becoming inconveniently crowded, an adjournment took place to the Assembly-room, at Barrett's Royal Hotel. The following Governors were present:—Whaley Armitage, Esq., W. Bridgman, Esq., Capt. Cuppage, Revds. Dr. Ogilvie, T. P. Symonds, J. Webb, W. C. Brant, T. C. Curteis, T. T. Lewis, H. C. Morgan, G. Garbett, — Price, T. Hill, Esq., J. W. R. Hall, Esq., W. P. Hooper, Esq., H. Chellingworth, Esq., — Tisborne, Esq., C. Richardson, Esq., Mr. W. Cary Cocks, and Mr. Barrett. C. E. Thomson, Esq., and G. Strong, Esq., two of the medical officers of the Institution, were also present.

The Rev. Dr. OGILVIE, rector of Ross, was unanimously called to the chair, and, having read the requisition calling the meeting, entreated the gentlemen present to co-operate with him, so as to render his duties light and easy.

W. ARMITAGE, Esq., rose and said that if no gentleman was prepared with a resolution, he would claim the indulgence of the meeting to move as as a substantive motion what he had intended as an amendment. Allow me (said the venerable speaker) to congratulate you on the very flourishing condition ofour Institution, which has never been in a better condition than it is at present, or given more general satisfaction. Gentlemen, I attribute that position to three causes: first, the prudence and consideration shown in the resolutions and rules of the society; second, to the unwearied labours of an indefatigable secretary, who, from the time of its formation, in which he took an active part, down to the present time, has never relaxed his exertions in its behalf; and thirdly, to the excellent character and exertions of its medical officers. It certainly struck me with surprise to find that we were to be convened together for an object, in my experience without precedent, to decide whether the medical officers of the Institution should be allowed to treat the patients of our Dispensary according to the homœopathic system. Gentlemen, I more than doubt whether we have a right to dictate to our medical officers as to what mode they shall practise, having expressed our confidence in them by electing them, and without any interference from without. I much regret the absence of the gentleman whose name is the first in the requisition particularly; because at the last meeting of the committee he pronounced a sort of anathema on the homœopathic system, when, on referring to the list of patients, it appeared to me somewhat remarkable that there was an almost equal proportion of cures to patients under both systems. On that occasion, Mr. Prichard wished to inquire into some cases which had been treated homœopathically, and on being asked if he would like to have the names of all the patients who had been so treated, and expressing such a wish, he was at once furnished with the name of every such patient, and therefore I much regret his absence, inasmuch as we cannot tell the result of his inquiries. The gentlemen who signed the requisition are all members of various professions, and what, I should like to know, would they think of the man who should come forward and dictate to them the mode in which they should conduct the business of their professions, of which he was himself totally ignorant? Would Mr. Prichard submit to a lecture on banking from one who knew nothing of the subject; Mr. Chellingworlh, on agriculture; Mr. Garbett, on divinity; or Mr. Barrett, on the management of his hotel? There is one gentleman present who has studied homœopathy for many, many years, and I question if he is not the only one present who has studied it, yet we, the Governors of the Ross Dispensary, are called upon by these five gentlemen to dictate to our medical officers as to what they ought or

Hosted by Google

ought not to do. In cases of complaint, we have the charge supported by evidence, the accuser and accused are brought before us, and we have then a right to inquire into the circumstances of the case, but wanting these, in this time of the day, we ought not so to commit ourselves. We may next be called upon to decide whether they shall use cod-liver oil or any other medicine, the efficacy of which may be discovered. I have a pamphlet in which many instances are recorded of new discoveries in medical science having been first violently opposed and afterwards adopted. Dr. Brown was thus opposed. Dr. Jenner, to whom I once had the honour of an introduction, whose invaluable discovery has almost annihilated that loathsome disease small-pox, was opposed. One medical gentleman in London gravely announced his fears that the introduction of animal matter into the system would produce a revolution of the feelings. In the little town of Ross, the medical men of that day refused to receive vaccine matter from Dr. Jenner, although he offered to give it to all, and it was only after Mr. Westfaling offered to vaccinate himself, that it could be done. I well remember the difficulty I experienced in getting my own family vaccinated, and I mention this to show that medical men generally are slow to receive new discoveries. We are Englishmen, and as such, I ask you to give fair play to Dr. Strong and the system he has introduced. I have not studied homœopathy, but the anathema which has appeared three times in my Hereford paper, the last time at the express desire of a Governor of the Ross Dispensary, although it had appeared twice before, contains an error I take this opportunity to correct. It states that the system was founded by a "half-crazy old man." Now I have the pleasure of stating that this "half-crazy old man" retained the full enjoyment of his faculties to a good old age, and that his conversation was cheerful and mild in an eminent degree, and when it was told him that one celebrated doctor after another was denouncing his system, his reply was, "I care not, if they will but examine it." Mr. Armitage was proceeding to combat objections raised against homœopathy, when it was suggested from the chair that it would be irrelevant. He then concluded by proposing a resolution to the effect that the meeting, seeing no ground to distrust the prudence or skill of the medical officers of the Ross Dispensary, does not consider it necessary at the present moment to set any limit to their exertions, but rather to confine itself to the more congenial duty of thanking them for that zeal and ability they have invariably shown in carrying out the efficiency of this Institution.

The Rev. G. GARBETT seconded the resolution.

Mr. CHELLINGWORTH wished to state that he signed the requisition with the best intention of benefiting the Institution, He had heard from some of the working classes that a new system was being introduced into the Dispensary, and thought a meeting of the Governors was necessary to satisfy the public on the subject.

The Rev. T. CURTEIS moved an amendment, declaring that the 13th rule of this Institution rendered the meeting incompetent, to sanction among the medical officers of the Institution, the use of any medicines in the treatment of patients except those which are supplied by the Institution itself. The speaker, at length, contended that Dr. Strong was just as much bound to treat the Dispensary patients according to the rules, as he himself was bound to preach by the Thirty-nine articles to which he had subscribed. He begged to ask whether, according to the 13th rule of the Institution, homœopathic medicines were kept and dispensed at the Dispensary.

Mr. HALL: Certainly not.

Mr. CURTEIS: That being the case, I wish to ask Dr. Strong whether, having accepted office under certain rules to which all are bound, he does supply medicines from the stores of the Dispensary or not?

The CHAIRMAN decided that Dr. Strong, not being a governor, could not be catechised.

Mr. CHELLINGWORTH seconded the amendment.

Mr. BRIDGMAN thought that there was nothing in the 13th rule to prevent homœopathic medicines being kept at the Dispensary. It was, he thought, quite competent to Dr. Strong to keep them there and dispense them. He suggested an alteration in the rule, if the amendment were carried, expressly allowing the practice of homœopathy when desired.

The Rev. T. T. LEWIS wished to ask the committee if any application had been made to them to supply homœopathic medicines.

Mr. HALL considered homœopathy was inadmissible in the way it was practised by Dr. Strong; and if it were introduced into the Dispensary, it can only, he said, be done by expressly altering the rules with that object, and therefore he should vote for the amendment of Mr. Curteis.

Mr. BRIDGMAN: I am clearly of opinion that, under the present rules, homœopathy cannot be practised; but, having in my own neighbourhood seen cases where benefit has been done to patients under that treatment, I should wish to see the rule altered to let in that practice, if it is competent to this meeting to do so.

The CHAIRMAN: It is clearly open to us at this meeting to alter the rule, if we feel disposed. Perhaps Mr. Bridgman will propose such alteration. I am quite satisfied it can be done by us to-day.

Mr. HALL: I am of opinion that no such alteration can now be made. This is an extraordinary meeting, "provided only that a notice specifying the purpose of the meeting and signed by the secretary be published in the two Hereford papers." Now, the purpose of this meeting, as stated, is to "consider and decide whether or not the medical officers of the Institution be allowed to treat the applicants for relief under the homœopathic system of medicine; and also to take into consideration the letter of Dr. Strong, which appeared in a Here-

Hosted by Google

ford paper, upon the subject, in so far as it refers to the Ross Dispensary." Nothing is said about any alteration of the rules, and the object of the meeting is to decide whether Dr. Strong's practice is in accordance with the rules. It is therefore clearly impossible under this notice to make a fresh rule to let in the practice of homœopathy.

After a desultory conversation, the CHAIRMAN recalled the attention of the meeting to the position of the business, and asked Mr. Bridgman if he wished to submit a motion for an alteration of the 13th rule.

Mr. BRIDGMAN replied that, as the general annual meeting would be held the first week in January, he would not press the question further at present, but would leave it to some gentleman of the committee to give notice at their meeting in December to admit words in the 13th rule excepting homœopathic medicines.

The Rev. CHAIRMAN then rose, and said he had carefully considered the subject for some time past, and the question he proposed to himself was this—"Is the practice of the system called homœopathy consistent with the rules of the Dispensary?" He had satisfied himself that such practice in the Dispensary was perfectly in harmony with its rules.

Dr. STRONG rose and said: Mr. Chairman and gentlemen, owing to the peculiar position in which I appear before you to-day—not as a governor, but by courtesy as one of your medical officers—I crave your special leave to address a few words to the meeting. It is now about nine years since I had the honour of being elected Physician to this Dispensary. During that time my studies and observations, and the intercourse that I have enjoyed with intelligent minds in other localities, led me gradually to make trial of an improved system of therapeutics. For some time former prejudices struggled with my convictions. I went up to town, and in the large Dispensaries and Hospitals there, watched the practice for many weeks. Convinced at least of its superior efficacy, I resolved to extend to the patients of this public Institution the advantages of my laboriously acquired experience. For the last two years my mode of practice has been openly professed, and must have been well known in the neighbourhood. I have also published from time to time in the medical periodicals the particulars of remarkable cures (some of them Dispensary cases) that present themselves in the course of my practice: still no objection was ever raised or opposition offered by any of the governors. However recent occurrences have plainly shown that I had mistaken the long-continued silence of the governors for an acquiescence of the entire body in my proceedings; and under these circumstances nothing could be more desirable for all parties than the present investigation. I cannot sit down without saying that I feel greatly indebted to those gentlemen who signed the requisition, and took the trouble to convene the present meeting, for affording me this public opportunity of avowing my opinions and of placing myself in a proper light before the Governors.

The amendment and resolution were then severally put from the chair, and the amendment was carried by a majority of 9 to 6.

Correspondence.

MR. RUTTER AND THE MAGNETOSCOPE.

To the Editor of the Homœopathic Times.

"Palmam qui meruit ferat."

SIR,—Being present at the illustration of the magnetoid currents, and of their application as a test of homœopathic remedies, given by Dr. Madden at the Hahnemann Hospital, I was sorry to hear expressions indicating a spirit of rivalry, about the precedent application of Mr. Rutter's discovery to the test of our homœopathic globules, as though such simple diversion or variation of the experiments, or extension of the test to a class of objects beyond those in Mr. Rutter's immediate possession, could in any way be considered a *discovery;* for assuredly Mr. Rutter could never have intended to limit the application of his instrument to the objects by which he was casually surrounded. Mr. Rutter started by declaring that all substances, animal, mineral, and vegetable, had a specific influence upon the magnetoid currents of the human body, and he invented an instrument to demonstrate this. Now, Sir, I speak for truth and justice, and maintain that if a goldsmith had been admitted to Mr. Rutter's study, he would have said, "I wonder if it will enable me to tell pure gold from alloy; let us try." Or, a mineralogist would have suggested a trial of *all* his varieties of minerals; and a chemist would have tested his chemicals or drugs, but neither of these would have declared to his fellow-labourers in science that *he* had made *a discovery*, because he had suggested a variation in the experiments as they were being shown to him, or had prosecuted them at his own home. He would have said, "Mr. Rutter's instrument shows us this or that as well as the other, and I find it is very useful to our body, who cannot be too grateful to Mr. Rutter." No doubt it must be very gratifying to him to find that such insignificant things, almost "without form and void," as our globules are supposed to be, attest the truthfulness and delicacy of his instrument, but so would a pebble from the seashore. Hahnemann discovered the law which regulates our therapeutics. He applied it in practice, and gave it publicity; but did the first man who applied it to animals claim any merit of a discovery? Any other mode of putting it, is, to my mind, nothing less than diminishing, by attempting to share, the credit of the discovery and invention, and I do think that the free and unrestrained liberality with which Mr. Rutter has received all scientific inquiries, commands a respect to his honourable candour and fair fame, and *a delicate sensitiveness* to his merit as a discoverer. Indeed so little restraint has he imposed upon those whom he has favoured with his confidence, that we have a

Hosted by Google

demonstration of *his* experiments as the groundwork of others, made upon an instrument *before* he has given his views, his instrument, or his experiments to the world. With, however, much emotion we have received these demonstrations of his discovery; we are certainly surprised at this. How few men would have permitted their work to be anticipated, and the first impress of their experimental discoveries to have dawned upon the world through any foreign medium; or allowed their freshness and briliancy to be dimmed by the over zeal of an inquiring neighbour. The question is not whether Dr. Quin or Dr. Madden had precedence—neither had; and it matters little, nor have we heard that Dr. Quin makes the shadow of a claim to any discovery at all, but refers all the results of the tests of every kind back to the discoverer of the instrument and its objects, to whom alone all honour is due. It is not my desire to abridge Dr. Madden of any merit to which he may be fairly entitled. If he has been foremost in directing our attention to the testing the value of our globules, by means of Mr. Rutter's instrument, he is thankworthy. His zeal for his profession is well known, and his efforts to bring into the focus of inquiry and discussion all debatable points, and to determine, if possible, the exact limits of the homœopathic law, are creditable to his spirit of investigation, inasmuch as they stimulate thought, induce a deeper reflection and study of certain parts of homœopathic treatment, although we have not always been convinced by his reasonings nor accepted his views, and have elicited open and healthful discussion. For this we thank him; but we thank Mr. Rutter still more for the opportunity his philosophical instrument has afforded us of demonstrating to our profession, and to the world, the power of infinitesimal globules to influence the magnetoid currents in the human body, and the existence in them of a something which chemistry has failed to prove.

I am, Sir, your obedient servant,

THOMAS R. LEADAM.

12, Wyndham Place, October 23rd, 1851.

THE CHEMICAL RECORD TRIED, AND FOUND WANTING.

To the Editor of the Homœopathic Times.

SIR,—Homœopathy, properly speaking, is the expression of a therapeutic law—*similia similibus curantur*—or of a therapeutic direction—*similia similibus curentur*. As a system of medical practice, however, it involves the administration of medicines in minute doses, and these medicines unmixed with any other medicinal ingredient. Accordingly we find that our opponents have at various times attacked homœopathy on these grounds:—

1. The law *similia similibus curantur*.
2. The infinitesimal doses.
3. The physical impossibility of preparing medicines unmixed with other ingredients.

And I think it will be found of great service to the homœopathic public, occasionally to condense into a short article whatever has been advanced by our opponents against one or other sections of our system, together with the arguments by which their statements have been met.

In the present paper, I propose to take up the last of these divisions, and to show from your own periodical how triumphant has been the vindication of homœopathy.

On the 19th July last, the Editor of the *Chemical Record*, in a leading article, "Homœopathy tested by chemistry, and found wanting," asserts that the disciples of Hahnemann maintain, that—

1st. "Medicines to act homœopathically must not be admixed."

2nd. "That silica, even in doses so small that it cannot be weighed, is a homœopathic medicament."

In omitting from his first proposition the words "with any medicinal ingredient," the Editor has been guilty of a very serious mistake, as will presently appear, for on these words the whole argument turns; and as I cannot believe that so respectable a periodical as the *Chemical Record*, would be designedly guilty of so flagrant an error, I shall attribute the misquotation to carelessness, and only, in passing, recommend the Editor to be more particular in future for his own sake, and for the sake of scientific truth, especially when, as in the present instance, he intends making his own logical deductions the basis for the abuse of a system whose propositions he has not been careful accurately to quote.

Having laid down these two propositions, he proceeds to state, "that during prolonged trituration, the mortar in which such trituration takes place is abraded," and he thus concludes his article, "hence not one solitary globule of Hahnemann's physic-store can exist without a notable admixture of silica;* and such admixture, according to a received canon of the obscure old man of Msissen" (proposition 1) "is fatal to the exercise of the homœopathic medical power."

Now this deduction would, of course, be irresistible, were proposition No. 1 correct; but the omitted words, "with any medicinal ingredient," being taken into consideration, the question arises, is the material introduced by the abrasion of the mortar a medicinal ingredient? That it is not so, we shall presently show by a quotation from Hahnemann's works; meanwhile we must continue our narrative.

On the 26th July, in a leader, the *Homœopathic Times* administered a severe castigation to the *Chemical Record*, and accused the Editor of ignorance of Hahnemann's writings.

On the 2nd of August following, the Editor of the *Chemical Record* replied, in a strain of great irritation, repeating his propositions, with the *omitted* words, and vindicating himself from the accusation of ignorance of Hahnemann's works, by quoting a passage from the Materia Medica,

* It will not be denied that, in the supposed case the medicine to be triturated would be greater than the amount of silica abraded; but it is here conceded that the *lesser* ingredient is present in a notable quantity in every homœopathic globule; *a fortiori —the greater!!* "Fas est," etc.

Hosted by Google

Pura, on *Carbo animalis*, cayenne pepper, and nutmegs.

Again, avoiding everything in the shape of a retort, and giving the Editor of the *Chemical Record* full credit for the truth of his assertion, that he had heard some of the works of Hahnemann descanted on at lectures, and has subseuuently perused the same, I must, nevertheless, be allowed to contend, that the legitimate construction of a man being acquainted with an author's works is, that he is at least acquainted with whatever that author has written on the particular topic under discussion. And in this sense it is obvious that the *Chemical Record* is ignorant of Hahnemann's works: 1st, because it misquotes one of hls fundamental propositio ns; 2nd, because it omits all reference to the answer provided by anticipation by Hahnemann to the very argument it had been insisting on.

An article such as this in the *Chemical Record* of the 2nd of August did not, of course, advance the argument one iota: accordingly we find no notice taken of it by the *Homœopathic Times*.

Having in vain waited a fortnight for a rejoinder, the *Chemical Record* on 23rd August, in a leader, headed "The Homœopathic Quacks," sums up the whole case, concluding that homœopaths are either "fools or knaves," once more repeating the mutilated proposition on which its entire argument is based, viz., "that medicines to act homœopathically; must not be admixed;" whereas the actual proposition is, "with any medicinal ingredient." Had the Editor of the *Chemical Record* waited till the 30th of August, he would probably have avoided committing himself as he has done; for on that day appeared in your journal a letter from Dr. Ransford, with the following quotation from Hahnemann on chronic diseases:—

"No one will feel disposed to suspect that quartz, rock-crystal,—some of these crystals containing drops of water which have been enclosed there unaltered for thousands of years,—or *white sand* are soluble in water or alcohol, or are endowed with medicinal properties. However, silica may be made soluble both in water and alcohol, by triturating it *after it had first been melted by means of an alkali, and then precipitated again from that compound.* By this process, the medicinal properties of silica are developed to an almost infinite extent." Then follows, in a note: "*Quartz or silica, unless they have first undergone this preparation, will not show any medicinal properties.* This is the reason why medicinal substances may be triturated in the porcelain mortar, together with the homœopathic medicine *Sugar of Milk*, without any silica becoming mixed with it. Some hypercritical homœopathists have apprehended such a result."

It is impossible for an unprejudiced mind to peruse this quotation without being convinced that the Editor of the *Chemical Record* was "ignorant of Hahnemann's works," in the legitimate sense of those words, when he published those articles which have called forth these remarks, and that the extract in question is a complete refutation of his entire argument.

For thus stands the case. Homœopathy asserts that medicines to act homœopathically must not be admixed *with any medicinal ingredient.* The *Chemical Record* quotes this proposition *minus* the last four words; asserts that none of our globules are free from silica; and deduces thence that, according to our own showing, our medicines cannot act homœopathically. The logical conclusion from the *true* proposition is, of course, *provided silica obtained from the simple abrasion of the mortar be a medicinal* substance. That it is not a medicinal substance is proved by the extract from Hahnemann given above; and thus it follows, that homœopathic medicines are not prevented acting homœopathically by reason of their being mixed with silica. But this was the assertion of the *Chemical Record. Ergo*, the *Chemical Record* is wrong again: it must either have wilfully misrepresented the case against homœopathy, or have been ignorant of Hahnemann's works. There is no pretext whatever for the former supposition. *Ergo*, it must be concluded that the Editor was ignorant of Hahnemann's works.

Under these circumstances, there is but one course open to him, and it is this:—honestly to avow his ignorance, and to apologize for the language into which that ignorance betrayed him.

And now let us see the conclusion of the whole matter. The most able of the allopathic journals, actuated by the most violent hatred to our system, and resolved on doing its utmost to crush it, has put forth all its power in an endeavour to prove our chemistry at fault, and has signally failed: so far, therefore, as the chemistry of homœopathy is concerned, it may fairly be regarded impregnable.

I am, Sir, your obedient servant,

F. J. SMITH.

74, Old Broad Street, London,
Oct. 14, 1851.

P.S. As a proof of the ability with which the *Chemical Record* treats subjects with which it is acquainted, I beg to add the following extract from that journal of 4th October instant. The article is headed "The discrepancies between *our* (the allopathic) pharmacopœias.—Whatever *danger* may have existed in past times, on account of this discrepancy, it is evidently increased *to a most alarming degree*, by the circumstances of rapid transit between the three kingdoms, which railroads and steam navigation have brought about. It is a very pleasing reflection to cross the mind of a travelling valetudinarian, that a prescription written in England *would subject him to the chance of death*, were he to have it dispensed in Scotland or Ireland; *yet such is literally the case!!!*"

I think your readers will congratulate themselves on having escaped from a system of which its professors are compelled thus to speak.

To the Editor of the Homœopathic Times.

SIR,—Sundry errors, typographical and others,

Hosted by Google

having found their way into the report you published last Saturday of my lecture on Mr. Rutter's magnetoscope, I shall feel obliged by your correcting them. At page 186, top of second column, I am stated to have said that Mr. Rutter supposed the reversing action of common *Salt* to be due to its crystalline arrangement; this, however, was not the case. Mr. Rutter evidently considered it a specific action of the *Salt* itself, although others who saw the experiment suggested that it might be due to its crystalline condition.

At page 187, first column, second paragraph, the influence of letters is erroneously stated. It should have been "the *female* influence was shown to exist in a letter written by one of that sex several weeks previously, when laid upon the operator's hand the current was immediately reversed;" indeed, no less than three times in that paragraph the words '*roused*' and '*rousing*' are printed, instead of *reversed* and *reversing;* lastly, near the foot of the same column, it is stated that I had inferred "that the agency producing the motions was not telluric." Now the fact is, that while the experiment I exhibited, viz., bone restoring to me the normal current when standing on the isolated stool, certainly militates against Mr. Rutter's explanation of the currents being produced entirely by terrestrial magnetism, yet I certainly did not infer from this that the agency was not telluric, but simply pointed out the anomaly, of which, indeed, there will be found a great many on close investigation. I was much pleased to observe the editorial note at the close of the report, urging caution upon those who might feel disposed to draw conclusions from what has already been made public connected with this most interesting subject. For my own part, I regret that the matter has been so much canvassed before the appearance of Mr. Rutter's pamphlet, which should have been the first public notification of his discovery. When I first saw his experiments, and proved their applicability to homœopathic remedies, I obtained his permission to send the notice that appeared in the October number of the *British Journal of Homœopathy*, but I should certainly not have done anything further, and had no intention of lecturing on the subject, until it was in a manner forced upon me by circumstances over which I had no control. My great fear is, that hasty conclusions will lead to much disappointment and great confusion. The whole subject requires further elucidation before we can draw any just inference from the results; and my own experience is, that every day's experience tends to modify considerably the views one might be, at first sight, disposed to take.

I remain yours truly,
HENRY R. MADDEN.

76, Grand Parade, Brighton,
Oct. 28, 1851.

To the Editor of the Homœopathic Times.

SIR,—The terms "presumptuous and offensive," which the reviewer of the *Lesser Writings* in one of your late numbers applies to the title of the first work in the collection, viz., "Instruction for Surgeons respecting Venereal Diseases," are not justified, when we take into consideration the different relation that existed among the various grades of the medical profession in Hahnemann's younger days and our own time, and the intrinsic merits of the work itself. The "surgeon" of former times in Germany—and this is still the case in many parts—was a very inferior personage to the Doctors of Medicine and Surgery; he was a person of very little education, kept a barber's shop, and his practice was mostly confined to shaving, bleeding, cupping, leeching, dressing wounds, and extracting teeth. His education scarcely allowed him to gather the little knowledge of surgery he possessed from the more scientific works on the subject, hence it is that Hahnemann has written the work in question in a semi-popular style, and has entered into some minutiæ of treatment, which we would not expect to find in a work addressed to the more educated of the profession, and doubtless he was induced to write a work of this kind, from having frequently witnessed the bad results of the treatment of syphilis ordinarily pursued by the common sort of barber-surgeons, under whose care the malady would frequently come, from its apparent external nature and trivial character. The new and original views unfolded in the book would also justify the title of "Instruction," even if addressed to his equals in medical rank. Among other important innovations on ordinary practice we now find, I may point to the caution against burning off the primary sore, a practice that was almost universal then, and still prevails to an unfortunate degree; the condemnation of the practice of pushing mercury to salivation, and the indication of the true test of the cured disease; the substitution of a new preparation of mercury for those in common use, which is known to this day in Germany by the name of "Hahnemann's soluble mercury;" the discovery of a preventive to the bad effects of mercury when administered in excess, viz., *Hepar Sulphuris*, which we still use for the same purpose in homœopathic practice, for the most part unconscious that we owe its discovery to Hahnemann's chemical skill, and not to the homœopathic analogy of the two substances. I might multiply examples of the original views contained in this little work, but the above will suffice. I may only add, that on an examination of the contemporary medical literature, I find this work of Hahnemann's most favourably reviewed in *Hufeland's Journal*, and largely quoted as an authority by many of the principal writers of the period.

Your obedient. servant,
R. E. DUDGEON.

NOTES OF IMPRESSIONS AND OBSERVATIONS OF HOMŒOPATHIC PRACTICE AND PRACTITIONERS IN FRANCE AND GERMANY.

By Carroll Dunham, M.D., of Brooklyn, New York.

My first studies in Paris were made at Tessier's clinique. The general results of his practice appeared to me quite favourable—*very* favourable, when compared with those of any allopathic clinique at Paris, and better, I think, than than those of Fleischmann's public practice at Vienna. Still, in Tessier's practice I saw nothing striking, nothing indicative of either the profound knowledge of Materia Medica, or the great sagacity in discerning indications which have characterised our *Masters*. Moreover, the extreme haste with which the daily visits were despatched, and the great taciturnity of the *Primarius*, whose disposition the opposition to him and slander on the part of his allopathic medical brethren are said to have soured, rendered vain all hope of greater advantage to the visitor, than would accrue from simple observation of the cases under treatment. Clinical remarks, the fruit of experience, so very precious to the novice, I never heard from M. Tessier. Nevertheless, one might reasonably hope for considerable advantage from simple observation of the considerable variety of cases which the 103 beds of M. Tessier's clinique should present; and doubtless one *would* profit, were not *this*, like most of the French hospitals, half *almshouse* as well. Patients are suffered to remain in the wards days and even weeks after complete recovery, on the simple plea of inability to maintain themselves outside. However humane, this practice very much diminishes the interest of hospital attendance. I do not think that at any one time, I saw in Tessier's wards two-thirds of the number of really interesting and instructive cases that were always to be seen in Wurmb's hospital of thirty-three beds, at Vienna. Thus, and because no endeavours are made to assist or instruct students and visitors, the largest of our homœopathic hospitals is, so far as education is concerned, almost worthless. Valuable it is, however, in a statistical point of view, and I am glad to be able to say, that from the method observed in examining and recording cases, the reports seem to me entitled to entire confidence. As for peculiarities of practice, nothing struck me as new or noteworthy, save the pretty frequent and generally successful use of *Cannabis* in the last stages of pneumonia and pleuritis—stages corresponding in some degree to those in which *Sulphur* is so efficacious, yet differing essentially from those in which *Sulphur* is indicated.

Among the homœopaths of Paris, my earliest and most frequent visits were paid to M. Croserio, who, beside valuable practical information, freely imparted, had much that was very interesting to communicate respecting the professional and private life of Hahnemann during his latter days. He says, that Hahnemann used frequently, and with great advantage, the 60th potency, and that he never thought of abandoning the psoric theory, which, Griesslich says, he *did* abandon. Croserio told me he has, on many occasions, treated small-pox with *Thuja*, as recommended by Bönninghausen, and that his success has been constant and complete, fully justifying the high esteem in which the practice is held by its discoverer. But Croserio is very particular in stating he employed the 200th potency of *Thuja*, and that he did not repeat the remedy oftener than Bönninghausen had done, or that if he *did* repeat it, he gave, as advised by the latter, an intercurrent dose of *Mercurius*. In short, he has followed as nearly as possible the road which Bönninghausen says led him to a successful treatment. This is a point to be noted. Ere long, we shall have reports of a large number of cases of small-pox treated with *Thuja* by Wurmb, at his hospital in Vienna, without any favourable result. And this will be, by some, considered decisive evidence against the practice—negative evidence though it be. On such evidence one could scarcely disregard the positive testimony of so upright a man and so wonderfully acute an observer as Bönninghausen, supported, as he is, too, by the results of Croserio's practice

Hosted by Google

and of that of two of our own most eminent practitioners. One scarcely knows how to understand or account for the discrepancy between the results of trials made by these men and others instituted by Wurmb and his coadjutors, until one examines closely, and sees whether the trials were fairly made in both instances. It is a pity that such examinations are not more frequently and more carefully made when discord in experience arises. They might save some of our younger members the discredit of stigmatizing as "dotards," "old enthusiasts," and "false observers," many of those earlier scholars of our Master, to whose laborious age, and generous spirits, and keen, wary observation they owe great part of what they are.

Such an examination in the present case shows, on the part of those who assert a want of success, considerable deviations from the method recorded by Bönninghausen. Croserio and all who *advocate* the practice as successful, observed exactly his prescription. Wurmb has not done so. He gives *Thuja* 30, *a dose every two hours.* Undertaking to test a proposed mode of treatment, he seems to assume that only one of its three or four elements is of real importance, disregards the others, and, if unsuccessful, claims to have made an impartial trial, and to have reached a reliable conclusion. This *petitio principii* has been, since the dark ages, the curse of our profession, and even *we* suffer now from its influence. By what right does Wurmb assume that the alleged benefits of Bönninghausen can come alone from the *Thuja* as *Thuja?* May they not be in part due to the form and mode of its administration? May they not even entirely *depend on* such certain mode and form? Into every question concerning any practice said to be successful, the questions of dose and potency enter as elements. They may or may not be important, but we have no right to assume *a priori* that they are unimportant —no right to neglect them in any experiments undertaken for the purpose of testing the practice. Suppose Faraday should undertake to test one of Dumas' experiences, but should assume it to be a matter of no consequence in what proportions he adds one of the ingredients, or how long he subjects the mixture to the action of heat before again disturbing it, and, failing, should publish to the world that Dumas' observation is good for nothing; what reputation would Faraday thereafter bear in the scientific world? We physicians act thus not seldom, and without excuse; for hear what Wurmb says about some of the allopaths, who tried *Belladonna* on Hahnemann's recommendation of it as a prophylactic for scarlatina: "Hahnemann advised to give *Belladonna* in the form of tincture, to give it in small doses, not frequently, and finally to give it only in cases of true scarlatina of Sydenham. Instead of doing this, the allopaths gave the extract—often a worthless preparation; gave it in large doses, gave it frequently, and finally gave it very often in cases of mixed purpura and scarlatina. Then, not succeeding in more than half the cases in which they tried it, they pronounced it a failure." In almost his own words we shall have to say of Wurmb: "Bönninghausen recommends *Thuja* 200, given seldom, and never to be repeated without an intercurrent. Wurmb gives it in the 30th, *very* frequently, and without an intercurrent remedy; and not succeeding, pronounces Bönninghausen's alleged experience a fallacy." Fallacious it may be, but this is not the way in which its fallacy can possibly be established.

Among the Parisian physicians, I became acquainted with but one who seems to have devoted to the subject of the "high potencies" attention and abilities at all commensurate with its importance.

M. Perry has been experimenting for years with the preparations of Jenichen, and with others prepared by himself from the lower ones of Jenichen. The striking results which he communicates are arresting the attention of the younger members of our fraternity. In the practice of M. Perry is easily discernible the same peculiarity that distinguishes the method of all who have obtained any considerable success in the employment of the high potencies. He appears, with reference to every case, to pass in review before his mind the whole Materia Medica, without any preference (so to speak) for a few of what it is fashionable to call "*specifics.*"

I heard from M. Perry a singular instance of the acuteness of sensibility to which the senses of patients are sometimes exalted. A lady, so severely affected with pneumonia, that the allopath previously called in in haste had bled her from both arms, was treated by M. Perry with *Aconite*, followed by *Sulphur* and *Phosphorus*, all of the 15th dilution. After one dose each of the *Sulphur* and *Phosphorus*, she said that one was *Sulphur* and the other *Phosphorus*, and continued to identify each remedy, however disguised, and however her attendants endeavoured to mislead her. *Tartar Emetic* she also recognised. *Aconite* and *Belladonna*, however, were without decided taste. As the intensity of the malady subsided, her taste became less acute.

Hosted by Google

When in good health her powers in this respect were not extraordinary.

I have at this moment a patient convalescent from pneumonia, with fierce delirium, whose organs of hearing have been, during her whole illness, almost supernaturally acute. She heard at a distance of 200 feet through closed doors, what I, distant thirty feet, and listening too, failed to hear. As she recovered, her powers of hearing sank to a normal condition.

I note that at your last Congress, globules so made as to stand the tropical heats were mentioned as a desideratum. At New Orleans our colleagues use globules of *Sugar* and *Starch*, made at Geneva, in New York. The apothecary, Lehrmann, at Schönnigen, in the Duchy of Brunswick, told me he had succeeded, after many trials, in making globules from the crystals of *Milk-sugar*, without previous solution or any admixture. He made them for warm climates, and says that they answer the purpose perfectly.

[We trust we shall be favoured with a continuation of Dr. Dunham's very interesting and valuable observations. When he has completed such a series of his European observations as he will favour us with, we shall feel at once obliged and honoured by receiving from him communications concerning homœopathy in the States—and his own practice.—ED.]

LETTER TO C. H. F. ROUTH, M.D.,

19, DORSET SQUARE, LONDON,

Physician to the St. Pancras Royal General Dispensary.

SIR,—After the society we have been accustomed to at the literary boards of the weekly medical press, in reference to the discussion of the homœopathic question, it is an inexpressible comfort to meet with a gentleman who does not think it necessary to bespatter us with the direct terms "impostors and liars." Since the noted era when Dr. Forbes showed the possibility of being equally strong in argument without these, every man of your party who has taken up the pen repudiated this idea of propriety, and has so profusely lathered himself with compliments and us with their converse, that I am quite surprised to find direct terms of abuse absent in your paper in the *Medical Times* of the 18th October, and I have only now recovered sufficiently from the surprise to enable me to analyse your remarks.

When I see a physician of respectability standing out in bold relief to his fellows on the stormy therapeutic field, ready to splinter a lance in his cause, and willing to risk his reputation on the manner in which he can disprove the subject he attacks, I congratulate myself. In entering on this discussion, therefore, I do so with renewed feelings of hope. But specially being desirous to recognise you as a gentleman, I wish I could recognise you as an impartial judge and deep-seeing philosopher. The title you give your paper has led me astray, for it impressed me with the idea that you were in a transition state, investigating the therapeutic effects of homœopathy, and not the theoretical reputation of it, and I was rather fearful you might have merited the designation of "bastard homœopath," so tastefully selected by your Editor, but it turned out not to be so; it turned out that you were a prejudging foe, that you, a physician of a few years' experience, came to pronounce judgment as a judge, not to discuss merits as a barrister. You came as a judge *full fledged*, every pinion of your wing dripping with professional decorum, erected from an allopathic sense of justice, though in direct contravention of the laws of feathers; and in this guise you do not hesitate to decide *against* a science in which you have by no means shown that you have even matriculated as a student of the first year.

We had high hope that you would premise what offered to be a good paper, by giving us the basis of all profitable argument, viz., a history of cases of acute and chronic disease, treated in conformity with homœopathic principles; and had you erected your judgment upon these, and had they been ever so few, you would have taken the right road at all events; but, like all that have gone before you, you have disdained any road, started off wildly across a barren heath, and have afforded me this opportunity of reclaiming you. The treatment of cases, their symptoms being duly recorded, the medicines and potencies registered, the results, whether cures or fatal, can alone advance you one step in this contest. Colleges, associations, and societies are ready enough in forming "resolutions" for us to laugh at, but not a man can be induced to take the only effectual way of putting us down, and *we* point it out to you.

Deficient, therefore, from the very first in the most essential element for your argument, *experiment*, you, in lieu thereof, commence the usual lamentation on the inroads we make in *legitimate* practice, a term we have in vain sought a solution of. We have sought it out in law, and hunted for it in physic, but in vain; but being in

Hosted by Google

every allopath's mouth, it *surely must be an entity*. We offer a reward for it. Your lamentation concluded, you put on an air of candour calculated to make the public think you intend well, and that, contrary to the *great professional spirit*, you have done us *more than justice;* for you admit abundantly our influence on the public, nay, upon the highest minds and clearest heads of it, and you promise to consider it fairly, and you break through that promise before you arrive at the end of the first half column, for at the twentieth line you agree with the decision of the Scottish Universities. This decision being given so *early*, we look over each column in hopes of seeing the "*cases of failure*" upon which it is founded, and alas! there are none. We cannot by any chance find out whether you have read a single homœopathic work, and yet you soon afterwards condemn this meagreness of inquiry by saying, "that something more is needed in this inquiring age than a mere declaration;" we quite agree with you.

I have, however, to thank you for your disapprobation of the spirit with which your party has endeavoured to crush homœopathy; and I have to thank you for your refutation of a certain portion of Dr. Christison's inaugural address, in which he asserts that Harvey and Jenner's discoveries, along with all other real discoveries, were hailed joyously by the profession. In strict conformity with the great allopathic principle of disagreement, you and he are the antipodes of each other. You give powerful illustration of the invariable intolerance of the profession, by their rejection of the very best parts of it. You bring this intolerance down so late as the difference between the Board of Health and the College of Physicians, and, contented with this display of candour, you think you have done enough. You apply your sense of justice to globulism, and at *once* declare it to be *false;* and you say "this opinion is the result of fair inquiry," and "disdaining abuse," for which I am most thankful, you continue, "and endeavour to show my opinion to be founded on logical ground."

Learned Sir, spare us your logic! One single experiment in scarlet fever, in pneumonia, in typhus, in chronic constipation, were worth a bushel of it. We have been so be-lathered with allopathic logic on homœopathic doctrines that we are quite wearied of shaving; we are quite surfeited, for the same dish has been served up to us weekly, heated over and over again in each new essayist's oven, so that our stomachs go quite against it. But your paper being all logic, to the total exclusion of experiment, I am forced, in self-defence, to show the shallowness even of that.

Is it reasonable to admit readily the homœopathic law to a certain extent, and to persecute, to excommunicate those whose belief in it is more extended? Is it good logic to make diet an objection—the same regulations as to diet being open to you? The first of these you settle by asserting, that Hahnemann arrived at the conclusion of its universality upon the evidence of forty cases (I wish you had recorded one-fourth the number), and you forgot to mention that these forty cases were followed by a long lifetime of them. According to allopathic custom, you confound the appreciable doses necessary for experiment upon the healthy frame, with the infinitesimal doses, proved by his after-experience as sufficient for the cure of disease. You use the term "mimicking disease," as one pointed out by the medical jockey-club to be well calculated to wean an inquirer from his pursuit. You decry "universalising" medicine, or, in other words, you denounce a "law" of medication—a natural guide to physic—because upon "the authority of a few facts," although we daily offer you hundreds of cases in confirmation of these.

You complicate this question by raking up the word "idiosyncrasy," by which you infer that all our cures are chance cures, whilst we look upon them as the general sequence of a correct choice of remedies. At this era of your paper, and in *some distress*, you fall back rapidly on the *old reserve of infinitesimal doses*, and safe behind them, you declare that many homœopaths have altogether discarded infinitesimal doses as forming any part of the system they practise. Were I to take the *Lancet* for my model, I could justly apply a hard term to you for this statement, which I dare you to prove, and I trust you may escape from the ordeal less defiled than Dr. Glover is.

Having admitted the occasional applicability of homœopathy, we offer you unbounded instances of its more extensive application, and because we do so and prove it by taking away your patients, you make war and "*Resolutions*." Throwing a screen over the doctrine after this admission, you creep within the shelter of infinitesimal doses, which is quite distinct from the doctrine; and your courage rising with this feint, you favour us with an algebraic calculation of great merit, in which the German Ocean forms a convenient medium of solution, and having taken the trouble to calculate the number of drops in a square mile of salt water, you refer triumphantly to

Hosted by Google

the exposure of infinitesimals by Dr. Forbes and Dr. Alexander Wood. I hope Dr. Forbes has made you a handsome acknowledgment for this tasteful conjunction, the spirit of these authorities and their manner of treating the subject being so identical, to say nothing of the laurels lately gained by the latter in his official capacity. Had you but taken one-half the trouble to treat a case of disease in accordance with the views of him whose statue in bronze already adorns the city of Leipsic, it would have gone further in this dispute than the measurement of the Pacific into cubic inches.

'Tis five years since Dr. Forbes wrote, during which we have lost nothing in our homœopathic *status;* then, as now, your party waited for the spontaneous subsiding of a "popular delusion:" you are waiting still. Go down to Deal; take your stand upon the beach, and rebuke the sea for its encroachments—the land once was where the Goodwin beacon stands. Sir, no logic, not even yours, can by one feather's weight cause refutation or acceptance of infinitesimal doses. But whilst the only feature in your paper is that it is all theory and no practice—all conclusions, and no right shown to draw them—we offer you our theory, be it right or wrong, but based upon a triple foundation, that all your faculty cannot gainsay by a hair's breadth. This triple basis is, experience, acceptance by the public, and evidence shown by registrars of deaths.

You try to prove, if our views are correct, as medicinal power *must* exist in our "*media*," sugar of milk and water, that *carbon* must contaminate the former, and various impurities the latter; and you leave out the very essence of our infinitesimal theory—for *that, if admitted,* would have upset you—I mean the dynamizing power of trituration. You forget that the carbon of the one and the salts of the other have had no power developed by this means, and that, if developed, unless homœopathic to the pathological condition of the patient, would not be followed by any action. This, *your fallacy,* is no fallacy, except in so far as *your elucidation* of it makes it so. You add to your accumulated difficulties the assertion of a Dr. Glover, "that a London homœopathic chemist was in the habit of supplying his customers with simple sugar of milk, but labelling them by the medical names, and that the cures effected by these were equally satisfactory." But you *somehow* forgot to mention that this Dr. Glover had been signally refuted by Dr. Hayle, of Newcastle; that Dr. Glover had failed lamentably in substantiating the charge, and consequently is, up to the present moment, in that enviable position in which every man must be who makes an accusation and fails to prove it. On investigation, no trace of the accusation could be discovered beyond Dr. Glover's pen and ink: it is put down as a foundling at his door, and a fine promising boy he has got of it.

But, Sir, had it been traced to any chemist, what a withering sarcasm it would have passed on Dr. Glover's system and yours!!

Surrounded, then, by the difficulties of homœopathic therapeutics, as Dr. Christison was by the allopathic, you rejoice that "in allopathy we are able to trace the good or deleterious influence of drugs." Patients! *lay this unction to your moaning hours.* We never get a new patient, but we are able to trace them distinctly; we have extended experience in this way; and as patients seldom come to us when good effects have resulted, we are, I think, justified in supposing that the "*deleterious*" predominate.

At this epoch of your paper, you get into such a confusion, between our little *pilule* dispute, the science of imponderables, as illustrated by miasmata, odoriferous effects, chloroform, Dr. Snow, vaccination, and putrid game, that when we get to the end, and remember the relation that all this bears to a *course of experiments,* we ask, "cui bono?" We must begin again, Sir. Experiments you *must* give us, in accordance with symptoms, and justly recorded; and you must give them with the humility of a student, and in whatever they come short we will point them out to you. We would not accept the giant of Giessen himself in the light of a homœopathist, unless he can prove a stern apprenticeship. You already find you have got no trifling matter before you. You have far and wide declared uncompromising war with those who, if left alone, would simply have extended their own doctrine; and having been so imprudent, we shall give your therapeutics no quarter. We shall refer you to the registrars of every parish in which a homœopath practises, and compel you to compare his death-certificates with those of allopaths around him.

The united powers of algebra, logic, and chemical analysis having, as you suppose, routed us for the twentieth time on infinitesimal doses, we are just where we were—curing a good many of your patients; I mean your party's patients—it would not be proper to cure yours—and working steadily for our cause. Spare us then the logic, the algebra, and the precise number of drops of the German Ocean! for the same

Hosted by Google

theory has been already illustrated by the Lake of Geneva, a proportion better suited to general capacity.

Meantime I would ask you, how it happened that, in the report of the meeting of the Medical Society of London, Dr. Camps was compelled to vote for the "*Resolutions*," although "*sorry they had been brought forward?*" How was it that, when Dr. Camps, appalled at the extent of allopathic drugging, and anxious to do something towards remedying this crying evil, attempted to give an illustration of it, and related "that a general practitioner sent in medicine for an *infant*, his bill for which, he said, amounted to £48!!! although *only three or four visits had been paid*," the candid allopath was called to order for *intruding irrelevant matter?* Fathers! mothers! little babies! you little know now great is the importance of "*Resolutions*" *against homœopathists*, and what a trifling matter a £48 *bill for drugs to an infant* is. Dr. Camps, you may decamp; there is no accommodation for you in that room; but you are an honest fellow, whatever your creed may be, and worth any fifty of the London Medical Society's members.

Sir, I congratulate you on your brotherhood of the London Medical Society, and on the "Resolutions" that have just emanated from it. I congratulate that body on the noble stand it has made in defence of a tottering fabric, and on the exalted position its presidential dignitary has just worked out for it. The laxity in medical ethics, the private practice of "globulism," have been thoroughly washed from a medical rag. Can you inform me if the water with which the purification was effected was much contaminated thereby? I should think it had been—a scum upon it, or some such like, or more professionally speaking, a pellicle. It is rather sharp work to be passed seven times through a Society's furnace, and come out—a cinder. The countenance of Medical Decorum has been furbished up wonderfully in this instance: we had always a light opinion of that body; indeed, we have often heard it hinted that she was "no better than she should be," and we have no doubt she stood much in need of the furbishing; but why, instead of whitewashing, do you apply the blacking-brush? Poor Medical Decorum was begrimed extensively; the blandness and smiles of the accused, the forgiveness of the London Medical Society, the promise to "never meddle with globules again," proved unavailing; for Medical Decorum was just "as Mr. Briggs appeared after he came out of the brook."

With the contents of that brook adhering to her presidential paletot, the "Resolutions" are entered upon. We know not whether most to admire the penitential candour on the surface, or the poltroonery that shines through it.

How was it that your august editor did not stand up and insult "Medical Decorum" on the spot, as "a bastard homœopathist?" He has done so to some of us, whom she imitates servilely: was she spared because of promises for the future? Paint her portrait, surround it with a frame of triple gilt, place it upon the same square-feet of your wall from which you have removed the portrait of your late president, and let the London Medical Society, when it meets, glow with generous feelings under the benignant smiles from the canvas of its *Great Whitewashed*, to whom the oil of allopathy has once more adhered in its pristine stickiness. Let Medical Decorum beware of this oiliness, for it is dangerous to all parties. We know of one petty partisan of yours, who perilled his fellowship by dealing in oiliness, but it was hair-oiliness. Excuse the alliteration, but the words came so readily to hand, that my pen recorded them obediently.

But I cannot pass over this resolution-hatching *sederunt* of the London Medical Society, without doing justice to the obstetric features of the evening. One feels particularly charmed with the gentleman whose speech of some ten lines embodies more really *original matter* than the columns of the other obstetric philosophers. After it was stated that ladies in this country *will dance the polka beyond a term at all prudent*, he proves it by a gratuitous confession, that "he was sorry to say he had himself seduced a patient so as to lead her to do that." We do not for a moment doubt this, because it is confessed to; nevertheless, this mode of illustrating obstetric science is rather too exhilarating,—it almost takes away one's breath. As no hurricane passed over the countenance of Medical Decorum, not even a cloud, but as, on the contrary, the jade seemed to enjoy this outrage to the feelings of all ladies in an interesting situation, we would suggest, as being likely to advance obstetric science, that this practitioner be requested to exhibit his experiments at the Society's next meeting, and to this suggestion we add a recommendation (to this obstetric dancing-master) to put a Simpson's tractor in his pocket—it might prove a great comfort to both parties; and to this recommendation we add a request, that Dr. Malden, of Worcester, might be invited to attend. He will then learn that laughing is only a

Hosted by Google

gratification according to the side of the mouth from which it comes, and that dancing is only an enjoyment when the tune is in good time.

I have the honour to be, Sir,
Your most obedient servant,
Nov. 1, 1851. SIGMA.

THE
HOMŒOPATHIC TIMES.

SATURDAY, NOVEMBER 8TH, 1851.

EVERY fresh movement in homœopathy tends to promote the confidence of the public in the growth of the system. That such would be the case we have fearlessly predicted for some time past. The vital importance of its influence upon the destinies of the great human family we have always endeavoured to point out in a clear and intelligible manner, and we are much gratified by knowing that our services in this respect have been appreciated.

The disciples of homœopathy have in their present struggle experienced all the hardships which attend the introduction of a new discovery, but they will be amply compensated by the future brilliant results awaiting the development of their science. Already have those prominently associated with its progress found the difficulties surrounding their early endeavours gradually giving way before the light of reason and the increased freedom of public thought. Under the influence, then, of such encouraging auspices, they may go on their way rejoicing, being perfectly assured that the opposition encountered will ere long be thoroughly cleared from their path, leaving them undisputed possessors of the field, for which they have so vigorously contested.

Nothing can more surely indicate the tendency of public feeling on this question than the late demonstrations which have taken place in the provinces. In the first instance evidently intended to crush homœopathy and its followers, not one of these proceedings have been brought to a close, without eliciting circumstances favourable to our Cause and our pretensions. Whether we turn to the right or to the left, the same prospect is apparent. Huddersfield with its noisy declamators; Ross with its dispensary orators; or even Brighton with its allopathic professors—all evince unmistakable symptoms of furnishingtheir quota of homœopathic progression.

Nor shall we stop here. The marvellous revelations made every day in connection with the practice and principles of medicine as evolved in the philosophy of Hahnemann, must plainly teach those who promote due inquiry, that there yet remains in store much for the universal benefit of mankind. This is no idle boast, and our opponents are quite alive to the fact, but their prejudices will not permit them to confess the truth. It is alone through prejudices thus created that homœopathy has been denied a fair hearing in times gone by. Such obstacles, however, have now been in a great measure removed, and it requires no prophet to assert that allopathy and its adherents will eventually have to make place for more successful compeers.

THE MAGNETOSCOPE.

"Man! the Discoverer, whosoe'er thou art,
Honour to thee from all the lyres of song!
Honour to him who leads to Nature's heart
One footstep nearer!"

THE intense interest which has been excited by the experiments made with Mr. RUTTER'S *Magnetoscope*, has awakened the attention of all thoughtful homœopathists to magnetic science. The liveliest hopes have been entertained that, by means of this instrument, there may be a direct physical demonstration of the fact, so long established by experience and statistics, that our very minute and even infinitesimal doses do act on the human organism. Such a demonstration by physical science, that is, the physical discovery affording unequivocal proofs of the theorem, would indeed be an invaluable aid for the conviction of the sceptical inquirer. Proofs of another kind we have in abundance that our medicines do act; but those from physical science, which have been hoped for from Mr. RUTTER'S instrument, would go far to satisfy the objectors who will not at present listen to us, nor examine for themselves.

Let us consider what, it has been affirmed, may be expected from this invention:—

1. That thereby the action of the homœopathic remedies, even in very infinitesimal doses, may be rendered evident to the senses.

2. The physical demonstration of the homœopathic law.

3. The proof that the action of our remedies is, in a certain sense, totally independent of quantity.

These propositions are derived from Dr. MADDEN'S communication to the Editors of the *British Journal of Homœopathy*.

Whether the experiments that are now being made will issue in confirmations strong, in direct proof of the propositions attempted to be proved, remains to be seen.

Hosted by Google

The views of REICHENBACH, Dr. BUCHANAN, HERBERT MAYO, Mr. RUTTER, and various other persons who have entered on this subtle field of magnetic investigation, are of the utmost importance. The science of *electro-pneumatics*, if that shall be found to be the suitable expression for the aggregate of facts in reference to imponderables, and the relation between the magnetic condition of the subtle, impalpable, and invisible properties or qualities of matter (in contradistinction to gross quantity and the rude force of bulk), and the magnetic condition of the human being, cannot fail to exert a vast influence on the human race. We are only at the starting-point.

We should not be discouraged now, or at any time. Truth is the thing sought after, and those who search for truth must be hopeful as well as patient. Those whose character of mind is cautious and sceptical, as well as those whose genius is dogmatic and sanguine, will be engaged in these investigations, which have been opened up for us by the philosophers we have named. By a careful accumulation of facts, and by cautious induction, a law or laws may be at last determined—*quando physicum terminatur in mathematico*—that is when the physical discovery is shown to rest on undeniable proofs.

The facts already recorded and accumulated in relation to this vast field of observation are so very interesting and important, that none of us should be discouraged by reported discrepancies, which science will no doubt solve, or by rumours of failure in this or that direction: none of us should look with a sectarian regard on this new science, nor strive

"To bring down to party what is meant for mankind."

Those who feel the importance of the dynamics of imponderables—the miasm and the breath, the exhalation and the emanation—the skyey and telluric influences—magnetism in all its forms, mineral or animal, electricity, and thermo-electricity,—the perpetual changes that are taking place every instant, by atomic revolutions, in the waste and supply of every animated being, whether of the elephant or of one individual atom of the myriads that live on a leaf,—must use the knowledge already gained with desire for advancement, and must desire progress without fear and distrust.

To persons of this stamp, if everything is not gained at the first step, there will be only a keener desire to go farther into the wood. It was by intuition divinely given, that the dweller in Eden named all the creatures of which he was made to be the lord: but it was by accumulated observations made by previous worthies that such men as Jussieu, and Linnæus, and Cuvier, and Buckland, reached their nomenclatures and classifications. As we cannot by intuition penetrate the mystery of the vital dynamics of the universe, in the aggregate or the individual, in Behemoth or the invisible atom, we must arrive, we or our successors, at the goal we desiderate by the patient labours of many high-souled, and deep-thoughted, and large-hearted inquirers. To them will be precious indeed the internal truth of things, which this new philosophy seems destined to reveal to us.

Traces of it indeed are to be found in the writings of the ancient philosophers, as those will find, who will consider the doctrine of "similar parts" of Anaxagoras, of the doctrine of "atoms" of Leucippus and Democritus, the teaching of Empedocles concerning the "discord and concord," and the speculations of Heraclitus on the "resolution of bodies." This was a "sprinkling of natural philosophy"—the seed was sown, and after very many days it seems in our time to be springing up to the harvest.

But these inquiries must be conducted in a fair and tolerant spirit. "As it is a caution given in religion, that faith be shown by works, the same is excellently transferred likewise to philosophy; that it be judged by its fruits, and the sterile be counted vain; and the more so if, in place of fruits of the grape and olive, it produces but thistles and thorns of disputation and strife."

The excellent inventor of the Magnetoscope is confident, it is believed, in the exact accuracy of his experiments, and the unvarying character of his instrument. That his numerous and varied experiments have been made most cautiously and honestly, and that the results have been faithfully recorded, is not doubted for an instant: but the question is, if the instrument acts independently of the will and of the muscular motion of its inventor, as suggested by DR. HERBERT MAYO in his third edition, and if the same results can be obtained, not by all, but by other experimenters: or would be obtained by himself, if he or the instrument were placed in certain conditions. His forthcoming book, "Magnetoid Currents, their Forces and Directions, with a description of the Magnetoscope, and a series of experiments," is anxiously looked for. All who look to his invention for proofs of homœopathy to be derived from physical science, are naturally anxious to have direct teaching from the master himself, and earnestly hope that

Hosted by Google

his instrument may be found, on the repeated experience of other experimenters, to perform what has been predicated of it, independently of the *will*, or of the *muscular motion* of the operator. Under any circumstances, he has laid the scientific world, and all those who love their kind, under great obligations. Let us hope that he has indeed found the key to open this palace of delight—and if not yet found, still be it his—to find it!

Correspondence.

THE ODOSCOPE.

To the Editor of the Homœopathic Times.

SIR,—As it is obviously your wish, as it is your duty and interest, in these stirring times, to keep the homœopathic public *au courant* (so far as it may be in your power, by the assistance of your colleagues, foreign and domestic) of whatever is of scientific as well as practical importance to homœopathy, I make no apology for sending the following rather long extract from the *Zoist*, vol. iii.

It was to Dr. Buchanan's experiments I alluded on witnessing Mr. Rutter's, both of which seem wonderfully to accord in *sensitiveness*.

The Magnetoscope (or what I prefer calling Odoscope) has, from letters which I have seen, been found to answer all Mr. Rutter's most sanguine anticipations. Nay, I understand he, by an extensive series of experimental investigations, considers his invention and discoveries as established facts in physical science. It is to be hoped no hasty conclusions will be arrived at by any one engaged in these wonderful experiments, as it has occurred to me, by a very little experience, that a *compound influence* and *certain conditions* are essential to the manifestation of the phenomena,—conditions which established facts in magnetic science fully warrant as being honestly legitimate, as all who have carefully studied Reichenbach and others must be aware. I will not venture a suggestion, however, at present, but, like the President of the British Homœopathic Society, look forward "with longing and impatience to the forthcoming work of Mr. Rutter."

Louisville, May 10, 1843.

"Dr. John Elliotson.

"SIR,—The moral courage and energy with which you have maintained in London the cause of truth, have inspired me with the desire to render my feeble tribute of respect to so eminent an example of qualities unfortunately too rare among the distinguished of the medical profession. My inclination to address you has been increased by the manner in which your name has been mentioned to me by your friend T. C. Grattan, and by Professor Caldwell.

"I take the pen now to give you some sketch or hint of what I have been doing, and to communicate to one, who I trust would shrink from no truth from any source, some of those things which a prudent man would not communicate to the public. In *profound* science—in discovery—there must be exoteric and esoteric knowledge.

"Last January I forwarded you from New York, by the house of Wiley and Putnam, a copy of a pamphlet published in this city, and a copy of the *Democratic Review* (the most influential and respectable monthly in our country), containing a friendly and liberal essay upon the science of neurology. From Boston I forwarded you, by Mr. Grattan, a copy of my diagram illustrative of the phrenological portion of neurology. These I hope you have received.

"I deeply regret that I have not been able to devote my time and energies exclusively to the cultivation of the science, which I might have brought by this time to a much more perfect state than that in which it is. The science of mind, I have asserted, is strictly a mathematical science; but I have made little progress in giving it the exactness and developing the facts by which this may be proved.

"As to the discovery that the brain may be excited and its functions ascertained by touching the different organs of the head with the human fingers, I presume you have by this time seen enough of the phenomena, and in your experiments made discoveries enough, to show you how vast a field lies unexplored. The most successful method which I have used for discovery, is not to touch the organs of my subject, but to make him place his fingers upon the various parts of my head, from which I wish him to derive an influence. Each organ radiates its own distinct and peculiar *nervaura*, which when received by another person stimulates in him the corresponding function. The impressible person may thus be compelled to act out the character of any organ which you wish to investigate. In some of the impressibles the influence transmitted through either hand will affect only one-half of the system, and it will be necessary to bring both of their hands into contact with your head that they may not experience a one-sided effect. This would not be very pleasant; but I have frequently distorted my subjects in that manner, making them feel contradictory passions in the two hemispheres, and giviug a double expression to the countenance. The most unnatural and terrible experiments may be made in reference to the relations of the hemispheres. It is even practicable to split the man in two—to destroy all co-operation between the two sides of the body, by passing the hands along the median line of the head, so as to form an influence between the hemispheres. The results of this experiment are so frightful that I never dared to continue it, but have always speedily arrested it by touching the organ of Self-possession upon the side of the head (marked upon my diagram, Self-possession).

"The physiological functions of impressible persons may be as effectually controlled by touching others' heads, as by having any excitement attempted upon their own. Just

Hosted by Google

before I left Boston, I relieved the wife of Dr. T. (while labouring under profuse menstrual complaints), by placing her fingers upon the upper part of the region of Cautiousness, where lie the organs restraining the sexual functions. Having a good stock of health myself, I have rendered much more pleasant and effectual service to the impressible in this manner than by touching their heads.

"The impressible constitution not only feels the influence of the human brain, but feels the influence of any medical article with which it is brought into contact. Thus small quantities of medicine placed in the hand of a susceptible subject, will affect him as powerfully as if it had been taken into the stomach. The results are developed almost instantaneously. In this manner I have found it practicable to ascertain the exact physiological tendency of any medicine uncomplicated with any morbid influences, by trying it upon healthy subjects, and to discover in what manner each mental or physiological function is affected by any medicine or article of diet.

"It is not even necessary that the medicine should in all cases be in contact with the hand. The influence of the medicine which can pass through the arm to the body, can also pass through intervening substances to the arm. Incredible as it may seem, I can assure you that I have had several subjects who could feel distinct medicinal impressions from substances which were contained in envelopes of paper, in boxes, or in phials. Persons of this delicate structure of course feel the efficacy of the homœopathic infinitesimal doses, and the prevalence of impressibility in various degrees accounts for the success of Hahnemann's doses. One of the homœopathic *globules* held in the hand would affect Mr. I. so sensibly, that he could describe a long list of symptoms produced in himself similar to those related by the homœopaths, when he knew nothing of the medicine or its effects. Medicinal influences, however, are not transmitted with speed and efficiency, unless the medical agency is transmitted into the system by a stream of the *nervaura*. Electricity and galvanism have been proved capable of transmitting the medicinal influence of any substance through which they are passed. I have proved that the *nervaura* has the same power. When we place our fingers in contact with the medicine which is touched by the subject, a stream of nervous fluid is passing from our hand through the medicine to him. This *nervaura* makes him feel promptly effects which would otherwise hardly be produced.

"The facts which I have just stated have inspired me with a determination to make a critical review of the Materia Medica, and investigate the properties of medicinal and alimentary substances in reference to the human organization. I hope thus to lay down the true laws, not only of therapeutics, but of dietetics, derived from the relations between the various species of food and the various mental and physiological organs of the brain.

"The impressible constitution is an inexhaustible wonder: it does not require the presence of any appreciable quantity of matter to affect it! The *nervaura* of the human brain and body will produce as great effects as ponderable medicines. The *nervaura* may be transmitted through any good conductor, and produce its effects as well as when the subject is brought into nearer contact. Thus by placing a pencil-case upon the cerebral organs, I have been able to affect the subject who touched its other extremity, and have sometimes made the experiment more striking by previously blindfolding the subject. Even articles which have been placed in contact with the human head will retain enough of the *nervaura* to give a strong impression to the subject.*

"But what is most wonderful of all--a fact which should never be stated but to those who are prepared 'to believe all things possible'—the paper upon which we write receives and retains a sufficient amount of the influence of our minds and bodies, to impart to another a correct conception of them, and of the sentiments expressed in our writing. I have made my subjects describe the impressions received in this manner, and I would mention the result of one of my experiments made last winter in my chamber with Mr. Inman, brother of Henry Inman, the distinguished American artist, to whose politeness I am indebted for the delivery of these lines. I placed in Mr. I.'s hands four letters unopened—all from men of marked character—one of whom was Professor Caldwell. Holding each between his hands, without even seeing the superscription, he gave his impressions in reference to the men from the effect they produced upon him. It is no exaggeration to say, that I could not myself have given a more correct description. (I beg you will bear in mind that my operations are *always* conducted in the natural state,—no mesmeric preparation or somnolence is permitted).

"The question has probably occurred to your mind, how far the mesmeric sympathy between the operator and subject interferes with the results in the cerebral excitements which I practise. I do not doubt that those who proceed according to formulæ of mesmerism alone, may be deceived from that cause. I believe the experimenters in England, as well as the United States, have operated almost solely in that condition of the system with which mesmerism had made them familiar, and have not adopted any simpler plan. I have the best evidence that my mental condition or design does not control the results in my subject, as I have necessarily often mistaken the positions of organs, and found it entirely impossible to develope their functions until I touched the exact

* "The *nervaura* of each organ radiates and passes through the atmosphere, but with less facility than through good conductors, as flesh and metal. There are very few *non-conductors* of the nervaura. Hair, bone, feathers, beeswax, and a few other substances, have the best claims to that title. Glass is a pretty good conductor. All forms of cerebral action, whether *thought or feeling*, admit of radiation and conduction from the brain. I have no doubt that impressible constitutions may be found capable of catching and describing these radiations. My experiments, however, have been chiefly by conduction."

Hosted by Google

points of their location. I always find the organs lying in fixed and certain positions, and their functions equally certain. Like the keys of a musical instrument, they respond only when touched; and if we have a good instrument, we elicit a full and distinct note (invariably the same) at every point we touch.

"The impressible constitution, which I have sometimes called my psychometer, gives me the means of making an unlimited *diagnosis* of all others. It feels and manifests every physiological action, morbid or healthy, and every mental action resulting from the influence of any part of the brain with which it may be brought into contact. By this sympathetic diagnosis, I have found it practicable to explore the functions of the living brain—*to trace the boundaries of convolutions* by the aura which they emit—to discover the degree of natural or artificial activity in the organs, and to ascertain the states of health and disease throughout the system. Have you fallen upon those things—and if so, how far have you carried them? The *cultivators* of science are few and far between. In our own country, Lilas Jones, Esq., of New York (author of a very respectable volume upon phrenology, etc.), has taken a most active part in the philosophical cultivation of neurology. Dr. S. Fonz, author of 'Climatology,' etc., has taken a lively interest in the subject. Professor Caldwell, as usual, has been a bold and fearless advocate of truth. In Great Britain I fear you have the same complaint to make. Scientific men dread new truths. The Edinburgh men I fear are cold-blooded conservatives. It will give me much pleasure at any time to hear from you, or to receive any document showing how the cause of truth is going on, or what is your individual progress. If I can reciprocate the favour in any way, command me as you please. Receive the assurance of my higheet respect, with the hope that you may live to be as justly appreciated and admired by all your contemporaries as by "Your humble servant,

"Jos. R. Buchanan."

"Louisville, May 12, 1843.

"My dear Sir,—By the politeness of my young but distinguished friend, Dr. Buchanan, I am permitted to add a brief postscript to his letter to you. Of this I avail myself the more promptly, and with the higher pleasure, because it affords me an opportunity to offer you an assurance of the lively and grateful remembrance I cherish of the many favours and courtesies I received from you in London. It is also peculiarly gratifying to me to be able to assure you of the entire confidence you may place in the Doctor's statements (strange and startling as they may appear to you) respecting his experiments in neurology. I have not myself either witnessed or performed all those experiments; but from those which, I *have* witnessed, and from what I know of Dr. Buchanan's character, I entertain no shadow of doubt in relation to the others.

"We live in most eventful times. I firmly believe, and have long believed, that we already perceive the dawn of a new epoch in anthropology, which. through discoveries in relation to the nervous system (the brain of course included), is destined to throw into 'shadows, clouds, and darkness' all our previous knowledge in that important branch of science . . . . .

"With the most distinguished regard,

"I have the honour to be, my dear Sir,

"Yours, very faithfully,

"Ch. Caldwell."

It is somewhat singular and worthy of note, that Dr. Buchanan should have broached such intensely interesting views nearly *two* years before the publication of Reichenbach's Researches. Between the latter—Dr. Buchanan's "*psychometer*" and Mr. Rutter's magnetoscope (if found to be all that its scientific inventor confidently predicates), there will be found to exist, in my opinion, an intimate and indivisible connection.

It will no doubt interest your readers to know that Dr. Buchanan is one of those who, when the "Eclectic Medical Institute" of Cincinnati, Ohio, in 1849, determined on establishing a homœopathic professorship, warmly supported the appointment, to fill which, Dr. Storm Rosa, of Painesville, was elected by the State Homœpathic Convention, to whom the nomination of a professorship was entrusted.

Dr. Rosa thus writes, which makes us acquainted somewhat with the liberal character of the "Eclectic Medical Institute" of Cincinnati, as well as the character and attainments of Dr. Buchanan, the distinguished author on Neurology.

"The unequalled liberality of this Institute is displayed not only in the establishment of a chair of homœopathic medicine, but in the appointment of a homœopathist, Dr. H. P. Gatchell, to the Chair of Anatomy. These things were done, too, at a time when the Institute was not obliged to look to collateral aid for success, but when it was in a most flourishing condition. It had already advanced in four years from a class of fifty to one of a hundred and fifty.

"While other schools had nothing but ridicule and misrepresentation to bestow upon homœopathy, the professors of this school were accustomed to speak of it with respect, and to commend its claims to the attention of their students.

"Such magnanimity should not pass unregarded. It is not so common as to justify us in holding it cheap. And I trust that there is sufficient generosity among homœopathists to enable them to appreciate it at its true value. There is no reason to apprehend a disposition on the part of the students of this school to treat homœopathy with disrespect, when their teachers are of such a stamp.

"I am now lecturing to a class of nearly one hundred and seventy students, and have among them a large number who design to graduate as homœopathists than has the Philadelphia school in the second year of its existence. With the homœopathists of Cincinnati the chair is decidedly popular, and is daily becoming so. The chair is a permanent one, and western physicians may send their pupils in the confidence that they will have an opportunity of learning ho-

Hosted by Google

mœopathy with as perfect an exemption from unfavourable influences as in any other school.

"No inconsiderable inducement to attend this school is found in the fact, that Dr. Buchanan, the Professor of Physiology, not only recognises the truth of the law *similia similibus*, but has also developed a profound and beautiful system of physiology, that analyses the human constitution more thoroughly and exactly than any previous system, but also affords a better basis for pathology and Materia Medica. I anticipate great benefit to the science of medicine from the splendid discoveries of Dr. Buchanan. And I hope that homœopathists will manifest the same liberal spirit towards the results of his labours that the Eclectic School has manifested towards homœopathy."

The gigantic spread of homœopathy in America cannot be wondered at, when we are informed that, independent of the number of students qualifying at the homœopathic schools, Dr. Rosa is lecturing at the Eclectic Medical Institute, in 1850, "to a class of nearly *one hundred and seventy* students, and has among them a *larger number who design to graduate as homœopathists* than has the Philadelphia school in the second year of its existence."

After this, our British universities and schools of medical education may take a hint—their professors and teachers learn wisdom; for *they* as well as *we* "live in most eventful times."

Yours faithfully,

Brook Street. D. WILSON.

THE "ODOMETER."

To the Editor of the Homœopathic Times.

SIR,—Mr. Wilson's interesting letter in your last number instantly set me to work to test the experiments therein recorded. I think I have detected the cause, or one cause, of the "discrepancies" mentioned as having occurred with different experimenters, both as respects Mr. Rutter's Magnetoscope and Caspari's Odometer. At first, my success in repeating Dr. Mayo's experiments was very striking. But, as with Dr. Mayo, the results soon began to be "capricious and contradictory," and this in spite of all precautions. It now occurred to me that the *will of the operator* might be at least a modifying force, if not indeed the sole cause of the various movements of the pendulum. Subsequent experiments, conducted by myself and by several of my friends, confirm me in this opinion. That the will of the operator is the sole moving power, I cannot yet assert; I merely suggest its possibility. Nor can I deny that the substances named by Mr. Rutter, Dr. Quin, and Dr. Mayo may exert specific influences on the pendulum. Indeed, my first trials (in which I had certainly no *intention* of willing the movements) gave different kinds of oscillations, according as the pendulum was held over gold, silver, copper, etc. It also appears to me, that the oscillations in a direction to and from the person of the operator are more easily produced than those from right to left and back again. Still, even in the first trials, I might unwittingly have had in my mind the idea that the pendulum would move in a certain direction. If this subject has not already engaged the attention of Mr. Rutter (and no mention thereof occurs in the able lectures of Dr. Quin), I would venture to suggest it to him. Mr. Rutter indeed believes that, under similar circumstances, the result of each experiment is always the same, whether or no the operator is aware beforehand what that result will be. But the Magnetoscope has with other operators given rise to certain discrepancies. The experiments I made were conducted, not exactly with the instrument described by Mr. Rutter, but with the very simple apparatus employed by Dr. Mayo, or a modification of it. Now for the results.

Make a pendulum, consisting of a sovereign, (or a bit of sealing-wax, or of wood), attached to a piece of silk thread (or of common string). It is probable that the silk or string attached to almost any other solid substance would answer as well; but the above-named articles are those to which I confined myself. The results were exactly the same, whether gold, or sealing-wax, or wood formed part of the pendulum. They were the same, whether the pendulum were suspended over a sovereign, a shilling, a penny, etc., or whether simply suspended over the table; *i. e.*, in all cases *it was the will alone which produced the results.* The experiments succeed best when the silk or string is attached immediately to any part of the operator's hand, without any intervening substance. But, in order to remove the suspicion that the oscillations might be unwittingly influenced by slight movements of the fingers or hand, I have also attached the pendulum to a fixed point, *e. g.*, to the frame of a picture; and on touching the loose end of the string, above the point of attachment to the frame, the pendulum was still completely under the control of the will, but the movements were fainter, and excited with greater difficulty. When my eyes were shut, or when I did not touch any part of the string connected with the pendulum, the will had no influence. Placing dead animal substances upon the operating hand never produced any influence upon the vibrations. When a person, having a feeble concentrative power, and who was therefore unable firmly to fix his attention upon a given direction of the pendulum, conducted the experiments, the oscillations were correspondingly feeble and uncertain; but when I placed either of my hands upon the engaged hand of the operator, I easily and powerfully influenced the pendulum. It may here be observed, that in some few experiments which I have at different times made, with the view of "mesmerising" various persons, I have never succeeded in producing any result.

I thus found that in whatever way my hand was connected with the instrument, I could invariably, by my will alone, almost instantly cause the pendulum to oscillate in any given direction. It is merely necessary for me to think of any special direction, or of a cessation of movement, and the pendulum immediately acts accordingly. The effort required to produce these results is very slight. In this way

Hosted by Google

the pendulum can be caused to move backwards and forwards from the person of the operator; or from right to left, and back again; or in any direction between these two currents; or elliptically; or in a circle, either "normal" or "reverse;" or, lastly, it can be brought to a dead stand. The movements may be rendered fainter or more marked at pleasure.

In concluding these hasty notes and suggestions, it is only necessary to remark that they are offered as facts, unaccompanied by theory; that I know not if similar results have previously been noticed; and that, with due precautions, any person can immediately confirm or refute them by repeating the experiments.

I am, Sir, your obedient servant,

A PHYSICIAN.

London, Oct. 30, 1851.

To the Editor of the Homœopathic Times.

SIR,—Having been privileged to be a witness of the experiments performed by Dr. Madden at the Hahnemann Hospital, on the 21st instant, I have been rather surprised to observe that none of your correspondents have suggested what appeared to me to be their true explanation, viz., that all the movements of the pendulum were due to involuntary motions of the operator's hand.

My reasons for coming to that conclusion were numerous and weighty; among them were the following:—

First. It is a well-known fact that ideas in the mind do excite such movements in the hand and fingers as well as in other parts of the body. The common experiment of suspending a ring in a glass, and finding that it will (in a large number of cases) strike the hour against its sides, establishes this point.

Secondly. I ascertained that exceedingly slight motions of the fingers, when applied to Dr. Madden's instrument, had the effect of producing all, or nearly all, the various motions of the pendulum which he had shown us.

Dr. Madden also expressly admitted (subsequently to the lecture) that motions could be so produced; and while declaring himself thereby convinced of the reality of the force supposed, avowed his want of perfect satisfaction with his instrument as a means of demonstrating it. He stated also that various contrivances had been employed to obviate this defect, but that hitherto it had not been possible to produce the movements on any instrument in which such communication of motion was *impossible*, owing, as he conceived, to the dissipation or non-conduction of the force, in accordance with the known laws of electricity.

Thirdly. After the lecture, Dr. Madden kindly consented to make various additional experiments; one of which was the following. Having established the normal motion by his right hand, a letter, written by a gentleman, was placed in his left in such a position as to be out of his sight: *the motion was reversed*. After the normal motion had been re-established, a letter, written by a lady, and received that day by a gentleman present, was placed in his hand, with a blank leaf only visible: the motion was not affected.

Several experiments were made with globules, the nature of which was unknown to him; but as the results were doubtful, and he was at the time in a state not only of exhaustion but of pain, it would not be fair to dwell upon them. I would remark, however, that the fact of the *reversal* of the current by a gentleman's letter proves that there must be a power capable of producing such an effect, of which Dr. Madden has not taken cognizance. My own opinion is that that power was the idea in his mind that the letter was a lady's, and that the reason why the lady's letter did not reverse the motion, was the idea that it was a gentleman's.

I would not have written this letter, if I could suppose for a moment that I should be understood as making any charge of deception or contrivance against Dr. Madden. Such a thought is as far from me as it can be from any one. To my mind, the experiments are of the most intense interest, as tending greatly to enlarge our physiological knowledge, for they go to prove an intimacy of connection between the bodily and mental states, which, without such evidence, we should hardly conceive possible, and thus throw a most valuable light upon many of the most obscure and apparently unaccountable facts connected with our nature. Not that the principle is new. We see hourly illustrations of it in the ever-varying expressions of the human face—expressions produced, as is well known, by involuntary and unconscious muscular movements, which follow with the most marvellous rapidity and exactness all the various shades of thought and feeling.

I might adduce many other arguments in support of the view I have taken, but I am unwilling to trespass on your space. I would merely suggest that the different motions obtained by different individuals, and the fact stated by Dr. Madden that *practice* is desirable in order to produce them with accuracy, are very significant of their real nature. I have not had the happiness of witnessing the results obtained by Mr. Rutter; yet I cannot but think it probable that they are referrible to the same physiological law, and will be found to be so on farther and more complete examination.

I am, Sir, your obedient servant,

London, Oct. 27, 1851. J. H.

MR. RUTTER'S MAGNETOSCOPE.

To the Editor of the Homœopathic Times.

SIR,—I have already expressed, in my letter of the 28th, the hope that those of our number who have become interested in the statements made by Dr. Quin and myself, respecting the applicability of Mr. Rutter's Magnetoscope to homœopathy, would be cautious as to the opinion they might feel disposed to form, as I considered it too soon to decide positively as to its merits. It is, I can assure you, no pleasant duty which I have now to perform, viz., to make known the fact that my recent experiments have detected a most serious source of fallacy in all the previous ones, and go far to show that it will be of

Hosted by Google

little or no real value to us as demonstrating the action of homœopathic remedies. Some days before I delivered my lecture at the Hahnemann Hospital, I had discovered, to my great disappointment, that the instruments employed by myself and Mr. Rutter were not so fixed as they appeared to be, and that every slight *voluntary motion* of the operator's arm was sufficient to produce any of the various movements. I therefore begged of Mr. Rutter to devise some modification of the instrument, for the purpose of overcoming this source of fallacy, or, rather, as I then felt, of preventing sceptics from declaring that the motions were *manufactured*, in place of being induced by the passage of a current. Mr. Rutter, however, was and is so convinced that he is altogether *passive* during the experiments, that he cannot see the necessity of any modification of the original machine. I should mention here that it is a very difficult thing to devise an instrument which shall be absolutely rigid, and in the construction of which none of the laws of induction shall be infringed. Many apparently unexceptionable instruments have been devised which have failed, but the failure could always be accounted for by the infringement of some of the known laws of induction. I am so strongly impressed with the fact, that the mere possibility of producing these movements voluntarily, reduced the whole series of experiments from the high standing of a demonstration down to the much less satisfactory one of individual testimony, and I knew so well that unconscious muscular movements occur in us every day, that I resolved to sift this matter to the bottom; do, if possible, what Dr. Quin already believed Mr. Rutter had effected, viz., to "leave no loophole for scepticism." We all know that winking is a voluntary motion, and yet, unless we are actually attending to our eyelids, we are altogether unconscious of this muscular movement. Now it was long ago pointed out to Mr. Rutter, and he has fully acknowledged the fact, that *unless you pay attention to the pendulum no definite movements take place.* The idea occurred to me that possibly this attention to the pendulum drew off my attention from my own body, and that I might accordingly make unconscious muscular movements capable of influencing the machine. I determined, therefore, to watch the pendulum and attend to my own sensations at the same time. I found, to my dismay, that when I resolutely determined not to move my body in the slightest degree, *no motion of the pendulum took place when I held the instrument in the usual way.* It is of great importance to note here that when I attended to my sensations I did not become conscious of any muscular movements, and it was only by a conscious voluntary determination to remain rigidly in one position that I checked the action of the pendulum. Thus far my investigations had proceeded on Monday, Oct. 20th. I accordingly had an interview with Mr. Rutter, for the purpose of communicating to him my doubts and fears, and had determined, in the event of his sharing in them, to give up my intended lecture of the next day; Mr. Rutter, however, assured me that he could contrive an unexceptionable instrument, albeit he could not see the necessity of altering his present one, and in the hope that this would soon be done, and being still confident that I remained passive during all the regular experiments, I proceeded to London the next day, and delivered my lecture at the Hahnemann Hospital, which step I have never ceased to regret, for the following reasons. As soon as possible after my return home, I commenced an elaborate series of test experiments, which have now been repeatedly performed in the presence of several friends, among others, before Dr. Sutherland of Leamington, and Dr. Dudgeon, and which tend strongly to corroborate my fears respecting the trustworthiness of the experiments; for I find—1. That in the ordinary condition of the magnetoscope, *any motion which is anticipated invariably takes place.* 2. *If I apply merely the point of any of my fingers to the brass ball and wish for any motion to occur, it takes place immediately, without my being conscious of any muscular motion on my part.* 3. If a medicine is put into my hands without my having any possible clue to its nature, the motions no longer coincide with my former observations; so much so indeed, that of *six medicines which have been tested in this way four times each, no one agreed more than twice, and two of them gave different motions every time they were tested.*

An important point, however, still remained to be proved, viz., whether the movements were produced by unconscious muscular motions communicated to the instrument, or whether they were really due to currents set in motion by the exercise of the will. To ascertain this, I arranged a series of experiments, from which it appears, that whenever a machine is so constructed as to admit of the greatest effect being produced by the smallest amount of mechanical motion, (which is unfortunately the case with Mr. Rutter's instrument, it being in fact a combination of three levers acted upon at the most advantageous point, to obtain the greatest effect from the smallest efforts,) such machine will act perfectly as a magnetoscope, even though all the known laws of induction are set at defiance in its construction; while, on the contrary, *every modification of the machine which increases its immobility, decreases in the same proportion its apparent sensibility to the so-called magnetic currents.* Under these circumstances, I fear we are bound to conclude that Mr. Rutter's magnetoscope in its present form is not applicable to experiments with homœopathic remedies; nay, more, that the very existence of magnetic currents passing through our bodies cannot be said to have been proved, until the experiments shall have been successfully repeated upon a more perfect instrument. I do not mean to deny that there is much which is very curious, and much that demands further inquiry in Mr. Rutter's experiments, but the time has evidently not yet come for drawing any practical conclusions from the resnlts of his researches.

I have the honour to be, Sir,

Yours faithfully,

HENRY R. MADDEN.

"RESPICE, ASPICE, PROSPICE."—St. Bernard.

No. 120. Vol. III. | SATURDAY, NOVEMBER 15, 1851. | Stamped 4d. Unstamped 3d.

Communications.

LETTER TO ROBERT CHRISTISON, M.D., V.P.R.S.E.,

AND PROFESSOR OF MATERIA MEDICA IN THE UNIVERSITY OF EDINBURGH.

No. VI.

Sir,—It is a principle held by many of the most humane men that, in order to preserve peace, it is necessary to be always prepared for war. This axiom is not likely to fall into oblivion with us homœopathists; indeed, for the future, we shall hold it steadily before us. I have chalked out for my guidance in any future communications addressed to you, or to any other member of your party, whose mode of entering the field of controversy is such as a gentleman can with propriety take notice of, four chief objects of attention, viz., first, to strike a balance, from time to time, of our ethical account, according as the items accumulate; indeed, we shall settle at short dates, as annual accounts are inconvenient in various ways.

Secondly. To keep a strict observation on the advancement in allopathic therapeutics in general, and as illustrated by the "Monthly Journal of Medical Science" in particular.

Thirdly. To analyse any allopathic *logic* on homœopathic doctrines (and we are not likely to have anything but logic) we may, from time to time, be favoured with.

Fourthly. To illustrate these subjects, deeds, and actors in such a manner as may subtract therefrom the usual monotony of medical subjects, so as not to frighten either allopathic or homœopathic readers.

Should any omission of importance occur to my memory at any time, I reserve to myself the right to fall back upon it. For instance, in Letter No. III., line 26 of first column, I stated that you had no diuretic that, in a strict sense, could permanently increase the elimination of solids from the system. It has since occurred to me that my mode of expressing this assertion is imperfect, for my homœopathic studies have not rendered me forgetful that certain *Salts of Potash* do (so long as they are taken) in some rare cases only increase the elimination of solids. The spirit of my assertion is not one whit invaded thereby. Stop the *Salts of Potash*, and see how long natural elimination will proceed; persevere with the *Salts of Potash* for a long continuance, with this view, and tell us the condition of muscular fibre, the firmness of nervous force resulting therefrom. Have you any proof besides, that the increase of solids, during the action of *Potash*, is identical with natural secondary assimilation—that it is the effected solution of animalization, and not simply the alkali itself? But if any allopath does say so, and were to act upon it, and to treat with *Salts of Potash* all cases where a deficiency of elimination is the characteristic symptom, he would fill the churchyard with more than wonted speed: it would be a therapeutic advancement with a vengeance. But in allopathic books there is no caution against it, so that any youthful graduate may go upon the principle for a season, until he finds out that it is only in a *few rare cases* that the danger is trifling.

Before entering upon our arrears of criticism, I have to ask you upon what grounds, at the late meeting of the Senatus Academicus of Edinburgh, a "motion of impropriety" was filed against Dr. Henderson for his publication of the famous "*Resolutions*" of your "Faculty?" You make "Resolutions" chiefly directed to one man as representing a body, with sternness truly Roman, if not with Roman wisdom (we use the adjective in the classical and not in the ecclesiastical sense); and you have the *common sense* to expect him, who is persecuted, to keep the Faculty's secret. Really, Sir, we fear you have not been dipping into Glassford lately. We wonder much whether law fraternized this time with physic, or whether theology decided on the infallibility of the pestle and mortar. I should rather say they did not, for the "motion" disappeared as suddenly as if it had been assisted on its way by "five grains of *Extract of Colocynth* and *two* drops of *Croton Oil*." But this sudden settling showed that I was right when (in a former letter) I stated that there was not so much difference between allopath and homœopath as is generally imagined. A cock upon his own dunghill looks imposing

Hosted by Google

so long as the sun shines, but just look at him under a cart towards the afternoon of a rainy day, and a very marked difference indeed may be observed.

Taking up my analytical position from the date of your October issue, I find a paper by Mr. W. Kerr, on "The Utility of *Persesquinitrate of Iron* in Ague." You will remember how strongly this paper speaks for *specific action*. Again our systems approximate, when the unpalatable word "homœopathy" is left out, and allusions to infinitesimal doses are dispensed with. You will observe how *your* specific as well as *ours*, *Quinine*, failed in some cases; *Arsenic* in others; and that Mr. Kerr's *Salt* cured a fair proportion of them. I could tell you of other forms of ague, which neither *Quinine*, *Arsenic*, nor *Persesquinitrate of Iron* can do anything for, but which will readily enough yield to *Bryony*, to *Phosphorus*, and to *White Hellebore*. I only want your acknowledgment of the *specific action* of this *Salt of Iron*, to admit your advancement of a step in therapeutics.

It gladdened my homœopathic heart when I hit upon Dr. Welti's specific for puerperal metritis and peritonitis, at page 379. But it must have been a sad trial to you to make the following quotation from his paper: "Dr. Welti was, in the year 1836, led to the employment of this remedy (*Oxalate of Potash*), by finding in a periodical an extract from an English journal to this effect: 'that *Oxalate of Potash* is a substance which, in the *normal condition*, acts *disturbingly (storend)* upon the intestinal canal. What, therefore, acts in *this manner* in the *normal condition must*, under circumstances of morbidly exalted activity, act as a sedative (*herabstimmend*)!!'" The points expressive of wonder, I presume, are yours, and not Dr. Welti's. You accept his cure, however, and pitch his theory to Davy Jones. I cordially agree with Dr. Welti, whose good taste kept out *homœopathy*: a name is but a jackstraw; I won't quarrel with him on the point. No one can read Dr. Welti's history of forty-four cases of puerperal inflammation (with one fatal case only) without being struck with the marvellous effects of *Oxalate of Potash*; but having no grounds whatever for doubting the correctness of the statement, I shall keep it in mind for special experiment, both in the healthy and puerperal state. Willing, therefore, indeed grateful for a homœopathic hint from Dr. Welti, or Dr. Anybody, I would rather have had the *Oxalate* on its own merits, than damped by the occasional combination of *Hyoscyamus*, *Nitre*, or *Aqua Cerasorum*. But in this list of forty-four cases, is one of special interest to you, to me, and especially to the public, whose veneration for the medical faculty is not quite so deep as it was; and the result should be engraved on the gates of every medical licensing body in the United Kingdom, and stamped on the boards of every medical book entered at Stationers' Hall, viz., *that the only case treated by bleeding, leeching, and Calomel, in accordance with the dicta of the schools, died;* and so little confidence had Dr. Welti in such treatment, that he prophesied the fatal termination. Dr. Welti, I think I may shake hands with you: don't poke your homœopathic fun any longer at the "Monthly Journal," but admit the soft impeachment. I have no idea what position you occupy in the scientific range, but you are clearly not cut out for succeeding with the colleges. I rather think you will no more be seen in the pages of the "Journal;" but we acknowledge this to be a step in advancement, particularly the record of the fatal case.

I am most anxious to record the early signs of improvement in your therapeutic code, and I give the two cases above recorded to show that, when you do make a forward step, it is by the appropriation of the principle of Hahnemann. Never mind *infinitesimal doses*—the principle gives considerable latitude in that respect; but with any advance you make I must not forget your retrograde motion, and when I examine into the paper on *Sarcina ventriculi*, page 382, I find you slipping downhill with a vengeance. This was a chronic case of a worn-out man, one especially illustrating a deficient amount of vitality, all the functions languishing, and periodically vomiting up a miniature cabbage garden, technically called "*Sarcina ventriculi*." Whilst an *out-patient*, he tried (but whether in combination or singly is not stated) *Nitrate of Silver*, *Prussic Acid*, *Creosote*, *Morphia*, *Henbane*, and *large doses of Carbonate of Soda*; the *Morphia increasing the pain, although it produced drowsiness.*"

No one can deny that this was a tolerable beginning, a pretty fair round of pretty potent drugs; and as they did not turn out to be *remedies*, we wonder very much what they are doing in James Martin's organism at this present moment. It is quite possible they may have a precious kick-up there some of these days, and a talented physician be reduced to the official dignity of "bottle-holder." We are distinctly told that James Martin "did not improve" under this particular medication; therefore

Hosted by Google

a change was necessary, and the change decided upon was "five grains of *Extract of Colocynth* and *two drops of Croton Oil*" *!!!—two* drops, mind you. As no mention is made of James Martin's digestion being very slow, we cannot imagine to what end, save a latter end, this battery of six-pounders was directed. But as, contrary to all expectation, and singularly true to allopathic uncertainty, *very trifling results* accrued, it is possible the five grains of *Extract of Colocynth* and two drops of *Croton Oil* fraternized with some congenial "sarcinæ and torulæ," and that vigorous plants of Croton tiglium and Cucumis colocynthis are in happy harmony vegetating in James Martin's "bread-basket," for no improvement in James Martin's condition followed *that*. Well! this was but a bad shot, but it is recorded manfully, for a therapeutic triumph is about to follow, after all. Three weeks of a different medication followed, during which we are informed that "the drugs given during the same three weeks were *Hydrocyanic Acid, Acetate of Morphia*, and *Sulphate of Zinc*," you won't forget that he had previously taken *Creosote, Nitrate of Silver, Extract of Colocynth*, and *two drops* of *Croton Oil*: still no cure—the "sweetness" of all these drugs had been wasted on the "desert air" of James Martin's internal organs. But a happy thought occurs, not to the physician, but to the physician's friend, which friend remembered that "Professor Graham" (we would forgive Dr. Malden if he would only come here and laugh with us) "had suggested the employment of *Sulphurous Acid* in cholera, when that disease was *supposed*" (oh dear!) "*to depend on the presence of a fungus* in the intestinal canal, as the agent *most* destructive to vegetable life, and at the same time one that might be involved in the *human stomach with impunity*." An eagle eye instantly acknowledged the identity of James Martin's toadstools with Professor Graham's exploded fungus in cholera, and *Sulphate of Potash* was ordered on the spot, with the intention of producing an unlimited supply of *Sulphurous Acid*, and blowing the toadstools to—we won't say where. The *Sulphate of Potash*, however, was not allowed to fight the toadstools singly, but was occasionally reinforced by *Carbonate of Soda* and *Sulphate of Zinc*. So long as the *Sulphate of Potash* was used the sarcinæ disappeared, but under *Carbonate of Soda* the torulæ vegetated rapidly. This part of the treatment extended from 1st of April to 1st of July, by which time great improvement in appearance, pain, and vomiting had taken place. There was some fear, however, lest this improvement should be laid to the account of diet; for we are told that James Martin relapsed into the toadstool diathesis whenever the *Sulphate of Potash* was discontinued. It is said to any one thus supposing, "Not at all, for Martin had had a pretty liberal supply of arrow-root, *beef-tea, mutton, milk*, bread, and potatoes, with two ounces of rum daily. Sometimes the meat has been replaced by fish; sometimes the diet has been chiefly animal, sometimes vegetable; but this has exerted, *apparently*, no influence on the formation of *sarcinæ*;" and it is concluded that, "were it necessary for this man to continue its use (*Sulphate of Potash*) *for life*, it would be *no great trouble*." James Martin, therefore, had *no care* as to diet, in limitation at least, but had much care *in abundance of good food*. As the *cure*, therefore, was only on the condition of the remedy being *continued for life*, it was most lucky for James Martin that it was not the two drops of *Croton Oil* that happened to be *the remedy*. It would have been still luckier had the physician hit upon his friend sooner, before the *Nitrate of Silver, Prussic Acid, Morphia, Henbane, Soda, Colocynth*, and *Croton Oil* were exhibited. Take care of yourself, James Martin! be most particular to keep clear of lighted candles, or you may "*blow up*," and

> "Like the baseless fabric of a vision,
> Leave not a rack behind."

The physician is quite decided, however, that a worn-out man, with a pulse at 60, reduced to the extremity of entering a charitable institution, is "not at all" indebted to the beef-tea, mutton, milk, bread, fish, vegetables, and rum, but is ready to make affidavit that *Sulphate of Potash* metamorphosed him into soundness of digestion. But methinks I hear some one exclaim, "You forget the direct evidence afforded by the fact that the sarcinæ return directly the *Sulphate of Soda* is omitted." To this we repeat, "Not at all;" but try *Sulphate of Soda*, and leave out the beef-tea, the mutton, milk, bread, fish, vegetables, and rum, and give us the results. Then had *Sulphate of Soda* (it was *Potash* originally, but somehow has been converted into *Soda*) no power? It had decidedly, and that a chemical power too; it dissolved the fungi in the stomach nearly as fast as they were produced, but it did nothing to prevent their reproduction; but the beef-tea, the mutton, the milk, fish, vegetables, and rum gave the patient a good push uphill; and so long as James Martin can keep that diet table going, he may grow his mushrooms for Covent Garden. We have a Hahnemannic respect for the name of

Hosted by Google

the great discoverer of the specific effects of vaccination, and we wish it had not been despoiled of its common-sense character by rather *too much* science. The Scotchman's definition of "metaphysics" comes uppermost, *nolens volens*: "When folk dinna ken what the minister's sayin', and when the minister dinna ken what he's sayin' himsel', that's metaphysics." It sometimes does duty for them, at any rate.

We observe with some interest that your "Monthly Journal" declares the obstetric value of *Chloroform* as lately "looking down" in the medical share-market. M. Chailly Honoré has given it an awkward poke downhill, which, in addition to the frequent sneers served out to it on this side the Tweed, renders it somewhat uncertain whether you were justified in placing it in your noted "Inaugural Address" cheek-by-jowl with "the Modern Treatment of the Calculous Diathesis;" but it being the adaptation, if not the discovery of a colleague who has sadly put at defiance your "*criterion*," it is only what he deserves; but when this colleague's mesmeric drawing-room entertainments fade from the memories of those who attended them, and when the Baron Von Reichenbach's translation is out of print, you may then, but not till then, publish such a notice of "False Homœopathic Reports" as is in your November issue, and Drs. Knowles and Stewart (who, as graduates, listened to your Inaugural Address) may testify to the veracity of the allusions to homœopathic graduates.

I have the honour to be, Sir,
Your very obedient servant,
Nov. 6, 1851. SIGMA.

THE MEDICAL TIMES.

THE Editor has very fairly given insertion to Dr. Dudgeon's reply to Dr. Routh, but as our correspondent *Sigma* has dealt excellently with that gentleman, we need not dwell on that point, beyond saying that Dr. Dudgeon has, we think, answered Dr. Routh most satisfactorily.

In the review of Dr. Ransford, there are some imputations on that gentleman's motives and character which are very unseemly, and we believe to be altogether unfounded. He was undoubtedly held in very great respect and admiration, testified by a presentation of plate, by the Fellows of the Edinburgh College of Physicians. On his declaring his conviction of the truth of homœopathy, the respect has been turned into contumely, and the admiration into slanderous censure.

Our contemporary, however, is passably quiet in this number on the subject of homœopathy, and we trust he will find it consistent with his editorial duty to leave us alone, or to conduct the controversy without the introduction of coarse and offensive epithets. In that department of writing he can never equal the *Lancet*, but in all others he greatly excels that journalist.

THE LANCET.

THIS notable journalist assaults, *more suo*, the *British and Foreign Medico-Chirurgical Review*—an eclectic journal—for "its support of quackery," because the discoveries of Reichenbach and others in magnetic science are impartially considered by the reviewer.

We find this patronising notice of a medical bookselling house:—

"MESSRS. HIGHLEY & SON *versus* QUACK PUBLICATIONS.—The profession will be much gratified on being made acquainted with the important fact, that Messrs. Highley and Son, the eminent medical publishers of Fleet Street, and booksellers to the Royal College of Surgeons of England, have declined the further publication of all homœopathic, hydropathic, and other works devoted to the advancement of quackery."

We give these important and august personages the full value of our notification of the fact, simply stating that we see on the cover of the last number of the *British Journal of Homœopathy*, October 1st, 1851, the name of Samuel Highley as the publisher.

On the whole, our fierce antagonist is gentle in this number—for him. We suspect he and our other assailants will soon discover, if they have not already done so, that they have been *writing us up*, while it was their autocratic purpose to *write us down*. We rather think that in ten years from the present time there will not be 25,000 allopathic practitioners in the kingdom; that is said by Dr. Crisp to be their present number. We give one leader from the *Lancet* for the delectation of our readers.

"According to intelligence we have received, our hints to the students of the University of Edinburgh respecting the removal of their globulistic professors will not be thrown away. We are, moreover, assured that those of the professors who have kept aloof from all tampering with globulism and its practisers, would be delighted to leave the matter in the hands of the students. It is rumoured that another effort is to be made by the professors to purify the chairs, and that pending this, students will be encouraged to absent themselves from the classes f the obnoxious teachers. As we have already

Hosted by Google

said, the best way to empty the *chairs* would be first to empty the *benches*.

But we trust the Scotch students will, for the honour of their National University, take some steps beyond mere absence and silence, to show their disapproval of the state of things which has been permitted during the last seven years. The Town Council is, we are told, to be memorialized strongly by the Faculty of Medicine. Let the students send in *their* Memorial—nay, let them present it to the Town Council in a body, so as to show these anomalous patrons of learning that medical students are anxious that the sources from which they derive their knowledge shall be pure. The disputed professorships in Edinburgh is really A STUDENTS' MATTER. The continuance of globulistic professors will injure the character of the students, and the rising generation of medical men in Scotland, far more than it will damage those now established in practice. In London, globulism is felt to be a matter in which the honour and credit of our students are intimately mixed up. It is for this reason that the students' societies of our hospitals and schools have met to repudiate all connection with the globulistic quackery, or with those who follow it. The coming November will be a time of no mean import to the University of Edinburgh; and if the students do not behave manfully, great and long-continued mischief must be the result."

THE
HOMŒOPATHIC TIMES.

SATURDAY, NOVEMBER 15TH, 1851.

CORRESPONDENCE BETWEEN MR. NEWMAN, AND THE PRESIDENT OF THE COLLEGE OF PHYSICIANS.

THE crowded state of our columns has prevented the appearance till now of the correspondence between Mr. NEWMAN and Dr. PARIS.

Mr. NEWMAN is well known as a homœopathist, and a successful practitioner, of long standing. Most of our readers are aware that he underwent a pretty sharp fire of persecution some years ago, on account of his therapeutical views. Dr. PARIS is known as a pharmacologist. We quote the opinion held of him by the Editor of the *Medical Times*, in preference to giving our own. That Editor thus addresses his correspondent M.D.: "The examination of the Royal College of Physicians is much less severe than might be supposed from the printed papers of questions. *Like many shopkeepers, they take less than they ask.* The Latin *vivâ voce* examination would be the broadest farce, if all humbug were not tragedy. What would CICERO say or do, if he heard the President of the College 'talking Latin?' He would not be able to hiss, for his breath would be exhausted by his laughter. We recommend the subject to *Punch*."

The person, so scantily supplied with learning, pronounces *ex cathedrâ* that his College was founded "for the purpose of guaranteeing to the public skilful and safe practitioners."

Does he know the history of medicine, generation after generation, from the foundation of the College till now? Let us take a single disease—small-pox. Time was when the "skilful and safe practitioners" of Dr. PARIS wrapped their small-pox patients in red blankets, gave them warm cordials, and excluded every breath of air.

Time was when the "skilful and safe practitioners" refused to adopt *inoculation*.

Time was when they refused to adopt *vaccination*, and Dr. MOSELEY, one of the fellows, *inter alios*, wrote a fierce diatribe against *vaccination*.

Look, again, at their prescriptions for patients suffering from this disease. What an awful jumble and farrago!

If Dr. PARIS is a "skilful and safe practitioner" for the treatment of small-pox, it is quite clear that *Caius*, *Harvey*, *Sydenham*, and *Heberden* (we take some of their very best names) were *not* "skilful and safe practitioners."

Yet this not very illustrious though pharmacological President of the College of Physicians takes it on himself to write:

"The College of Physicians regard the so-called homœopathists as neither skilful nor safe practitioners."

When we have time we will give some historical sketches of the progress of medicine in this country, from which it will be made to appear that the Fellows of the College, from its foundation to this day, are not entitled to be considered skilful and safe practitioners.

Hosted by Google

Mr. NEWMAN was ignorant, but Dr. PARIS could scarcely have been so, that the College of Physicians cannot confer *diplomas* and degrees in medicine. They only grant licenses to practise. These licenses are scarcely so good as those which men obtain for the purpose of shooting game.

The President of the College of Physicians ought, however, to have been above the concealment of this fact in his answer to Mr. NEWMAN. He should have written to him thus:

"Sir,—The College of Physicians has no power to confer *diplomas* and degrees in medicine, we only give licenses.

"Permit me, however, to say that we hold you and all other homœopathists in abomination, and will give none of you the license," etc.

We do not think the President has dignified either himself or his College by his illogical and absurd note to Mr. NEWMAN.

To the Editor of the Homœopathic Times.

Glastonbury, Oct. 14, 1851.

SIR,—Allusion having been made in the *Lancet* of last Saturday to the following correspondence between the President of the Royal College of Physicians and myself, respecting my examination for the degree of Doctor of Medicine, I have much pleasure in sending it to you for publication in your journal,

And remain, Sir,
Your humble servant,
G. NEWMAN, M.R.C.S., L.S.A., etc.

(COPY.)

Glastonbury, Aug. 30, 1851.

SIR,—I am anxious to know if you will admit me to examination for the degree of Doctor of Medicine, and as I wish to act honestly and fairly to you, I think it best to state that I differ from the views of the College in one branch of the examination, viz., the therapeutical; however, I will give my answer to any question you put according to the old mode of treating disease, and at the same time, if agreeable to you, state what homœopathists consider the best method of curing disease.

I trust the fact of my being a homœopathist, which I am from conviction and long experience, will not prevent you from granting me that diploma which I am desirous of obtaining.

I have the honour to be, Sir,
Your obedient servant,
GEO. NEWMAN.

To the President of the Royal College
of Physicians, London.

(COPY.)

Dover Street, Sept. 8, 1851.

SIR,—The foundation of the Royal College of Physicians was for the purpose of guaranteeing to the public skilful and safe practitioners.

The College of Physicians regard the so-called homœopathists as neither skilful nor safe practitioners.

Therefore the College of Physicians cannot, without betraying a sacred trust, give their license to persons whom they regard as wholly unworthy their confidence, and with whom it is not possible they can hold any communion.

I am, Sir, your obedient servant,
J. A. PARIS, President.

G. Newman, Esq., Glastonbury.

THE MAGNETOSCOPE.

From the Torquay Directory.

A QUESTION was once proposed to the Royal Society by Charles II. whence it is that a vessel of water receives no addition of weight from a live fish being put into it, though it does, if the fish be dead. Various solutions, of great ingenuity, were proposed, discussed, objected to, and defended; nor was it till they had been long bewildered in the inquiry, that it occurred to them to *try the experiment;* by which they at once ascertained that the phenomenon which they were striving to account for,—which was the acknowledged basis and substratum, as it were, of their debates,—had no existence but in the invention of the witty monarch.—*Historic Doubts, by Archbishop Whately.*

Such, I believe, is the solution of the marvels of the magnetoscope recorded by "P." in the two last numbers of the *Directory*, and which have since attracted so much public attention, as forming the subject of the President's address before the Homœopathic Society in London.

Unfortunate as I have always been in my endeavours to witness the marvels of clairvoyance, electro-biology, and other kindred mysteries, there seemed something so plausible, and so capable of positive demonstration, in Mr. Rutter's experiments, that I obtained the loan of an instrument, which came direct from Brighton, in hopes, at least, of producing what is denominated its normal action. After a patient trial, strictly in accordance with the directions which accompanied it, I have been unable to produce the least result, the oracle refuses to give any answer, so that the question of its veracity in "the elucidation of the hidden secrets of nature," or whether science has indeed made "the gigantic stride" so confidently announced by the President, must be solved by those who are more highly favoured, or perhaps, as Reichenbach would explain it, possess more *od* than seems to be allotted to the philosophers of Torquay; for the like failure attended the efforts of the collective wisdom of the Natural History Society, to whom the instrument was submitted, at their annual meeting on Saturday last, the only insight into the hidden secrets of nature on that occasion being that one of the gentlemen present was pronounced to be of the feminine gender, or at least a Bloomer, "the normal or natural action of the electric current" being from right to left."

But how, it may be asked, are we to explain the statements so circumstantially put forth of

Hosted by Google

Mr. Rutter's experiments, as there can be no question of the good faith in which they are conducted by him, or of the accuracy of P.'s report. I believe that they may be accounted for upon the same principle which solves a host of similar miracles,—the deception of our own senses. The motion communicated to the pendulum is, as P. suggests, identical with that in the familiar experiment of striking the hour with a ring—"the wish is parent to the thought"—expectation and desire actually amount to volition, and the nerves insensibly convey to the appropriate muscles the order, as from head-quarters, to effect the anticipated motion. A great portion of what in the first instance are voluntary and deliberate actions, become, by habit, spontaneous, and are effected by means insensible to ourselves. Thus, the effort to maintain the body in a perpendicular position is with the child a constant effort; it soon becomes a habit, and the muscles act as purely without specific volition or consciousness as the heart or viscera. It is indeed this very action which, I believe, causes the motion of the magnetoscope; the movement of the body, or even of the arm when resting upon a table, is generally circular, and the hand, when holding the instrument between the thumb and finger, as in the first stage of the experiment, communicates, mechanically, a similar motion to the pendulum; in the second experiment, when only the finger or thumb are separately applied, an oscillation in a right line is produced, the direction in each case being either matter of chance or the effect of the insensible volition to which I have referred.

A firm faith in the truth of the experiments being thus established, the subsequent steps, as in the case of electro-biology, etc., become easy; even when off the scent, as P. expresses it, we have only to hark back, and the doctrine of chances will set all right. I am the more convinced that this is the true solution, from the greater facility with which the pendulum is set in motion when the instrument is not steadily fixed, and the impossibility of communicating motion to it when the hand and the prime conductor are connected only by a chain; a result which would not be the case in any corresponding electrical experiment, and which should not occur in this, as, according to Dr. Quin's report, a thread of silk is enough to carry the electric current when the operator is placed upon an isolating stool, and the influence of a dead fly in the hand of a chain of men divided by a wire of copper 500 feet long, produced its effect upon the instrument as fully as if placed in immediate connection!

If the alleged phenomena were satisfactorily proved by direct experiment, it would be contrary to the principles of inductive philosophy to dispute their accuracy by any *a priori* argument; but as this is not the case, the difficulty of reconciling them with the established laws of science becomes insuperable. For instance, it is inconceivable how any influence acting in right lines can produce transverse motion; even the electric or magnetic currents, to which this is supposed to have the closest affinity, act only when intermittant, and at an angle with some other force. Again, there is no parallel instance in the whole range of science in which forces act irrespective of the *quantity* of the agent employed. If a battery of ten pairs of plates produces a given effect, an addition to their number produces a proportionate increase in power. In the reported experiments with the magnetoscope, the homœopathic globules produce as much motion as the metal or other substances in mass.

Much allowance must also be made in the case of the homœopathic experiments for the insensible influence of preconceived opinions. "Now, gentlemen," says Dr. Quin, "I feel certain that you have perceived that *it was not without an object* that I requested Mr. Rutter to have the kindness to experiment before me and the persons present, upon the above metals and other substances, the *whole* of them being materials from which we extract some of our most valuable medicines." For the sake of his patients, we may hope that this is not to be taken literally, for the enumeration concludes with the following delicacy:—"The ammonia was again put into the operator's hand, when the normal action in full vigour was again produced. A small piece of horse-dung put in the same hand with the ammonia, immediately counteracted its action and stopped the motion."

E. V.

[We request E. V. and other inquirers to suspend their opinions. If George III. were conscious of the new applications of science to *practic* and every-day life, the good old king would be marvellously astonished. Since his day things that were looked on as most visionary have been accomplished, and excite no surprise in prince or peasant. The lighting of our streets and houses with gas, travelling by the agency of steam over land and over sea, the electric telegraph, the daguerreotype, and many other marvels, are now matters of the commonest use. We fully expect the discovery of "magnetoid currents" will lead to divers inventions of great practical value.—ED.]

KINESOPATHY.

To the Editor of the Torquay Directory.

SIR,—Twelve months ago, if one had spoken of the power of a corn-reaping machine he would have seemed to most of us as one that dreamed,—six months ago, if one had told of the fleetness of the American pilot craft he would at least, have been pooh-poohed;—nevertheless, for a dozen years or so the implement has been steadily and beneficially at work in America, and the speed of the pilot boats has been for an equal time an acknowledged fact. It remained for some extraordinary circumstance, such as the gathering of the nations in 1851, to bring those every-day matters of fact of one country so palpably before our senses, as not only to carry our conviction, but to lead us to adopt plans of acknowledged

Hosted by Google

and approved merit and value. The same may be said of fifty other matters: and really if no other lesson had been taught by the Great Exhibition, its value will be incalculable if it shall have led us to throw aside prejudice, to inquire into such matters as come to us not only fraught with interest and importance, but stamped with the impress and guarantee of experience, albeit from a foreign source.

Such a train of thought is naturally suggested when our attention is drawn to hygienic or remedial agents which to us are new, or at least not understood, albeit they may have been long known, long used, long tested, and long recognised as valuable in other parts of the world. Kinesopathy is such an agent. A hard word, perhaps, but not the less significant: derived as it is from the Greek words, signifying movements and diseases, which are systematically connected in a *science* founded by Professor Ling, of Stockholm, as long ago as 1805,—pursued through a long course of years, first under his own care and then under that of his successor, Professor Branting, to the full satisfaction and conviction, not only of the Swedish public and government, but to that of the medical profession, speaking decidedly on the subject, through a special commission appointed to inquire into its working and effects.

Here then is a subject which comes to us under circumstances which at least entitle it to our candid consideration. What is it? Why, a system which professes to maintain and promote health; to obviate, to alleviate, and to remove disease by the due exercise or movements of muscles. Oh, a system of gymnastics! Yes, a system of gymnastics, if you please, which bears the same relation to gymnastics, as heretofore known to us, that the highest productions of the most scientific artist do to sign-painting. Very valuable, no doubt, are gymnastics, under the direction of a judicious superior, but certainly not scientific nor therapeutic. Kinesopathy, on the contrary, possesses and undertakes to prescribe for each particular case, whether of health or disease, those particular movements which shall have a direct and specific tendency to produce the desired effects; arriving at such powers of selection and prescription through the medium of the most intimate study of anatomy, physiology, and pathology. Such an application of these sciences is certainly new to us. We have no good grounds for rejecting it, on the contrary, we have, I repeat, every reason for inquiring into the truth of that which comes to us with a large amount of respectable credentials. I say *we*, intending to include professional as well as lay brethren.

To the laity the subject is exceedingly interesting, as assisting them to throw physic to the dogs; to the profession it is not less interesting, as furnishing it with a new weapon with which to combat the approaches and ravages of the enemy, whose name is legion, and whose strategy is such as to render every means of countervailance valuable and acceptable. Nights as well as days of incessant study, arduous, often health-destroying, labours usher the medical student into the arena, where he has to combat with the host, which he undertakes to repel from those who trust themselves to his care. He spares no pains in arming himself *cap a pie* with scientific weapons, which it is his pride and pleasure, as it is his necessity, to keep burnished and polished to a degree which not only renders him a match for his enemy, but enables him to walk abroad an intellectual warrior, entitled to at least as much respect as the wearer of the casque and cuirass. Such being the well-educated medical man, shall he not gladly avail himself of any new weapon which may come to his knowledge? Very many of our gallant officers have lately prepared themselves for the dangers of actual campaigning, by arming their holsters with Colt's revolving pistols; new weapons, or as least new to us—hitherto used for the most part in rather irregular warfare, but proved to be efficacious. Shall not our regulars of the medical profession be at least equally prompt to inquire into the merits of a new weapon offered to their hands? Shall not the one profession be as ready to try a new method of preserving life, as the other to adopt a new instrument of destruction?

I have been tempted to make these remarks *en passant*, but I by no means intend to lecture the profession, much less to instruct it. I aspire to nothing beyond drawing the attention of those whom it may concern to the new, agreeable, and, as we are led to believe, efficacious method of preserving and restoring health. Not even to this should I have been tempted had I not believed that the system is absolutely unknown to the great mass of our world. Indeed, until the last few weeks we had little means of becoming acquainted with the system. It is true that Professor Georgii some time ago published in English his very interesting little work on Kinesopathy; but however elegant and satisfactory, that was not in itself sufficient to bring the matter home to our hearths, and to remove from the system of Ling the dead weight of the multifarious gymnasium. It is true that Professor Georgii has been for some time practically demonstrating, to the satisfaction of a considerable number of patients and their friends, that what is true in Sweden is no less so in England, and that if disease reigns equally in both countries, prophylactics and therapeutics are no less uniform in their action; but that was not enough to give the desired diffusion of knowledge to our public. Very lately, however, a goodly volume has been published by Dr. Roth, entitled "The Prevention and Cure of many Chronic Diseases by Movements" (Churchill). The subject is so thoroughly discussed in this volume, that I might well rest content with referring to it; but inasmuch as a given book is likely to find its way into comparatively few hands, I shall here extract from it one paragraph of the report of the Roya Medical Association, in Stockholm, dated May, 1849.

"Many members of the Association, from the knowledge that the medical treatment by movements, according to Ling's system, has proved very effective as a curative means, and has produced extraordinary and most satisfactory re-

Hosted by Google

sults in many chronic diseases, are convinced that this method, developed with the scientific and practical clearness which is required for the adoption of any new medical system, and practised in harmony with other medical sciences, under the special direction of, or in conjunction with, the physician, will take a high standing in medicine."

"Ling's gymnastics were introduced many years ago," says Dr. Roth, "not only into all the military academies of Sweden, but into all town schools, colleges, and universities. In the rooms of the central establishment at Stockholm, persons of every condition and age, the healthy as well as the sick, executed or were subjected to the prescribed movements. The number of those who adopted the use of the therapeutic movements increased every year, and among them were even physicians, who, in the beginning, had been most opposed to Ling. In the Central Institution clever teachers are educated, and no one obtains a diploma, or any authorization to the pædagogal practice of these movements, without having finished the course and passed an examination in anatomy, physiology, and the bodily movements, which have become in Sweden a popular and necessary part of education."

Should these remarks and quotations prove acceptable, I shall probably be tempted on a future occasion to extend them.

* * *

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—I perceive there still exists a strong feeling to explain the movements of the odoscope as being dependent *chiefly* upon the *will*. In my last communication to your journal, I hinted that there seemed to be *compound influences* and *conditions* essential to the manifestation of these singular phenomena, nor do I see reason to change that opinion, but will wait until Mr. Rutter publishes his own explanation.

It is a matter of regret, that gentlemen will continue to advance explanations and distract thought, which they would not do, had they followed my advice, and read Dr. H. Mayo's third edition on "Popular Superstitions," wherein many will find their own theories already recorded, which to the uninformed may appear as original, and which may no doubt *incidentally* be the case in many instances.

It looks better, however, to do do full justice to those who have preceded us in the same path. We cannot then be charged with ignorance, indolence, or negligence of other men's merits, and the honourable mention of a fellow-labourer's name seems to me a dutiful and graceful recognition. It is in this spirit, to render full justice to Herbert Mayo, that I quote his postscript (to the third edition), written July 24th, 1851.

"An accident has given me the opportunity of making further additions to this little volume, of which I proceed to avail myself; and, first, by communicating my latest experiments with the divining-ring, July 24.

"1. I have stated that, if a fresh egg be placed upon the table, with the small end directed *from* me—or a crystal, with one definite pole so turned from me—or a bar-magnet, with its northward pole so disposed—and I then suspend the divining-ring half an inch above either of the three so averted ends, and half an inch further off from me, the ring exhibits clock-rotation in each instance. Held in a parallel manner over the opposite ends—that is, half an inch from, and half an inch higher than, the same—the ring exhibits versed rotation. If the three od-subjects be moved round, so that their hitherto distal ends point to the right, or if they be further turned, so as to bring the previously distal ends now to point directly *towards* me, the ring continues to exhibit exactly the same motions as in the first instance.

"If, these objects being removed, I lay a horseshoe magnet on the table before me, with its poles turned directly *from* me, the northward limb being on my left hand, the southward limb-pole on my right, and experiments parallel to those just described are made, the results remain the same. If, near one side of the horseshoe magnet, I lay my left hand on the table, the palm downwards, the thumb held wide of the fingers, the ring, if suspended half an inch from and above either of the finger-points, displays clock-rotation; suspended similarly before and above the point of the thumb, versed-rotation. Or the fingers of the left hand, so disposed, may be compared, in reference to od, to the northward pole of a horseshoe maget, while the thumb corresponds with its southward pole.

"If, removing my left hand, I turn the horseshoe magnet, without altering the side on which it rests, half round, so that the poles point directly *towards* me, the northward pole being now, of course, on my right, the southward pole on my left, the ring held as before over either of the two poles, displays the same results. If I now move the magnet still nearer to me, so that its two poles are an inch beyond the edge of the table, I can obtain results which furnish a more precise explanation of the two rotatory movements already described, than I had before arrived at.

"If I now suspend the ring, with its lowest part on a level with the magnet, and half an inch from its northward pole—that is, half an inch nearer me—it begins to oscillate longitudinally, with a bias towards me, as if it were repelled from the pole of the magnet. If I then suspend the ring an inch vertically above the first point of suspension, it begins to oscillate transversely, with a bias towards the right, or as if impelled by a dextrad current. If I then lower the ring half an inch, the first effect observed is, that it oscillates obliquely, being evidently impelled at once to the right and towards me—that is, in the diagonal of the two forces, of each of which I had before obtained the separate influence. In this third variation of the experiments, I have brought the ring to the limit of the two currents, where both tell

Hosted by Google

upon it. This oblique oscillation soon, however, undergoes a change; it changes into clock-rotation, showing that the transverse or dextrad current is stronger than the longitudinal or proximad current.

"If parallel experiments be made at levels below that of the pole of the magnet, corresponding but opposite results ensue. If the whole series be repeated upon the south pole of the magnet, opposite but perfectly corresponding results are again obtained: and similar results may be obtained with the two poles of an egg.

"II. The mode in which I have latterly educed the rotatory movements depending upon galvanism, has been this. I have laid two discs, one of zinc, the other of copper, one on the other, having previously moistened their surfaces with salt and water. Then, as I mentioned, the ring held over the middle of the zinc disc (that being uppermost) exhibits clock-rotation. Held over the middle of the copper disc, when that is laid uppermost, versed-rotation. I mentioned, too, that if held beyond, but near the circumference of the same discs, the direction of the motion of the ring is reversed.

"The discs which I employ are circular, an inch and a half in diameter, and about as thick as a sovereign. Upon these I do not fail to obtain, when dried and used singly, the first series of phenomena described in the preceding letter. But it occurred to me to try what would be the result of suspending the ring over the two together, and alternately laid uppermost, when they had been well cleaned and dried. This is evidently a still simpler voltaic arrangement than when the salt and water is additionally used. The result was in the highest degree interesting. When I suspend the ring half an inch above the centre of the copper disc (that being laid uppermost), the first motion observed it transverse; but after a few oscillations it becomes oblique—dextrad and proximad combined, in the diagonal between the primary influences of the zinc and of the copper. This change does not last long; the transverse force again carries it, in this instance, and clock-rotation is permanently established. When the zinc is uppermost, the corresponding opposite phenomena manifest themselves; and in either case a reversed movement occurs, if the ring is held extramarginally to the disc.

"III. I may say that I have now obtained positive evidence that these motions of the odometer do not depend upon my own will, or the sympathy of my will with existing conceptions in my mind; for they succeed nearly equally well when the discs are covered with half a sheet of writing-paper. In nine cases out of ten, when I thus manage to be in perfect ignorance which disc, or what combination of the two, is submitted to the odometer, the right results manifest themselves, and the cause of the occasional failures is generally obvious. Let me add upon this topic, that one day, the weather being cold and wet, and myself suffering severely with rheumatism, the odometer would not move at all in my hand. On another day, late in the evening it was, when I happened to be much fatigued and exhausted, the ring moved, indeed, but every motion was exactly reversed; thus my left hand I found now obtained exactly the results which, on other occasions, I got with the right.

"IV. But by what cause, then, through what mechanism, so to speak, are the movements of the odometer immediately produced? Early in the inquiry I made this experiment. Instead of winding the free end of the silk round my finger, I wound it round a cedar-pencil, and laid the latter upon the backs of two books, which were made to stand on their edges, four inches apart, with the od-subject on the table between them, the ring being suspended half an inch above it. The ring, of course, remained stationary. Then I took hold of the pencil with my finger and thumb, at the point where the silk was wound round it; my finger and thumb rested on the silk; but no motion of the odometer ensued. Hence it follows that the odometer is, after all, always set in motion *by the play of my own muscles*. I venture then to suppose that my sentient nerves, unknown to me, detect on these occasions certain relations of matter—let me call them currents of force—which determine in me *reflexly* certain sympathetic motions of the very lightest, and even of an unconscious character. This idea, which I am sure affords the just solution of the matter, is highly consistent with some observations which I have before recounted. It explains how the primary delicate impression should yield to the coarser influence of a strong conception in the mind, that this or that other motion of the ring is about to follow, or even to that of a vivid and, so to say, abstract conception of another motion. It explains what I have several times verified, that on certain days a person standing behind me with his hand on my ear, or on my shoulder, can, by an effort of his will (mine not resisting), make the odometer which I am holding move whichever way he happens strongly to imagine to himself, without communicating the same to me. It explains to me on what the difference consists between those who can set the divining-ring in motion, without a conscious effort, and those who cannot. The former, it will be found, are persons of so great nervous mobility, that any such motions, if their occurrence be forcibly anticipated by them, will certainly be realized by their sympathetic frames. Among this class should be sought, and would still remain to be detected by experiment, those whose *impressionability by Od should prove commensurate with their nervous mobility*. Finally, I cannot doubt that the view which I have thus arrived at respecting the mechanism of the motions of the odometer, is equally applicable to the explanation of those of the divining-rod. I see that, through its means, many before anomalous facts, with the narrative of which I have not bored the reader, which emerged in my former trials of the divining-rod, made by the hands of others, lose their obscurity and contradictoriness, and leave the whole subject in the condition of an intelligible and luminous conception.

Hosted by Google

"N.B—It is a pity that of the inquirers who now amuse themselves with investigating these subjects, very few realize in their minds the idea of Von Reichenbach, that Od, though often exhibiting the same relations with electricity and magnetism, is yet an utterly different principle."

Dr. H. Mayo's observations, in my opinion, afford much matter for deep reflection, and an answer to himself, as well as some of your correspondents and colleagues, on the theories of *muscular motion* and *will* when *individually* enlisted to explain phenomena which evidently emanate from an *indissoluble chain* of causes.

Your's faithfully,

Brook Street. D. WILSON.

P.S.—Perhaps it may not be uninteresting to your readers to be informed that Od is of more ancient date than Herr Caspari imagined, and of which Dr. H. Mayo seems to have had some notion when he first witnessed Caspari's experiments.

The following quotation is from that useful and instructive publication, *Notes and Queries*, of August 30th last.

"*The Od Force.*—As considerable interest appertains to the earlier manifestations of what is now termed mesmerism, the following note may not be altogether unworthy of a place.

"The experiment upon which a subjective proof of the agency of the power of Od is founded, as described by Dr. Herbert Mayo in the supplementary chapter to the last edition of *Letters on the Truths contained in Popular Superstitions*, and alluded to by R. D. H. (vol. iii. p. 517), is another instance of there being 'nothing new under the sun.' In the *Bigarrures du Seigneur des Accords*, first published at Paris in 1582, in the chapter 'Des faux Sorciers et de leur Impostures' occurs the following passage, which I copy *verbatim et literatim*:—

"'Autres ont une ruse, qu'ils semblent d'attacher un anneau d'or ou d'argent à un petit filet, qu'on suspend dans un verre à demy plain d'eaue, et puis l'ayant trempé pair trois fois, disent bellement ce verset du Psalme, autant de fois. "Ecce enim veritatim dilexisti, incerta et occulta sapientiæ tuæ manifestasti mihi." L'anneau bat contre le verre, et sonne autant d'heures qu'il en peut estre.'

"Ham." "W. PINKERTON.

To the Editor of the Homœopathic Times.

SIR,—Many people, like myself, have taken a good deal of interest in the lectures of Drs. Quin and Madden, and it is very likely that many persons are of my way of thinking, that Dr. Madden has been premature on both occasions, of publishing his claims of having it in his power, which however seems to be no less in the power of others, to show by the magnetoscope that homœopathy is true, both in the law and its very small doses, and of lately protesting against himself and his own experiments.

I don't like his way of trying to get out of a mess. He had, he says, very serious misgivings before he gave his lecture that there might be some fallacy in his experiments. But why didn't he give some caution about it, and let some of his misgivings ooze out? Why didn't he tell the folk who attended his lecture, that he donbted if his experiments would bear a close testing? This seems to be the strangest thing in the world, and I can't at all make it out, and a good number of people can't make it out, how an experimental lecturer should get into such a mess. His manner of trying to get out of it only makes matters worse.

Dr. Quin has been much wiser, for he seems to be quietly waiting for Mr. Rutter's own account of this wonderful instrument, which has been so much talked about, and the president of the homœopathists, I suppose, still sticks to Mr. Rutter.

It seems plain too that you, Sir, still have some hope that something will come of Mr. Rutter's discoveries: I am sure I hope so.

Can you tell me what is the meaning of the word *Od?* I asked a gentleman, learned in words as well as a wise man, and he told me it was from a Greek word; and another thinks it is from a Hebrew word. I should like to know, if you can tell me; and I hope Dr. Madden will make up his mind about what he has found out, and will speak out plainly, so that a body may find out what he means. He seems at present to have to do with nothing but *odds and ends*, and his *od* has had a queer sort of *end*, *if it is the end.* Forgive me for taking up so much of your time, and if you will publish this, you will oblige me very much.

Your obedient servant,

A HUMBLE HOMŒOPATHIST.

To the Editor of the Homœopathic Times.

SIR,—As my name appears in your columns as one of those who were engaged in examining Mr. Rutter's instrument, perhaps it may be proper that I should give you the results of my investigation.

Through Mr. Rutter's kindness I received, a few days ago, the instrument upon which he had been for some time experimenting, and I immediately commenced the following series of experiments in company with a non-professional friend.

1st. I repeated successfully all the experiments I had seen Mr. Rutter perform, and also many which Dr. Madden had shown me.

2nd. Having received a note from Dr. Madden, in which he tells me that the *will* can influence the result, I repeated all the former experiments, and obtained or altered them, as I willed them to be. In the first series, for instance, standing upon an isolating stool, stopped the movements, but in the second they were all obtained, and that without any *conscious* voluntary effort of my own.

3rd. I found that by touching the pillar or base of the instrument, or even the table on which it stood, either with my finger or with any solid substance, I could obtain all the results. Thus far I was willing to believe that

Hosted by Google

there *might be* some truth in Mr. Rutter's explanations of the phenomena, namely, that there being an electrical arrangement between the plate of glass and the wax bob of the pendulum, when the earth's electricity could pass freely through the body of the operator, "magnetoid" currents were produced, which were the cause of the oscillations; though it seemed evident, from Dr. Madden's discovery of the influence of the will, that the vital force was also concerned in their production.

4th. I began to take the instrument to pieces, first removing the plate of glass away from the wax bob of the pendulum, which made no perceptible difference in the movements produced. Next I took away the wax itself, and substituted a wooden bob, which, making a little allowance for its less specific gravity, acted just as well as the wax; lastly, I connected various *flexible* substances, some metallic and others not, with the brass ball, but I could produce no motion in the pendulum, unless I stretched these connecting links so as to make them *rigid*. For these trials the glass and wax were restored as at the first.

These last experiments banished from my mind all remaining ideas of electrical or other currents, and obliged me to conclude that the phenomena are simply *mechanical*. Why, if otherwise, in order to produce them, must the connection between the hand and the instrument be *rigid*, seeing that the same material when in a *flexible* condition fails to accomplish anything?

If this conclusion should prove to be correct, of course the instrument can be of no value in reference to homœopathy.

I have been thus particular in describing my experiments, because, having written to Mr. Rutter respecting them, I find from his answer, which I have received to-day, that he still adheres to his original opinions.

I am, Sir, your obedient servant,

Rugby, Nov. 11, 1851. WILLIAM SHARP.

To the Editor of the Homœopathic Times.

SIR,—On perusing your number of the 8th inst., I there observed that some of your correspondents are disposed to draw a too hasty conclusion as to the incapability of the magnetoscope detecting the presence of different substances.

I would ask those who feel disposed to reject *all* Mr. Rutter's experiments, to explain how muscular motion of the arm brings the depending wax into a state of rest, which was observed to take place when certain materials were brought to act on the pendulum? Certainly, the same power which set the pendent body in motion, being applied in the same way, could not cause it to stop.

No one will come to the conclusion, that because he can move a suspended piece of iron by his hand, he cannot therefore set it in motion by the approach of the loadstone. Again, in Faraday's diamagnetic experiments, though we can arrange the different hanging substances in any position we please, no one will deny that they are not induced to take up a certain position by the magnetic forces applied. May we not infer and reason by analogy, that as various bodies do produce motion in each other when they approximate, that this capability resides in all, and that we only lack the necessary instruments to detect the distinctive movements of each?

No two substances can be brought near together without producing some effect on each, some change in their *emanating* qualities. Now as there is a tendency in all bodies to be in motion, and to influence those surrounding each, if we could so arrange solids that they might be free from a few of those influences that overcome this tendency to fly off or be in motion, no doubt we should find that very delicate impressions would cause them to set up their own proper and distinctive oscillations, which of course would be varied as they received an impulse from any substance acting on the immediate exciting agent, as in the instance before us, where the operator's hand was touched by different bodies.

When I presided at the Homœopathic Society, where Dr. Madden's apparatus was exhibited, I observed that on some bodies being presented to the instrument the pendulum was readily set in motion, and arrested by others. This I think cannot be explained to take place from the power of the will, for when it has been my object to act upon a substance by the mere effort, the desire always occupied some time to establish a motion, as shown in the German experiment, where a gold ring is suspended by a single fibre from the cocoon of the silkworm; and I always found that after creating a movement I could not stop the ring by the same process. The force that causes a body to be put in motion cannot be the *identical* power that brings it to a state of rest, especially emanating and passing in the same direction from the same object; this must only increase the motion. Further, if the oscillations of the pendulum belonged to the operator's arm handling the instrument, how was it that so many failed in producing any effects at all? I witnessed many unsuccessful attempts, and my own efforts were inadequate, though I desired it most strenuously, but fell short of my purpose. This goes against the muscular action and the will, since each individual exercised both. Like causes must produce like effects, and all things being equal, similar agents would give analogous motions. In all our experiences, we have found that it requires long study to elicit to a certainty the aptitude of giving a like impulse to a thing, as to produce similar positions in the arrangement of bodies.

Dr. Madden states, that "when he *resolutely determined* not to move his body in the slightest degree, no motion took place." This was because he was not operating on the magnetoscope; his attention was taken up in influencing himself, and of course the *magnetic battery* of his body was not acting on the instrument. Until the brain is set in motion, or assumes that condition so as to cause the animal *aura* to escape from the fingers, no result can ensue. I cannot mesmerise unless that is my distinct purpose; the magnetism will not flow from the

Hosted by Google

digits, if my thoughts are absorbed in attending to anything else, which I discover by losing the tingling sensation in my fingers; this feeling always accompanies my mesmeric manipulations, especially when the brain is employed to a desired end. Unless we fulfil the conditions, the expected result must fail in every experiment.

I am led to suppose that the magnetoscope is intended to be employed as a test of the animal *aura* escaping from our bodies, and also to show how it becomes modified by being influenced by other substances acting on the person who is operating.

The question then is, has this fluid—if we may so call it—the power of moving the pendulum, and if so, what is the normal direction, and can it differ by being handled by distinct individuals, and altered by the contact or presence of dissimilar bodies? I for one think so.

No one for a moment doubts but that the pendulum can be made to oscillate by other means or appliances, and solicited to *imitate* the natural motions produced by the application of certain substances; but our object is to discover the spurious from the true, and also to measure how much may belong to each.

It has struck me, that if we employed Melloni's battery under another arrangement, that is, instead of the horizontal needle, to make use of an oscillating pendulum, we should be able to indicate some of the motor qualities belonging to different bodies, by which we might detect their identical approach to this instrument. The motion induced in the needle of the battery has always been put down to the heat of the presented body, as the fly's foot, the human hand, or the metal touched by it; when, probably, it may be other qualities, which, if we could measure them, might indicate the peculiar *aura* escaping from the substance employed in each experiment.

A chain of causes *must* always *precede* every effect; but in the present state of our knowledge, we are only able to recognise a few of the proximate producers of events.

I have the honour to subscribe myself,

Yours truly,

23, Duke Street, J. HANDS.
Grosvenor Square.

P.S.—I have observed that many in their early attempts to mesmerise often fail, but after some trials, their efforts are crowned with success. These results I account for by concluding that the animal *aura* does not escape with sufficient intensity, or that the brain of the operator at first is not brought into a proper state of excitement, which can readily be made to take place when a confidence is established by one or two successful cases. Would this not account for the failures of many who have attempted to put the pendulum in motion? Again, it often requires various sittings before we can produce any effect on some of our patients. Does this not agree with Mr. Rutter's observations, that the first efforts of some persons are insufficient to act on his instrument, but who, after some trials, are successful? Further, may not the magnetoscope be compared to a musical instrument, which always improves by being played upon by a good performer, who can elicit a variety of tones that an indifferent executor could not educe, and who, by the bye, instantly discovers if a bad musician has touched his flute, fiddle, etc., and formed false notes, and often exclaims, that he shall be some time before he restores it to the state in which he left it? Now, no doubt, the good performer has established certain channels for the perfect tones which he has created to undulate through, and which become altered by transmitting counterfeit sounds over his instrument. J. H.

To the Editor of the Homœopathic Times.

SIR,—I have watched with interest the recent excitement which has been caused by the magnetoscope, and have anticipated the opinion which is now gaining ground respecting its real nature, as a delicate respondent to the thoughts and volitions of the operator.

My object in writing this brief note is, to commend you and my homœopathic brethren generally to the works of Mr. Braid, of Manchester, which contain, to my mind, the most important criticism on mesmerism, odylic influence, etc., etc., that has yet been given to the world. Had these works been read by our brethren, they would have possessed a knowledge of the physiological subtlety of volition and thought, as influencing the body, which might have precluded them from any rapid conclusions respecting the magnetoscope.

I feel bound to say this much, in order to make known Mr. Braid's discoveries, which are second, in medical as well as physiological significance, to nothing since the great discovery of Hahnemann himself. It were only to be wished that Mr. Braid would reprint his work on Neuro-hypnology, and thus render it accessible to the public. Until this is the case, I would recommend your readers to peruse his little *brochure* on *the Influence of the Mind upon the Body*, which bears intimately upon the present affair of the magnetoscope.

Your obedient servant,

J. J. G. WILKINSON.

St. John's Wood, Nov. 8, 1851.

To the Editor of the Homœopathic Times.

SIR,—Permit me to state my opinion in your valuable paper relative to petitions to be presented to the patrons of the University of Edinburgh from the homœopathic practitioners.

The petitioners, referring to the rejection of Mr. Alfred Crosby Pope, observe, that they believe "that this has been done arbitrarily and without the authority or even the knowledge of the *Senatus* or of the patrons of the University." They farther say, "they have no wish to obtain from the patrons the expression of any explicit preference for or approval of the homœopathic system," etc. It is an old and a true saying, that "those who are not with us are against us." I am decidedly opposed to this petition. If it be our object to establish homœopathy, and to propagate its truth, we must ultimately have

Hosted by Google

a school of our own. Our professors must be believers—practitioners of homœopathy. Much time is now thrown away in studying the *therapeutics* of the allopathic *Materia Medica*—attending *clinical lectures*—the *art of mixing drugs*, etc., as they are now taught. These are certainly "delusions," "fallacies," "nonsense." It must be a painful thing to the medical student, who has become convinced of allopathic errors and of homœopathic truths, to be examined by allopathic professors. The medical student must be painfully affected, when he is compelled to answer that he would prescribe bleeding, purging, emetics, *Calomel*, etc., when he knows that it would be against his conscience to commit such grievous errors. What step shall Mr. Pope take? Shall he receive his diploma from these men who are opposed to his principles of practice? We do not see the propriety of humbling ourselves by the presentation of a petition to the patrons of the Edinburgh College, or to any other allopathic university, for the protection of those who intend to practise homœopathy. We have no confidence in the promises of the allopathist. As long as he (the allopath) thinks that homœopathy is a fallacy, he will devise means to counteract and discourage the laudable intentions of the medical student, who has, like an honest and conscientious inquirer, made up his mind to investigate the merits of homœopathy.

Dr. Russell, in his work on Cholera, has not much lauded the proceedings of the Lord Provost, etc., and now we are about to present a petition,—to whom? to the very men who are our most inveterate and bigoted enemies; what shall we gain by such a step? nothing but contempt. Let us present a petition to our gracious Sovereign for an Examining Board of our own, which will be followed by the establishment of a homœopathic school in London.

Dr. Mure has succeeded in establishing a homœopathic school, on a vast scale, in Brazil.

Dr. Hering, and others, have succeeded in establishing a homœopathic school, on a vast scale, in the United States. I do not see the reason why we should not succeed as well in LIBERAL OLD ENGLAND.

Yours very faithfully,
J. G. ROSENSTEIN.

10, Valentine Terrace, Greenwich,
10th Nov., 1851.

[As we are aware that many homœopaths, for whose judgment we have considerable respect, entertain views similar to Dr. Rosenstein, we have the more readily given insertion to his letter. Our object is union, and a desire that no false step should be taken.

Without committing ourselves to any opinion for the present, we shall be happy to afford an opportunity to all who may wish to discuss the question raised by Dr. Rosenstein. The majority, if backed up by sound logical argument, ought to govern.—ED.]

THE MAGNETIC INDICATOR.

To the Editor of the Homœopathic Times.

SIR,—In connection with Mr. Rutter's late invention, the magnetoscope, there appears to be one remarkable phenomenon, which has not received sufficient consideration in the lectures, etc., published in your journal on the subject: that is the fact of the instrument, in the movements of its pendulum, being entirely under the influence of the operator's will, which, astonishing as it may appear, is most undeniably the case, as I have proved over and over again with an instrument, which in its form and materials is essentially the same as the one used by Mr. Rutter; so that, although different metals and other substances, however minute in quantity, do invariably produce the currents peculiar to themselves, when brought into contact with the disengaged hand of the operator, yet the mere concentration of the mind is alone sufficient to superinduce any other movement he might wish to set up, or to bring the pendulum to a dead stop, even whilst the substance still remains held in the hand. It is no proof, as Dr. Quin assumes, that because a person cannot, on the first attempt, produce any impression on the pendulum, that the will necessarily has nothing to do with it, since it is well known that it requires time and frequent use to impregnate the instrument with the odylic power of the operator; so that, until that result is obtained, the will, as a matter of course, can have no effect either one way or the other. Moreover, it is probable that the power of exercising such an influence is not possessed in the same degree by every one, and perhaps not at all by some.

That the magnetic currents of the body should be so completely under the control of the mind, cannot be regarded as a matter of great surprise, when we consider that they are probably in their nature similar to, if not identical with, the nervous influence (animal electricity) of vital organizations, which, *in obedience to the will*, performs every voluntary movement in the living body. As a seeming proof of such being the case, I may mention a curious illustration which occurred to myself: having put my hand to sleep, as it is called, by compression on the arm, I placed my finger and thumb whilst in that condition on the brass rod of the instrument, but it produced not the slightest effect until the pricking sensation, "pins and needles," having restored the conducting power of the nerves, the pendulum set up its usual rotary movement.

Therefore, should the instrument be found of less service than was anticipated as a certain test for minute medicinal substances, our disappointment will be more than compensated by the discovery of such wonderful evidence, as it appears to be, of the power of mind over matter, and by the boundless field it will open for physiological research.

I remain, Sir, yours truly,
Blackfriars, Nov. 4, 1851. RICHARD WELLS.

PATHOGENETIC EFFECTS OF ASTERIAS RUBENS OF THE GENUS OF THE ZOOPHYTES ECHINODERMES.

By Dr. Petroz.

Communicated by Dr. Rosenstein.

Experimenters: M. M—, P—, P. J—, T—, M—, Madame B—, Madame T—, and Miss M—.

Moral.—Sadness, alternating with almost insupportable cerebral excitation, desiring to give one's self up to intellectual or corporeal labour, to walk, to take violent exercise; this state does not resemble the drunkenness produced by fermented liquor, it is rather a moral intoxication; second and third day.—Miss M.

General debility; the ideas somewhat confused; sixth day.—P. J.

Sensation of extreme anguish, from noon to three o'clock; fear of impending misfortune; expectation of bad news, succeeded by a disposition to shed tears; sixth day.—M. M.

Irritation, anger, wishing to quarrel with somebody, from noon until two o'clock in the afternoon.—*Idem.*

Depression, tediousness; a fear that some misfortune will happen, with the consciousness that, when known, it will cause weeping; angry feeling; sixth day.

The symptoms gradually disappear, with an inclination to shed tears from the least emotion; eleventh day.—P.

Extraordinary cheerfulness in the evening; first day.—Madame T.

Tears, with despair, soon succeeded by more tranquil feeling; third day.—Miss M.

Difficulty to perform labour in the evening; sixth day.—P.

Vertigo.—Ephemeral vertigo.—T.

Vertigo in walking; first day.—T.

Vertigo; tenth day.—Madame B.

Head.—Sensation of fulness, as if from congestion.

The blood flows to the head; sensation of fulness, heat; the head feels as if it would burst; second day.—Miss M.

Heat of the head; it seems that the air which surrounds it is warm; first day.—Miss M.

Sensation of confusion in the brain; first day.—P.

Heaviness of the head at the end of an hour; first day.—P.

Heaviness of the head, heat, throbbing in the head, redness of the face; first day.—P.

Fulness of the head, which seems to distend its lateral sides; first and second day.—Miss M.

The blood flows stronger to the head; fourth day.—*Idem.*

Flying pain in the right side of the head; third day.

Pain in the right side of the head, which is suddenly felt; third day.—Miss M.

Slight shooting in the brain.—Miss M.

Shooting pain in the right temple; second day.—B.

Violent shooting at the forehead, temples, particularly in the occiput; first day.—T.

Shooting in the brain on blowing the nose, during the first part of the night; fourth day.—T.

Pressive pain at the forehead, sensation of fulness; contraction of the muscles, and pressure above the eyes.—P.

Strong pressive pain in the sinciput in the morning, which ceases in the course of the day, after walking in the air.—Miss M.

The headache discontinues towards noon, at which time the thoughts are more clear.—Miss M.

Very strong pressive pain at the forehead, above the eyes; fourth day.

Pressive pain in the right side of the occiput, which renders walking difficult; fifth day.—Miss M.

Strong pressive pain at the forehead, which seems to weigh down the eyes as if by a great weight; fourth day.—Miss M.

Pressure at the temples; first day.—T.

Throbbing in the head; second day.—Miss M.

Throbbing in the head, on ascending, or walking; second day.—P.

Pain above the left eye, which comes on suddenly, and ceases in the same manner; it produces contraction of the

Hosted by Google

eyebrows. During this pain the sight is obscured as if by a mist; second day.—Miss M.

Pains, during which it seems as if the head would burst; third day.—Miss M.

Pains at the top of the head, as if the cranium were split; third day.—Miss M.

Waking in the night, with great anxiety; it seems as if the brain were receiving electric shocks; the head feels empty; unconsciousness; fear of an attack of apoplexy in the night, from the sixth to the seventh day; this state continued several minutes; the pulse was hard and very quick; the right carotid throbbed with violence; this arterial excitement lasted until the end of the next day.—P. J.

At the end of the day the headache increased, and forced her to lie down; the pains are stronger at the back of the head than in the front, continuing the whole of the night; ninth day.

Agitation, spasms; sensation of uneasiness in the superior part of the brain, particularly on exerting the memory; this sensation is similar to that of the lassitude after great muscular efforts; tenth day.—B.

Difficulty to perform labour in the evening; sixth day.—P.

Eyes.—Heat in the eyes; first day.—Miss M.

Eyes injected; fourth day.—P.

Light fatigues the eyes; first day.

Difficulty to bear the light; fourth day.

The eyes are drawn backwards; third day.

Sight fatigued.

Winking of the eyelids, their edges red; seventh day.—Miss M.

Nose.—Bleeding of the nose; ninth day.

Bleeding of the nose, which returned three times in five days.—P. J.

Sneezing, coryza on waking in the morning; ninth day.

Pains in the eyes, from the inside outwards; seventh day.—Miss M.

Ears.—Shooting pains for a few seconds in the ears, in the occiput; these pains return in the course of the day, but are weaker; third day.—T.

Dullness of hearing, more marked on the right side; second day.—B.

Hearing dull; noise as of running water; seventh day.—P.

Face.—Coloration of the face; fourth day.—B.

Face coloured, swollen; third day.—*Idem.*

Expression of dullness in the features; inanimate appearance; seventh day.—B.

Mouth.—Swelling of the tongue; third day.—B.

Twitching pain in the tongue.—*Idem.*

Impediment of the tongue; unwillingness to speak; fifth day.—B.

Abundant saliva in the mouth; a tendency to bite; fifth day.—B.

Irritation of the throat; sensation of heat, which does not long continue; first day. This irritation returns several times during the day.—P. J.

Irritation in the throat, slight at the commencement, but becoming stronger the fifth day.—B.

Dryness of the throat; sixth day.—B.

Pain in the throat (constriction) on awaking in the morning; eighth day.

Loss of appetite and of taste; fourth day.—Miss M.

Dislike to meat; seventh day.—P.

Variable appetite; desire for spiced meats, strong cheese, spirits, coffee, tea; eighth, ninth, and tenth days.—Miss M.

Stomach.—Dull pain, which seems to occupy the whole passage of the œsophagus; first day.—T.

Strong and frequent eructations in the morning; first day.—P.

Nausea; second day.—P.

After strong eructations in the morning, weakness and great heat of the stomach; seventh day.—P.

Dull pain in the muscles of the præcordial region; second day.—T

Contraction in the præcordial region.—M. M.

Abdomen.—Obtuse pain by shocks in the right side of the abdomen, and near the navel; seventh day.—P.

Flatulency, especially after meals; third day.—Miss M.

Colic, alternating with shivering, with heat in the face; fifth day.—Miss M.

Alternation of swelling of the abdomen, with diminution of its size during the twenty-four hours; third day.—*Idem.*

Frequent desire to urinate; urine more abundant; seventh day.—P.

Urine thick, viscous; heat in the urethra when urinating; eighth day.—P.

Sensation of pressure upon the inferior part of the abdomen; walking is difficult; third day.—Miss M.

Sensation as if the catamenia would come on; second day.—Miss M.

The catamenia delayed eight days, attended with colics and other pains, which ceased on the catamenial appearance, which was more copious than usual.

Chest.—Shooting pain in the anterior inferior part of the chest, from the right to the left of the sternum; this pain, which was of short duration, decreased on keeping

Hosted by Google

the body erect, and the shoulders backwards; fourth day.—B.

Pain towards the internal part of the chest, from the front to the back, under the left nipple; this pain extended from the whole internal part of the arm to the extremity of the little finger; fifth day.—P.

The left side of the chest is painful, increasing by movement; first day.—T.

Sensation as if the left breast were drawn inwards.—M.

Anxiety during the night, caused by throbbing in the chest; sixth day.

Sensation of fulness in the chest, which causes fear of syncope; seventh day.—P.

Strong and frequent throbbing of the heart.

Beating of the heart scarcely perceptible; seeming as if the heart had ceased to throb.—M.

When the palpitations are very strong, they extend to the epigastrium, with a sensation of oppression; third day.—P.

Anguish of the heart, night and morning; seventh day.—P.

Slight eruption between the breasts.—Madame T.

Slight redness, with efflorescence upon the chest; fourth day.—Miss M.

A large spot upon the chest, about the size of the palm of a child's hand, causing violent itching; this redness disappears at the end of five or six days.—Miss M.

Drawing pain in the breasts; second day.—Miss M.

Swelling distension of the breasts, similar to that which precedes the catamenia; third day.—Miss M.

Trunk.—Twitching pain at the sacrum; first and second day.

Pain in the back.

Superior Extremities.—Restlessness of the limbs, particularly in the arms and elbows; cannot bear any covering; fourth day.—Miss M.

Pain, which extends from the articulation of the thumb to the shoulder; seventh and eighth day.—P. J.

Numbness of the hand and the fingers; sixth, seventh, and eighth days.—P. J.

Numbness of the left hand, extending to the arm; second day.—Miss M.

Coldness in the left arm, as if exposed to a cold wind; third day.—Miss M.

Numbness of the eminence of the hypothenar and of the little finger; fifth day.—M.

Pain in the tendons of the flexors of the left wrist; second day.—T.

Pain in the right shoulder; second day.—T.

Pain in the articulation of the left elbow; seventh day.—T.

At the left elbow, upon the olecranon, a circular red spot, the size of a franc, causing neither itching nor smarting, with a furfuraceous covering, dry and friable, which falls off after two days, leaving no trace behind. A similar eruption, of a smaller size, on the anterior part of the same arm; eleventh day.—Miss M.

Inferior Extremities.—Weakness of the inferior extremities; fourth day.—P.

Weakness in the legs when standing, so as to require assistance to walk; third day.—B.

Pain in the right hip, and the whole left side, to the scapula, which lasted till the sixth day, accompanied with fever.—P. J.

Obtuse pain in the left coxo-femoral articulation in the morning; second day.—P.

Burning, shooting pain in the great trochanter and the left coxo-femoral articulation, rapidly extending itself to the external side of the knee; third day.—P.

The same symptom the ninth day.—B.

Shooting in the anterior part of the thigh; sixth day.—P.

Twitching at the external side of the left thigh; seventh and eighth days.—P. J.

Twitching in the soles of the feet, and in the toes; eighth day.

Pain in the left knee; second day.—T.

Sensation of twitching in the right hip, as if the leg were too long and drawn downwards; fifth day.—Miss M.

Pain in the articulation of the left foot; second day.—T.

Lancinating pain in the toes, particularly in the great toe of the left foot, with great heat and extreme sensibility, preventing the wearing of shoes; after sunset, and in a close apartment, the pain is greater; the skin is red; heat increases the pain; cold air and the application of cold water give ease immediately; but the heat of the bed renews the pain, although it had ceased during the first part of the night; third day. This pain was very troublesome during some evenings, but finally disappeared, like the other symptoms.—Miss M.

Pain in the left foot, concentrated in the articulation of the great toe, continuing there the whole day; sixth day. This pain, which movement increases, rendering walking impossible, has the character of gouty pains.—T.

Violent pain in the articulation of the left foot, increased by walking; seventh day.—T.

Insupportable pain in the left foot; eighth day.—T.

Cutting pain in the left great toe; sensibility of the sole of the left foot; toes very painful; third day.—Miss M.

Hosted by Google

Pain in the articulation of the right foot.—Madame T.

Constant itching on the thighs and legs, increasing towards six o'clock in the evening, in the air; seventh day.—T.

A slight excoriation, produced on the leg from scratching, causes violent pain; eighth day.—T.

Pricking in the inferior extremities; eleventh day.—P.

Diminution of the sensibility of the limbs, particularly of the legs and thighs; fourth day.—T.

Burning heat in the legs; eleventh day.—P.

Great restlessness in the inferior extremities when in a close room; desire for fresh air; third day.—Miss M.

Three days after the discontinuance of the medicament, the pains returned in the articulations, particularly in the left great toe.—T.

Heat.—Removing everything which increases the heat of the body; desire to use cold lotions; third day.—Miss M.

Desire to be in the air; anxiety; impatient when in the room.—Miss M.

Fever; general uneasiness in the evening after a meal; the skin hot; frequency and fulness of the pulse; first day.—P.

Heat of the head, which is afterwards felt over the whole of the body; desire for cold water; third day.—B.

Shivering, with somnolency; heat of the skin; agitated nights; third day.—P.

Heat of the skin; fever at the close of the day; shivering; heat, followed by cold; second day.—B.

Sleep.—Sleep from two o'clock in the morning until noon; third day.—Miss M.

Sleep, with agitation; eleventh day.—P.

Dreams of various persons and events; the impressions are all of a lively character; imagining to hear, touch, and understand the individuals dreamt of, as when awake; second and third day,—Miss M.

Disinclination to rise again after sitting down; disposition to sleep; tenth day.—P.

General Effects.—General uneasiness; lassitude; agreeable feeling after eating.

The symptoms increase in intensity the latter part of the day, especially in the evening.

Great lassitude, produced by heat, particularly in bed.

THE ROSS DISPENSARY.

(*From a Correspondent.*)

THE picturesque and usually peaceful town of Ross was lately the scene of one of those struggles which seem ever to attend the advance of homœopathy into a *terra incognita*. It appears as though the allopaths would not quietly endure the presence of this unwelcome intruder, until they had tried the effect of an appeal to the public. This ordeal over, the dreamy doctrine, hitherto received with scorn and ridicule, is henceforth treated with at least decent respect.

The *Hereford Times* of Oct. 23 contains a full account of an extraordinary general meeting of the Governors of the Ross Dispensary, held on the 20th of October, to consider and decide whether or not the medical officers of the Institution be allowed to treat the applicants for relief under the homœopathic system of medicine, and also to take into consideration the letter of Dr. Strong, which appeared in a Hereford paper, upon the subject, in so far as it refers to the Ross Dispensary.

Whatever hostility against the interests of homœopathy may have been contemplated in this attack, it does not appear from the report, that the feeling of the governors in general was adverse to the system; for, after a discussion which lasted three full hours, an amendment was carried, which merely rendered more stringent an already existing rule. "Rule XIII. That a constant supply of drugs, procured expressly for this Institution, by order of the Secretary, acting on the written suggestion of the Physician and Surgeon of the week, be kept at the Dispensary, and that from thence alone medicines be dispensed and relief afforded to the objects of the charity."

The Amendment.—"That it is by the 13th rule of this Institution incompetent to this meeting to sanction among the Medical Officers of the Institution, the use of any medicines, in the treatment of patients, except those which are supplied by the Institution itself." The amendment was carried by a majority of 9 to 6 votes. But one of the most influential governors present, Mr. William Bridgman, chairman of the Ross Union, while voting in favour of the amendment, expressed his intention, at the approaching annual meeting, to move the alteration of Rule XIII., so as to enable Dr. Strong to keep a supply of homœopathic remedies at the Dispensary. We trust the good sense of the governors will lead them unanimously to adopt an enlarged and liberal view of the question.

The union of the two systems of medicine now proposed to be carried out at this Institution may, at the first blush, appear very objectionable. Yet if a reformed mode of practice is to be introduced at all, it must be by the old-established founda-

Hosted by Google

tions of the country gradually relaxing their efforts of opposition. It not only *will* be so, but it is becoming so even as we write. Already in London there are some hundreds of medical practitioners who employ globules for the treatment of certain classes of disease, almost without knowing why. Many conceal the fact from their patients; others, with a frank grin, inquire "which mode of treatment the gentleman prefers;" or, at the first failure of the globules, suggest, in alarm, "falling back upon the good old method." Such an amalgamation has taken place at Glastonbury. The guardians of that Union, who some years ago dismissed their medical officer, Mr. Newman, for employing homœopathy among the paupers, have recently retraced their steps, and finding that the health of the Union was less, or at all events, that the expense was far greater under the old system, have now reinstated him in the office he formerly held. Several of the druggists, whose interests we may suppose to be most affected by the change, are yielding to the requirements of the public; and in order to keep their custom, resort to the simple expedient of vending both sorts of medicines. This at least we know to be the case at the large firm of Lea and Perrins, chemists, Cheltenham; and with two other chemists in Worcestershire, where homœopathic prescriptions are professedly made up. We have just seen, fresh from Paris, a friend of Dr. Petroz, the eminent homœopathic physician, who informs us that the same commingling obtains in that city. Some avowedly admitting the use of leeches and counter-irritation only, in addition to pure Hahnemannism.

In Dr. Tessier's hospital, a branch of the famous Hôtel-Dieu, the working of the rival schools under the same roof may be daily witnessed. He has 100 beds, which are generally all occupied. Dr. Tessier is a man of the greatest talent, a first-rate pathologist, and thoroughly skilled in all the learning of the old school. He has never experienced anything but uniform kindness and respect from the Central Bureau of Hospitals, although at various times there have been medical men among them, and such is the case at present; not the slightest opposition has been offered to him in the change that he has carried out in the homœopathic treatment of his patients.

[We published the report lately, with a leader upon it. Our correspondent's observations deserve attention, and therefore we have given the space they deserve. —E. H. T.]

THE MAGNETOSCOPE.

From the Torquay Directory.

SIR,—I have been much interested in the perusal of a letter signed "E. V.," commenting on the subject of the magnetoscope, which I had the honour of introducing to your pages. So courteous a comment demands an acknowledgment, although diverging lines can interfere so little with each other that one need not much apprehend their clashing. I cannot but think that the lines taken by "E. V." and myself are of this character. I simply state what I saw, in the belief that, without pretending to see far into a deal board, I was not deceived throughout a series of experiments lasting for five hours. He argues the *a priori* improbability of the results, and thence deduces their fallacy.

"Segnius irritant animos demissa per aures,
Quam quæ sunt oculis subjeita fidelibus."

I am not in the smallest degree surprised that the wonders of the magnetoscope should appear incredible to "E. V." and to the great majority of those who have only *heard* of them. They were so to myself, but I could only say, after witnessing Mr. Rutter's instrument, "*Veni vidi*," *et victus sum*. I regret exceedingly that the Torquay experimenters have not succeeded in obtaining through the instrument used any other than negative effects. Of the precise value of these I cannot judge, for I confess that a rusty memory will not conjure up so much of the smattering of logic, which I suppose I once had, as to determine how many negatives make up or counterbalance a positive. That their relative value should not be recognised by many I can very well imagine, though not in the case of "E. V." Seriously, it is a very extraordinary fact, and quite justifies caution and hesitation, though not disbelief, that none of the Torquay experimenters should have obtained *any* effect. But I am not surprised at it, because Mr. Rutter warned us that the magnetoscope would not respond to the influence of any new hand; but he assured us that it would do so in most cases where persevered with, just as the wires of an electric telegraph require the influence of a less powerful battery in the direction to which impressions are *usually* conveyed, than they do when it is attempted to convey impressions in the contrary direction. I may observe that I saw palpable, though comparatively faint, effects produced on the pendulum through the agency of one of us "outside people" at Mr. Rutter's, but our interest would not allow our time to be so occupied long.

But the reported experiments are contrary to all acknowledged phenomena and laws—are they the first set of reported results which have at first had this appearance, yet have ultimately been received as quite orthodox? May we not suppose that when the first electrical eel was discovered, those to whom the report came from afar would have pronounced its effects as contrary to all experience, since of the thousands of fish theretofore handled none had produced such an effect. How was the discovery of Harvey received? Was it the learned or the unlearned that were most opposed to its reception? Were

Hosted by Google

not a host of observations and the invincible phalanx of known laws opposed to it by doctors learned in the laws? Suppose a hundred years before Newton read the laws of gravitation in the book of nature, and before Priestley and others had investigated the properties of air, some philosophic student had proclaimed and exhibited that an apple and a feather would, under certain circumstances, fall to the bottom oi a glass globe at the same time, would not those to whom the matter was reported have declared that it was contrary to all observed laws of nature? I confess then that with me the argument of antecedent improbability falls to the ground, from a disbelief in the infallibility and universality of our knowledge. Well, but Mr. Rutter has succeeded in all honesty in deceiving himself and others. All I can say is, that I believe that to be impossible. Take the normal motion — the reversed motion — the diagonal motion,—it is conceivable that they might be produced by the thought the father of the deed—"the wish the father of the thought:" but look over the list of effects produced, and their rapid changes, and I cannot for a moment believe in the possibility of any means producing these effects by the utmost stretch of his ingenuity, and, under long practice, for the purpose of deceiving others,—as to deceiving himself the thing is out of the question. But further, how did the wish produce the effect when the operator was in ignorance of the substance placed in his hand? and I think I have abundance of unimpeachable evidence that this was the case. Were the results in the category of chances? What, in a score or two of cases without fail? Again, supposing motion to be given to the pendulum by volition, could that stop it? Try it. Nay, let some intelligent observer go to Brighton and see the experiment, and if he comes back and pronounces them fallacies I shall be very much surprised,—let him acquire the skill to produce the effects already noted *by volition* and I will pay his rail expenses —just as a penalty for my own credulity.

One word with respect to homœopathy in conjunction with the magnetoscope. I am quite aware that this is likely to bring discredit upon all concerned with it with a certain section of the world,—but what can one do? If a philosophical instrument-maker could construct a balance so delicate that it could weigh the infinitesimal amount of medicinal matter contained in a globule, and if homœopathists were to use these scales by way of demonstration and proof of some of the first principles of their system, should we be justified in rejecting the scales as contrary to nature and at best a self-imposition? I very much regret the concluding paragraph of E. V.'s communication, not only as mixing up the merits of the questions, but as not in keeping, if I may say so, with the rest of the letter. I may observe that the agent which was supposed to counteract the ammonia was the dead animal matter. On the subject of homœopathy I should be sorry to open a discussion in your pages, considering the spirit which I have observed elsewhere to prevail in regard to it. Its advocates, I apprehend, right or wrong, are not ashamed of their cause, nor afraid of its biding its time.

P.

P.S. Who shall decide when doctors disagree? or experimenters either? *Quod ad* the weight of argument,—if I mistake not, one experimenter in Torquay fails to produce the results which his near relative in Brighton has entirely under his control.

THE
HOMŒOPATHIC TIMES.

SATURDAY, NOVEMBER 22ND, 1851.

It has seldom fallen to the lot of the propounders of a new truth to have succeeded in establishing for themselves such a favourable position as those who have advocated homœopathy. Unfortunately, it too frequently happens that internal dissensions and petty jealousies have been allowed to creep in to mar and displace the harmony which must invariably exist to ensure success, whatever cause we may be called upon to espouse. Attempts, however, have been made, by enemies, secret or avowed, to sow the seeds of discord and annoyance, with the view, doubtlessly, of impeding the progress of their philosophy, but happily the intended mischief has been speedily averted, and its influence has proved of the most transient character.

The body of homœopathists in general now perceive the desirableness of steady and active co-operation, especially since the shafts of the allopathists have been so freely levelled at them. It is no longer a question how far the truths of our doctrine are right with our opponents; they have found them successful, and therefore, if possible, they must be crushed. Under these circumstances, they do not hesitate to adopt every means in their power to annoy and vilify us in our proceedings.

But the real question is, do they make any prejudicial impression upon us or upon the public? We think we can answer conscientiously in the negative. As far as true homœopathists are concerned, it is a potent fact that they in reality feel more grateful than annoyed, for the extensive notice allopaths have lately deigned to

Hosted by Google

extend towards them; whilst as regards the public, it is certain a greater desire has been manifested to investigate the doctrines of Hahnemann since these attacks than previously. On both grounds, consequently, there is some reason for congratulation, seeing that, on the one hand, it has called forth increased vigilance and zeal on the part of homœopathists, and that, on the other, it has stimulated inquiry among those who were not before acquainted with our principles.

The good seed thus sown must bring its proportionate reward. Much as the writers of the allopathic press fancy they can decry homœopathy and its attendant benefits, they will in the end find themselves, miserably mistaken. They are providing, without doubt, the fuel for their own *auto-da-fé*, and will, in due season, be enabled to appreciate the worth of their servile lucubrations. When the period of total defeat shall arrive, then will they discover how inglorious has been their career. *In fugâ, fœda mors est: in victoriâ, gloriosa.*

THE PRESIDENT OF THE COLLEGE OF PHYSICIANS.

A Zoological Problem.—On the 3rd day of October, 1851, and towards the hour of evening, one of the boa constrictors in the Zoological Gardens of the Regent's Park received a present of two live rabbits for his supper. . . . As he has not had any food for some weeks, it is supposed that the rabbits will be a very acceptable present for his serene lengthiness. The cool air of autumn is tempered by a warming apparatus in his saloon, but, in case he should wish for a still greater degree of heat, a blanket is given him to creep under, or in the folds of which he may enroll himself at his pleasure. It is not a fine household blanket, but a thick, rough, railway blanket-wrapper of the largest size. All his comforts being thus attended to, the keeper of the serpent-house bows and takes his departure for the night. . . . In the course of the night of the 3rd of October last past the watchman, as usual, entered the serpent-house. Walking round, and holding up his lantern to the different cases, he perceived that the boa constrictor's "supper" was hopping about the cage in a very unconcerned manner, but, on turning from the rabbits to their proprietor, what was his dismay at perceiving that the serpent had seized upon one corner of the thick, rough blanket in preference, and was drawing it down his distended throat. Away ran the watchman to call up the head keeper. . . . The head keeper, knowing it would be in vain to endeavour to get the blanket back after "matters had gone so far," hoped that the serpent would disgorge it of his own accord, if left to himself quietly, as soon as he had found that he had made a mistake in the food he had chosen. Both head keeper and watchman, therefore, went away. It is the opinion of Mr. Mitchell, the secretary of the Zoological Society, who is constantly studying the habits of animals, that the serpent has no palate; and that in the night he had made a dart and a snap at one of the rabbits, but, missing it in the darkness, had caught a mouthful of the blanket; and, conceiving it to be a very good rabbit (but with rather a loose skin, we should suppose), had never troubled himself with any further considerations. In the morning, when the head keeper went to the serpent-house, in a very anxious state of mind as to the result, there he saw the two rabbits sitting up by the side of the serpent's water-pan washing their faces, to be nice and tidy for the day, and the last two inches of the thick railway blanket just going down the serpent's throat. Since this event the serpent has never shown any signs of having discovered his blunder or any disposition to disgorge his bedding. . . . He lies torpid, as usual after a good meal, drinks more water than he drinks in general, and perseveres, with full reliance on his wonderful powers and peculiar organization. The blanket can be seen to have moved several feet down his body. It is now about the middle (October 28th). Will he manage it somehow, or will he die? This is the problem.—*Dickens's Household Words.*

The President of the College of Physicians is here represented as the Boa Constrictor. Mr. Newman is the rabbit he expected to gorge, but instead of that he has swallowed his own blanket. The President is the type of his College. The College has devoured its rough, old, worn-out blanket; the creature is now in a state of torpor; it has swallowed its own *Parisius* and its own *Aureus Avis*, and divers others of its acolytes, thinking it was gulping down homœopathists. Mr. Dickens puts a very pertinent question. It is now getting to the fag-end of the year. The blanket, with its contents, has moved several feet down its body. Will the Collegiate Boa manage it somehow, or will it die?

Meanwhile, it only requires a calf-skin wrapper thrown over it, to present a complete image of Collegiate Dignity in repose—

"Go, spread a calf-skin o'er that torpid trunk."

Hosted by Google

What a picture this would be for *Punch*—the College a great Boa, with the outlines of the physiognomies of the *Ultimus Wilsonorum, Parisius, Aureus Avis,* and its other notables—shown even through the blanket and the boa's skin,—while the *licentiates,* walking reverently backward, are in the act of dropping a huge calf-skin over the torpid creature!

THE LANCET.

We have in the *Lancet,* November 15th, a lusty assault, and, as the writer thinks, from a decided vantage-ground. During two weeks he was gathering up his loins and his forces, and in the third he has stricken his blow. But we are not conscious that our lines reel, or our flanks are turned, or our centre gives way.

His vantage-ground is the assumed failure of Mr. Rutter's instrument to demonstrate, physically, the fact that the small doses of the homœopathists act on the human organism. There is, however, one sign of grace in the *Lancet.* The Editor has obviously been studying the *Homœopathic Times,* though he styles this journal "a wretched publication in the service of the quacks:" we might retort on him, and call him "the wretched servitor of medical bigots." He devotes twelve and a half columns to his leader on Mr. Rutter, and Drs. Quin and Madden, and the *Homœopathic Times.*

He enters with great *gusto* on his study of the "Quinian narration," the stimulating force of which he compares to Homer's vivacious and rapid flow. He divides the drama into acts, and evidently takes great pleasure in his work. We must do him the credit to allow that, with his presumed views and convictions, he has written a very slashing, very clever, and very amusing article, in which he harps on the credulity or the knavery of the homœopathists.

But this very clever and very unscrupulous Hotspur of the allopathic body forgets that there is such a thing as "laughing on the wrong side of the mouth." We do not know, and do not prejudge the question, whether Mr. Rutter will be able to make out his case, as it has been presented by his earnest and zealous expositor, Dr. Quin; but we do believe that Reichenbach, Herbert Mayo, Rutter, and many others are right in their views of magnetism; we believe there are *Odic* polarities in the human body, and "magnetoid currents."

We also advise the Editor of the *Lancet* that, however glad we should be of demonstrations from physical science of our noble Cause, we rest the proof of homœopathy on experience and statistics. We do not doubt that, sooner or later, we shall have the proofs from physical science; and we hope that Mr. Rutter will be the man to show us the way. We have no doubt whatever of his science, his integrity, and his conscientiousness. With this conviction, we are glad to see that his promised treatise is already published; we will review it next week.* Time and experience will confirm what is true, correct what is imperfect or wrong, and reject what is untenable.

The Editor of the *Lancet* should have given us full credit for wishing to convey, through the columns of our journal, which he calls the "Quack Repository," the expression of every shade of opinion on this subject. We have published the lectures of Dr. Quin, and a report of Dr. Madden's, lecture, and we have also published Dr. Madden's *palinode,* and Mr. Sharp's testimony to that palinode, and a variety of opinions from various correspondents. We have shown that our anxiety is for Truth, and that we care nothing for sectarian prejudice.

We "wait and watch" still. We are nothing daunted by the forays of this hero of allopathy: we cheer him on. We know that our Cause is true; and we are most hopeful. We forbear for the present to show the gross inconsistency of the Editor of the *Lancet* in his own great article. He is a very truculent partisan, but he trembles in his shoes, or he would not have devoted twelve and a half columns *—to an exploded fallacy.*

* Magnetoid Currents; their Forces and Directions, with a description of the Magnetoscope. By J. O. N. Rutter, F.R.A.S. London: Parker and Son, West Strand.

Hosted by Google

THE MEDICAL TIMES.

THE notices to correspondents are generally the "dirty corners" of the anti-homœopathic weekly journalists. We give the following of these notices:—

"*General Practitioner.*—A physician cannot *consult with* an homœopath any more than he can consult with a man who believes in the universally curative powers of Morison's pills or Holloway's ointment. An accurate diagnosis can avail the patient nothing, unless the treatment be such as shall remove or palliate the disease detected. What the better would the Duchess of —— be for a consultation between the homœopath Quin and Dr. B., if the conclusion of that consultation should be, that the Duchess was suffering from sthenic pleuro-pneumonia, and that she should be treated by decillionths of a grain of *Tartar Emetic?* Accurate diagnosis is of no use but as a guide to efficient treatment."

The logic of this oracle is exquisite. If a person is supposed to be clever at diagnosing a disease, but not clever at treating it, there is no apparent reason why he should not give an opinion on a subject he understands, *for the consideration.* In this very number the Editor takes the opinion of a clergyman as the best, on a particular subject connected with diagnosis. We advise the homœopaths to have nothing to do with the allopaths.

Our contemporary has three little hits at homœopathy, from three different correspondents. They rejoice in the names of *Argus*, *Amicus*, and *Rusticus*.

Argus, who seems to have only one eye instead of a hundred, his proper number, is anxious that the Royal Medical and Chirurgical Society should be afforded an "opportunity of repudiating homœopathy." We had supposed, in our simplicity, that the said illustrious Society had already repudiated the doctrine and practice of Hahnemann.

Amicus is strong on medical ethics; it seems there is a Provident Society at Birmingham, which is blessed, or not blessed, as the case may be, with a staff of twenty-one medical officers. One of them is a homœopath, and *Amicus* thinks the other twenty should have pluck enough to turn him out. But if they are peaceable subjects, might they not themselves vacate, and leave the homœopath "alone in his glory." But on this letter the Editor of the *Medical Times* observes, "The principle of non-intercourse and non-co-operation with homœopaths must be carried on without reservation. It is as binding on the surgeons of a Provident Club, as it is on the members of a Royal College. The profession must act unanimously in this matter, or the demonstration will be useless. If the practitioners of Birmingham do not at once make a stand against this insidious quackery, the time will come when they will regret their inertness or their indifference, and will strive in vain to recover the vantage-ground they have unnecessarily surrendered."

Rusticus seems to think that some members of the Royal Medical and Chirurgical Society are glad enough to urge on others against the homœopathists, but, like the retired rat, wish to sit each in his Parmesan cheese; in other words, to have the advantages of a *sub-rosâ* unwhispered sort of dalliance, and occasional consultations with homœopathic practitioners.

How is it that the *Medical Times* is without notice of the magnetoscope? Why has the *Lancet* been allowed to get the start?

As the signatures of non-medical homœopathists, as well as of graduates of Edinburgh, are asked to the following petition, it is proper we should give it insertion. The object of the petitioners is to obtain justice and fair play for the homœopathists who may present themselves for examination by the Medical Faculty of Edinburgh.

We refer our readers to a very able letter by *Alumnus*, which they will find in our Correspondence of this week; but they will bear in mind that we have always advocated the necessity of agitating for a CHARTER. In the present state of the great body of the medical profession, there is not much probability of any marked improvement of feeling of the allopathic towards the homœopathic practitioners.

We can only hope to be tolerated by any of the licensing bodies; but toleration is

Hosted by Google

better than hostility. It is known that the Medical Faculties of the four Scotch Universities have pronounced against homœopathy. The College of Physicians of London has done likewise; but there are other licensing bodies that have not pronounced against us as yet, and, till they do, "silence is consent." So let our students obtain their diplomas and licenses from them; those in Scotland can come south for that purpose, and those that are in the south can obtain their licenses here, if the Scotch universities permit their Medical Faculties to misuse their privileges for the purpose of excluding the homœopathists.

Whatever petitions are presented to whatever bodies, it is our conviction that the greatest weight is due to *numbers*. A poor man with common sense is quite as good a judge of what is for his advantage as a prince.

The Crown or the Government or the Parliament, and we presume Patrons of Universities, are more impressed by vast numbers, than by a few names only, however dignified by rank, or intellectual distinction, or political influence, or virtue, or piety, their possessors may be. Furthermore, whatever is worth doing at all is worth doing well.

We are satisfied that all who are interested in homœopathy should agitate for a CHARTER for the homœopathists.

"*Unto the Right Honourable the Lord Provost, Magistrates, and Council, Patrons of the University of Edinburgh, the Petition of the undersigned Graduates of the said University, and others,*

"Humbly sheweth,

"THAT your Petitioners, deeply impressed with the importance of providing adequate instruction for those who are to become Practitioners of Medicine, and of securing that University Degrees in Medicine, which are public attestations of the studies and acquirements of those who receive them, shall be granted simply on the ground of such studies and acquirements; and feeling a deep interest in the progress of Medical Science, and in the prosperity of the University of Edinburgh, as one of the principal Medical Schools in Great Britain, desire earnestly and respectfully to direct your immediate attention, as Honourable Patrons, to a matter connected with the granting of Degrees in Medicine in the University of Edinburgh, which has been forced upon the notice of your Petitioners. The facts upon which your Petitioners found the present application appear in the following document, with reference to the examination of one of the Students of Medicine, issued by the authority of the Medical Faculty of the said University, and published in the "Monthly Journal of Medical Science" (No. 128):—

"'Mr. Alfred Crosby Pope, having appeared before the Second Division of Examiners of the Medical Faculty in the middle of June, underwent the usual written examination on the practical branches of Medicine and Surgery, and was afterwards subjected to an oral examination on the same subjects. He had satisfied several of the Examiners; but his surgical knowledge was evidently defective. While under examination in Midwifery, he was asked what doses of calomel, opium, tartar-emetic, and aloïn he would give in certain diseases. In reply, he stated correctly the doses usually given in medical practice; and when asked whether these were the doses which he would himself prescribe, he replied that they were. He then underwent an examination on Materia Medica, the Professors of that branch and of Clinical Surgery being present. His replies were satisfactory enough; the only objection of any moment indeed being, that his doses of medicines were somewhat large. The Faculty having been furnished with positive information that Mr. Pope had avowed his purpose to become a homœopathic practitioner, after graduating, it was determined that he should have an opportunity of answering to the charge. The question was put to him by Dr. Christison, and the following are the very words of the conversation that ensued:—"Well, Mr. Pope, I am satisfied so far with your answers; but there is another point on which I wish to be informed; and, as it is best not to beat about the bush, I shall put to you a plain question, in order that I may get a downright answer. I am told by a colleague that he has been informed, on good authority, that it is your intention to become a homœopathic practitioner after you graduate; *after the answers you have this day given me*, I feel bound to say I do not believe it. Am I right?" To which Mr. Pope replied, "I am not now a Homœopathist; but after graduation, I mean to inquire into the truth of it." Professor Syme then remarked, "Now, Mr. Pope, suppose that this inquiry which you meditate were to confirm your belief in the truth of Homœopathy, what would you do with the diploma received from us? would you burn or return it?" "No," replied he, "I would keep it." "For what purpose?" "To show that I had regularly studied." "Studied what? Delusions! Fallacies! Nonsense! It would only show that you had misspent four or five years of your life in studying what could not possibly be of any service, according to your own view; and I am sure that, on reflection, you must see how inconsistent it would be with common honesty or common sense to use a diploma, after ceasing to entertain the principles which were professed in order to obtain it. But recollect, Mr. Pope, I offer this remark to you as a friend, and not as a pro-

Hosted by Google

fessor." Mr. Pope then withdrew, and in what remained of his examination he made a satisfactory appearance, except in Medical Jurisprudence, in which, as in Surgery, he was defective. The case being a new one, it was referred by the Examiners to the whole Medical Faculty for decision. Of the thirteen members, eleven were present. After considering the whole circumstances, the Faculty unanimously resolved—"That serious doubts are entertained as to the soundness of Mr. Pope's principles of practice; and that on this account, as well as his insufficiency on some subjects of examination, he shall be remitted till the end of July, by which time he will have had ample opportunity of making the inquiry into the truth of Homœopathy which he says he contemplates." This resolution, which admitted of his graduating this year, in the event of his satisfying the Medical Faculty, was communicated to him in conversation by the Dean. Mr. Pope, however, withdrew at once from the list of candidates.'

"From the above statements it appears that, in requiring from any candidate an explicit pledge, limiting his future course of study and practice, the Medical Faculty have made a fundamental change in the conditions under which Degrees in Medicine have been heretofore granted; and the Petitioners believe that this has been done arbitrarily, and without the authority, or even the knowledge, of the *Senatus* or of the Patrons of the University: That your Petitioners are deeply convinced that this innovation, if adhered to, will be highly injurious to the progress of science and to the morality of the students, as well as greatly detrimental to the usefulness and to the reputation of the University of Edinburgh; and that those who find themselves thus debarred from pursuing their studies in whatever direction Truth seems to call them, will be driven to other and possibly to foreign Universities, or to separate and independent Institutions: That this proceeding on the part of the Examiners seems the more objectionable when they are also Professors in the University, and have ample means, as teachers, of bringing under the notice of students any facts or reasons which they may think important in reference to medical doctrine or practice; and that the attempt to protect and perpetuate their own particular opinions, by the imposition of such a test, argues, either doubt of the stability of their own position, or a most unworthy distrust of the judgment or integrity of the Medical Students of the University.

"It may hardly be necessary for your Petitioners to repeat, what must be quite familiar, that the art of medicine, inasmuch as it is progressive, and dependent, to a great extent, upon the advancement of the related sciences, is continually liable to change; so that the wisdom of one generation is the folly of the next; and that the endeavour to prevent its free growth in any direction is unwise, and cannot but be injurious.

"That, with particular reference to the mode of practice which the Medical Faculty is now attempting thus to obstruct, viz., that founded on the law of specifics announced by Hahnemann, and generally known as the homœopathic law, for the selection and administration of medicines, your Petitioners would respectfully represent to the Patrons of the University that the belief in it has been, during more than half a century, steadily and rapidly extending over the Continent of Europe, and in the United States of America, as well as in Great Britain, where, among the Physicians now practising in accordance with it, are many of the Graduates and one of the Medical Professors of the University of Edinburgh: That, in several of the most distinguished foreign Schools of Medicine, it has been distinctly recognised and taught: That there are public Hospitals and Dispensaries, both foreign and domestic, for the exclusive practice of it: And that, in the opinion of your Petitioners, aad in that of a large and influential body of Her Majesty's subjects, this system is calculated to exercise a greatly beneficial influence on the art of healing.

"Your Petitioners, however, have no wish to obtain from the Patrons the expression of any explicit preference for, or approval of, the homœopathic system; on the contrary, the object of the present application is to secure the intervention of the Honourable Patrons of the University, should such appear to be necessary, in order that any undue attempts to interfere with the full liberty of the Students of Medicine may be prevented in future; and that the honour, independence, and distinguished reputation of the University may be preserved.

"In conclusion, your Petitioners have to request that the Honourable Patrons will cause the irregularity complained of to be brought under the immediate notice of the *Senatus* of the University, or will act otherwise in the matter as to their wisdom shall seem best.

And your Petitioners will ever pray.

Correspondence.

THE PETITION TO THE PATRONS OF THE UNIVERSITY OF EDINBURGH.

To the Editor of the Homœopathic Times.

SIR,—I have read in your last paper a letter, signed J. G. Rosenstein, with your own editorial note; and take the earliest opportunity to correct the errors of your correspondent, with reference to the objects and the expediency of the proposed petition to the Patrons of the Edinburgh University.

It is not, as he seems to suppose, intended that petitions on the subject shall be presented by homœopathic practitioners. On the contrary, *one* petition is to be presented in the name of all persons who are prepared thus to express their disapproval of the manner and grounds of Mr. Pope's rejection, and endeavour to secure in future entire liberty in the matter for all our students of medicine. Those who are of opinion that such rejection was right, and the beginning of a course which ought to be persevered in, will naturally not sign the petition; and, on the other hand, all whose desire it is to secure ab-

Hosted by Google

solute liberty for all graduates, and to prevent the imposition of any such test as was applied in Mr. Pope's case, appear in a condition to sign the petition; and while, practically, it is quite immaterial whether or not your correspondent shall sign it, it seems to me very desirable that it should be signed by all the graduates of the Edinburgh University, who are in circumstances to do so, and by as many as possible of our influential laymen; as such a petition will have the effect not only of influencing the Patrons, but of greatly encouraging timid students.

Whether or no such a petition shall be presented, *is not now the question;* the petition has been prepared, is receiving signatures (among which are names of the highest eminence), and will certainly be presented. It is not in the power of any of your correspondents to prevent this being done: they can only, by refusing to co-operate, render it less influential. Their opposition, therefore, can only do harm, by no means good; it being quite apparent, that if such a petition is to be presented, for many reasons, it is of the utmost importance that it should bear as many and as influential names as possible.

The expediency of taking this step was well considered by those with whom the decision rested, and who had such knowledge of the circumstances as to entitle them to form a judgment. That your correspondent should be so entirely uninformed as to the nature of our municipal institutions as to argue that because a former Lord Provost showed some hostility (referred to by Dr. Russell), therefore the present one, who has just taken office after the interval of another reign, must also, with all his council, be hostile too, is not much to be wondered at; only it is to be regretted, that in such ignorance he should have deemed himself qualified to appear as an adviser in the matter.

You will observe, then, Sir, that this is by no means a matter of government which a majority must determine; it is a practical local measure, resolved upon by those best informed, and called on to act; local, but of most important general consequences, and in which, therefore, it is just to claim the cordial co-operation of all true adherents of the common cause.

My own opinion is that the step is wisely taken; but even if I thought otherwise, I should give all the help in my power to make it effectual. But in any view, it can do no harm. On the one hand, suppose it successful—then in future no student will be examined as Mr. Pope was; all will have fair play: a most material advantage at least, in the mean time, until other arrangements can be made. On the other hand, suppose it unsuccessful—then there will be another strong argument for the appointment of an Examining Board, or the granting of a charter. On these grounds, I trust there will be a cordial co-operation in this matter on the part of all who desire to secure full freedom in the medical schools; an object of extreme importance, even should there be also separate homœopathic institutions.

The expediency of these is a question much too large and important to be discussed in this hurried letter. The reasons against it seem to me greatly to preponderate, and to include nearly all the higher considerations.

To extend and perpetuate sectarianism is an evil so great that only *necessity* will justify it; and the superiority which the homœopathic practitioners can now justly claim, on the ground of their being learned in all systems, will be cut from under them, from the moment that they are nursed in a sort of medical Maynooth.

No one, I think, can read Hahnemann's writings, and come to the conclusion that the ordinary teaching of the schools gave him none of the materials from which arose his grand discovery, and from which, therefore, must come the means of progress to his disciples.

It is altogether undeniable that a sectarian position has always the effect of *dwarfing* its victims; a most disastrous result, but, I fear, an inevitable one. Again, the probability of gathering in the *élite* of the general students of medicine, which we are now doing, will be greatly less when the homœopathists, on their own confession, assume the position of a *sect*,—one into which it is the persistent policy of our opponents to drive us, but from which let us earnestly and successfully struggle for delivery.

On this vital subject I can say no more at present, but desiring that it may be most seriously pondered,

I remain, yours faithfully,

AN ALUMNUS OF THE UNIVERSITY OF EDINBURGH.

Edinburgh, Nov. 17, 1851.

THE MAGNETOSCOPE.

To the Editor of the Homœopathic Times.

SIR,—As I perceive from the tenor of two letters in your paper of this date, as well as from private communications, that different explanations of the results of Mr. Rutter's experiments are being propounded and freely discussed, I think it highly important that we should have a few fixed principles around which to accumulate our observations, and by which to test the value of any series of experiments which may be brought to bear on the elucidation of this most interesting but withal most intricate subject. I will therefore take the liberty of proffering the following hints for the consideration of my medical brethren, in order that they may accept of them if approved, and may, at all events, know the rules in conformity with which my own researches are being carried out. I may premise that many of these rules have been suggested to me, and many directly obtained from a most profound review of odyle, mesmerism, electro-biology, etc., which appeared in the October number of the *British and Foreign Medico-Chirurgical Review*.

I. In a series of experiments designed to prove the existence of a new force, it is essential, wherever the case admits of it, that such experiments should assume the character of a positive demonstration, and not depend for their accuracy upon individual testimony.

Now it must be obvious to all who have read

Hosted by Google

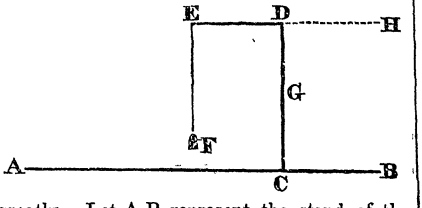
the history of Mr. Rutter's experiments, that this rule was strongly felt by him, and indeed formed the stimulus to all his endeavours after a fixed instrument; indeed, he repeatedly told me that his desire for a fixed instrument was simply because by the hand pendulum, though satisfied with the results himself, it was impossible to convince others of their accuracy. It is obvious, however, that no instrument can effect this desirable end which is capable of being set in motion by any slight voluntary effort, seeing that however rigid it may appear to be, if this fixedness exists in appearance only, the instrument is practically not one whit better then the hand pendulum. Now this has been proved by myself, "J. H.," and others, to be the case with the magnetoscope, and hence it follows that this first and most essential desideratum is yet awanting—a desideratum, without which all experiments must depend for their accuracy upon individual testimony.

II. In performing experiments of any kind, and especially when advancing upon new ground, it is essential that the experimenter should be accurately acquainted with his instrument, and fully alive to all the influence which may modify or in any way bear upon the results of his trials.

In the experiments with the magnetoscope, therefore, it must never be forgotten that two distinct series of laws co-operate in influencing the results obtained, viz., *the physical laws* appertaining to the machine, and the *physiological laws* appertaining to the man operating with the machine. We must accordingly analyse these, and determine what the probable results of each will be.

1. The *physical laws* appertaining to the machine. These may be divided into—(*a*) the *mechanical laws* belonging to the structure of the machine itself; and (*b*) *the magnetic laws* regulating the transmission of currents, should such exist.

(*a*) *The mechanical laws.* It is obvious that the first and most essential point to be attended to is *rigidity*, or incapability of being moved by moderate muscular efforts, as we cannot obtain demonstrative results in any other way. We have, however, already seen that this law has been disregarded. The next point to be determined is, whether there exist in the machine any arrangement for neutralizing the effects of slight muscular movements, or whether, on the contrary, such movements are allowed to take fullest effect; here a diagram will help us



greatly. Let A B represent the stand of the magnetoscope; C D the upright pillar; D E the brass arm; and E F the pendulum. (The dotted line from D to H will be referred to afterwards.) Now, in all the instruments I have seen, the fixing has been effected by cramps applied at the points A and B, thus steadying the stand, and through it the rest of the apparatus. Granting that the stand A B is rendered immovable, the remaining parts, C D, D E, and E F, represent three levers, and it is manifest that, in order to produce the greatest possible effect from the smallest amount of force, that force must be applied at the point D; because, first, it is the point of the column C D which is best fixed, and from whence the column could be most readily moved, or caused to vibrate. Second. It is manifest that any vibration given to the column C D will be communicated along the second lever D E, and that at the point E the effect will reach its maximum. Third. Any motion communicated to the pendulum at E will be transmitted to F, and will at that point attain its maximum of visible effect. Now it is at the point D that the brass ball is situated in the magnetoscope, and this is the point taken hold of by the operator. It must be obvious, therefore, that the first step in the proving of the fitness of any such instrument for the investigations in question, would be to ascertain what amount of force applied at D was necessary to affect the pendulum, and yet I have reason to know that this test was never properly applied; or, in other words, it was never attempted to imitate the motions of the pendulum voluntarily, which, however, should certainly have been tried, and every instrument discarded wherewith such imitated movements could be effected, without employing a considerable amount of force.

(*b.*) We come now to consider *the magnetic laws* regulating the transmission of currents through the apparatus. These are three in number.

1. Magnetic, electric, and similar currents, when transmitted to any apparatus, pass along the best conductor with which they come in contact.

2. The amount of magnetic force is always in an inverse ratio to the distance from the point of its origin at which it is tested.

A B C D E F

Thus let A B represent a magnet, and C F a bar of iron magnetised by contact with A B; if the magnetic force in the iron bar be tested at the points D, E, and F, it will be found to be stronger at D than at E, and stronger at E than at F. N.B. I need scarcely say, that this test is applied by breaking the bar at the points indicated, after it has been magnetised.

3. Mr. Rutter informs me (but not having yet found out the source from which he derives his opinion, I must give it on his authority) that any joint or diversity of material in a conductor influences considerably its conducting power, and that it is, therefore, important to have it constructed of a uniform material, and worked out of one single piece.

Applying these laws to the magnetoscope, we must conclude that, to obtain a perfect instrument, D E must be a much better conductor than C D; nay, to render the apparatus perfect, C D should

Hosted by Google

be a non-conductor. Again, the arm D E should be short, seeing that the magnetic force will diminish in proportion to the distance between the points D and E; and, lastly, according to Mr. Rutter, D E must be of uniform material, and composed of one single piece.

Thus far we have dealt with the physical machine alone; but as in all these experiments the operator is necessarily in contact with the instrument, he must himself be viewed as constituting an essential part of the apparatus, and before it is possible for us to estimate correctly the value of any such experiments, we must investigate minutely such physiological laws appertaining to the operator as might influence the results obtained. This I shall endeavour to do next week.

Yours faithfully,

Brighton, Nov. 10. HENRY R. MADDEN.

To the Editor of the Homœopathic Times.

SIR,—As you were so good as to publish my note last week, I trouble you with another. I am a very quiet sort of body, and I am seldom excited by anything that occurs in the world, but believing in homœopathy, and anxious that my sceptical friends should be convinced too, I hailed with great delight the magnificent promises held out by Drs. Quin and Madden, that the sort of proof we wanted of homœopathy had been provided for us by the fortunate genius of Black Rock, at Brighton. Now it seems that as nothing is new so nothing can be depended on under the sun, for these magnificent promises turn, out according to Dr. Madden, to be like the queer-looking spectres one sometimes sees rising from lakes and rivers in the grey morning, which change into various forms, and curl themselves up like misty snakes, and then unfurl their petticoats and vanish.

Dr. Quin, to judge from the lectures published in your paper, seems to be a very modest, humble-minded man, for he claims no sort of merit for himself, but gives all to Mr. Rutter; but Dr. Madden, judging him in the same way, seems to have a very good opinion of himself, and to claim the merit of making discoveries. He puts me very much in mind of idle people playing at *ninepins*, for he seems to set up his discoveries for the pleasure of knocking them down, and I suppose there is some pleasure in that kind of sport: but they might as well be knocked down, for they turn out to be no discoveries after all.

But plain people like me don't like this sort of sport, for though it may be very amusing to such philosophers as Dr. Madden, it is a very great disappointment to humble homœopathists like me; and after all, I don't know what to make out about this magnetoscope. Are all the experiments reported by Drs. Quin and Madden to a certain degree fallacious, and have all who have engaged in them been so careless or incautious as to mislead us?

A friend of mine tried Dr. Herbert Mayo's experiments some six or eight months since, and quite failed in producing the slightest effect; but he is a man of very strong power of will, and a remarkably fine character every way; and he steadily fixed his determination that no motion from his hand should act mechanically on the pendulum, and he told several friends, who had been more successful, that he feared they, without knowing it, communicated a motion (apart from any fluid), and thereby unwittingly deceived themselves, and he suggested that the person holding the string should be blindfolded, so as to prevent the possibility of the mind acting. This plan, however, was not, I believe, carried out; and when he heard that the motion could be produced when the string was attached to a rigid instrument, he concluded that his ideas were erroneous. What a pity Dr. Madden had not my friend at his elbow when he began those experiments, which occupied him threemonths! What a deal of trouble it would have saved him, and what a happy escape he would have had from making discoveries that turn out to be no discoveries at all, as he himself seems to think.

But even a plain ignorant body like me can see that even if Mr. Rutter's instrument don't exactly fit, another may be found out that will; and Dr. Madden's lapses and failures will make others more cautious, for no doubt great caution will be required in future.

There is a great deal of good sense, to my thinking, in the letters of Messrs. Wilson, Hands, Wilkinson, and Wells, so that though my heart is in my mouth about the magnetoscope, I have still a good deal of hope about it.

It is, at all events, pleasant to know that Mr. Rutter is as strong as ever in his belief that he is right, and that his experiments will be found every way true, and "no mistake."

No more at present from your servant,

A HUMBLE HOMŒOPATHIST.

To the Editor of the Homœopathic Times.

11, Clayton Place, Caledonian Road,
Islington, Oct. 29, 1851.

SIR,—Several of your readers in this neighbourhood, and, perhaps, some elsewhere, would be greatly obliged to Dr. Quin, if in a future number he would have the kindness to give a precise reference to the title of the work, the page or number, in which occurs the very beautiful and appropriate passage, which, in his "Inaugural Lecture," he quotes from Swedenborg, as illustrative of the Hahnemannic doctrine, and its confirmation by the beautiful instrument invented by Mr. Rutter.

I am, Sir, your very humble servant,

OVERTON GRIFFITHS.

"RESPICE, ASPICE, PROSPICE."—St. Bernard.

No. 122. Vol. III. | SATURDAY, NOVEMBER 29, 1851. | Stamped 4d. Unstamped 3d.

Communications.

LETTER TO ROBERT CHRISTISON, M.D., V.P.R.S.E.,

AND PROFESSOR OF MATERIA MEDICA IN THE UNIVERSITY OF EDINBURGH.

No. VII.

Sir,—We are twitted upon many points and we twit you again. You lay it as a healing unction to your wounded feelings that we have taken "alarm." Does "Sigma" betray any? and he can speak for the rest of his brethren. We are asked why our ranks are recruited from men unknown to allopathic fame. Are you or your obstetric colleague in a favourable position for conversion? Can you lay down the thousands at which you arrived tardily and he gained by a short cut, but which short cut you warn all students and graduates against? And in this warning is there no leaven? no approach to the "fox and grapes" principle? What thousands are to the few, hundreds are to the many. Patients can see, however, that there *are* certain conditions essentially necessary to conversion, but no greater pressure of the "res angusta domi" operate in its favour, than of the "auri sacra fames" against it. Nay more! On trying the experiment, you might have slipped into the "cave of Adullam."

Whenever it pleaseth a third-rate allopathist to bring his name before the public, he theoretically analyses our published cases, without a single experiment of his own, he constitutes himself an unerring judge, and fully as experienced in homœopathy as the most verdant greengrocer in "composition powder;" he tells us that our remedies have not been administered in conformity with our "*law*." In that case he is a better homœopathist than we are, and he has arrived at this stage of Hahnemannian perfection by a far shorter cut than we did: in obedience to your "criterion," therefore, we have a distrust of him and his "short cut," and the more so, as the cases recorded *were cures*.

The more you can do towards satisfying the public that there is no homœopathic law, the more destructive is the sarcasm you expend upon yourselves; for our cures of acute diseases exceed the allopath's; our cures of chronic diseases trebly exceed his; *ergo*, we, without a law, according to allopathic assertion, do more for humanity than he does, and if we sometimes fail to cure, we never kill—thank God for *that*.

You have blown a strong*ish* breeze, but the elastic stalk from the Hahnemannian root, heavy with ripening grain, bent its head thereto, and the blast swept over it; it is still erect, and drawing that nutriment from the soil which your allopathic oak so sadly stands in need of—for, with straining roots, and rended limbs, and bark all lightning scathed, her leaves scattered "whither the wind listeth," look out for the crash! it may fall on you at any time, it is falling even now.

Your November's issue of the *Monthly Journal of Medical Science* has proved a sad derelict in the therapeutic field. The pen so potently wielded by "six," has been left with ink upon it of a most corroding quality, but therein true indeed to its master's salt. Could we set Dr. Routh's slate-pencil a-spinning on our side, he would cast you up a term of 500,000,000,000 years, which, at your present rate, must elapse ere you can square the therapeutic circle, or arrive at a solution of the "*great pill problem*." The same pencil might easily compute you the innumerable stomach-aches that must in that space resolve themselves into diseased membranes. Sir, if *Artemisia vulgaris* is a cure for epilepsy and chorea, as your contributor says, why stuff the poor patient with the additional abominations, *Assafœtida*, *Dippel's Oil*, *Empyreumatised Olive Oil*, and *Castoreum?* Your correspondent asserts that *Artemisia* cured the two cases; and a few lines lower down, he says that *diaphoresis* cured the one, and *change of air the other*. A warm hip-bath might have saved the patient's gorge, and the diaphoresis been quite as effectual.

It is strange that, with one exception, you, of all the worthy names in allopathy, can risk so much in its defence. The "exception" entered a fair field, you preferred "inaugural" abuse. Why do the great names hang back? is it because one-half of them disbelieve their own system, and the other half practise homœopathy in

Hosted by Google

secret? or lest annual thousands might dwindle into hundreds under the trial? How comes it that the "*exception*," Dr. Forbes, an avowed opponent, has sent more converts to our ranks than it would gratify you to acknowledge? Your "inaugural address" will do the same, and like that gifted physician, you will retire from a beaten field.

Sir, there are hundreds in your ranks who practise homœopathy partially: the sin, however, only takes its date from the acknowledgment of it. Those who have the heart to do so, bear the brunt: those who have none are being whitewashed in your penitentiary.

We are taunted with the loss of friendships, and we are asked how we can bear the contempt showered upon us. I will tell you that half of the allopathic friendship we have hitherto rejoiced in was so meagre that we do not, in the least, feel the loss of the other half, and your contempt for us is thoroughly counterbalanced by our return of it. Nay more: the more we are persecuted, the more we rise superior to personal considerations, for we know that, having worsted you hitherto, we shall worst you again. Every successful case in our hands is an effectual bulwark against your sternest hostility, and already have we accumulated a mass of evidence, which is working allopathic discomfiture, and is being, by the cured, spread abroad among the nations. Whilst men of science and of education are neglecting therapeutics on the acknowledged ground of "difficulty," and who cannot by any means settle the momentous question, whether a fossil represents a quondam fish or a reptile, we are curing the sick by a means they ignore. Whilst men, blest with the abundant gifts of nature and intellect, meet constantly in assemblies, and spend the most precious hours, until the hours are accumulated into months, in deciding upon the very analogous importance of an intimate knowledge of "spiders" and their "descendants," we are meeting with therapeutic triumphs, which render us proof against any allopathic storm.

It is in your official capacity, and as therapeutic high-priest of your *Lancet*-goaded Faculty, that I deem you a fitting person to whom to address my remonstrance; and because, in obedience to the dictates of the hideous Moloch of Medicine, and "*te duce*," a wrong has been inflicted on men whose sense of ultimate responsibility to the highest tribunal is as strong as your own, whose hearts are as true to the physical well-being of their fellow-men as that which beats within your own mortal coil. It is not for me to judge, but as justice has been administered in this case, so may it be meted you again. Neither you nor I may see that day, but it *must come*, and those who are then by to acknowledge the law we advocate may, like you, tell "how joyously it was received by the profession."

Looking forward to the future often leads to reflection on the past. Your "Modern Athens" and your fortress-capped rock seem a meet emblem of your system of medicine: for generations it enjoyed the reputation of strength; perched up far above the reach of men, so long as slings and arrows were the weapons of the age it was strong, in virtue of its situation—the foundation, the noble collateral sciences; but the therapeutic edifice built thereon by puny man was but stone and mortar. So long as men knew no better system, the artificially-cemented structure kept its place in public estimation. But homœopathy was enunciated, and, despite contempt and oppression, she has advanced her parallels on a vast and open plain, easily scanned over by an unjaundiced eye, and now bomb-proof within her modern works, she proves to you most feelingly that antiquated medicine is no better than antiquated anything else. She smiles at *balistæ* and *catapultæ*, at slings and arrows, and peppers you incessantly with small shot, which, small as they are, have been so penetrating that there are as many holes in your walls as in a cane-bottomed chair. The public eye peeps through these holes, and lo! "the incalculable mass of rubbish" you are so familiar with.

I am thus reminded of an epoch when your University professors had some very slow coaches among them. They are gathered to their fathers, so let them rest; but *their* slowness gave rise to a body of private lecturers, whose extreme energy, in all but therapeutics, placed them high in the scientific scale of that day. One, endowed above all others, the Hyperion of his race, drew around him the advanced students of your Edinburgh school. He was a maniac upon one point—bloodletting; he taught his doctrine with a fascination peculiar to himself, and he presented to the neophyte a draught that I have many a time seen drained to the *very dregs*. It seems to me now a dream, if it pleaseth you, "a homœopathic dream," when I look back upon all that,—the empty benches of the drowsy professor, the bumper-house of the private lecturer,—both have passed away. You doubtless remember them well; but professional jealousy was not unknown in that day, so I may not say with what feel-

Hosted by Google

ing you do so. Could they look up and read "page 301" of your September issue, and "Article IV." of your November one, they would require no great improvement in medicine ethics. You might ask Mr. Syme's opinion upon that point, and ascertain if his contempt has been so lavishly expended on homœopathists that he has none to bestow upon the surgeons of Dublin, or gratitude to cast away upon the London men? Does he know that surgery is declining; that in 1851 a first-class artery has been fatally tied without any aneurism at all? Sir, we have not got one-half into the little niceties of the twin-profession of medicine and surgery. We shall do our best to make a glass in which to see them clearly.

But we have left "our subject," let us return to it. The teacher I alluded to, then esteemed a most gifted physician, and by patients much sought after, spread his sanguinary doctrine; the desire to draw blood became an exanthem in that class-room, a universal scarlet fever of the mind. He judged of the abilities of a pupil by the temerity with which he used the lancet; he illustrated the necessity for its use by a few favourite subjects, one of the most prominent being "puerperal inflammation;" twenty-four, thirty-six, even forty-eight ounces were deemed *indispensable*; it was so taught, and such a spoliation of human life medically canonized the young butcher who boasted of the theft, which was recommended to be "*repeated in twelve hours*," if no improvement, and *very often there was no improvement.*

Sir, you made no "*resolution*" against that practice, and yet in your October issue of the *Monthly Journal of Medical Science*, you show by Dr. Welti's paper, that he cured forty-three cases of that disease, with out the loss of a drop of blood; and that the only one case treated by "*bleeding, leeching*, and *Calomel*," according to the "*text-book, died.* It is said that acute disease has altered its type since then, and that such bleedings are not now required. In that case, *Nature has changed her course to suit homœopathists!!!*

I learnt the falsity of this teacher's doctrine not in a single night, but only by degrees—degrees long spun out. I have seen, in obedience to it, many a strong man sink at noon, and youth put on the "sere and yellow leaf" in May, who else had deferred it till October. But if this doctrine is no longer recognised by your school in its *then integrity*, the operation was ingenuous and *visible* to all men; and in this it possessed an advantage over its antiphlogistic substitute, the *Calomel* and *Opium* of to-day.

Sir, *Calomel* and *Opium* does wonders for homœopathy. We recognise it in a large majority of our chronic cases; we see it in the bones and their periosteal covering; we trace it in irritable nerves, in copper-colour skin, in spongy gums, in torpid livers; it beclouds the wrapping-sheet of the hydropath; it provides with temporal comforts a whole democracy of dentists. With you, in acute diseases, it is a "saving health;" with us, in chronic, it is a symbol of mortality.

Are men's pulses, then, to be brought within limited vibration by means which so frequently inflict chronic ailment? Is *Opium* to be prescribed to receive it more? Can you purge the system of peccant humours, and say to the drug, "*take nothing* but peccant humours," and will the drug obey you? Medical men have been sad strangers to humility; a pall of it is spreading over them.

Sir, if we mistook your forbearance in the earlier years of homœopathy, as is said you also mistook ours, the eagerness with which you strove to unmask others has resulted in the unmasking of yourselves. You have torn the veil from the countenance of Medical Ethics, in consideration for which mythical goddess we have hitherto been silent. We now know who are our friends, and we know who are our enemies. We hope to be protected from the former, from the latter we can protect ourselves; but it is a great comfort to be assured, so frequently *as we are*, that—

> "We've done you a deal of good;
> For far too confident in yourselves,
> You didn't know where you stood."

I have the honour to be, Sir,
Your most obedient servant,
Nov. 10, 1851. SIGMA.

INNOVATIONS, HOMŒOPATHIC, OR ANY OTHER.

From the Hereford Times.

SIR,—At the first promulgation of a new discovery there seems in man, and in his institutions, a disinclination to adopt it; hence the opposition arising when innovations are broached; with the present he seems satisfied, and probably would remain, were it not that a power superior to his feelings is in action, which subdues him, and to whose imperious influence he must yield the obstinacy of his will. We are linked by habituation to old notions; that which we have tasted and handled we are reluctant to relinquish, and the attempt to set us free is oftentimes fraught with danger to the innovator,

Hosted by Google

and loss to those who by their perverse resistance are deprived of the benefits of the change.

How does it happen that innovations are attended with peril, the inventor either falling a martyr in the blaze of the light he sheds on the world, or received with incredulity, or assailed with direct hostility? The reason is obvious: although the human intellect by its force can penetrate the deep recesses of knowledge, or by its achievements can anticipate and overcome obstacle, yet it encounters with doubt and slow acquiescence the facts which have no similarity to its previous information.

The innovator, probably, after penetrating the profundities of nature, approaches with the fruits of his research. We cannot follow him through the elaboration of his thoughts; the processes of his deductions are too refined for our indurated conceptions; his calculations too complex for the grasp of faculties confined within the limits of old actualities. And when we observe him assailing principles, the basis of long-continued action, we conclude that he is a designing speculator, who is either paltering with human belief or attempting to mpose the crudities of theory for the digested axioms of truth. And how much of repugnance is intelligible on the ground of conceit, believing that the acme of wisdom is reached, and further advances unnecessary, or elucidated by wounded vanity, which sees in the adoption a censure on its judgment.

Any innovations which threaten "existing institutions or systems," whether true or false, are pronounced dangerous, and the innovator is tabooed, not because men are over-zealous for right, or instinctively despise error, but because they menace "vested interests," and the clamour will be co-extensive with the dread of loss. Yet it is by innovation that the storehouses of the arts and sciences have been opened—it is by innovation that old things are dismissed as unfit for use, and new things created more adapted to the community—it is by innovation that we have obtained means to procure bouudless benefits, and further the manifold interests of society. It has established our claim to intellectual dominion, and by its operations of demolishing and remoulding, it evokes beauties that were hidden, uses that were dormant, and means that were unknown until revealed by its power.

It may be that all innovations are experiments, perhaps hazardous or imperfect at first; but, if in conformity with truth, the germ expands, thrives, and becomes susceptible of improvement and perfection. The most finished production of art was once a crude idea in the folds of the brain, and in its embodiment presented no characteristic of the matured power now manifested. Why, then, should we be arrayed against innovations in their incipient state, or because they break the chains which bind the mind to predilections, or abolish those material agencies which have survived their efficacy? This is not a time to cherish fancied forms: everything is estimated by its usefulness, and maintained accordingly.

We ought not to forget, in appreciating propositions submitted for general acceptation, that change is a law of life—improvement the consequence; and however much we may abhor it, it will be a peculiarity of our condition, for in the records of our race there is no evidence of a durable institution impervious to the march of time, or impregnable to that spirit of just inquiry which expatiates beyond the confines of old formulæ.

At the bar of public opinion (a tribunal seldom wrong in its decisions) homœopathy solicits, and ought to have a fair and impartial trial; for if it be what its opponents represent, a medical delusion, having no foundation in fact, it will perish in the ordeal. It does not admit of a solution by argument; a long series of reasoning, however convincing, cannot touch its merits, or ascertain its defects; and it would be as vain as to argue blindfolded on the presence or absence of light, which could be easily decided by removing the bandage. As, therefore, the question is one of feeling and sympathy, and lies between relief and suffering, the safest way to discover its efficacy is to apply to it the Baconian test of experiment, which no quackery can withstand, and from which truth returns with renewed lustre.

In it is involved a primary principle of humanity, the alleviation of human agony; and surely the assuaging of pain must claim paramount attention, for, in comparison with that great result, the rule which excludes its practice from the Ross Dispensary is a mere trifle, not to be considered for a moment.

The governors of that Institution or any other, devoted to such noble purposes, would be stultifying themselves, and fail in their mission of distinguished benevolence—the ministrations of which exemplify one of the holiest precepts of religion, "Heal the sick," if they refused to listen to the suggestion of any efficacious mode for alleviating the bodily anguish of the afflicted patients. If possibilities of restoring health exist, and are untried, will they have such reverence for the prevailing treatment as to say that none other is curative? Is it not rather their duty to relax their rules, and admit other systems in addition to those now practised? If not, they are morally responsible for a continuation of suffering which might have been removed, had it not been for their inflexibility.

Moreover, they ought to bear in mind that homœopathy has not been introduced at Ross by a mere stranger, in whom no confidence could be placed, but by a gentleman of considerable experience and high attainments, whose convictions deserve attention, and entitle him to be heard, and who could only be actuated by the purest motive—a wish to benefit his fellow-beings, and ameliorate "the ills which flesh is heir to."

J. WILLIAMS.

THE
HOMŒOPATHIC TIMES.

SATURDAY, NOVEMBER 29TH, 1851.

HOMŒOPATHY is in the ascendant. This our old opponent the *Lancet* well knows, and therefore its writers do not dispute the great fact. Curiously enough, however, while the admission is made, a show of resistance is attempted against our progress; but as the cloven hoof is exhibited to a fearful extent, the remarks contained in the columns of this (shall we say "obscure?") periodical fail to exert the influence it is vainly imagined it so universally possesses. Once again we would warn these self-constituted censors that they have overshot their mark, and are likely in the long run to rue their indiscretion.

It is no fresh circumstance in remembrance that the professional community, so far as allopathy is concerned, alone represent the movement against homœopathy. And why is this? Simply because the public discover, when they become enlightened on the topic, that there are two sides to the question of medical reform,—one involving the maintenance of old prejudices, the other the exposure of past follies, and a proposed revision of the existing forms of practice. The advantage, therefore, to be gained from a proper consideration and investigation of the subject is apparently so manifest, that society at large show a determination to set at naught the revilers of our philosophy, and to give us at least the benefit of a trial.

Thus it is that, from month to month, and from year to year, we have gone on gathering strength and securing sympathy; for not only has our system been assisted, through the beneficial influence of its curative powers, but it has also derived support from the recognised spirit of persecution with which it has been assailed—until at length we stand in a position to defy the most malignant of our antagonists and their elected organs.

The task for ourselves at this juncture is one of the most simple that can be imagined, and it will merely require all homœopathists to be true to each other in triumphantly weathering the storm provoked by our adversaries. Spread the doctrines of our illustrious predecessor through every conceivable channel. Professional and lay disciples should alike work with zeal in the Cause. Whenever sources fail for distributing printed evidence of our progress and prosperity, give oral evidence, by means of conversation and every-day-life illustration. No lack of testimony will be wanting in these respects, and the sooner the work is commenced in real earnest the sooner will our labours meet their reward. Allopathy, under such circumstances, must pass into its merited decadence, leaving homœopathy, as its successful rival, the pleasure of distributing its blessings throughout the civilized world.

THE LANCET AND THE MAGNETOSCOPE.

WE recur to the *Lancet's* twelve-and-a-half columns leader, for the purpose of showing that if some dozen homœopathists were credulous in believing the wonders of Mr. RUTTER's instrument, a vast number more of the allopaths were no less credulous. We derive the testimony from the *Lancet* of the 22nd.

Dr. ROUTH, however, in the last week's number of the *Medical Times*, declares the belief of some homœopathists in the magnetoscope to be "another proof of their tendency (that of homœopathists in general) to universalize from a few non-conclusive experiments." Dr. ROUTH thus calls the experience and the statistics of several thousand homœopathic practitioners, during half a century, a few non-conclusive experiments.

We have already stated that we still believe very much will come from the attention of very many persons that has been awakened to the study of "magnetoid currents," by Mr. RUTTER. His facts are not explained away by any of the given solu-

Hosted by Google

tions; they still remain, and there will soon be the accumulation of many more.

We invite the attention of our readers to the note of Dr. CHARLES COWAN, extracted from the last week's *Lancet*.

"THE NEW MAGNETIC INDICATOR OF FOLLY.

"*To the Editor of the Lancet.*

"SIR,—I beg to thank you for your able and most crushing leading article of last week, on the 'New Magnetic Indicator of Folly.'

"It is highly calculated to advance the cause of true science and common sense, and to bring down well-merited castigation upon that extravagant absurdity and deep delusion which is so extensively pervading the educated minds of this much-vaunted age; and, alas! involving so many members of the medical profession.

"Mr. Rutter's experiments were most obligingly exhibited to the members of the Provincial Association, when meeting at Brighton, and I was astonished and pained to observe the great excitement, the easy and unquestioning faith of many whose education and presumed habits of accurate thinking would have justified the hope of a keener and more cautious induction.

"Of Mr. Rutter's honesty I am perfectly satisfied, and for his courtesy I feel obliged; but when witnessing his experiments, and listening to his philosophy, I was inwardly convinced of the fallacy of the one, and the unsoundness of the other.

"On returning home, I repeated the processes he employed, and several others which have been described by that ingenious, but erratic and self-deceived observer, Dr. Mayo, in his recent volume on Popular Superstitions.

"The result has been completely confirmatory of my *à priori* impressions, and I believe the whole series of facts to be nothing more than the combined effects of muscular unsteadiness, and a non-suspected volition. I could detect no trace of magnetic, electric, or any other more recondite influences, but was able distinctly to assigu the phenomena to the causes above mentioned.

"I wrote to this effect to Mr. Rutter, suggesting the performance of his experiments with *the eyes bandaged.* In reply, he stated *that he was aware that under such circumstances they would fail;* and I promised to withhold all further criticism, if, in his threatened book, he would preface every chapter by this admission.

"Really, Mr. Editor, philosophers are rapidly passing into their dotage, and it is high time for those who still retain a *mens sana in corpore sano*, to combine in the defence of the citadel of truth against their insane and desperate assaults.

"I beg to subscribe myself, in much haste, yours obliged, and obediently,

"CHARLES COWAN, M.D.

"Reading, Nov. 1851."

We remark in this note:—

1st. Dr. COWAN has merely *asserted*, and neither he nor the *Lancet* has *proved*, that the magnetoscope of Mr. RUTTER is the "New Magnetic Indicator of Folly," or is a foolish invention.

2nd. It appears, from the third paragraph, that the members of the Provincial Association, when meeting at Brighton, saw Mr. RUTTER's experiments, and Dr. COWAN was "astonished and pained to observe the great excitement, the easy and unquestioning faith of *many* whose education and presumed habits of accurate thinking would have justified the hope of a keener and more cautious induction." It appears then, that many allopathic practitioners saw Mr. RUTTER's experiments, and many believed. Yet the Editor of the *Lancet*, in his famous leader, attributes the belief of some homœopathists in those experiments to folly and credulity. We have been informed that Sir CHARLES HASTINGS, the President of the Association, was in the number of the believers. We have also the following testimony from Dr. KING, of Brighton, an allopathist, a Medical graduate of Cambridge, a Fellow of the College of Physicians, and a gentleman deservedly held in high respect and consideration. He thus writes to Mr. RUTTER on the 7th of November:—"When I first saw your machine prove the polarity of a decillionth of a grain of *Silex*, and when I first saw it respond to the billionth of a grain of *Quinine*, I was seized with the same kind of awe as when I first studied the resolution of the nebulæ, snd when I first saw the globules of blood and the filaments of the nerves through the microscope. Truly, as PALEY says, in His hands great and little are nothing.

"I have often asked myself what was to be the next new wonder after the electric wire across the Channel? Surely we have found it in the magnetic aura of the human body acting on the aura of other bodies, impregnated with the spirit of the mind within it, and upheld and actuated by the eternal mind in which it has its being."

3rd. Dr. COWAN believes that the whole

Hosted by Google

series of facts (the experiments of Dr. HERBERT MAYO and Mr. RUTTER) "to be nothing more than the combined effects of muscular unsteadiness, and a non-suspected volition."

4th. In his brief letter, he jumps to the conclusion that philosophers are passing into their dotage, and declares the necessity for those who are still sane, to combine in the defence of the citadel of truth against the insane and desperate assaults of doting philosophers. Would he kindly tell us what truth he means, and specify the insane and desperate assaults against which he has evidently prepared himself to lead a chosen band of the "brothers of the coat?"

We request our readers to observe that if some of us homœopathists have been credulous in this matter, many allopathists have been equally so; and some of them distinguished men too. In conclusion, we again express our belief that much will yet come of the continued investigation of these "magnetoid currents."

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—Dr. Madden has stated that he could elicit or imitate any of the movements that have been excited in the magnetoscope. Admitting this to be true, I conjecture that had Dr. Madden examined with a microscope, and mathematically measured the motions he educed, he would have found them something like, but not identical; but suppose they were, he was not the inventor, or rather composer of the motions set up, he was merely like a musician, who from memory plays on his instrument the airs that others have arranged, and that such was the case may be presumed by observing the many failures of beginners in these new experiments. We must learn to produce the *tones* of the master, not the *noises* of the pupil, before we can play with effect. It appears that the greatest difficulty is, first, to lead the pendulum to give the normal motion of the person presenting himself, and then it is observed that the contact of different substances easily modifies the animal current as it is flowing, and of course changes the motion or form of the ellipse described by the pendent wax, which ellipse, when perfect, is distinctive of and appertaining to the material employed. Now, as impressions made or daguerreotyped upon matter remain a long time, if not for ever, so the brain of Dr. Madden was impressed, whilst exerting its natural action on the magnetoscope, by the near approach of the new body, and thus set up a *compound* influence and operation, which was not effaced when he tried his second series of experiments. That the motions produced are the result of the magnetic *aura* as it escapes from the body is self-evident, from so many that I have seen bringing out the same effects, by the same appliances, who have never heard of the precise movements educed by Mr. Rutter; that these should be the event of accident is absurd to suppose, since there are hundreds of billions of chances against such a consequence.

Dr. Madden, in the opening of his letter of the 22nd instant, seems to expect that we should be able, previously to believing a thing, to demonstrate, as by a scale, the results of the operationss of the forces in Nature; but we must remember that the *modes* of natural effects refuse our attempts to weigh, measure, or calculate them. Even how the long-discussed manner of the *attraction* of *gravitation* takes place is but a mere conjecture; for when it ought to be most positive, that is, when bodies approximate—for they cannot touch each other—the apparent force is annihilated, as observed by their rebounding in opposite directions, which circumstance is attempted to be explained by another term, whose signification is as vague as the former in accounting for the fact, namely, *elasticity*, which property or consequence is destroyed, and does not ensue when an iron ball is projected against a magnet, powerful enough to hold in check this new developed quality. No one has ever as yet discovered *how* any one thing takes place, but we are often led to infer, that we comprehend the cause, on account of witnessing a *portion* of the results of a certain event; how or in what manner the effect took place from the consequent we cannot conceive. With our present endowment of senses, we must be contented to witness facts, as we glide along the path of life, and wait the hereafter to comprehend the mode, and *manner* of causes producing effects.

There is a saying related of Archimedes that, "if he had but a point whereon to stand, he could lift the world." Now this was a grand idea, and calculated to fascinate, yet when our astonishment has subsided, and the reflective faculties come into action, we find he forgot to mention—or if he did, it is lost in the pages of history—the other point whereon to rest the moveable bar that should form the *fulcrum*, before he could execute the feat. Now, something like is the circumstance in Dr. Madden's proposition relative to his series of supposed levers. If we think for a moment, it will be discovered that we cannot employ this mechanical force, unless the bar can *move about* a fulcrum, and in the diagram before us it is fixed; and further, the effort—if one be made use of—is applied at the wrong end for developing the effect that should result in using a lever, because the upright portion of the instrument cannot in any way be employed to act directly on the pendulum, for that, if made use of properly as a lever, would elevate the plank into which it is fixed; and that, according to Dr. Madden's statement, is impossible, it being held down by cramps. Now the only chance left for Dr. Madden's *desired* result is to overcome the elasticity of the upright pillar, which would employ a power equal to lifting many hundreds, which he, I presume, would not think of applying, if his aim

Hosted by Google

was to move so insignificant a substance. Again, admitting that all the levers spoken of were free to act as such, it would not cause the pendent body to oscillate, or rather describe an ellipse, but merely depress and elevate it. If Dr. Madden will but *try* the experiment of shaking or moving the whole instrument, he will find that he cannot accomplish any one of the motions described by Mr. Rutter; and if it should be in action from one of the mentioned impressions, he would by this proceeding tend to bring it to a state of rest. Moreover, Dr. Madden applies his supposed force to either side of the ball that surmounts the perpendicular support, which is not the point to bring into play his mechanical force; and be it remembered, the pressure employed would scarcely disarrange the featherlets on a butterfly's wing, and yet he speaks of lever power. If my object be to move but a particle of dust, I should be conscious of using an effort. Further, by the mode after which we apply the digits to the instrument in question, the effect would be to steady the apparatus altogether, and not induce motion; and suppose a normal movement to be set up, the mechanical agent would only modify the oscillations, *not create them.*

Dr. Madden quotes the theorem, "that the amount of force is always in inverse ratio to the distance from the point of its origin." The *quantity* of the force will always be the same; it is the *intensity* alone that becomes altered. The sun attracts the earth equally at the aphelion as at its perihelion, only at the latter the intensity is increased; to counteract which that principle of matter, the centrifugal force, is awoke up and made evident by the earth's increased *reactive* motion. The sun and our globe are not lessened in mass by being situated very remote from each other; therefore their attractive forces must remain the same in *quantity*, making it evident that it is the *intensity* alone that is changed, as the distance (or approximation) increases. To give a more significative illustration of our meaning, we would state that the principle—if we may so call it—of *intensity*, which may be associated with *motion*, is equivalent to *power;* as for instance, the bullet of an ounce weight, travelling at fourteen miles a minute, will strike the target with a greater force than the cannon-ball of many pounds only progressing one mile in the same period; showing that motion, which adds nothing to the bullet in weight, or alters the earth's attraction for it, gives to the matter of which it is composed an *intensity* that far surpasses mass or *quantity.*

We may also bear in mind that this *intensity*, whether resulting from solids or their properties, always leaves its *impressions* on matter with greater force than *quantity*, as seen by the missile's operation on a target, in the one case, and the different pieces of magnetised iron, alluded to by Dr. Madden, in the other; for in applying a force to a chain of balls or atoms, it is the first of the series that will receive the greatest influence, and be stamped with the deepest impulsive power, whether the force made use of be from magnetism or any other appliance; and whilst *quantity* traverses the last link equally as the first, the *intensity* is expending itself as it permeates each ball.

Dr. Madden's proposition of using a different material for the perpendicular support has been anticipated, and to prevent the possibility of mechanical motion, a piece of wood, four inches in diameter, termed by carpenters quartering, was employed, and yet the instrument answered to the application of each substance; but to be more secure, Dr. Leegr has fixed his instrument down upon the wall of the house, and thus, by cutting off all interference by shaking, he finds the magnetoscope more equal to display the results of the approach of bodies, thus showing, that accidental vibrations retard and interrupt the normal influences of the substances presented;—with this instrument, also, very many are successful in educing magnetic results, who failed whilst using it under its early form and situation.

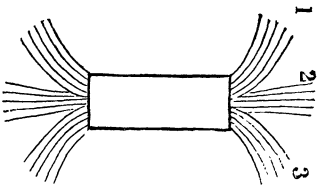
Dr. Leger likewise shows that the circulation of the blood through the arm, or its muscles in motion, does not produce the phenomena, for he transmits the animal *aura* through a small crystal, and applies only its fine point to the ball attached to Mr. Rutter's and his own instrument, and in this way, equally detects every material, and even the high dilutions of the *homœopathic medicines.* With the above experiments, we also witnessed the normal action of the crystal itself upon the animal magnetism, whilst transmitting the *aura*—we say transmiting, for the stone when applied alone, resting on a stand, produces no effect. On Dr. Leger applying the apex or positive pole of the crystal to the magnetoscope, which was situated to the south of the operator, the pendulum oscillated from east to west; on presenting the base or negative pole, the piece of wax vibrated from north to south; when the side of the mineral was brought to bear on the instrument, its apex pointing east, the pendent body traversed from north-east to south-west, and reversing the crystal, with its base directed also towards the east, and again applying its lateral surface, the direction of the pendulum was from north-west to south-east. Similar results likewise ensue on using an onion, only with less vigour, showing that *organized* bodies have poles as well as mineral substances. All these effects are brought forth, if the positions are changed as above stated, by an assistant, either with a crystal or onion, whilst resting in the left hand of the operator, his right being employed to influence the pendulum, by pressing the ball of the magnetoscope slightly with the finger and thumb. If a little of the poison snuff (*nicotine*) were placed in Dr. Leger's left hand, neither the onion nor crystal, when presented, would act on the instrument, which accounts for my own incapability of moving the pendulum; this fact has also been suggested to a gentleman who was unable to produce a movement, but after abstaining from the use of the snuff for a day, he could then produce the natural motion. I observe the different experimenters state that the pendulum sometimes describes a circle; if so, it is not natural, for when bodies are free to exert their inherent tendency

Hosted by Google

to be in motion, they always traverse an ellipse, which could be witnessed, if our vision might be made to extend so far as to follow the course of a stone projected beyond the influence of our planet, when its direction would be found to be like another asteroid or ærolite. When Newton spoke of the *inert* tendency or property of a body to be at rest, he did not recognise that by destroying or holding in check a principle of matter, we do not give it a new force, we merely withhold its natural propensity, which would instantly be developed, if free to exercise its inherent disposition; therefore, to be in a state of rest is not a contingency of ponderables or imponderables. As before stated, there is no such thing as a circle in nature, though there may be in mechanics. The planetary systems, with their foci, all move in ellipses, and each after its particular kind, subjected of course to slight eccentricities or perturbations, according as they are attracted to deviate from their orbits by approaching into the effective influence of any other sphere. Again, no substance can oscillate in a straight line, it will always describe an ellipsoid; which can be detected in the magnetoscope, if we draw a series of radii from the centre of the paper above which the hanging body is vibrating, we may observe that the piece of wax, like the pendulum of a clock, does not traverse a right line, but will vary to one side in going, and to the opposite on returning, making a comet-like and very lengthened ellipse.

A learned dignitary of one of our first colleges is mathematically at work at the ellipsoids traversed by the piece of wax, and already he finds that the character of the ellipse depends upon the substance which may be contiguous to the pendulum, and varying as this latter is influenced by different bodies; so that each distinct substance has the power of giving birth to its own particular elliptical movement, by which it can be detected; and he states that no mechanical power can educe the ellipsoid described by each; thus the most exact of sciences will afford us a proof of the truth of Mr. Rutter's discovery.

It is perfectly true that you can move the pendulum of the magnetoscope by the power of what has been designated *will*, either with or without contact, in the one case by *conduction*, in the other by *induction;* which latter was effected many years ago, in the experiment on the ring alluded to in my former letter. Now, in bringing this power to bear on Mr. Rutter's instrument, the magnetic current is prescribed in a certain direction, which striking the pendulum causes it to describe the ellipse you solicit. It might be asked how it is that, when acting on the suspended wax by the will, we can cause it to vibrate in any direction we please. No doubt it will be recollected that whilst some of the undulations when emanating from a magnet pass directly forwards, others pursue a curvilinear course outwards, as seen in the following diagram, where iron filings are allowed to fall and be struck by the emanating beams bursting out of the magnet, and are found to arrange themselves after the manner marked 1, 2, 3. Now if, whilst employing the *will*, we can give a greater force to one set in preference to another of the magnetic pulsations escaping from our brain, like those from the



bar marked 1, 2, 3, this will account for our being able by the mere *will* to direct the course of the oscillations in any order we desire, because the two exterior sets of beams will cause it to move diagonally either to the right or left, and the middle ones directly forwards.

I saw Dr. Leger mesmerise a crystal, leaving his intent *impressed* on the stone, and now when he presented it, without any effort of his brain, the pendulum read off the *mind-written* inscription. I have often seen somnambules do this, but never before inorganic matter.

Now, that the pendulum is caused to move by animal magnetism, and modified by the undulations from other bodies passing through the operator, may be inferred, from the current being arrested by the presentation of certain substances, which are chiefly poisons, that tend to take away life by destroying our vital *aura;* and as impressions are indelibly fixed on matter, our systems can recognise, and the instrument read off, the recognition where death has stamped with his dark seal the ivory, the leather, and the dead fly.

Now, no doubt the ellipses produced by the *will* would be found, if examined mathematically, to vary from those brought out by touching the operator with particular substances, and we find that on presenting certain bodies, so as to touch the operator, unknown to himself, whilst exercising the *will*, that their influence is brought out, instead of the operator's design; and again, when the pendulum was set in motion by the presence of a body, the operator could, after a time, alter it by his *will;* but this was merely a greater power overcoming the lessening natural impulse excited forth by the offered substance.

In conclusion, after reflecting on Nature and her belongings, we are led to exclaim that we know nothing of matter, and were it not for its *properties*, we should be unconscious of its existence, so that we may be tempted to conclude, that substances are merely the solidification of the different *principles* of Nature.

I have suggested to several gentlemen the possibility of causing the pendluum to oscillate, and to display magnetoid polarities without our body being in *contact* with the magnetoscope, which I have no doubt will be effected, as I have been informed that one of the gentlemen alluded to has already partially succeeded.

I have the honour to subscribe myself,

Yours truly,

J. HANDS.

SIR,—The *will*, and *muscular motion*, and *arterial pulsation*, are some of the attempted solutions of Mr. Rutter's experiments with his magnetoscope; and every one of these solutions may be in part true, and yet leave Mr. Rutter's facts untouched. He seems to be uncommonly cool and clear-headed, and business-like, and practical, and not to have any will-o'-the-wisp *aura* in his brain; and though I do not think that his essay on the "magnetoid currents" has added materially to what we knew before of his views and experiments, yet he has expressed himself with such thorough plainness of language, and with so evident a frankness, that many people will try his experiments, and from the investigations of many we may get much new and valuable matter.

The friend whom I quoted in my last letter as having tried Dr. Herbert Mayo's experiments six or eight months ago, remarks:—"Mr. Wells states confidently, that the magnetoscope is much influenced by the *will* of the operator, and this at first sight would seem to do away with the possibility of rendering it useful as an indicator of the effects of medicines brought into contact with the operator; but on more closely analysing matters, I think that this will not be borne out, as without the operator exercising a powerful will, the medicine would give its proper indications, and if those indications are changed when the will of the operator is brought into action, it is only a proof that it is stronger than the medicine; and if this were not the case, what would become of mesmerism? A powerful mesmeriser with great concentration can frequently eradicate the ill effects produced by the most deadly poisons; but if this will cannot overcome the medicine, *that* will inevitably overcome the will, and therefore any attempt to benefit by mesmerism a patient who has been injured by deleterious drugs would be but a waste of time. I have, as you will observe, taken as proved that the instrument will perform certain motions, without those motions being specifically willed, although it may, to produce an action, be necessary that the currents passing through our system should be willed and be passed through the instrument, without reference to the specific effect they may produce."

These thoughts are exceedingly valuable, and I hope they may receive the serious consideration of the many experimenters now engaged with the magnetoscope; and nobody should be disheartened because many persons have altogether failed to produce any effect on the instrument, and of those who have succeeded in producing an effect, some have not obtained the same results as Mr. Rutter.

You know, Sir, there are very many things in this working-day world of ours which are perfectly true, though nobody can account for them; and you also know how trifling sometimes are the circumstances that influence the fate of opinions and of lecturers, as well as of kings and nations; and indeed, nobody goes through the world with his eyes open who does not find out that many things he did not believe at one time, he comes to believe at last. The watching of the drift of some sea-weed, the looking at a spider's efforts to get his thread over an awkward gap, and the fall of an apple, are the reputed causes of the discovery of America, of the victory of Bannockburn, and of the declaration of the law of gravitation. How many a man beside Columbus had seen drifting sea-weed, and many a man besides the Bruce had seen a spider at work, and no doubt many a body saw apples drop before Sir Isaac Newton did; but there was something in the molecular condition of their brains which led to trains of thought that had not occurred to other observers of these things. And if you will excuse a humble homœopathist for saying so, it is very wrong in anybody to be rash on the subject of the "magnetoid currents," and conclude there are no such things, or that Mr. Rutter is wrong in his description of these currents and forces, because he cannot make his experiments tally with those of Mr. Rutter.

I remember reading, that when Columbus went on his voyage of discovery, and had sailed on over the big herring-pond for many a weary month, that every soul of his crew rebelled against him, and were for turning back, but he was stedfast in his belief, and found land at last; and I also remember that Dr. Lardner, and other mathematicians, demonstrated to their own entire satisfaction, from mathematical science, that no greater speed could ever be got on railways than twelve or fourteen miles an hour, and yet the Queen goes at the pace of sixty or seventy miles, whenever she likes to do so.

So we see the conclusions of what is called science, made beforehand about a thing which is not yet reduced to the laws and domain of that supposed science, are very often wretchedly at fault.

Somebody proposed the electric telegraph twenty or thirty years ago, and he was laughed at for his pains; but we now have got the electric telegraph.

I have a notion that this will be the upshot of these magnetoid currents, which are now looked upon by the objectors to Mr. Rutter's instrument as drifting sea-weed; but I should not be at all surprised if they are found to set steadily in to a bay of discovery, with promontories above it, and goodly valleys beyond it, and governed by a dynasty of princes named Rutter, Herbert Mayo, Reichenbach, and I dare say a good many other worthy souls who sailed long ago on this same voyage of discovery, but have been forgotten for a long time.

Being a working man, I have not much time for reading now, but I think I could ferret out some very old and queer bits of information about these magnetic currents from the books I used to read. If this letter is not worth your publishing, put it in the fire, please.

Your obedient servant,

A HUMBLE HOMŒOPATHIST.

To the Editor of the Homœopathic Times.

SIR,—Having perceived with much pleasure that you take interest in the petition now circulating

Hosted by Google

amongst us, may I beg to join my opinion to that of Dr. Rosenstein, and to state my reluctance to that petition, for the following reasons:

1st. Why summon all our strength, and gather signatures for a matter which to the public is one of partial and local interest?

2nd. For that very reason, many of the friends of homœopathy will decline coming forward, and the number of signatures will thus appear poor and insignificant.

3rd. If we gather signatures for no decided object, we shall fail to obtain them when a great result is wanted.

But *if* protection is absolutely necessary—*if* a charter is to give it, and *if* the time is come for it, let us combine all our efforts for that one object. Let committees be established and signatures gathered from every part of the empire for a petition to our "Gracious Sovereign," and for the grant of a charter, and nothing short of a charter. My private opinion however is, that, for the present at least, we must not think about one: and that, notwithstanding all the animosity shown, no university or college whatever can prevent us from preaching loud, and spreading right and left the doctrines of homœopathy. All this very violent opposition reminds one of the words of Gamaliel; and if we believe, as we do, that we have the truth on our side, we must do as holier men than ourselves did in a much higher and holier cause. If the colleges and universities choose "to beat us and let us go," knowing they can do no more, we must "depart from their presence rejoicing," and never cease in a good work which no power on earth can crush down. Their effort to annihilate it must, sooner or later, end in its complete triumph. Whatever they may now do or say, others tried it before them and failed, and they will fail likewise. Persecution never answered the end intended by the persecutors, and I feel convinced, that the present duty of those who are persecuted, is not to make petitions, but to persevere in the fulfilment of their daily work, continuing to do good with all their heart and power.

I remain, Sir, your obedient servant,

H. V. MALAN.

Great Cumberland Street,

To the Editor of the Homœopathic Times.

SIR,—I observe that you wish to afford to those practitioners who may wish to discuss the question raised by Dr. Rosenstein, an opportunity of expressing their opinions, and I must say that I agree with him in thinking that the presentation of this petition to the Patrons of the Edinburgh College would be humiliating to us, and not calculated to serve our cause; but that the proper course would be to present a petition to the Queen for an Examining Board of our own, which no doubt would, in due time, be followed by the establishment of a Homœopathic School in London.

I am, Sir, yours truly,

ARTHUR GUINNESS, M.D.

Exeter, Nov. 18, 1851.

To the Editor of the Homœopathic Times.

SIR,—I regret that it should be necessary to make the present communication with reference to the magnetoscope experiments. No one could have felt more interest in the alleged discovery than myself, and no one could feel more bitter disappointment and regret that it should be necessary to expose its fallacy. But fearing damage to our cause from a very hasty but widespread publication of experiments and deductions, which I believe, after all, to be fallacious, I am induced to give your readers the result of a great number of very carefully-conducted experiments, which have been made by Dr. Walker, Mr. Phillips, Mr. Harrison, Dr. M'Dowal, and myself, from which we are (very unwillingly, I can assure you) forced to conclude that the movements described in the detailed experiments are due to mechanical and not magnetic causes. Let me be understood: I fully and heartily believe that not one of those who have had to do with the experiments, or with making them public, had any idea that they were themselves deceived, much less that they were misleading others: that be far from them—they are above suspicion; but I am compelled to think that they have been unconsciously pursuing an illusion. But to come to our experiments: a few days ago, Dr. Walker and myself constructed an instrument according to the description given in Dr. Quin's lecture; finding, however, that this gave fallacious results, from want of firmness in its parts, we had another made, in which the defects of the first were remedied. In the construction of this we had the advantage of suggestions from two gentlemen, one of whom had seen the original instrument of Mr. Rutter, and the other that used by Dr. Madden in his lecture. It will be unnecessary to describe the instrument minutely, as we tried it with a great number of modifications in its form; suffice it to say that a turned wood pillar was fixed firmly into a solid block of wood, and surmounted by a solid brass knob, an inch and a quarter in diameter, from which projected a rod six inches long; to the extremity of this was fixed a pair of brass forceps. The instrument is substantially made, and very firm and steady, so as not to admit of any movement being communicated to it by mechanical means, except such as would be plainly perceptible; the pendulum, however, is quite free to move in any and every direction. We have tried it with a great variety of modifications as to form and construction, such, for instance, as the position of the brass rod and knob, different lengths and thickness of silk, as well as different modes of attaching it to the rod, forceps, etc., differences in the form and quantity of sealing-wax, etc. We also tried it protected from and exposed to atmospheric currents; we also experimented in different rooms, at various temperatures, and in different states of the atmosphere, etc. etc. In short, we have tried it under every conceivable form, and with every modification we could think of. It has also been tested by persons of almost all ages from sixteen to sixty, and of almost all sorts of temperaments, as well as by the dif-

Hosted by Google

ferent sexes, and *without ever once obtaining a satisfactory result.* We could never get a movement of the pendulum at all, except such as could be distinctly traced to mechanical agency.

Having, therefore, exhausted our capabilities of varying the experiments, and our patience together, and convinced ourselves (contrary to our wishes and expectations) that there is a fallacy somewhere, I feel it to be a duty, though a very unpleasant one, to caution the homœopathic public against a too enthusiastic expectation of evidence for homœopathy and its doses from this source, which expectations will, in all probability, be doomed to disappointment. It is a comfort to reflect that we do not need evidence of this kind; to the unprejudiced inquirer there is amply sufficient in its cures to convince all real truth-seekers, who dare to investigate; and what do we want more? Our cause is progressing, and that rapidly—I believe as rapidly as is healthy for it; we need not catch at every straw, as a drowning man would. Let us remember the memorable words of Sir William Temple, "Truth will be uppermost some time or other, though like cork kept down under water." Let the magnetoscope experiments be proved to be themselves on a good foundation before we build so precious a truth as homœopathy on it.

Before I conclude, I may mention that we also tested the experiment with the ring, which, although it seemed perfectly satisfactory at first sight, turned out to be a complete fallacy when the eyes of the operator were bandaged.

I am, Sir, yours very truly,

Manchester, H. TURNER.
Saturday, Nov. 1, 1851.

THE MAGNETOSCOPE, No. II.

To the Editor of the Homœopathic Times.

SIR,—Owing to the delay of one week in the appearance of my last communication, which, as you have already explained to me, was caused by the necessity for preparing a wood-cut diagram to illustrate my remarks, certain points which I had intended to advert to in this letter have been already propounded in your columns; I refer more especially to the letter of "E. V.," who elucidates very clearly the *physiological laws* connected with the operator, which are liable to influence any experiments with Mr. Rutter's instrument. I shall accordingly, but briefly, refer to these, and then pass on to some other points which demand our attention.

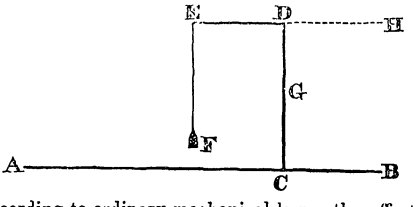
1. The muscular system being an organ and helpmate of the will, acts in accordance te its dictates with a precision and alacrity, which often cause the resulting motions to appear spontaneous or involuntary.

2. Mere attention and anticipation influence the whole nervous system to such a degree, that various subjective phenomena occur as a consequence, in a manner which exactly simulates the effects produced by various external or objective causes.

Thus the attentive and expectant ear will hear sounds during the deepest silence. The watchful and anticipating eye will see imaginary figures. Mere attention to a given part of the body will call forth unusual sensations; and, lastly, an anticipated movement is unconsciously helped forward by the muscles by whose action such motion can be voluntarily effected. Bearing all these points in mind, it is obviously essential that slight muscular movements should be incapable of influencing the pendulum, ere we can accept of any results obtained by the magnetoscope as proofs of the existence of magnetoid currents in and through our bodies.

Moreover, so long as such an imperfect instrument is made use of, it is essential that we should carefully compare the points wherein the magnetic and mechanical laws oppose each other, and ascertain with which of the twain the instrument accords, seeing that in the event of the results agreeing with the magnetic laws, and going counter to the ordinary laws of mechanics, we should thus obtain strong presumptive evidence in favour of the movements having a magnetic origin.

Mr. Rutter's instrument affords the following points for such a comparison:—1. According to the second magnetic law referred to, it appears that the amount of effect upon the pendulum should be in an *inverse* proportion to the length of the arm D E (see diagram); whereas, according to ordinary mechanical laws, the effect would be in a *direct* proportion to the length of the arm, seeing D E is a lever, and the moving force is applied at the point D, and hence the maximum effect will be evidenced at E, and be in direct proportion to the distance between these two points. Now, I have procured several arms of different lengths, which can be used with the magnetoscope, and having tested them, I find the result *invariably in direct proportion to their length.* In this case, therefore, the instrument follows the mechanical and not the magnetic laws.



2. According to the first magnetic law referred to, the nature of the material constituting the arm DE would influence the result, in consequence of the different powers of conduction possessed by different substances; whereas, mechanically considered as a lever, the nature of the material will not influence the result unless there is at the same time a difference in the physical character, of rigidity. According to the magnetic law therefore, one would anticipate very different effects from arms made of metal, wood, and bone, the more especially as Mr. Rutter states that bone at once puts a stop to all motion of the pendulum. I find, however, that bone, wood, and brass act equally well when employed as the arm D E, and that the only

Hosted by Google

detectable difference between them is, that which is traceable to difference in length. Here again, therefore, the mechanical and not the magnetic laws are obeyed.

3. According to the third magnetic law, which I stated on Mr. Rutter's authority, a complex arm DE, that is to say, an arm formed of different pieces, especially if not firmly united together, should produce a much less sensitive machine than one manufactured of one solid piece. I accordingly had an arm constructed of three pieces joined together like the parts of a lazy tongs, and so arranged that, when attached to the upright in the usual way, the three portions mutually supported each other, and in this position I found the arm equally sensitive with one of the same length constructed out of a single piece of metal. To test the point still further however, I changed the position of this compound arm, and fixed it to the upright portion CD, in such a way that two or three pieces projected behind, in the position of the dotted line DH, and one long piece occupied the position DE. The separate portions between the points D and H were jointed, so that any slight muscular motion communicated to H would not be transmitted to D; whereas, the fact of the whole arm forming a sensitive instrument when fixed in the first position, proved that the magnetoid currents, if such exist, could readily traverse the whole arm. Now, in this position I found that when I touched the instrument at the point D, the pendulum at once was set in motion; whereas, when I touched the arm at H *no effect was produced*, nor could I in this position move the pendulum by any voluntary effort. I am aware that some will suggest, that this experiment failed on account of the magnetic fluid passing from my hand down the upright, DC, and thus escaping to the earth, seeing that wood is not a perfect non-conductor. Although, however, there is much improbability in this view, seeing that if the magnetoid current possessed any strong tendency to descend the upright stem, it would do so equally well in all the experiments, yet I modified the instrument by simply rendering the junctions between the points D and H rigid, which wus done by binding a small brass rod over the flexible portion, and I there found that the pendulum could be equally readily set in motion, either by voluntary or unconscious muscular movements, from the point H as from the point D, excepting only that the motion was proportionally less from the point H, in accordance with the ordinary laws of lever-power.

4. Once more I rendered the arm D E much more fixed, by substituting a short bracket, firmly fastened into a wall, for the upright stem D C; in this position all moderate voluntary efforts were insufficient to move the pendulum, and in like manner, none of the so-called magnetoid phenomena took place. Here again, however, I may be told, that the proximity of the wall presented an easy way of escape for the magnetic fluid. I therefore modified the bracket so that its condition as respected conduction remained unaltered, while it no longer remained so rigidly inflexible; and I then found that the so-called magnetoid currents reappeared, while at the same time I could of course voluntarily produce all the various movements of the pendulum.

It has, however, been suggested to me, by a friend who has adopted the will theory, that the fact of my experiments appearing to coincide exactly with the mechanical theory, might be explained by the fact that I had anticipated the results, and hence they occurred in accordance with my expectations. A little examination, however, into this hypothesis will, I believe, prove it to be groundless. If by the will theory the propounders simply mean that the will, or rather in this case the mental functions of attention and anticipation, influence my muscular system, and give rise to automatic movements I fully agree with them. But if, on the contrary, they wish it to be understood that the movements are truly magnetic, but that these magnetoid currents are entirely under the control of the will, that they only pass in certain directions, in obedience to its mandates, I would then direct them to the following particulars:—(1.) If the currents are magnetic they must, on passing the body to inert matter, obey the ordinary magnetic laws. (2.) That if this were the case, in the third series of experiments detailed above, when the compound arm was made to project behind the upright stem, C D, nothing should have interfered with the passage of the currents beyond the condition of my will, which is assumed to have anticipated a failure. Now it so happens that numerous experiments of an exactly similar character, were performed both by myself and Mr. Rutter, at a time when neither of us had the smallest doubt about the magnetic nature of the currents, and hence at times when the will operated altogether in our favour, and yet these experiments uniformly failed. At that time the failure was always explained by detecting some infringement of the laws of induction; but my experiments have proved that much more serious infringements of these laws do not in any way influence the results of the experiments, provided only the mechanical laws are adhered to.

It has been two or three times asked by your correspondents, how it is possible that the same muscular power which is supposed to set the pendulum in motion, can also bring it to a state of rest? a remark equally sage as if it had been observed, how is it possible that the same arm which can strike so heavy a blow, can also hold a weight steady? The remark, however, affords me an opportunity of mentioning a significant fact, whose full meaning I was at a loss to comprehend, until the mechanical theory suggested itself to my mind. It will be remembered by those who were present at my lecture, that I referred to a striking difference between Mr. Rutter and myself with regard to the stopping of the pendulum, viz., that while ivory, bone, dead animal matter, opium, arsenic, etc., at once stopped the pendulum, when placed in his hands, they did not produce the same effect on me; for while the movements of the pendulum certainly became less vigorous, yet the changes occurred

Hosted by Google

so slowly, that I had never had the patience to wait until it actually came to a stop. Nevertheless, if I took any of these articles into my hand before touching the instrument, no movement of the pendulum occurred during the experiment. Now, when I began voluntarily to imitate these various movements, I found, to my surprise, that *I was just as incapable of stopping the pendulum voluntarily, as the ivory, opium, arsenic, etc., had been to do so magnetically;* or, in other words, that those movements alone were elicited by the so-called magnetoid currents, which I was capable of producing voluntarily with the greatest facility. Lest, however, it be suggested that the stopping of the pendulum with Mr. Rutter is a direct proof of magnetic action, seeing that I cannot imitate this effect, I may mention that I know at least one gentleman who can voluntarily bring the pendulum to a stand-still; thus showing that it is perfectly possible to imitate this effect also. I shall only add, in conclusion, that I have now read Mr. Rutter's pamphlet, but regret to find that no attempt is made to satisfy our doubts on this most important source of fallacy, and I may also mention that the Hahnemann Medical Society have appointed a sub-committee to meet with me and examine fully into my experiments, so that I trust, ere long, the above statements will not rest upon individual testimony.

I remain, yours faithfully,

Brighton, Nov. 24. HENRY R. MADDEN.

P.S.—I wish it to be distinctly understood, that in all my experiments, excepting those voluntarily imitated, I am still utterly unconscious of any movement of my arm or body which could influence the pendulum, so much so, indeed, that I seldom touch the instrument without reiterating to myself the question, is it possible that this can be muscular and mechanical? Nevertheless, I am so fully alive to the possibility of self-deception in these and similar experiments, and it it is so clear to my mind that *demonstrative* evidence must be attainable if the agency is truly magnetic, that I hold it as a positive duty to rest satisfied with no experiment which falls short of this; and until the pendulum can be made to move in its various characteristic ways, *when placed beyond the possibility of muscular influence, either direct or indirect,* I maintain that we are bound to return a verdict of "*not proven.*"

N.B.—In my last communication, at page 261, second column, line 12 from the top, for *best* read *least.*

To the Editor of the Homœopathic Times.

SIR,—I regret I cannot altogether agree with Dr. Rosenstein, in opposing the petition from the friends of homœopathy (not "the homœopathic *practitioners*") to the Patrons of the University of Edinburgh. I believe I am correct in regarding the patrons of an university as the guardians of (among other things) its customs and usages, and a medical faculty as a body appointed to carry out those customs and usages in its medical department.

Now, it has long been one of the customs or usages of the University of Edinburgh to confer the degree of M.D., "without requiring from any candidate an explicit pledge limiting his future course of study and practice;" but the Medical Faculty have now determined, by a recent decision, that this full liberty of study and practice shall no longer be allowed, and in so doing have disregarded (which they probably have no power to do) a custom or usage of the University.

This appears to me to constitute our only ground for complaint.

At present we have no quarrel with the *University;* on the contrary, we believe the Medical Faculty have acted "arbitrarily, and without the authority or even the knowledge of the Senatus, or of the Patrons of the University," and we do what, as orderly men, we alone could do, petition the Lord Provost, magistrates, and council, as the guardians of the customs and usages of the University, to stop the innovation. I should not presume to anticipate the answer of the Patrons to the petition, but I would submit that, until that answer shall have been received, the friends of homœopathy cannot advantageously proceed in their movement for a charter,

To petition the Sovereign at this time would, in my humble opinion, be altogether premature, for I could hardly expect that her Majesty, in the face of the Universities, the Royal Colleges, and so very large a proportion of the medical profession, would grant a petition, for which no other very obvious reason could *now* be urged than to save a few medical students the trouble of studying allopathic Materia Medica, and the art of mixing drugs, etc., and to make them a little more comfortable while answering a few questions in therapeutics.

I am most desirous, with yourself, of union, and that no false step should be taken in promoting our common object; but regarding the petition to the Patrons of the University of Edinburgh as a proper and orderly proceeding, I have endeavoured to assist the Protective Association in obtaining influential signatures to it.

Dr. Rosenstein appears to be under some little misapprehension, not only as to *from whom* the petition is to be sent, but *to whom* it is to be presented; and also as to the duration of the office of the Lord Provost; for certainly, neither the present Lord Provost nor the other Patrons of the University have yet shown themselves "our most inveterate and bigoted enemies," and therefore we shall not humble ourselves by presenting this petition, nor bring upon ourselves "contempt" by so doing.

I remain, yours faithfully, SYDNEY HANSON.

REVIEWERS REVIEWED.

By a Progressist.

The moment of popular clamour is not the time for serious and impartial inquiry; deliberate investigation should precede, and profound reflection succeed, all such commotion of sentiment which is more intimately allied with our passions than our reason. Weak and ambitious men, indeed, seize such moments as propitious to their views; but wise men fear and great men despise them. This is so universal, that the character of a writer may be almost estimated by the *time* he chooses to promulgate his opinions, as well as by the principles and manner in which he supports them. The man who writes for a party, works not for posterity but the day. He must be a hypocrite if he would maintain his post; he must dissemble his own opinions to gratify the caprice of those who, in fact, are his rulers. He must be ready at all times to be the executioner of the virtuous, while he holds his power but by a brittle tenure, fluctuating with the winds of popular indignation. Whatever scenes his fervid imagination may design, must not be slightly sketched but boldly finished. He must not be dismayed by compunctions of conscience, nor by any considerations of morality; and after having deluded others, he must proceed to delude himself, and do ill that good may arise from it. He must affect power and popularity under the garb of innocence; he must fawn, flatter, and change with the times. Deaf to the cries of innocence, and unmoved by the "compunctious visitings of nature," he must beguile away every tender sentiment for what is called the "mutability of principles." This is the character of the man who writes for a party. Who can avoid pitying the virtuous mind which is thus seduced from honourable pursuits, and made the slave of vanity and crime? The serious responsibility which attaches to a character of this sort, has no charms for any one who really loves independence. It is surely better to keep wholly in the shade, than to deceive for the poor gratification of a moment's applause, or to lie for the sake of power; for every man who by any means acquires the favourable prepossession of another, obtains power.

The editor of any scientific journal should unceasingly be regulated by the decision of the inward man; and, like Aristides, he should even suffer himself to be hated because he is just. In taking upon himself the review of any subject, he should sit down without any prejudice whatever—he should read the inquiry with an unbiassed mind—he should attentively consider and most seriously weigh all the arguments and facts adduced by any author on his own system, and not listen to the representation of persons who may be infected with prejudice, having an interest in the advancement of falsehood or in the concealment of truth. He should point out defects—he should expose any false views and errors into which the world may be led—he should direct the attention of the public to his subject, and promote that deep and temperate discussion of the question which can alone be productive of any efficient advantage. His arguments should be conducted with ability and conclusive in their effect—his principles and sentiments should be sound.

My plan of noticing or reviewing editors must, in the present state of criticism, be

Hosted by Google

deemed by every impartial observer peculiarly useful, I trust, therefore, that you will deem no apology requisite, if I call your attention for a short space of time to the singular manner in which the Editors of the *Lancet* and *Medical Times* have thought proper to notice the subject of homœopathy.

Amid all the stern necessities of our daily life in this busy nineteenth century, the demonstrations of the English people in favour of Hahnemann's discovery are still continued, and promise to become both remarkable and important. Homœopathy is growing in favour. The above ill-judging journalists have ostentatiously declared their determination to write it down. In so doing, they are not expressing the public sentiment, but their own interested alarm: they see their mistake, and although they continue to carp and cavil, they will have to lower their tone. The determination of the English to judge for themselves, will carry consternation into the Colleges; arguments full of power, composed of calmness and reason, will be continued to be addressed to the Engish understanding as well as to the English heart, in words of eloquence and power. Truth must prevail. Oppression and abuse shall not succeed In riding rough-shod over the finest system of therapeutics ever yet introduced.

Unhappily for the Editors of the *Lancet* and *Medical Times*, the good sense of the great body of the English people renders their mischievous intentions harmless, and the perfect freedom with which the homœopathists permit them to exhaust their own folly, is the most biting satire that can be pronounced upon the insignificance of an interested party. "We will use our exertion to put down this humbug," says the *Lancet*. "I can write," said Tom Paine, "a better book than the Bible:" but there is one part of this book which surely could not be improved either by Thomas Paine or the Editor of the *Lancet*, I mean that in which it is said, "Seest thou a man wise in his own conceit, there is more hope of a fool than of him." "We will turn it into ridicule," says Dr. Malden, of Worcester.

> "All the human race would fain be wits,
> But millions miss for one that hits."

So said Swift. In spite, however, of the ridicule of Dr. Malden, and the sneers of the Editors of the medical journals, wise and inquisitive men will continue to esteem it. The journalists write under the impression of alarm and apprehension for the sake of their publications—medical men, from the present posture of medical affairs, and the critical state of their practice. Little do either class dream that all the fuss they have made, has made no impression on the country, though the addresses presented by these unworthy publications are full of falsehood and abuse, that none but themselves know how to administer. Which is the fool and which is the rogue? is the question that most obviously suggests itself to the mind at the sight of the weekly extravagances of these alarmed and disappointed Editors. It has been their constant boast that they are the friends and benefactors of all reforms, and to the assumption of this character they are indebted for a great portion of their success. The claptrap of exposing what they termed the "hole-and-corner" practice of hospitals, dispensaries, etc., procured for them, in the first instance, the support of the unthinking students whose judgment is alone under the control of their feelings, and who are always ready to assume that anything must be right and good, because it is asserted by a fearless editor.

When we hear that a question, no matter what, has been taken up by the *Lancet*, we may be sure that it is treated in a narrow-minded, sordid, selfish manner. Is it "medical reform?" it requires it to be such as shall make the whole kingdom subservient to its own interest. Is it any other reform? the Editor insists on such measures as shall make his publication thrive, no matter if the rest of the world should go to the dogs. Such is this Editor, a complete incarnation of egotism, looking upon all homœopathists as raw material, to be worked up for his own especial benefit. A century or two ago, this bluster might have availed to stifle discussion, but in the nineteenth century the world is not so easily satisfied, particularly when curiosity is aroused, or the powers of discrimination are brought into play. We suspect these journalists are beginning to see how matters really stand; in short, they can hardly fail to perceive that the craft and the trumpeters are both in danger.

Nothing can be more unfair, nor anything more prejudicial to the discovery of truth, than to charge an opponent with conclusions and intentions remote from his object. Now, I am not aware of any subject, political, social, or moral, at once so interesting and so important, or which de-

Hosted by Google

serves such attentive consideration, as that of homœopathy. It is a temperate discussion, an attentive consideration, even a fastidiousness in the examination of facts, we ask. *We* say, that all our arguments and conclusions are founded on certainties; there is nothing in them which is conjectural, or merely matter of opinion. Our medicines have been proved, and may be tried a hundred times with the same effects. I am aware I may expose myself, by this frank declaration, to the charge of presumption, but I am fully satisfied, to those who have seriously and unbiassedly examined the subject, there cannot be two opinions; yet, strange to say, there are numbers who will not investigate—who are so obstinately blind, so stupidly infatuated, so criminally perverse, as to shut their eyes against this system, and to deprecate those who attempt to raise it in the estimation of the world; but all those who labour to dispel a delusion so extraordinary, and introduce a new system of therapeutics so truly advantageous in its consequences, are unquestionably entitled to the gratitude of the public. It is a peculiar source of satisfaction to find all the assertions respecting Hahnemann corroborated by every writer, who, from personal observation or experience in his writings, are enabled to speak of the ability, the untiring perseverance, the character, and conduct of that good and thoughtful man who introduced homœopathy; one who, from a conscientious conviction that he was carrying out the work of God, despised restrictions.

(*To be continued.*)

THE MAGNETOSCOPE.

My attention having been drawn to the subject of the magnetoscope by various notices in your journal and elsewhere, I have naturally felt anxious to ascertain whether the discovery claimed by Mr. Rutter be of a nature so entirely different from and opposed to all other observations and known laws in physics, as to render it *a priori* unworthy of credence, and deserving not only of disbelief, but of being scouted by all true philosophers, involving in its disgrace all those who may have been silly enough to think it worth even an investigation. I shall not pretend to have satisfied my own mind as to the absolute truth and value of all that is attributed to the magnetoscope, but I certainly have succeeded in fortifying myself in the belief that it is not well to refuse to entertain an idea or a claim, because it goes beyond our existing knowledge and experience, and because, judging by these, the matter appears not only novel, but opposed to existing knowledge; and here I may observe, that Mr. Rutter has been peculiarly unfortunate in having had his discovery ushered into the world as corroborative of homœopathic doctrines. A novelty in science would inevitably have been met by suspicion; but a novelty which was proclaimed before its legitimate appearance as conclusive proof of doctrines which are anathematized, excommunicated, and placed under a ban by the great body of that learned profession which may be supposed to be most conversant with such matters, was doomed and prejudged beforehand. Not a man in the medical profession (except in the phalanx of homœopathists) who was not bound, as he valued his position, his privileges, and his consistency, to disbelieve, to sneer at, and, if possible, to disprove so preposterous, because so dangerous, a discovery. Again, Mr. Rutter has been unfortunate, in my opinion, in the very excess of his caution. He has brought out, or rather his friends brought out for him, his discovery in too complete a form. Had it been stated that the magnetoscope gave a rotatory motion when acted on by an individual under ordinary conditions, but that isolation suspended such action, whilst re-connection with the earth or with an electrical machine in action reproduced the motion which had been suspended—had it even been stated that the motion of the pendulum was affected by the poles of the magnet and other such matters, I doubt not that philosophers would have bestowed some attention upon it. Whether this would have led to its confirmation or the reverse, I am not prepared to say. But when the world is told of the more subtle and delicate powers of the instrument, why it is at once frighted from its propriety, and every man feels himself called upon to take up arms on behalf of the perfection of science as it exists. In such matters a little goes a long way; if the whole concoction is to be taken, it must be administered p. r. n., or as the patient can bear it—else you shall have him exclaiming, with Macbeth—

"A third is like the former.
Why do you show me this? A fourth! Start, eyes!
What will the line stretch out to the crack of doom?
Another yet? A seventh! *I'll see no more!*"

It was under such impressions, with regard to human nature in general (and not of any particular section of it), that I have endeavoured to ascertain whether analogy would indicate that there was any-

Hosted by Google

thing so absurd and incredible about the claims of the magnetoscope, as at once and *in limine* to put them out of court; or whether they might assume a *locus standi*, upon the ground that important results have sprung from quite as forbidding commencements. The first thing that presented itself to my notice in this investigation was an admirable essay on Electro-Magnetism, by Professor Barlow. The history of the subject there set forth, in a condensed form, not only interested me, but seemed to hold out encouragement to those who, like myself, are inclined to believe that there be more things in heaven and earth than are dreamt of in our existing philosophy. Thus "for many years it was *suspected* that there existed a strong analogy, if not a complete identity, between the electric and magnetic fluid, and various attempts were made to establish this, but they were not attended with success.

A dozen of years passed, it seems, between the time when Professor Oërsted caught the first dawnings of the light and that in which he arrived at some definite conclusions on it. "He now placed a magnetic needle within the influence of a wire connecting the extremities of a voltaic battery, and which was now observed to deviate in different directions, in different degrees, according to the relative situation of the wire and needle; subsequent experiments proved that the wire, of whatever metal it was composed, became during the time that the battery was in action magnetic, and that it affected a magnetic needle through glass, etc." Now, without at all prejudging the merits of the magnetoscope, I confess I cannot see that there is any greater antecedent improbability or absurdity attaching to its pretensions to indicating the influences produced on the motive currents of the animal body by the poles of a magnet, than there was attachable to the researches of Oërsted. I have used the term "motive currents of the animal frame," because to call them magnetic, odylic, etc., would be just begging the question, which I am anxious to avoid. Well, now observe, this discovery of Oërsted's excited great attention on the part of various well-known philosophers; and, "in the first place, it was conceived that the greater the power of the battery, or the machine by which the electricity was excited, the greater would be the effects produced on the magnetised needle. After some time, however, it was found that great tension of the electric fluid was not only unnecessary, but injurious to the effect produced; and that the most active power was found to proceed from single plates of considerable surface, and even single plates of very small dimensions were found more efficient than larger plates in high combination. In fact, the exhibition of the electro-magnetic effect on the needle was soon reduced to such a state, that Professor Cumming constructed on this principle a galvanometer, which exhibits the existence of electricity when in so low a state as to be inappreciable with the gold-leaf electrometer, and other delicate instruments; and thus a power, which had remained hidden for so many years, and which, after it had been discovered, was as difficult to exhibit, is all at once, as it were, become one of the most delicate tests of existence, and measurer of the quantity of electricity of other bodies under experiment." Surely there is nothing so very incredible or absurd in the idea of finding a still more delicate test and measure of electricity and magnetism. "A law," says Professor Whewell, in his Bridgewater Treatise, "may be the same, while the quantities to which it applies are different. The law of the gravity which acts to the earth and to Jupiter is the same; but the intensity of the force at the surfaces of the two planets are different." But the magnetoscope may be said to have no *locus standi*, because its indications are not all in accordance with all the hitherto observed laws of nature. That, again, is begging the question, for it supposes that our knowledge is *perfect*. "It is no longer doubted by men of science," says Chalmers, "that every remaining semblance of irregularity in the universe is due not to the fickleness of nature, but to the ignorance of man." Are we to deny the existence of spots on the sun's disk, because our grosser ideas attribute perfect brightness to that luminary? I confess I am quite unmoved by an objection such as that to which I have alluded. Let an alleged discovery stand or fall on its own intrinsic merit. If it stand, though it may seem opposed to other facts, it will inevitably be found to dovetail with them in the general design and course of nature, *when we know how to put them together*. Will our present investigation illustrate this point? I think so. Mr. Faraday, it seems, in the course of his investigations of the galvanometer, made a most interesting discovery, viz., that the nature of the force was such, that if a galvanic wire be freely suspended over the pole of a magnet, and the fluid passed through the wire, the latter will commence a rapid rotation about the magnet; and on the contrary, the wire

Hosted by Google

being fixed, and the magnet free, the latter will revolve about the former. *This curious fact pointed out most distinctly that the force, whatever it might be, was totally different from any that had yet come under the contemplation of philosophers; for no known natural force was competent to the production of a motion of rotation.* Surely this might make us pause before we summarily dismiss another claimant of a natural rotatory motion. By the bye, there is at present, and has been these twelve years, in London, a purely rotatory steam-engine, working not only with immense speed, but considerable power and economy, and yet there are hundreds and thousands of intelligent and scientific engineers in the world who would not believe it, except upon the testimony of their own eyes, and then would have numerous objections, which have never been found out by the master whom the engine has served so long, with scarcely a hitch in its movements. But we have not yet quite done with the galvanometer. "In this state of the science," continues our author, "every fact seemed to have been exhausted. Some new facts, however, were now discovered by Professor Seebeck, of Berlin, etc. etc. And another discovery still remains to be noticed in this novel and prolific branch of natural philosophy. Hitherto it was understood that two different metals were *necessary* for exciting the electro-magnetic action in the conducting wire, but Professor Moll, of Utrecht, has shown, by some recent experiments, that this is not the case; for that one metal with acids will exhibit all the leading phenomena to which we have referred." Surely this teaches the imperfection of the knowledge of the very wisest amongst us. To-day the subject seems exhausted, we are in possession of all that can be known upon a given subject; to-morrow, an entirely new light is thrown upon the matter, and that which we had set down as an invariable law of nature, is found to be liable to material variations and modifications, aye, and to what a few days before would have seemed contradictions. I confess that it does appear to me utterly incomprehensible, when I hear people limiting discovery by what we already know, or confining it within prescribed paths. Let us proceed a step further in our inquiry, and see whether the galvanometer removes any other difficulties from the path of the magnetoscopist. I confess that it appeared to me as a very extraordinary thing, to say the least of it, that in Mr. Rutter's original instrument the principal part of the arm should be composed of glass, a non conducting substance. However, I find it stated, respecting the galvanometer, "the effect of the uniting wire passes to the needle through the glass, metals, wood, water, resin, stone-ware, stones, for the interposition of these substances do not destroy, and indeed scarcely diminish, the effect; and this, be it observed, is the *first* instance in which electricity was known to transmit its effects through non-conducting substances, and from which we may infer that it is not actually the electric fluid that is transmitted, but some power which is excited by its presence." Did time and space allow, it would be interesting to quote the experiments of M. Ampère, detailed before the Academy of Sciences in Paris, as proving that movements in a delicate wire were produced by electric agency scarcely less astonishing, when novel, than those attributed to the magnetoscope. I have said that I believe that the magnetoscope would not have been objected to if its pretensions had not been so extensive; thus it is considered absurd that it should be affected by such infinitely minute agents as to be not only inappreciable, but inconceivable; but Professor Cumming's observations tend to remove the antecedent absurdity of such a case. He says, "my first experiments were made with a battery of 220 double six-inch plates, possessing very powerful effects, both electrical and chemical, *yet its influence on the needle was scarcely perceptible.* ONE of these plates taken separately caused a deviation of nearly 80 degrees."

In another branch of the subject, this non-importance of bulk in the agent was rendered still more apparent by Professor Cumming, and it is well worth observation. It had been discovered that notable currents of electricity were produced simply by heating one or two contiguous metals. "It occurred to me then," says Professor Cumming, "that as the juxtaposition of two *particles* of the same metal, at different temperatures, was the sole condition for eliciting electro-magnetism, it might be exhibited by the minutest metallic particles. Portions of bismuth and antimony, each weighing one grain, were therefore placed on a silver disc connected with the galvanoscope. On touching the upper surface of each separately with one end of a heated silver wire, the other extremity of which was placed in the other cup, the needle deviated through 90 degrees, positive and negative respectively." Mr. Barlow adds, "by this method the author was enabled to examine the compound ore of iridium and osmium, of which the largest specimen did not exceed four-tenths of a grain, and to

Hosted by Google

verify, in a few minutes, results for which the laborious process of casting bars of different metals had been previously requisite." Hence it may be inferred, that if it were possible to effect a division of particles in a bar of metal, so that alternate particles might be hot and cold, the bar would act as an assemblage of an indefinite number of small plates; as the common magnet may be conceived to be composed, if the expression may be allowed, of an infinite number of atomic magnets.

I have been tempted to multiply these quotations partly because of their intrinsic interest, but chiefly because they seem to clear the way materially for the unprejudiced considerations of the claims of the magnetoscope. I must again repeat that I am not attempting to inquire into the validity of these claims; I am only anxious that they should obtain a fair hearing. Be it also observed, that I have not the least idea of identifying in any way the galvanoscope of Cumming with the magnetoscope of Rutter. I only mean to say that the one is little more wonderful than the other, and that the one, which is now an established fact, must have appeared almost as incredible at first as the other now does. Indeed, Sir Humphry Davy tells us, of some of his own experiments on the subject, that they were so wonderful that they could scarcely be believed without being seen. This argument which I have had in view is thus expressed by Erskine: "We have an intuitive perception that the appearances of nature are connected by the relation of cause and effect; and we have also an intuitive desire to classify and arrange the seemingly confused mass of facts with which we are surrounded, according to this distinguishing relationship. From these principles have proceeded all the theories which were ever formed by man. But these principles alone can never make a true theory: they teach us to theorise; but experience is necessary, in order to theorise justly." Our acquaintance, then, with certain causes as necessarily connected with certain effects, and our intuitive conviction that this same connection will always subsist between these causes and effects, form the basis of all our just anticipations for the future, *and of all our notions of probability and internal evidence with regard to the systems or histories, both physical and moral, which may be presented to us.*" Thus, if we know that a centripetal force always acts in a definite manner, we shall not be incredulous when told that a centrifugal force has also its definite laws and line of action. Neither shall we rigidly claim to be made acquainted with the theory or *modus operandi* of a new system, when we find such men as Barlow concluding his dissertation on an old one, in which he has so much distinguished himself, in such words as these:—"What do we know of the nature of gravitation or universal attraction, or of simple, electric, or magnetic forces? In these and in various other physical subjects, we are content to find the mathematical laws, without making useless inquiries concerning first causes; and it is highly probable, after all that has been or may be written on the subject of electro-magnetism, we shall be obliged to stop at the same point and leave the first cause as too subtle for our comprehensions."

Trusting to your kindness for excusing the length of this communication,

I remain, INVESTIGATOR.

THE
HOMŒOPATHIC TIMES.

SATURDAY, DECEMBER 6TH, 1851.

THE true advocates of homœopathy would, at this time of attempted persecution of the homœopathists, do well to introduce into their general family circles the great fact of the steady progress of our system. The advantages the Cause is sure to derive from this mode of popularizing its existence cannot be too largely estimated, since the truth, wherever disseminated, cannot fail to produce its effect in some channel or the other, and in a shape and manner that is often least expected.

The importance of promulgating the doctrines of our illustrious predecessor is admitted on every hand, therefore we should be ready to enter upon the work with becoming zeal and perseverance. To resist the attacks of our adversaries, and in resisting them to explain the utter groundlessness of the charges of quackery alleged against us, constitutes a duty which we owe, not alone to ourselves, but also to the memory of one whose career was as unexceptionable as the principles he has bequeathed to his disciples. Who, then, shall prove foremost in the field, will find an ample and abundant reward.

Hosted by Google

The great battle of Hahnemann and homœopathy is one which the whole civilized community must speedily recognise. It will not be confined to the Royal Colleges, the schools of students, or the columns of allopathic journals. The fiat has gone forth, and it is certain that truth will ultimately prevail. In our daily walks of life, in our homes, in our warehouses, in our counting-houses, it will be necessary to be mindful that we waste no fitting opportunity of giving the system publicity and of assisting its progressive career. The time is not far distant when we shall ascertain the fruitful results of this kind of communication with our friends, and when we shall see it carry confusion into the ranks of our enemies.

What can be more encouraging than to find that, even in the midst of the derision and scorn heaped upon us by the allopaths, conversions to our principles and practice are numerous and constant. Despite the jealousy evinced among the followers of the old school, the supporters of the new school find that they are upheld and listened to by the public. Let any allopathic practitioner who doubts this, investigate the subject for himself. Let him, if he desires, ascertain the ratio of increase which is to be discovered in homœopathic practice in the various sections of the metropolis, and he will soon learn that it is much greater in proportion than he anticipates. The public have, in most cases, investigated for themselves and are satisfied, and hence we have reason to be grateful. With the allopathic profession it is widely different; they condemn before they institute any inquiry. *Res apparet*, but they obstinately refuse to believe.

THE LANCET.

In his last week's number the Editor of the *Lancet* dilates on the doings anent the Ross Dispensary. Dr. Strong holds his ground, and will not resign his office of physician; if the majority of the Governors should be with him, as we think is very probable, he will keep his post, and the allopathic officers may resign if they please. If the majority should be against him, they must depose him, and in that case he will, no doubt, on the very instant open a dispensary for homœopathic practice.

Our contemporary next dilates on the iniquity of the homœopathists who use chloroform. But his whole account of the correspondence between the chloroformist, by profession, and our colleague is erroneous. The homœopathist did not ask the chloroformist to administer it for him; and he is quite as able to do it—even as Dr. Snow. All the homœopathists who use chloroform are perfectly competent to its cautious and proper administration. We, too, have seen the correspondence.

We are informed by a correspondent of the *Lancet*, that at the opening of the Edinburgh Medical Session, while the other professors were cheered, the professor of pathology was received with groans and hisses by the students. This, if true, only shows the ill breeding and feeble judgment of those who indulged in such gross misconduct: but neither groaners nor hissers—if there have been such,—nor the *Lancet*, will induce Professor Henderson to resign his chair. He is made of sterner stuff, and will not yield to the students, whose rudeness a policeman may soon check — supposing their conduct to have been such as is represented—nor to the ungentle solicitations of the *Lancet*.

THE MEDICAL TIMES.

We are favoured with an editorial article on "unlicensed homœopaths." The Editor singles out one individual, who, it would appear, is practising without a diploma or license of any kind, and without having received any medical education. But should this be the case with respect to this individual, nothing can be more unfair and unjust than to insinuate, as the Editor has done, that many or most of the homœopathists practise without having received any medical education, and without any diploma or license.

We challenge him to produce his list of

Hosted by Google

"unlicensed homœopaths." We challenge him to cite one other example of persons calling themselves medical practitioners, who practise homœopathy without diploma or license.

We are very anxious that all those who practise according to the law of Hahnemann, should be above all suspicion of using false titles of any kind whatever.

"Honesty is the best policy" on all occasions, under all circumstances, and at all times.

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—According to the saying, "give an exacting person an inch, and he will take an ell;" and I fear you will think this is the case with me, and won't be particularly pleased at my writing to you so often; but I mean well, and I suppose you will no longer print my letters than you think your readers will like to have them.

With regard to homœopathy in general, the progress of it has been wonderful in the last few years, and I have heard of homœopathic enthusiasts in the islands and highlands of Scotland, and amid the bogs as well as in the civilized parts of beautiful Ireland.

The public will not be content with the attempts made to put it down by the other schools; they will have the matter inquired into, whatever professional men may say or write; and if they should be satisfied that homœopathy is true, they won't rest till the advantages of it be secured for them. They know that it is not practised in corners and in secret places; that it is not puffed in newspapers and heralded by advertisements; that those who practise it claim to do so under a special law; and that their medicines are known and can be got at any of their chemists; and they are ready to believe that its practitioners are fully as respectable, and well-conducted, and trustworthy as those of the other school.

They won't therefore believe, on the mere assertion of its opponents, that it is quackery, and that its practitioners are quacks, when all the facts of the case go to prove the contrary.

Of course, there must be a *choice* among the homœopathists as well as among the allopaths; for all men are not equal in talents, and intellect, and observation, and experience; and, besides, some men are more fitted by the constitution of their minds to be doctors than others are, as some men can only paint signs, and some can produce beautiful pictures. People should recollect this when they talk of homœopathic failures to cure this or that thing, Mr. So-and-so, or Mrs. This-or-that, or Tom's babby, or Farmer Thimbleby's cows: and it is not fair to visit on the method of treatment, what is due to the imperfection of the doctor.

Besides, people and "live stock" must die; it is the law of Nature. The fair way of judging is, do more people die under homœopathy, or under allopathy?

The public will also, by and bye, look at this question in the economical point of view.

It is capable of proof, that if the grazing farms had the advantage of homœopathy for "live stock" of every kind, that the land would be worth at least a pound an acre more than it is now. And with regard to human families, the saving in drugs would be no trifle, I promise you.

As the homœopathists only demand what is the right of every free-born Briton, "a clear stage and no favour," I fully believe the public will stand by them, and see that they have fair play.

By the way, your contributor "Sigma" is a very awkward customer for the allopaths. How he does pitch into them! I guess Professor Christison don't like it at all. I only hope that the regular set-to between the two schools will be conducted on both sides in a generous spirit, as the gallant British and French fought their battles in the Peninsula, the outposts exchanging brandy bottles, and other like civilities shown by one party to the other, till their blood was up in the fray.

I see in your columns letters from different correspondents on the subject of petitioning the patrons of the Edinburgh University. I hope, as the petition is afloat, that it will be numerously signed, so as to secure the point: but I think, in the present state of things, every man Jack of you, who are medical homœopathists, should rouse all your energies for obtaining a charter. This being gained, will not make any difference with regard to the colleges. Your young men can still get their diplomas and licenses from them, so long as they will give them, and you can have an examining board, as the Company have for their medical officers of the Indian army. A clause might be introduced in the charter, empowering you to give a diploma or license, to be accounted legal, in the event of all the allopathic colleges and halls refusing theirs to the homœopathists.

What I want you all to understand is, that a charter for such a purpose cannot be got off-hand; and you will probably have to ask for it again and again before you get it. Suppose the petition is presented to her Gracious Majesty, she will ask the Home Secretary about it; and he will inquire of the different halls and colleges, and some will say they *won't* look at a homœopathist; and others will say we don't care what men call themselves, or in what way they may hereafter doctor her Majesty's subjects, provided they answer our questions, and pass a good examination. Then the Home Secretary will say to her Majesty, "there is no reason for giving this charter yet." But we shall know who are for us and against us; and the small edge will have been introduced into that hidden mystery, the Royal Purpose, and so that purpose will gradually be worked on. But if the charter should be soon gained, then the foolish abuse of the unwise partisans of the other school will be stopped.

The thing that you most seem to want is

Hosted by Google

union among yourselves. Can't you get it? I can't see the difficulty, if you would have a small council, armed with full powers, to do the best for you: and let this council be appointed for three years, or for the life of a parliament: a new election to take place whenever there is one for the Commoners. But this council should comprise men of all the parties into which you seem split.

Be assured this is no time for divisions; the public will look closely into them, too, if you don't mind your p's and q's.

Your obedient servant,

A HUMBLE HOMŒOPATHIST.

To the Editor of the Homœopathic Times.

SIR,—From the eight columns of Sigma's letter to Dr. Routh in your journal, it seems possible to extract one idea, that the writer rejects all means of testing the accuracy of the homœopathic hypothesis, save the appeal to experience alone.

At this no one will be surprised who has tried to place before his mind in an intelligible form, and subject to any kind of analysis, the various ideas (or dilutions of ideas) which are involved in that theory, and the arguments by which they are supported. It is not by such means that any result favourable to homœopathy can be obtained, and it must be that conviction alone which can have led its advocates to claim for the crude facts of an unrectified experience a blind and unreasoning acceptance.

A man with so much vigour of mind (although so curiously directed) as Sigma, would not have fallen into so gross and often-exposed a fallacy, unless it had been necessary for the support of a doctrine he had resolved at all hazards to maintain. He must know perfectly well, that there is no form of mal-praxis which has ever cast disgrace on medical science, no kind of quackery which has ever thriven on the credulity of mankind, that has not appealed to the same test, and supported itself by the same argument. He cannot be ignorant that in this day, all the most audacious and disreputable quacks make use not only of his arguments, but almost of his very words, and that, with a few verbal alterations, his entire letter would read just as well in the pages of the *Hygeist*, etc., as in your journal. But I need not dwell on this subject. From the days of Hippocrates, it has come down to us that "experience is fallacious," and the history of medicine since that time has afforded abundant confirmation of the fact. In the *British and Foreign Medico-Chirurgical Review* for April 1851, there are some excellent observations on the subject of empiricism in general, a perusal of which might benefit not Sigma only, but many others.

Unscientific, however, as this cry for experience alone may be, it is by no means necessary that the advocates of the ordinary practice should refuse to gratify it. The unprofitable task of "comparing death-certificates" may be left to Sigma, and others as much in the confidence of the Registrar-General as he appears to be. In the mean time, there are some facts openly occurring around us from which we may derive more instruction. It appears, from the first Report of the Hahnemann Hospital, that up to that time the deaths among the out-patients there had been in the proportion of 1 in 93 cases. (Patients 1485; deaths 16.) From all inquiries I can make, the mortality is decidedly higher than that which is usual among the same class at other hospitals and dispensaries, and having been during a great part of the time an attentive observer of the practice there, I can testify that the patients did not appear to me to comprise any unusual number of necessarily fatal cases. That the diseases could not have been of any great severity is obvious, inasmuch as the patients were required to present themselves before nine o'clock in the morning.*

Sigma assumes that no experience is to be gained of the success of homœopathic practice, except by the personal use of the globules; but he forgets (or perhaps he does not know) how large an amount of such experience is now forced upon the most careless and unobservant practitioners. In the war of "taking away patients," it is a long time since homœopathy in this country ceased to act entirely on the aggressive. Will Sigma kindly tell us how we are to interpret those cases (so many of which come before us), in which persons labouring under diseases easily cured by appropriate remedies, have been long under homœopathic treatment and derived no benefit? Will he tell us what we are to say to those people who come to us stating that they have tried homœopathy a long time, and think it is a "humbug," or to those who, still believing in it, tell us that it is not suitable to their particular disease? What shall we say, when we find that these patients have been treated by men whose names stand highest in the homœopathic ranks? Is it not better to trace the effects of homœopathic remedies prescribed by physicians of experience and authority, than to make chance experiments "by book" ourselves? Above all, will Sigma tell us what we are to understand, when those who have been loudest in praise of homœopathy, and most earnest in their endeavours to induce us to try it, suddenly inform us of their having recourse, and successfully, to allopathic physicians? I am speaking of things that happen in my own experience, and in that of all my friends, so far as I can ascertain, and before I can embrace the new doctrines, I need an explanation of them. *Our* practice has no charms for those who love novelty and dislike bitter draughts; *our* doctrines present no simple theory, level to the capacity of all intellects, removing all doubts and difficulties, and yet invested with a romantic tinge of mystery; *we* have no array of marvellous cures industriously paraded before the public eye. The patients who come to us from homœopathy, leave the pleasant, the fascinating, the new, the apparently simple, for that which can have no recom-

* I have not selected this report to serve any special purpose, but because it relates to the only homœopathic institution of which I have personal knowledge. The number of in-patients is too small to furnish any valuable data.

Hosted by Google

mendation, but that they cannot do without it. What are we to infer from this, and from the still more curious fact, that of all our patients hardly any are so confiding, so desirous to take medicine, and so sanguine in their belief in its efficacy, as those who have apostatized from homœopathy?

But I am occupying more of your space than I intended, and I hasten to conclude, simply asking Sigma this question more: Whether, considering the success which every new mode of treatment has had in its day, especially if well urged upon the public—considering the cures wrought by Dr. Coffin *et hoc genus omne*, and the acceptance which every unsound theory has met with in its turn from some at least of the medical body, there is any real difficulty in regarding homœopathy as one among the number? And whether any man who shall give the true reason of the constant succession and rejection of new medical doctrines and modes of treatment, will not have explained also the philosophy of this last and most improbable of all.

I am, Sir, your obedient servant,

A SURGEON.

London, Nov. 10, 1851.

[We subjoin "Sigma's" answer to this letter; but we inform our opponents, to use the language of the Editor of the *Medical Times* to Dr. Dudgeon, *mutatis mutandis*, that "our great object in conducting the *Homœopathic Times* is the advancement of medical science in connection with homœopathic therapeutics. It is therefore clear that, entertaining the opinions of allopathy which we do, we cannot allow our pages to be occupied with letters in defence of that ancient, intolerant, ever-shifting, pretended inviolable, but often violated system, which rejoices in a pretentious, injurious, and *systematic* abuse of drugs, and of all kinds of hurtful influences—with no fixed law for its guidance, shifting its principles in every successive age, now mechanical, then chemical, now physiological, then pathological—the harlequin of arts—mocking science with a grave air, and assuming that it is the very concrete of all that is known or can be known." We doubt not the science of many, and the perfect good faith of many of our opponents. If there was a good medical Eclectic Journal, the battle of Allopathy *versus* Homœopathy might be waged in its columns; but our correspondent can hardly find fault with us for following the example of the *Medical Times*.—ED.]

LETTER TO A SURGEON.

SIR,—You have invited me to answer queries. I do so, but I do so to yourself. I am glad you have succeeded in extracting one idea from eight columns of my letter. I know a gentleman who has extracted two. But your idea is deficient, for I admitted "theory," if supported by cures duly recorded. I reject hypothesis alone, for as I treat my patients by experience, and a fair average of cures takes place, I object to them being treated by the theory of any man. The "dilutions of ideas" you refer to are *yours*. Dilutions of medicine are what I deal in, and so might you, if you would take them. We can cure diseases with the latter; with the former you can do nothing. Our "*crude facts of unrectified experience*" are gradually creeping on towards better things. Allopathic experience has not been rectified to the satisfaction of your best authorities in twenty centuries.

I can see nothing curious in any man directing his mind to the defence of a doctrine he believes to be a great truth, and to assert his own integrity of purpose, be that mind vigorous or be it dull as a brickbat. I know of no exposure of any fallacy into which I and my brethren have fallen. Dr. Forbes, in attempting it, laid bare the fallacies of allopathy. Your other authors *exposed themselves*. If quacks of every grade appeal to the same test, they show their judgment, it is a good test, and not invalidated thereby; the shoeblack may polish his shoes by it if he pleases, it is a good test even after that.

I support a doctrine which I believe to be true—a belief arrived at after no trifle of allopathic experience to guide me in a new selection; and I assert my rights to honesty of intention, to freedom of thought on an uncertain department of medical science, and to public estimation, which all men regard; subject to a *Tribunal* we must all one day arrive at, and in comparison with which colleges are naught; but which rights have been unjustifiably invaded by the tyranny of medical corporations.

Upon that ground of complaint I beg some indulgence from the public, should my "milk of human kindness" not very readily cast up its cream to suit the taste of every allopathic theorist. We are well aware of quackery existing in the profession of healing; the word is the "doxy" of every man, according to his interpretation of it. A system of therapeutics can appeal to nothing but experience under a natural law of guidance; therapeutics without a law, theory unbacked by experience, are jackstraws. If my letter might have read equally well in the pages of the *Hygeist*, it is so determined upon your dictum. I never read the *Hygeist*, having long since been satisfied that the system therein propounded, is a very clumsy bit of indiscriminate allopathy, as applied to the *old* humoral pathology; the *best* bit of allopathy is purloined from us—specifics.

If the cry for experience is unscientific, be it so; I can cure many patients with it; the *science* I reserve for diagnostic purposes alone. I have not the honour to be acquainted with the Registrar-General of deaths, your insinuation falls blunted from the convex of his shield. But when my account at his office is called for, it will bear comparison with those around me. Your report of the Hahnemann Hospital is probably correct, I cannot verify it; but you omitted to place your own in juxtaposition therewith.

If experience in "personal use of globules" is forced to a large extent upon even "the most careless and unobservant practitioners," we congratulate these patients on their shrewdness of selection. We recommend these careless and

Hosted by Google

unobservant practitioners to keep the patients, if they can. All practitioners are not equally successful, be they allopaths or homœopaths; for the latter, *memory* is an especial requirement. Many circumstances combine to render it impossible to retain *all patients* by either party. It differs nothing, from one allopath getting the patient of another. Those cases *easily* cured by allopathic practice, after lengthened homœopathic treatment, are not likely to return to it—be thankful for them.

I am well aware that cases which are not cured by us occasionally return to allopathy. I am not aware that cases are cured by that return, to any considerable extent; rapid cures are not always the best in chronic cases, some of which we could sooner seemingly cure by salves and lotions than by globules. After such cures, apoplexies, congestions, and inflammations are not uncommon; they are tantamount to a repercussed exanthem. Rather than undergo surgical operation, patients will insist on homœopathy being tried with them; failing, they go back to the surgeon, to whom they ought to have gone at first. Among surgical cases we occasionally relieve patients from the necessity of operation, and the chance of *that* induces us to try them. Now and then acute cases fall into allopathic hands; but such apostacies are among new converts, when the *fear of an inflammation* first striking on the patient's mind, makes him waver in his confidence—*dear allopathic friends* are whispering in his ears. When patients come to you stating that they have been months under homœopathy, and that it is "humbug." tell them they *are lucky at last*, and cure them. So, God speed you, there is room for us both in this world.

It is well to trace the effects of homœopathic remedies prescribed by physicians of experience, but it is not right to sneer at want of success in single cases. Our general practice shows another thing, and it is not well to be satisfied with the experience of others, if you can form an experience for yourself. As to allopathy, a very fair proportion of our patients do entirely without it—never dream of apostatizing. If you think otherwise, accept it as an unction, and the apostates take good care of.

When you say, "*our* practice has no charms for those who love novelty and dislike bitter draughts—our doctrine presents no simple theory, level to the capacity of all intellects, removing all doubts and difficulties," you speak truly; it has none and is none of these things. Dr. Coffin's system is allopathy, whether a good or a bad kind of it, I cannot tell; but if there were three thousand Dr. Coffins in Europe and America, who all agreed that "composition powder" could cure disease, I would not call them "impostors," I would look into their means of cure and try it; and if it did not come up to my expectations, after a fair time, I would set to work and improve my own system, and beat them with that.

I am, Sir, your obedient servant,

Dec. 2, 1851. SIGMA.

To the Editor of the Medical Times.

SIR,—I must again appeal to your generosity to grant me a portion of your valuable space in order to reply to Dr. Routh's answer to my former letter.

I am duly sensible of Dr. Routh's politeness in congratulating me on having spoken lucidly, but was not aware that that was such a rare accomplishment of mine, that Dr. Routh needed to qualify his congratulation by the exceptional "for once;" and I may, at the same time, state that I consider I have a sufficient supply of good arguments in defence of what I conceive to be the truth, to enable me to dispense altogether, both now and at all other times, with that very bad substitute for good argument, *abuse*, even if it were possible for you, Sir, to permit your respectable pages to be sullied by anything of the sort.

I cannot wonder at Dr. Routh being somewhat disconcerted and annoyed that the observations he was addressing to the practitioners of the "legitimate school" should have been profanely criticised by a heretic, and that the thing which he had described as homœopathy, and was proceeding to demolish *con amore*, should be repudiated and disowned by a homœopathist, in the name of the whole homœopathic school. Moreover, I have not called in question "*opinions*" of Dr. Routh's, but have endeavoured, to the best of my poor ability, to set him right as to *facts*, and as such facts formed the premises on which he intended to found his demolishing deductions against homœopathy, I conceived that the earlier he was set to rights the better, as all deductions from false premises must necessarily be false. It is amusing to hear Dr. Routh apply the term "attack" to my observations; it is as though an enemy should come up against my house to besiege it with all his heavy artillery, and on being received with a discharge of pistols, blunderbusses, and what disposable weapons I could lay hands on, should exclaim that I was attacking him, and that unfairly, as he had not completed his parallels, his redoubts, his ravelins, and his bastions, and had not yet received a promised reinforcement of howitzers and mortars.

Dr. Routh very incorrectly defines the law *similia similibus*, in his quotation from the Organon, viz., that the medicine must produce an affection similar to that to be cured; not one symptom similar to one of those of the disease under treatment, as in Dr. Routh's case of cinchona in meningitis, with intermittent febrile symptoms; for Hahnemann is explicit enough in stating that it is the similarity of the pathogenetic action of the drug with the collective symptoms of the disease, and particularly with the important and characteristic symptoms, we are to look to; and he is equally explicit in condemning a mere symptomatic treatment, such as that adduced by Dr. Routh would be. I may mention that *my* account of the origin of the discovery of the homœopathic law is taken from the writings of Hahnemann himself; and, for Dr. Routh's satisfaction, I may inform him that I translated and published, some years ago,

Hosted by Google

the essay to which he refers, from Hufeland's Journal, for a volume issued by a popular Homœopathic Association, and that I reprinted the same essay in a collection of Hahnemann's Essays published this year, under the title of *Hahnemann's Lesser Writings*, where, at page 311, note, Dr. Routh will read that Hahnemann at first sought for a homœopathic remedy for chronic diseases principally, and there and throughout the essay, he admits the treatment of acute diseases by allopathic or palliative remedies. I may state once for all, that *isopathy* can only be applied to the treatment of disease by an agent that can produce the *same* disease, and as no medicine is capable of producing the *same* disease as that which arises naturally, there can be no isopathy in the treatment of natural diseases by medicines, and the more nearly the drug-disease resembles the natural disease, the more homœopathic is the medicine. *Identity* of effects can only be produced by identity of causes: therefore, to treat isopathically, we should have to give to the patient the agent that produced his disease, or one that could produce the same disease in another. I trust I have now convinced Dr. Routh that I know the difference betwixt *similar* and *identical*, and that the treatment of hæmaturia by *Turpentine* is not *isopathy*, nay, is not even homœopathy, unless the rest of the patient's morbid state correspond very closely with the pathogenetic effects of that drug.

The re-provings of the Vienna Society, and of other homœopathists, were not undertaken, as Dr. Routh states, because Hahnemann's views were not to be depended on, nor yet because his statements as to the action of the medicines were doubted—those re-provings have most beautifully corroborated Hahnemann's statements and views; the object of undertaking these re-provings was principally to obtain a clearer view of the exact pathological conditions produced by the medicines, and the connection of their symptoms, than could be learned from the Materia Medica of Hahnemann, where the natural groupings of the symptoms of the remedies have been unfortunately broken up to admit of an artificial arrangement of the symptoms, which, while it possesses certain undeniable advantages for the practitioner, renders it difficult for the student to obtain a just idea of the whole sphere of action of the drug.

Space, and the patience of your readers would fail me to enter on a defence of all the points touched on by Dr. Routh, I must, therefore, pass by his reflections on Hahnemann's mental powers, and his sneers at Hahnemann's dynamization and psora theories. I may, however, remind Dr. Routh, that a false calumny can never become truth by ever so frequent repetition; and I again distinctly deny, as I did on a former occasion in this journal, when the charge was brought forward by the late Dr. Inglis, that there is any truth in the assertion "that Hahnemann began life by inventing a nostrum as a cure for all diseases." I challenge Dr. Routh to substantiate his charge, and have not the slightest fear of the result.

Dr. Routh's statement that a drop of the mother tincture is frequently given by homœopathists, does not invalidate my assertion that no homœopathist, as far as I know, has altogether discarded infinitesimal doses, and I could point out published cases of Dr. George Schmid's, where such were successfully employed; but even his favourite drop of the mother tincture is an infinitesimal, when compared with the drachms, ounces, and pounds of the ordinary system.

I well remember the discussion at the Medical Society of London, alluded to by Dr. Routh, where the members, not having any Brighton protest as yet hanging over their heads, like the sword of Damocles, and being innocent of any unanimous anti-homœopathic resolutions, backed by illustrious precedents from beyond the Tweed, resolved, by a majority, to continue the discussion after the usual hour, in order to hear what a homœopath had to say to the elaborate statistics of Dr. Routh himself. I certainly instanced Dr. Fleischmann as a slovenly homœopathic practitioner; but it was not on account of his giving drops of mother tinctures; for, as Dr. Routh must know, that is not his usual practice, and I cannot recall to my recollection any case where he did such a thing. I gave him that character because his visit to fifty patients occupied usually less than half an hour, and because he seldom changed the remedy he first prescribed, however the case might alter.

As regards Dr. Routh's *assertion*, which he calls a *demonstration*, relative to the impurities in sugar, sugar of milk, starch and water, admitting it to be true that such impurities exist, it by no means follows that they are of such a nature or in such a condition either to act medicinally on the body, or to counteract the action of our remedies. All our experience shows the contrary to be the case.

Dr. Routh has not much cause for exultation in the history of the magnetoscope as it is called; for if it was brought forward by homœopathists, it was received with great suspicion by the general body of homœopathists, and the source of fallacy in its results was first demonstrated by the first homœopathist who brought it before the profession, and I may add, that its inductions are so deceptive, that several old-school practitioners who witnessed the experiments of Mr. Rutter for several hours, came away thoroughly satisfied of its correctness.

I know nothing about Dr. Glover's high professional character and his claim to veracity. I never, indeed, heard his name mentioned except in connection with his assertion that a homœopathic chemist cheated his customers. Dr. Routh says, "he is only acting as a man of honour should," in refusing to give the name of his authority. Perhaps Dr. Routh will kindly inform me if he only acted as a man of honour should, when he made a public statement of that character in such a vague manner, that every homœopathic chemist in the country must have felt aggrieved and injured by it, and many among them I know to be most honourable and respectable tradesmen; and yet his statement was so cautiously worded, that no court of law could have touched him for it. Of a truth, I

Hosted by Google

think such conduct on a par, as regards honour, with that of his chemical friend, who confidentially confessed to him he was a rogue!

I have taken up so much of your space, that I shall not touch upon the question of the inoculation of diseases. The facts, as Dr. Routh states them, may be true or not, they do not affect homœopathy; therefore, as far as I am concerned, Dr. Routh may have them all his own way, and make the best of them he can. I shall only, in conclusion, say a few words upon the calculations which must have cost Dr. Routh so much trouble, and which he is so mortified at my disparagement of. If Dr. Routh's calculations are *not identical* with those I have elsewhere seen, they are at all events *similar;* and as Dr. Routh states I am apt to confound these two adjectives, it is scarcely to be wondered at that I felt disposed to exclaim, like Dr. Primrose, when he for the second time heard the magnificent oration beginning "the world is in its dotage,"—"Stop, my friend, I think I have heard all that before." Dr. Routh is greatly mistaken if he thinks we object to authentic figures, when they are relevant. On the contrary, it is principally by their aid that we think to make known the excellence of our system. But what I object to in Dr. Routh's and similar calculations, is their utter irrelevancy. State the proposition thus: a ray of light would take so many centuries to travel from end to end of a decillion of sugar-comfits (the vehicle in which we give our medicines), placed all in a row; therefore *Aconite* will not cure diseases for which it is homœopathically indicated; or, therefore, *Phosphorus* has no power over pneumonia; or, therefore, Hahnemann was a quack, or anything else you like. Why, there is to be got out of this proposition no legitimate conclusion whatever against homœopathy. It is just as though one should say, one million of pill-boxes, placed side by side, would reach from Pentonville prison to the buoy at the Nore; therefore, the Earl of Aldborough was never cured of a bad leg of thirty years' standing by Holloway's pills.

Dr. Routh is of course facetious, when he asks me to show him the decillionth of a grain, but as he has a friend of the name of Thomson, who has apparently got a collection of ultimate atoms, I shall take it as a great favour if he will send me one for my private collection of curiosities.

I am, etc.

82, Gloucester Place. R. E. DUDGEON.

To the Editor of the Homœopathic Times.

SIR,—Will you permit me to add a brief postscript to my former letter, by way of answer to Dr. Malan's, which appeared in your last paper.

The University of Edinburgh may be justly termed the most influential medical school in Great Britain, from all parts of which students come to it; and I am surprised that Dr. Malan, having there studied and graduated, should have overlooked the importance of any measures tending to keep that school open to all future comers, by the removal of recent obstructions; and Dr. Malan's private opinion being, "that we must not at present think about a charter," I confess myself at a loss to explain his intentions; for surely he cannot mean that he wishes his fellow-practitioners not to be graduates of any university.

His three reasons may, I think, be very shortly answered.

1st. Even were the object of the petition one of greatly more "local and partial interest" than I can regard it, it will still be our best tactics to concentrate our forces on the first point of attack: it is a great matter never to be defeated.

2nd. From the number of signatures already obtained, it is certain they will not "appear poor and insignificant;" although Dr. Malan, and others adopting his course, are doing what they can to produce the result which he fears.

3rd. The object of the petition is certainly a "decided" one, both as being definite and important; greatly more so, it seems to me, than any other step now proposed.

Cordially concurring in Dr. Malan's view, that the present duty is "to persevere in the fulfilment of daily work," I also feel that part of that work is to help those that are oppressed, a view in which I am sure he will agree; and I would trust that further consideration of the subject in its practical bearings, will lead him to assist in protecting the students of all the universities, and especially of the one with which he is connected, from all future undue interference.

I am, Sir, your obedient servant,

AN ALUMNUS OF THE UNIVERSITY OF EDINBURGH.

Edinburgh, Dec. 1, 1851.

THE WORD OD, *UNDE DERIVATUR?*

To the Editor of the Homœopathic Times.

Wickwar Rectory,
Nov. 24, 1851.

SIR,—As no one has answered your correspondent who, a short time ago, inquired the derivation of Reichenbach's term "Od," perhaps you will allow me to state that "Oddz" is the Icelandic, and "Od" the Danish for a point. "Yddi," in Icelandic, is *acuminare.*

I presume, therefore, that Reichenbach uses the term "Od" force, to designate that force which proceeds from points.

I am, Sir, your obedient servant,

THOMAS R. EVEREST.

To the Editor of the Homœopathic Times.

SIR,—So much has been, I think, prematurely said, done, and written concerning the magnetoscope, that I hesitate to write anything about it, fearing this communication may be considered in the same category. A sense of justice, however; towards Mr. Rutter, the truly philosophical discoverer and enunciator of the laws regulating magnetoid currents, demands that I should add my humble testimony to the cloud of witnesses who have already seen the beau-

Hosted by Google

tiful experiments at Black-Rock. A short time since, I had the good fortune to be one of the "jury of twelve" who patiently and carefully assisted in putting Mr. Rutter's experiments to the severest possible test; I again enjoyed, to-day, the privilege of seeing many of them repeated, and of witnessing, besides, experiments of a still more delicate and satisfactory nature, beyond measure satisfactory, because they proved incontestably that the *mechanical* hypothesis and the muscular contraction hypothesis have nothing whatsoever to do in eliciting the wonderful phenomena shown by the magnetoscope. I am not at liberty to *describe* the experiments to which I refer; suffice it to say, that Mr. Rutter will, at a fitting time, give to the world these beautiful experiments in detail. My only object in sending this communication being to endeavour to induce all those interested in the subject to wait and watch for further confirmation of that which, instead of being, as some think, "a delusion and a snare," will prove one of the grandest discoveries of the day, as connected with physiological science.

I am, Sir, your obedient servant,
ROBERT DOUGLAS HALE, M.D.

Hastings,
Nov. 25, 1851.

MEDICAL INHUMANITY.

From the Edinburgh News.

SIR,—The first example of the operation of the recent resolution of the College of Surgeons, that none of its fellows should co-operate with a certain class of physicians, has just come under my notice; and as I consider it of importance that the case should be tried at the bar of public opinion by the principles of common sense and common humanity, I beg of you to give it the benefit of publication in your widely-circulated paper.

A few nights ago, about ten o'clock, a respectable physician was sent for in great haste to see a gentleman just come from the country. He found his patient suffering from hernia, in great pain and danger. He administered some homœopathic medicine, and tried to reduce the tumour (as the return of the protruded intestines is technically called). He failed, and nothing seemed left but an operation. Not being himself an operating surgeon, he went for Professor Miller, who was out of town. He then went to another, comparatively unknown to the public, who said he could not go without first consulting Professor Goodsir; accordingly the physician and surgeon drove to the Professor of Anatomy. The surgeon went in and talked for about half an hour with Mr. Goodsir, and then the physician was told that they could only go on condition that he did not *remain even in the house* during the operation, and would give up the poor sick man entirely to them. To save his patient's life, the physician consented, and they drove to the house of the sufferer. On examining the tumour before proceeding to operate, it returned at once to its natural situation, showing that the medicine, more true to nature than the surgeons, had rendered their interference unnecessary.

Now, Sir, allow me to make a few remarks upon the principle of this surgical combination. The number of operating surgeons in any town is very small; there being not more than six in such a town as this, it is quite easy for them to combine to effect any purpose they have in view. If they have the right to extort, under penalty of death, such an ignominious condition from a patient as that he shall dismiss out of his house his medical attendant, and perhaps only friend in the place, they may extort anything else they please. If he must abandon his physician at the bidding of surgeons, may he not be compelled to abjure his faith, or to dedicate his fortune to some pious surgical charity? If once medical mortmain be admitted, it will prove infinitely more dangerous than clerical. The surgeon holds present sufferings in his hand, the priest only threats of future punishment. If the principle of such a trades-union be once admitted, the proud boast of medicine that it is broad as humanity itself, and ignores all differences of creeds, nations, languages, is at an end; and in some parts of Ireland we may have Orange surgeons who refuse to save the lives of the heretic Papists, while in others the Roman Catholic may recruit the ranks of his church by the victims won by the dexterous use of his scalpel. As regards homœopathy, it merely accelerates the period when, among the number of the many graduates of our University who are embracing the new faith, there shall be found some of more than average manual dexterity and anatomical knowledge, and less than average sensitiveness of feeling, who will devote themselves to pure surgery; and as regards Professor Goodsir, we acquit him of any personal animosity towards homœopathy, for some years ago he undertook to write pathological articles in the *British Journal of Homœopathy*, and only desisted for fear of "offending" his less liberal brethren; but we cannot justify this outrage on humanity, by the plea of his fearing the consequences of breaking the college law without admitting the same extenuation for almost all the cruel deeds under which this earth has groaned, for fear is the parent of cruelty.

I am, etc.,
J RUTHERFURD RUSSELL.

[We are much obliged to Dr. Rutherfurd Russell for his spirited exposure of the chirurgical *clique* of Edinburgh. We hope he will publish the case at length. The only way of dealing with *cliques* is to expose them. Why do not the homœopaths of Edinburgh have a good operating surgeon, who is also a homœopathist? We should be in such a position as to be always, and under all circumstances, independent of the allopathic body.—ED.]

Communications.

LETTER TO JAMES Y. SIMPSON, M.D., F.R.S.E.,

AND PROFESSOR OF MIDWIFERY IN THE UNIVERSITY OF EDINBURGH.

SIR,—I have a small bill against you. You have encroached upon Dr. Routh's prerogative of figures; become a humble imitator of that gifted physician, and have proved yourself to be one step lower in the scale of originality than he was. This is to be regretted, when we consider the lofty pedestal you have so long and so justly occupied in virtue of the merits of obstetric innovation. But you have not only condescended to plagiarise from Dr. Routh (not that they were original in his case), but you have outheroded Herod, and swept your own assumed "*standard of common sense*" from the face of modern medicine.

You have expended many pages of type to prove that there are *three* homœopathic drug-shops in Edinburgh, and that they *are all thriving*—beyond this you have proved nothing, save the "*consultations*." But if there is any truth in Dr. Henderson having inadvertently used globules, accidentally mixed by a child, seven years ago, Dr. Henderson has had abundance of time to correct that error; and had that gentleman insisted ever afterwards in mixing his own globules, the comparative results of his practice in respect to those around him would inflict of itself a blow upon allopathy, which she is courting most strenuously.

You have added nothing to the support of allopathy by your calculation from the time of Adam; by such staleness you only insist upon the public swallowing a camel of antediluvian dimensions, whilst you warn them that a gnat must produce an epiglottic spasm. If an operating surgeon feels his conscience at ease when refusing the use of his art to a homœopathic physician, and merely to support a party-spirit, the odium remains with him, and it will attach itself to him, do what he will, and notwithstanding he is scrubbed with soap and water by the Colleges every Saturday night. It will be well if that conscience, so comfortable in this world, be equally so when it passes beyond it.

You have yourself proved the truth of Dr. Henderson's assertion as to "*consultation*." The motives which led to these consultations are quite distinct from that assertion, and are susceptible of any variation without invading the spirit of that assertion by *one line*.

The substitution of a "*standard of common sense*" *in lieu of the medical creed which you acknowledge you have not*, is a standard raised in the utmost extremity. We shall knock it down for you; phantom-like it will fight for your cause under as visionary a banner—"legitimate medicine."

Your exploits before the Medical Society of Edinburgh in this disputation are the latest "*spirited*" achievements that have come before us. We shall sketch hastily a few of a parallel merit, by which you will perceive that you have eclipsed them all.

We feel as firm in our position as the rock on which your castle stands, and from the height we look down smiling, and see your whole Faculty appealing to, and your "fidus Aehates," the *Lancet*, hounding on to their aid, the rising generation of medical students. Beaten in open fight, they take to stratagem, and a *Faculty of medical philosophers invokes the aid of those they profess to teach.*

I was right when I said that a "pall of humility is spreading over them." Is the Medical Faculty of Edinburgh insensible to shame? Can no blush mantle on its collective cheek at the bare idea of such a degradation? Must they sink into the condition of well-whipped schoolboys, and must schoolboys be set up as judges on a *great medical question of experience*, which men of age cannot settle. We never thought they could arrive at this *acme* of insignificance, but your weekly organ declares it, and moreover declares it to be a question which these youthful *judges ought* to settle. Let Professor Henderson go and lecture to empty benches; better

Hosted by Google

do that than lecture to empty heads. Professors in the Edinburgh University have lectured to empty benches before now, at least very nearly so; they might have done so completely, and it had not mattered a pistereen. Nor did the good old gentlemen grieve; we remember them right drowsily.

When party feeling can so far act upon human nature as to blind men to the injuries they thus inflict upon themselves, we are prepared for almost any folly; but we were not prepared for this quintessence of it. We saw cut out from the second edition of the "Text Book" the names of those homœopaths whose allopathic labours, before their conversion, had added to its value; we saw how Hahnemann's discoveries were appropriated; how the grossest plagiarism was admitted without snubbing the mighty discoverers of the antiphlogistic virtues of *Aconite*, the prophylactic properties of *Belladonna*, the healing qualities of *Arnica*—perfect, if you add thereto the Bath practitioner's discovery, that "*Extract of Nux vom.* is a cure for constipation," the thing is perfect; and we shall have many great discoveries in this line, and professorial chairs to bestow as rewards therefore.

Will no one hold out his arm and be bled to fifty ounces on the spot? Will no one take a *course* of *Calomel*, and risk salivation for the good of "Old Allopathy?" No end of spirited deeds are being done by the profession, but not a man of them will swallow one of his own pills; he knows better. We are told that Messrs. Highley have had a qualm of conscience, and can no longer publish homœopathic works. Very good; Messrs. Highley must be permitted to have a conscience.

The graduates of last quarter at St. Andrew's have followed this "spirited" example of the Messrs. Highley, and have made a "spirited" remonstrance against their parchments being *desecrated* by the signature of a homœopathically-inclined Professor of Civil History; and they fully expected that the professor would assault them, and stamp his cognomen on their frontal development; they didn't calculate on the signature being refused; they scarcely knew the man they had to deal with.

The insulted professor, insulted within his own domain, very naturally failed to take this conduct of the graduates more kindly than it was meant, and his reply thereto met with the decided disapprobation of two very prominent and extra punctilious graduates (whose august names have escaped my memory, and for which I beg to apologize) who instantaneously convicted the insulted gentleman of unbecoming "acerbity of temper;" and thereupon these Guy Fawkes throw an ignited lucifer into the powder magazine of the *Lancet*, and recommend that "fallen spirit" to continue his pyrotechny. It appears, therefore, that it is expected that we homœopathists shall be quite prepared to receive all insults blandly, and that we shall always have on hand a complete dairy of the "milk of human kindness," of the very richest quality, and no end of skimmers for our allopathic friends.

But these deeds fall quite into the shade, are totally eclipsed by the appeal to the Council of the Royal College of Surgeons, by Dr. J. C. Hall, of Sheffield, in which he requests to know if that body intends to oblige him by removing an obnoxious homœopath (who is taking a trifle of the Sheffield practice) from the College list, which rejoices in having Dr. J. C. Hall's exalted name upon its pages; the undoubted right to do which, Dr. J. C. Hall feels quite certain, is vested in the College. This appeal concludes with the following threat, in case of refusal: "It will only remain for me to return into your hands the diploma of your College, and to do myself that justice which, up to this moment, you have thought proper to deny me."

There is a dire intent in these mysterious lines, which we cannot contemplate without trembling. We hope Dr. J. C. Hall has not become the proprietor of "Warner's long-range," nor has any gunpowder-plot in view in reference to the Royal College.

We have a great admiration for this *very spirited* thing of Dr. J. C. Hall, of Sheffield. If he is a man of means, and can enter into securities to defray all the expenses, and come down handsomely with all the damages in which the Royal College might be mulcted, for removing any member for Dr. J. C. Hall's special convenience, the College might indulge him; until then he may whistle on his thumb. But Dr. J. C. Hall's threat to *return his diploma* is a most serious affair. The Royal College may shut up shop. What a curious state of matters it would be, if all the members of the Royal College, and all the M.D.s addicted to pills, were to return their diplomas; there would be no deaths from ovarian tumours extracted; no arteries tied without aneurisms; no inquests resulting from "*composition powder*;" and all because of us homœopathists. We should do a pretty tidy piece of work for the next six months, and

Hosted by Google

the "cave of Adullam" might have "*every seat taken.*"

But Dr. J. C. Hall leaves us in a most pleasant uncertainty as to what he intends to do if the College in future, and as heretofore, turns a deaf ear to his cry. Will he excuse us for suggesting to him to administer to the Council a dose of Indian hemp? for there is, indeed, a charming romance in that drug, producing a commotion like a thunder-storm, or melting away upon the tongue harmless as a flake of purest Alpine snow, or mellowed to the innocence of a rose-leaf. Or he might stuff their nostrils with gun-cotton, and seduce them into trying "a mild Havannah." We only throw out these suggestions as likely to suit any man in Dr. J. C. Hall's state of mind in this very critical juncture of medical affairs. If Sir Harry Smith had only a regiment of Dr. J. C. Halls, wouldn't he just walk into those rascally Kaffirs? Meantime, until Dr. J. C. Hall's "*revolver*" is discharged, we feel much in the condition deseribed by the poet, previous to the battle of the Baltic:—

"When the boldest held his breath for a time."

Some three years ago *there was* an office-bearer in your College; he found it poor, he left it rich; he had laboured for years in behalf of that body; which severally and collectively acknowledged their debt by presenting him with a *most solid mark of esteem.* He was the equal of any of that body in education, and he accepted that token *as a badge of services faithfully performed.* It turns out, however (now that his therapeutic views have changed), that they intended that gift as a *bribe for future serfdom to that College.* If there is a man of that College who breathes that same atmosphere of honour, they so ludicrously assert as theirs alone, let him stand up and repudiate the *Reviewer* of "Reasons for Embracing Homœopathy;" let him stand forth and disown the great reviewer, who, in order to render himself worthy of his hire, merged a public and professional question in an attempt upon private reputation, and whose intention has recoiled upon his own head. I say, let each member of that body hold up his head, and look like "a Fellow of a Royal College of Physicians;" let him do his best to wash out this stigma from that body, and be clean. If not, then silence will chronicle as a fact that, in presenting that physician with *any marks of esteem*, they wrote themselves down "a College of Physicians," Royal merely in virtue of prerogative.

Sir, for many a day your party scouted homœopathy as being beneath their notice; their present commotion proves how completely they have changed their opinion. The public has for a long time been interested in it, and is doing it that justice which "*the profession*" has denied it. It is strange to think, however, that with such lamentable confessions of the deficiencies of a system, as have been made by such justly-esteemed men as Drs. Forbes and Christison (I would not detract one whit from *many* services the latter has done to certain branches), it is strange, I say, that a new science, asserted by a large body to be more successful in their hands than the old, which has been cherished amid the chilling influences of autocratic Russia; which has taken deep root in the same soil that nourishes the upas-tree of Hapsburg; which flourishes in inquisitorial Spain; which breathes an atmosphere free as the air of her Italian skies in the bosom of the Roman hierarchy; which "goes a-head" merrily in the republic of the West; should, in this land of freedom, this merry England, be left to struggle as it may. A friend, whose opinion I hold in great esteem, when alluding to this, seemed to think that a "deeply-hidden" cause existed for such a discrepancy, and that it offered an inquiry worthy of one of an iron mind, an iron grasp. I looked over the "profession," and saw none whose iron grasp was not relaxed by prejudice and self-interest. Such a man was not to be found within her pale. Thinking, therefore, that we might wait a long while, and being rather disheartened than otherwise by the idea, it suddenly struck me that my friend had been entirely wrong, and that his "deeply-hidden cause" is so completely on the surface, that no one thought of looking for it there.

It is this. In autocratic and republican governments all matters of dispute are made matters of public investigation; the spirit of it is grasped by an iron hand, and the matter is settled beyond appeal; professors, colleges, and societies are very small beer indeed with them. Homœopathy has stood this severe test; had it not done so, the head of many a homœopathist had rolled from off his shoulders. In England there is no investigation by government; we are all left *perfectly free* to fight it out; so let us set-to "hammer and tongs."

I have the honour to be, Sir,

Your most obedient servant,

Dec. 10, 1851. SIGMA.

REVIEWERS REVIEWED.

By a Progressist.

(*Continued from page* 279.)

Whatever opinions Hahnemann formed, he submitted to the best of all tests—*experience*, and freely communicated to the public the results of his labours. It is, indeed, melancholy to hear a man reproached as a humbug and a cheat, merely because his wisdom increased with his years. Where a man becomes more foolish as he advances in life, where he deserts sound and good principles for those of an opposite nature, he deserves neither pity nor forbearance, and he must not be surprised if motives are imputed to him creditable to neither his head nor his heart. The name of Hahnemann, the founder of homœopathy, as the author of the Organon, the Materia Medica Pura, etc., is now familiar in this country, but his name is not known and appreciated as it should be. The opinion of his virtues is general. We have learned to venerate the man upon the testimony of his friends, and from them we learn the qualities which compose his character "were so admirably compounded, that pre-eminence was swallowed up in general excellence." Even those who were least favourably disposed towards him, have allowed, with a sort of distorted confession, the extraordinary endowments with which nature had gifted him. In looking at the prints of Hahnemann, what an idea do they convey to the mind of the fascinating simplicity of his countenance and deportment. Such a countenance and such a deportment, added to such a mind, must have powerfully concurred to give him that ascendency over the thoughts and affections of all who approached him. Modesty, which is a rare attendant upon excellence of any sort, and peculiarly so upon intellectual excellence, was conspicuous in Hahnemann. It was not in him, as in some men, a vain affectation, springing from rank pride of heart; it was a principle engrafted on his mind, emanating from piety and supported by it. Perhaps there never existed an individual to whom may be applied with greater truth the words of Shakspeare—

> "His life was gentle; and the elements
> So mixed in him, that nature might stand up
> And say to all the world THIS WAS A MAN."

He shrunk from no enterprises to which he might beneficially exert his great talents for the welfare of the human race. He looked abroad upon man, and when he felt that he could benefit him, he needed no other motive to employ his whole power; and yet this man, whose lustre is obscured to those who have not contemplated his character, during life was maligned, treated with persecution and slander. The equanimity of his mind, the meek forbearance of his heart, never forsook him; he walked his course with the patient consciousness of rectitude, unmoved by the rancorous attacks of malice, envy, and fanaticism.

To Hahnemann the thoughts of a future being were always present; and these thoughts not only fitted him for the duties of this life, but gave him the power to fulfil the intention of the Almighty for the benefit of mankind. Piety in him was a vital principle: it cheered his path, matured his thoughts, purified the affections of his nature. "Shortly before his death, while suffering from difficulty in breathing, his wife said to him, 'Providence owes you a mitigation of your sufferings, since in your life you have alleviated the sufferings of so many and endured yourself so much.' 'Me,' replied the dying sage, 'why, then, me? Each man here below works as God gives him strength, and meets a greater or less reward at the judgment-seat of God. God owes me nothing, but I owe God much—yea, all.'" *

Such was the man that the Editors of two medical journals have attacked as a "humbug" and a "cheat," and this ill-judged and unlimited censure has not only been passed on Hahnemann, but upon all, without exception, who attempt to inquire into the truth of his discovery. These gentlemen have animadverted on the followers of Hahnemann, whom they have represented as guilty of self-confidence and presumption in daring to inquire more deeply than themselves, and their attacks have been furious and disdainful. No proof, however, is offered by those who prefer the accusations, filled as they are with a spirit of illiberal prejudice, misconstruction, and unwarranted statements; they have accused us of wild conjecture, extravagant delusions, and absurd conclusions. But, I say again, they have never produced any arguments to show that we are wrong and they are right. It is somewhat ludicrous to observe the mingled vexation and self-importance of these gentlemen who accuse us of presumption. They, in the first instance, it seems, intended to pass by homœopathy in contemptuous silence, assuming, that contempt from such a quarter might, of course, be expected to operate powerfully in blasting the fame of the system altogether, or, at least, in retarding its progress. How immeasurably great must be their surprise, when they find

* British Journal of Homœopathy, i. 415.

Hosted by Google

that the public have declared they will judge for themselves; when they find that it is gaining confidence, and spreading in every direction—even though it is unlicensed by the *Lancet* and *Medical Times*. They are most unwillingly obliged to admit that homœopathy has taken a firm hold. It has become impossible to deny that it has commanded attention! This is a very *reluctant admission*. Why should Editors *wish* to deny it, if it be true? After appearing to treat the subject with contempt, finding their authority totally disregarded, we cannot wonder that these literati should at length step heroically forward to combat the presumption of the public; stung, as we must naturally suppose them to be, with all that high disdain from a sense of injured merit, which other slighted champions have so often felt before.

Having failed in their endeavour to blast homœopathy by cold and contemptuous indifference, our worthy Editors of the *Lancet* and *Medical Times* can now only resort to their thrice-repeated system of broad abuse, and having volleyed forth their invectives with no little fury against this ill-starred system of therapeutics, they attack those persons who follow in the wake with the most opprobrious epithets. One cannot cease to wonder, notwithstanding all this abuse, that there is no attempt to bring forward one proof for the purpose of justifying their animadversions.

They abuse the whole system, and endeavour to malign the character of those who practise it. I humbly beg leave to remind these gentlemen, that tricks of this sort can be deemed nothing less than fraudulent deceptions on the public, when used by persons who hold up their works to the world as "reviews." I have said before, no argument has been brought forward to justify their opposition. Their abuse reminds one of a military maxim, "that a rapid movement is sometimes more successful in war than a tedious and regular siege." Some maxim of this kind may influence certain reviewers in arranging their schemes of literary warfare, and hence, when they observe that the subject is somewhat formidable, they may deem it more politic to overrun and tread it down with all speed, than to waste their whole store of ammunition (perhaps to no purpose) in attempting to assail each particular argument.

These Editors seem but imperfectly aware that it is no longer possible in this, as in former ages, for any individual, however distinguished in the literary world, to rule the opinion of the public, or to blast the prospects of any discovery by the power of his own *ipse dixit*. The increased diffusion of knowledge has qualified numbers in the united empire to judge for themselves in physic, as well as on other matters, with a boldness and a freedom to which many of their forefathers were little accustomed. Were a *Pope* or a *Johnson* to return from the grave, it would not now be easy for the one with his satire, or the other with his learning, to browbeat a well-informed Englishman out of his notions. Whether an enlightened community will pay greater deference to the gentlemen who conduct the *Lancet* or the *Medical Times* than it would to a Johnson or a Pope, may perhaps be deemed too wide in its scope to be discussed with propriety by a humble individual like myself. If, indeed, I were disposed to retort on these Editors, by recurring to language like that which I condemn (the language of *general invective*, unsupported by proof), I now might aver that the Editors of the *Lancet* and *Medical Times* are, in truth, the very last of all to whom Englishmen will dream of surrendering their judgment. Far, however, shall I be from maintaining that any such expression of contempt would be just, nor shall I presume on any account to make use of it; for I humbly conceive that the language of *general invective* discovers the person who employs it to be anything rather than a gentleman. I am anxious to satisfy your readers how easy it would be to *retort* upon the above Editors, without the assistance either of wit or argument.

In offering the foregoing remarks, my object has rather been to excite the attention of others, than to publish my own ideas on the matter. I beg very respectfully to draw the attention of the public to a point of vital importance, namely, the pernicious effects of the scurrility, falsehoods, calumnies, etc., which are regularly disseminated in the weekly journals. Some of these publications are set up and supported by speculating adventurers, who, devoid of all moral principle, become the vile panderers of a party merely to gain a subsistence by the sale of their extravagant revilings and interested misrepresentations. There is no falsehood too great, no principle too absurd, no passion too base for this class of adventurers not to assert and defend, provided that it may enable them more effectually to deceive their deluded supporters, and to levy additional contributions on the public for their infamous effusions.

In this manner the "liberty of the press" is prostituted to the vilest purposes, and the basest calumnies are perpetrated on the pretext that the writer must live; and for

Hosted by Google

that they must adapt their sentiments to the taste of their readers. They, therefore, consider it no longer necessary to study anything but what may contribute most to stimulate the curiosity or inflame the passions of their subscribers. Thus is the press, that palladium of our national liberty, distorted to the most hideous purposes. To enlarge upon the ill effects would be needless, and we do hope that some means may be interposed which may tend effectually to rescue a deluded class of people from being the prey of covetous and unprincipled scribblers, who have no other God, country, or friend but *gold*.

THE
HOMŒOPATHIC TIMES.

SATURDAY, DECEMBER 13TH, 1851.

HOMŒOPATHY continues to survive the most virulent attacks of the allopathic school—a circumstance that must sadly mortify the promoters of the persecution. In the midst of the disagreement occasioned by the unsuccessful attempts made to stultify our proceedings, the Cause prospers, and the allopaths have themselves alone to thank for the severity of the recoil. *Ab alio refectes alteri quod feceris*, says the proverb, and, in this respect, it has been perfectly verified.

It matters, however, little what is the shade or complexion of persecution, so that it is not permitted to exterminate truth. Standing on a secure foundation, we can smile at the taunts of our adversaries, and in returning good for evil, merit the reward that belongs to those who practise the noblest acts of Christian charity. It is certainly not worth while, when our system is making such rapid strides as it is at present, to descend and calumniate in the coarse terms employed by the writers of an opposition press.

Our great duty at this period, is to point out to the public the revolution homœopathy is making through all grades of the medical profession; the certainty that our career is flourishing, and that the benefits to be derived from the recognition of our principles will carry comfort into the hearts and homes of those who embrace the same faith. Idle would it be in us, then, having a task of this magnitude before our view, to step out of our way, and in recriminatory observations seek to throw dirt at those who have made it the study of their lives to throw dirt at us.

The year 1851 is rapidly passing away. It has been distinguished by the unparalleled success of the Great Exhibition and other co-operating events to produce peace and good-will among nations. Without the slightest egotism, we may claim for homœopathy, associated with its hospitals and its societies, the development of principles assisting to cement the bonds of universal brotherhood. Why, then, should we feel alarmed at the efforts of disappointed and prejudiced individuals, who, fearing the progress of our Cause, endeavour to damp and discourage a belief in that which they must be perfectly aware is based on the soundest philosophy. But these efforts must not be regarded; the same constancy, the same faith which has upheld us all along, must be maintained, and the result will abundantly testify in our behalf.

THE ROYAL COLLEGE OF SURGEONS OF ENGLAND AND HOMŒOPATHY.

To sundry insolent, or impertinent, or importunate communications the Secretary of this College has been instructed to write, that the Council will not interfere with homœopathy.

Let Auld Reekie be ashamed; let old St. Andrew's blush; let Aberdeen put a fan before her face; let Glasgow, whose chief honour is to have had LEIGHTON for her bishop, be disgusted with herself. Let the *Lancet* rave; let the *Medical Times* whimper over the queer fraternisation with the *Medical Gazette*;—it is plain that we have gained the day.

We hold PARISIUS as nobody: we know nothing of him: as an individual he has, in very inelegant and bad English, pronounced against homœopathy—but up to this time,

Hosted by Google

none but the four Scotch Universities have so pronounced.

The Englishman has been more canny than the Scot. Not one English university, college, or hall has yet pronounced against homœopathy.

The Medical Faculties of Scotland are demented, if they think that by *brute* decrees they can stop the investigation of truth: but *their rulers and their masters* will teach them another lesson; and except they determine to be the laughing-stock of the world, even those Medical Faculties will acknowledge their folly, and admit homœopathists for examination.

The following extract is from the *Lancet* of last week:—

THE ROYAL COLLEGE OF SURGEONS AND HOMŒOPATHY.

Conclusion of the correspondence between Dr. J. C. Hall, of Sheffield, and the Council. Most disgraceful Resolution of the Council.

To the Editor of the Lancet.

DR. J. C. HALL presents his compliments to the Editor, and requests the publication of the enclosed correspondence with the Council of the Royal College of Surgeons of England in the next number of his journal.

Surrey Street, Sheffield, Dec. 1, 1851.

Royal College of Surgeons of England, Nov. 28, 1851.

SIR,—I am desired to transmit to you, in reply to your letters on the subject of homœopathy, a copy of the following resolution of the Council of this College, on the 26th instant—viz.:

"That the Council have attentively and repeatedly considered the various communications which they have received on the subject of homœopathy; and after mature deliberation, have resolved, that it is not expedient for this College to interfere in the matter."

I am, Sir, your most obedient servant,

E. BALFOUR, *Sec.*

To Dr. John Charles Hall, etc. etc., Sheffield.

Our readers will see, in our correspondence, a letter from Dr. H. HASTINGS, to show that mineral waters cure on the principle of homœopathy, *i. e.*, when the waters are rightly chosen. We have here shown us the way in which candid and unprejudiced allopaths should approach the subject of homœopathy.

They will also see a very valuable letter from Mr. M'Taggart, who seems to have been most successful with our remedies in Veterinary Practice, written in a *catholic* and *eclectic* spirit. In Dr. Hastings and Mr. M'Taggart we have two good specimens of men who rise above class-prejudice, and seek only for truth.

The time has come for the full and unhesitating exposure of those of our opponents who, in proportion to their virulence, are uncandid and unfair, unscrupulous in their statements, unreasoning in their abuse, and bent to use all means for the hoped-for overthrow, *per fas vel nefas*, of homœopathy.

The charge of bad faith and deceit has again and again, been brought against the homœopathists; this charge has never been substantiated—those who advanced it have been challenged to bring proofs of their allegations, they have never been forthcoming. Professor HENDERSON has openly charged Professors SYME and SIMPSON with want of candour and good faith, and we reprint his letter in which that charge is substantiated by witnesses.

This letter of Professor HENDERSON should be circulated by thousands of copies, not in the way of retaliation on our misjudging and injurious opponents, but as a triumphant occasion of calling on all parties to judge between the champions of the old school and of the new school, as to the question of *veracity*.

We make a solemn appeal to the public to award us the palm of good faith; and we call on our professional brethren of the old school to prove against any of our body any of the alleged "homœopathic lies." Let them prove bad faith, and not assert it rashly, and without any show of reason.

We trust that each of our homœopathic colleagues will distribute at least a hundred copies of Professor HENDERSON'S letter. While our virulent adversaries are using all means against us, our own body should not be inert, but should show something like a generous appreciation of such a man as Professor HENDERSON, the maligned but triumphant advocate of homœopathy. This is not a time for sleep, nor for unwise indifferenee or disunion. We have been aroused to combat, and with a well-directed energy and union, the victory is won, and for the truth in this matter. Our war is not with the allopathic practitioners, but with the virulent and unfair advocates of that body,

Hosted by Google

who use such shameful and unscrupulous language in reference to us, who asperse our characters, and charge us with deceit and falsehood, and never bring forward a single proof in support of their wicked charges.

We have ventured to reprint Professor HENDERSON'S letter at length, in the hope that he will excuse our doing so, and with the view of stimulating our colleagues, and all the friends of homœopathy, to secure its general circulation throughout the three kingdoms.

In order that our readers may fully understand Dr. Henderson's masterly letter, we have placed the *famous* resolution first, although Professor Henderson gives it only the place of an appendix, in his crushing letter.

"Resolution of the Medico-Chirurgical Society (of Edinburgh), of date 19th Nov., 1851.

"MOVED BY MR. SYME, 'That the public profession of Homœopathy shall be held to disqualify for being admitted or remaining a Member of the Medico-Chirurgical Society of Edinburgh.'

*To the President of the Medico-Chirurgical Society of Edinburgh.**

"61, Northumberland Street, Edinburgh,
"1st December, 1851.

"SIR,—I should not have troubled you, or the Society over which you preside, with any comments on the proceedings of your last meeting, did I not observe in the report of the speeches made by Mr. Syme and Dr. Simpson, published in the *Monthly Journal* for December, statements which I cannot allow to pass unnoticed without appearing by my silence to admit their substantial accuracy. In the resolution which called forth these speeches I feel no interest, for I had long ceased to expect from the Society a calm, candid, and unbiassed judgment on the important therapeutic law to which that resolution refers, and had for several years absented myself from its meetings, as being those of a sectarian body with whose limited views I could not sympathise. I need scarcely add, that the resolution in question amply justifies the estimate I had formed of the Society.

"In my letter to the Patrons of the University, I allege that Mr. Syme on two occasions acted in the face of the motion which he had himself proposed in the College of Surgeons; that he twice met in consultation with one who 'practises homœopathy,' while the motion referred to maintains that to meet with those who do so is to countenance the system. That such meetings on Mr. Syme's part (if they occurred) were a countenancing of homœopathy is an allegation of his own, as contained in his motion in the College of Surgeons. That they *did* occur I repeat, and Mr. Syme admits that they did, although he endeavours to explain away one of them, as if it was not entitled to be regarded as a consultation at all. I sincerely regret that I am under the necessity of saying that Mr. Syme's version of that meeting, in particular, in most inaccurate. His printed statement is as follows:—'The first of these (cases) he would mention was that of a young man from Dundee, whom he had been requested, by Dr. Nimmo of that place, to take under his charge. Finding that he was attended by Dr. Henderson, he had requested a meeting with him, for the purpose, not of consultation, but of arranging for the medical treatment of the patient by the respected secretary of the Society, Dr. John Taylor, with whom Mr. Syme might co-operate, as he could not do so with Dr. Henderson.' Now, Sir, if such was Mr. Syme's purpose, he never communicated it to me; and I feel, as others no doubt will do, that there was something very marvellous in the manner in which I, all unconsciously, carried Mr. Syme's purpose into effect. Mr. Syme called at my house, and after stating that he had been requested to see this patient of mine by one of his friends in the country, an hour for our meeting was agreed on, as I then knew nothing of Mr. Syme to prevent my meeting with him.

"We met accordingly, saw the patient together, retired to converse about the case, and then found that we differed both as to the seat of the disease and the suitable treatment. *I informed Mr. Syme that I could not superintend the execution of the plans he recommended! I suggested that Dr. John Taylor should take charge of the case instead of myself! I called on Dr. Taylor, told him of the circumstances which had occurred, and sent him to Mr. Syme for his instructions!* I never heard a whisper from Mr. Syme of his being unable to co-operate with me. Dr. Taylor, no doubt, remembers my visit to him on the occasion referred to; and those who know me cannot believe that I would go in search of him for Mr. Syme, had the latter given me the smallest reason to suspect that he entertained the purpose which he now says he did. Mr. Syme's account of the other case contains several inaccuracies, short though it be; but as he admits the fact of the meeting, and does not attempt to deny any allegation of mine in reference to it, I do not think it worth while to lengthen this letter by adverting to it farther. In concluding this part of the subject, I think I am amply entitled to aver that all my allegations respecting Mr. Syme, in my letter to the Patrons, are incontrovertibly true.

"Mr. Syme says, in reference to Dr. Black, that he 'had proposed to attend along with him a lady who had come from England to undergo an operation, but met with a decided refusal of any such co-operation; but he does not tell us that he met with Dr. Black on another occasion, to which the following note refers; nay, he virtually denies that any such meeting took place, for he omits it from his account of 'the

* Letter to the President of the Medico-Chirurgical Society of Edinburgh, on the recent Speeches of Professors Syme and Simpson. By William Henderson, M.D., Professor of General Pathology. Edinburgh: W. P. Kennedy; Glasgow: D. Bryce; London: Hamilton, Adams, and Co.

Hosted by Google

whole amount of countenance which Mr. Syme had afforded to the homœopathists of Edinburgh.'

"*From* WILLIAM ERSKINE, Esq., *late of East India Company's Civil Service.*

"'28, Regent Terrace, Sept. 17, 1851.

"'MY DEAR DR. HENDERSON,—On looking back into my books, I find that Mr. Syme visited my late daughter, ——, on the 8th of November, 1843. He was accompanied by Dr. Francis Black, who at that time attended her.—I remain, dear Dr. Henderson, yours very truly,

WM. ERSKINE.'

"I come next to the speech of Dr. Simpson. The confusion, inaccuracy, misstatement, and irrelevant matter, that abound in this production, make it difficult to deal with it so concisely as with Mr. Syme's, yet I hope to pick my way to the simple truth in this, as in the other case. That his hearers condemned the oration with 'faint praise,' I cannot omit to notice, as it was so very much to their credit. Why a member of my family is introduced to the notice of the Society, I can only conjecture; and I must, in common, I should hope, with all who heard the speech, denounce the very bad taste of alluding to 'some long and anxious hours' of attendance upon her, made in a public place, and made most unnecessarily for any worthy purpose. If the allusion was made in order to prejudice him in the estimation of the Society, as having, in my various recent notices of Dr. Simpson, made him a bad return for obligations received at his hands, I take this opportunity of saying, that even had there been a balance of obligations against me, (which I utterly deny,) there are acts capable of cancelling any amount of obligation, and of such I hold Dr. Simpson to be guilty, by having aided in the composition of the scandalous Resolutions of the Royal College of Physicians,—if indeed he did not actually compose them. But, Sir, it is not my intention to lose temper even with Dr. Simpson, for I cordially agree with him who says, that 'so much as there is of passion, so much there is of nothing to the purpose,' in any discussion.

"Dr. Simpson makes one distinct affirmation, when he avers that the case from which he removed a polypus, was, with the exception of the member of my family to whom he adverts, 'the only patient at whose bedside he had met Dr. Henderson.' Were my own character not concerned in this miserable business, I should grieve to lay the following letters before the Society:—

"*From* J. HAWKINS, Esq., *late Judge H.E.I.C.S.*

"'2, Regent Terrace, June 17, 1851.

"'MY DEAR Mr. HENDERSON,—Dr. Simpson, at your request, attended a lady at my house on the 17th August last, and you and he met here together on the 20th of that month.—Believe me, yours very truly, J. HAWKINS.'

"This was little more than a year ago, and cannot have been difficult to remember, especially by one who attached so much consequence to such meetings, as, on the other and previous occasion to which he alludes, 'to have felt it was perhaps more than questionable whether he should have met him.' These are the two cases to which I made reference in my letter to the Editor of the *Witness*, and I told Dr. Simpson so, when he called at my house professedly to make inquiries on the subject. I have never mentioned the case on which Mr. Syme subsequently operated, as having been one of those which Dr. Simpson and I visited together; and, therefore, all that Dr. S. has said respecting it, has nothing to do with the matter at issue. That there may be no evasion of the evidence of the last letter, I have to state that the meeting it refers to was at 'the bedside.' And so was that to which the next letter bears testimony; and if it was not of a very recent date, it shows all the more clearly the probability of the statement contained in my letter to the *Witness*, that Dr. Simpson was in the habit of agreeing to such meetings whenever he was asked, a circumstance which can be attested likewise, I believe, by my friend Dr. Russell.

"*From* CHARLES CHALMERS, ESQ., *late Principat of Merchiston Academy.*

"'Katesmill, Colinton, June 17, 1851.

"'DEAR SIR,—It consists with my knowledge, that towards the close of 1846, you and Professor Simpson attended professionally together one of the members of my family, who was then residing in Merchiston Castle.—I remain, dear Sir, yours most truly, CHARLES CHALMERS.

"'Professor Henderson, M.D.'

"Dr. Simpson excuses his having operated on the case of polypus in the company of Dr. Henderson, on the ground that 'Dr. Henderson was the only medical man that the lady would, he believed, have allowed to be present.' How he ascertained this, it would be curious to know. *I* know that there is no human being less likely to have had any such exclusive and unreasonable prejudice than the person in question. The plain fact seems most unquestionably to be, that when Mr. Syme and Dr. Simpson were in the practice of doing just what they ought to have done, and what humane, candid, well-informed, and liberal-minded men will always do, it had not been generally believed that homœopathy had stolen a march upon its opponents, and had fastened itself firmly in the confidence of all classes of the community. Medical men have waked up lately as from a dream, and having found themselves surrounded on all sides by this ubiquitous intruder, their alarm and hatred cry out with a vehemence proportioned to their former indifference or contempt, and with as little reason, too, if they would only make themselves acquainted with the subject of their ridiculous excitement.

"I have no intention of taking to pieces Dr. Simpson's *réchauffé* of the stale jokes and vul-

Hosted by Google

garisms on homœopathy which are current among a certain class of men. I shall not even stoop to rebut the foul insinuations in which he indulges; but I will say this to him:—If you are conscious of rectitude, of truth, honesty and fair dealing, and of these simply and alone, in all the particulars to which I have been alluding in this letter, you must feel more deeply now than you have ever done before, the liability of an innocent man to fall under the gravest suspicions, and you will be prepared, by contemplating the peculiarity of your own position in this controversy, to judge hereafter more charitably of those whom you have reviled.

"The story of the box, in which all the medicines are said by Dr. Simpson to have been mixed before they were given to me, meets me in the published speech in a somewhat different form from that in which I heard of it formerly from the author of the petty narrative. He told me on that former occasion, on the 10th of June last, that I had said to him some six or seven years ago, 'your box has converted me.' I remember well, Sir, and so must Dr. Simpson, that I replied to him emphatically on that occasion, that *I did not believe that I had ever said so,* and *that* because it would have been untrue. My first experiments on homœopathy were made by medicines from five different sources in addition to Dr. Simpson's box. The 'respected secretary of the Society' favoured me with a box, in connection with which there was, as became his character, no trick, but all that was fair and honest. Dr. Russell supplied me with many other medicines: Headland, of London, did so too; the chemist in this city, at a later period, did the same; and some I prepared with my own hands. The results were published, and drew from Dr. Forbes, of London, the admission, that had the cases been treated according to the rules of the ordinary school, he would have regarded the results as 'very satisfactory.' Among them were 'some wonderful effects and cures,' which I have always regarded as evidences of the power of homœopathic remedies; but that they were due to 'Dr. Simpson's own former homœopathic box,' in which the trick was, I do not believe that I could have ever averred, because I was not in the habit of noting in each case from what source the medicines I employed were taken, for I suspected no trick. Since Dr. Simpson made his trick public, I have suspected, reasonably enough, that some of the failures which I could not formerly account for but on the ground of my own want of skill, must have been due to the dishonest box. At any rate, if this paltry affair must be judged of on the word of either party, I ask you, Sir, to look back on what is recorded on the preceding pages, and to judge by that test, as to which of us is the most entitled to credit.

"To one only of all the remaining rash and idle statements of Dr. Simpson shall I advert at present. He avers, that there are men who, to use his characteristic language, 'doctored people according as people themselves wished, either with drachms of drugs, or billions of a grain of the same.' That Dr. Simpson knows of any such persons I do not believe. I know a great deal more of those whom he delights to calumniate than he does, and I solemnly aver, that I neither know nor ever have known a single instance of the conduct he has ventured to lay to their charge. I dare him to the proof, and if he fail to prove his allegation, he must be contented with the disgrace of having uttered a deliberate and groundless calumny. I rejoice to say, that I know many physicians who, while they adhere to the homœopathic law as the great regulator of their practice, consider themselves entitled, in the free exercise of their profession as independent men, to prescribe any quantity of medicine they think necessary for their patients, and where the homœopathic principle cannot be of service to them, whether from its own present or necessary limitations, or their insufficient acquaintance with it, consider themselves not only at liberty, but bound in duty, to employ any other expedients for the benefit of their employers that may be within their knowledge.

"This course has had my hearty concurrence and public advocacy, as the only course of professional and scientific catholicity; and I confidently anticipate the time as not far distant, when there shall be physicians worthy of the honourable name, in all parts of our country, whose model shall be that philosophic greatness,—beautifully sketched by one who formerly adorned our University, and whose spirit is not yet utterly extinct among us,—which 'knows how to distinguish what is just in itself, from what is merely accredited by illustrious names; adopting a truth which no one has sanctioned, and rejecting an error of which all approve, with the same calmness as if no judgment were opposed to its own.' If the Society shall sneer at all this as inconsistent and unfair, I would remind them that the sneer will come with a very bad grace from men who, while they profess themselves to be allopathists, often employ remedies which they admit to operate homœopathically, and that it is incumbent on them honestly to restrict themselves to their sectarian principle of '*contraria contrariis curantur*,' before they can consistently stigmatize others as dishonest for openly advocating a more comprehensive creed.

"As I perceive, from the newly-printed list of members, that I still belong to your Society, I conclude with the following motion; and, if it be not adopted, I request that my name may be erased from your records, for in that event it can be no longer reputable to remain a member of the Society. I move—

"'*That any one who cannot exonerate himself from the suspicion of deliberate misstatement, shall be held disqualified for being admitted, or for remaining a member of the Medico-Chirurgical Society of Edinburgh.*'

"I have the honour to be, Sir,
"Your obedient servant
"WM. HENDERSON."

Correspondence.

MINERAL WATERS CURE ON THE PRINCIPLE OF HOMŒOPATHY.

To the Editor of the Homœopathic Times.

SIR,—In these days of marvellous discoveries and startling phenomena, both in the animal and physical worlds, whether as exemplified by mesmerism, electro-biology, or the magnetoscope in the animal or gigantic undertakings in the physical world, such as connecting nation with nation by means of that *unknown something*, which, for want of a better name, we call electricity, I think that it displays a prejudiced, ignorant, and unphilosophical mind, to sneer at or ridicule any new discovery, however *apparently* absurd, before investigating its claims as a science, or, at all events, considering the rationality of its results. Though, owing to our finite and limited capacities, we may not be able to positively know the mysterious principles by which God performs many of his most marvellous operations, such as the circulation of the blood, and a thousand other phenomena in earth, sea, and skies, still this does not nor ought not to prevent us using these hidden principles for the accomplishing of grand results. As I have observed, we do not know what electricity is—we are only acquainted with its mighty results; yet who who would think of not turning these to account because he cannot explain or understand the *nature* of their active property? Thus it has been with all new sciences, results were first seized upon, and then their principles investigated. The fall of an apple, the oscillations of a suspended lamp, the clattering of the lid of a boiling teakettle, the symptoms produced by cinchona, etc.—being *all* mere *results* of hidden principles—set the minds of Newton, of Galileo, of the Marquis of Worcester, and of Hahnemann to work respectively, to endeavour to discover their principles, and hence resulted the science of gravitation, oscillations of the pendulum, the steam-engine, and homœopathy.

Now being, I hope, an attentive observer of all that is stirring in the worlds of matter and mind by which I am surrounded, I thought it right to make the above remarks prefatory to the present communication, as they will show that I am not one of those who fancy that the world has arrived at either its present knowledge by stupid opposition to new facts, or at its *ne plus ultra* in science, but one who believes that there is a mighty and secret impulse propelling the mind of man into new fields of discoveries, and which will ultimately terminate in revealing many of those now hidden arcana of God to the ravished eyes of astonished mortals.

Entertaining these ideas, I think it but right to lay before your readers the following facts, as they will tend to add a testimony to the much reviled and persecuted, but brilliant discoveries of Hahnemann, and as I am at present an allopath, they may have greater weight with the public.

About twelve months ago I wrote an essay on the "Medicinal Springs" in this town, and when treating of their medicinal efficacy, I was obliged to bow, though rather reluctantly, I must confess, to the doctrine of homœopathy, as upon no other principle could I explain their *modus operandi*, owing to the minute quantity of salts, iron, etc., in their composition.

I am aware that the action of mineral waters, so far as their small doses of salts are concerned, has been cited ere now as a proof of the action of homœopathic medicine; but I am not aware that their action has been discovered to depend upon the principle of *similia similibus curantur*. Now, having investigated this subject, I am able to state, that a course of mineral waters, if taken by a person whose digestive organs are in perfect health, will, to a certainty, produce dyspepsia, that very disease for which they are a sovereign remedy—hence *similia similibus curantur*, and another feather in the cap of Hahnemann.

"Truth," Sir, "is powerful and will prevail." Let us then tear off that blindfold of petty prejudice which certain *periodicals* are endeavouring to blind our eyes with, and fling to the winds of heaven that gross and opposite system which has too long deceived us, and embrace the homœopathic, if, after due inquiry, investigation, and experience, it be found more in consonance with modern science.

This is a duty which we owe not only to science, but also to the public, as the people acknowledge us to be their *curators;* and, therefore, if homœopathy offers them more proper remedies than allopathy, and us more certain and valuable ones, we are *doubly* bound to practise the one and receive the other.

Cheltenham, Nov. 29, 1851. I am, Sir, yours truly, H. HASTINGS, M.D.

To the Editor of the Homœopathic Times.

SIR,—With your permission, I mean from time to time to trouble you with my rambling notes—pencillings by the way—as Mr. N. P. Willis called his jottings of daily observation.

Now, Sir, in answer to the question of one of your correspondents, the excellent clergyman, loyal friend of Hahnemann, and true homœopathist, Mr. Everest, has deigned to inform us whence is derived, and what is the meaning of the word *Od*,—I thank him for his decision of the point. I hope you will answer another—what is the circulation of the *Homœopathic Times?*

I am led to believe there are some 300 medical homœopathists in England, who practise homœopathy *out and out*, and perhaps about 1000 more, who either practise it *half and half*, or *secretly* and so *dishonestly*.

Let us strike the balance at 500. If these 500 are *true men*, as your good service to the Cause is beyond all doubt, we must calculate that each of them contrives to take and dispose of at the very least ten copies; that secures at once the weekly issue of 5000 copies, and as it is calculated that ten persons read each number of any journal paid for, you must have 50,000 readers, at least, every week.

If this be not the case, if the medical homœo-

Hosted by Google

pathists, who are glad enough of your columns and of your good word, when they want your help, do not aid you, to this very moderate extent, I can only say they do not understand their own interest, and they are at once stupid and ingrates.

Supposing you were to shut up shop, and you no longer exposed the *Lancet* and the *Medical Times*, etc., etc., would not the medical homœopathists be somewhat the worse, for your retirement from the field? If they don't think so, they are geese indeed.

I wish you would answer my question about your circulation. I don't suppose you will, but it can't be helped. At the festival of the Homœopathic Congress, at Soyer's (what a queer place, by the way, for the homœopathists to dine at—very bad taste in *that*, at all events), Mr. Sandoz made a capital speech, which was reported in your journal. He said the homœopathic literature should be supported, and that it was absurd for any person to say he did not like the *tone* of this article, and he was offended with the *sentiments* of another, but that *all* should support what was done in the defence of the common Cause; or words to that effect. That Mr. Sandoz is obviously a very fine fellow, a good man of business, and a *regular trump*—a conscientious man, who works for the good of suffering humanity. Why don't you get him to be dictator of both your hospitals, and settle your foolish differences? I like Mr. Sandoz very much; he is in earnest, and what he undertakes to do, he does.

You all want stirring up, that is *a fact*. Another thing, what is the reason that you don't get Dispensary reports from Edinburgh, Dublin, Liverpool, Manchester, Birmingham, Exeter, Torquay, etc., etc.? Where are the weekly reports of the two London hospitals and of the Manchester one?

If the persons who are connected with hospitals and dispensaries *won't* send you reports, they deserve the censure of all genuine homœopathists.

I like fair play, and as I have watched your course from the beginning, I can't help thinking you have been very badly used by most of your medical homœopathists. Are they jealous of you? Are they afraid of you? Are they split up into parties? Are they jack-straws?

There is something very bad in all this; and I want you to enlighten me about it.

And who is that mysterious personage—your Editor? pray, excuse my indiscretion. Is it Dr. Laurie, or Dr. Curie, or Von Viettinghoff, or Lord Brougham? In sober earnest, when your foes are many, I mean the foes of homœopathy, I do think you homœopathists should pull all together. It is good for brethren to dwell together in amity, but you seem to me not to love one another over-much. Be united, like good fellows, and then—but not till then—you will thresh the allopaths, and show true reverence to Hahnemann, whom you are always quoting, but never truly honouring either in word or in deed, while you have these divisions in your camp. Excuse the plain speaking of

Q IN THE CORNER.

To the Editor of the Homœopathic Times.

PLEASE, Sir, I want to ask you a question. Some fellows think one thing and some another, but I think it's very odd in a fellow that belongs to one of our houses, no matter which. You see, a little time ago, a fellow that does'nt belong to our school, came to play at marbles on the common, and, do you know, he'd got some uncommonly queer marbles, very handsome, and such ones to spin! None of us had ever seen any like them, and we all took a deal of notice of them, especially when he told us that he'd made them all himself. One of our fellows made up to him directly, and got quite thick with him, and went to his house ever so many times, and he showed him how he had made them and all that.

So a little time after, out comes my master with some marbles of the same sort. "Look," says he, "look here, and see what I've found out! That's the kind of marbles! I make 'em out of my own head." Well, we were all rather taken aback at this; but one big fellow cries out directly, "Holloa! why, these are just the very marbles that fellow that was here the other day makes. *He* found out the way, and I've seen him make them scores of times!" Well, our chap goes off home rather huffish-like, and the very next day up he comes again, and then he calls us all a set of blockheads for calling those things marbles at all! "Why, they are nothing but sham," says he, "just clay painted and varnished over to deceive the eye, and make them look like real marbles. Mine are just as good as the other fellow's, but they're both *gammon*, and you're a set of stupids!" Now, wasn't that cool? but if that's the case, I should just like to know why, as he knew the whole thing was a cheat, he wanted at first to put off his for real marbles, and whether he'd ever have told us anything about it if we had all given him the credit of having found out how to make them.

The other fellow that first brought them up to the playground says, he can't answer for any gammon that anybody else may have tried to put upon us; but he knows his are the right sort of thing, and that he's sure he can prove it. "But," says he, "I don't want you to buy any of them; I've none to sell. Nor I don't want you to pay for my showing you how to make them." Well now, I think that's like a jolly fine fellow! and I think it was very queer in the other fellow; don't you? I think we ought to say to him

KNUCKLEDOWN.

THE HOMŒOPATHIC TREATMENT OF ANIMALS.

To the Editor of the Homœopathic Times.

SIR,—It is now about two years since I last wrote to you, stating that I had tried the homœopathic system of the treatment of disease on my class of patients, viz., the horse, cow, dog, and pig; and that I was agreeably surprised with its curative effects. I am happy to inform you, after a more lengthened experience and in-

Hosted by Google

timacy with Hahnemann's principles, that I can still testify to its great superiority over the old system of treatment. In affections of the lungs, inflammation, congestion, bronchitis, laryngitis, cough, etc., I find it decidedly better, and have always cured in a much shorter period, and without loss of condition, than by the allopathic treatment.

In enteritis, colic, cystitis, and nephritis, the homœopathic medicines act much quicker and surer than the allopathic remedies. In puerperal fever in cows, I find an immense improvement upon the old system; in about twenty-five cases, several of which were affected with puerperal paralysis, I have not lost one.

In rheumatism in cattle, I have been agreeably surprised with the curative effects of the properly selected homœopathic medicine. As an instance, I had under my care, two years ago, a bull belonging to a gentleman in this neighbourhood, which had been suffering from rheumatism in the joints for a considerable time; he could scarcely walk, and was very much reduced in condition. I treated him allopathically for several months, but without any good results. Having at this period been led to the consideration of the homœopathic system of treating disease, I considered this a good case for trial. Accordingly, I administered the appropriate medicines, *Acon.*, *Bell.*, *Lach.*, *Nux*, *Sulph.*; he gradually improved, and in four weeks was perfectly convalescent, and recovered rapidly in condition. He had no return of the disease.

Within the last twelve months I had a similar case, and with equally good success.

In the treatment of dogs there is great gain, besides the extra advantageous manner in which the homœopathic medicines act; they are much easier given than upon the present mode. In the treatment of swine, I have also been very fortunate with the new medicines. I may mention a case I had lately of a sow (belonging to a Mrs. Booth of this place), with a litter of pigs three weeks old. When called in, I found her in a woeful state; her tongue swollen, and hanging out of her mouth, with gangrenous patches under and on the sides of it. She had also angina maligna (putrid sore throat); her milk was gone, and she had not eaten anything for several days. I administered *Merc.*, *Bell.*, and *Ars.* She gradually improved, and in two days she was able to swallow some gruel, which we gave carefully with a small horn; in six days she was able to eat, and is now getting up her condition. The owner was strongly advised by her neighbours to kill her, as they were sure she could never be cured. However, Mrs. Booth remained firm, and is now rewarded for her faith and good conduct.

In cases of lameness in the horse, some yield readily to the appropriate medicines, but in others I find it necessary to resort to more severe treatment, such as actual cautery, setons, blistering, etc.; and when I consider a dose of physic is required, I give it. I do not think it necessary to throw aside all former experience. I consider it my duty, as a professional man, to get all the knowledge I possibly can in aid of my calling, whatever may be the source; and I would consider myself culpable and unjust towards my employers, had I remained ignorant of Hahnemann's system of the treatment of disease. I have never seen it properly made manifest why we should not become acquainted with Hahnemann's practice of physic. I suppose he gives us his experience, as other writers do on the same or similar subjects. He was a respectable member of the medical profession (at least the contrary has not been proved), and as such is entitled to credit. I can honestly state, from the experience which I have had of Hahnemann's system of treating disease, and of his chemistry (I prefer this mode of expression to that of homœopathy, as the majority of people are apt to be deceived by terms, being ignorant of the substance), that it is a great acquisition to our knowledge in the healing art, and in my humble opinion is the best and soundest, the least speculative and best proven of any system which hitherto has been propounded. It is probable that in time Hahnemann's system may be improved upon, and I hope to be always open to the reception of new truths. I do not class myself in the catalogue of those who style themselves "the perfect." I am a student through time, ever alive to the development of Nature's progressive laws, and to the investigating powers and progress of unbiassed intelligent man; and whatever may be the source, or by whatever name a new system may be called, if, in testing it practically, I find hints which enable me to relieve suffering quadrupeds or bipeds in a superior manner to that which I have been practising, I shall not consider it derogatory to my professional honour to adopt it. I consider it a duty to myself and to the public, my employers, to be up to the most recent improvements in the science of the healing art; and as homœopathy is the most recent, I should be ill fitted for my station were I ignorant of it. It is an increase to my acquirements, of which I am proud, and which enables me to relieve the sufferings of my poor dumb patients in a much more benevolent manner than heretofore. I should likewise consider myself shamefully behind the age, were I ignorant of that noble influence so rich in Nature's domain—that electrical agent, which gives life and activity to every living tissue in the animal kingdom, viz., animal magnetism or mesmerism, and of its influence in the cure of disease, physical and mental. I have a sorrowing pity for the members of the profession who know it not. It is a common phrase, that "every little makes a mickle." I should also consider myself a drone in the little world of medical science, were I unacquainted with the new science of the physiology of the brain and nervous system, or what is technically called phrenology. I have found this knowledge of the mental powers of much service in my intercourse with the lower animals.

I should also be guilty of a great omission in the necessary professional acquirements for the public interest, had I not investigated the efficacy of hydropathy. I have, in many in-

Hosted by Google

stances, found this an excellent adjunct. It gives me much pleasure, Mr. Editor, to perceive that the conductor of our veterinary journal has hitherto acted with much gentlemanly reservation on the subject of homœopathy, and no doubt will test its merits or demerits in an honourable, practical manner, before he expresses himself fully upon the subject. I wish I coald say as much for some of your allopathic leading journals and knights of the *Lancet*.

I am, Sir, with much respect,
Yours obediently,
D. McTaggart.

Halifax.

To the Editor of the Homœopathic Times.

Sir,—I have read Mr. Rutter's pamphlet, and I have read or heard the many letters and lectures on and against his discovery. I have not the pleasure of Mr. Rutter's acquaintance, nor have I ever seen him, but it requires no great amount of perspicuity to feel convinced, on reading his book, that it is the work of a "true" man, the fair, honest dealing of an honourable, scientific, and straightforward mind. His way of stating facts, of mentioning what he has seen or tested, and of avoiding all pompous words and vain praise of himself or his discovery; his diffidence and his honest statement of what he assures us to be true—all that is more than sufficient to carry the reader to his side, and while giving him a fair hearing, to make one rather regret the paper war which has been bespattering him all over with so much ink these last few weeks. Why all this "leaping hastily at conclusions?" Why this lecturing one day in his favour and then *unlecturing* it all over again? Why these accusations against him, and these conclusions against his work—bitter criticisms, hasty scribblings, and still more hasty words? In my humble judgment, it seems to me that it would have been far better to follow Mr. Rutter's sound and good advice, "to go on observing and recording," rather than trying to raise one's self at the expense of his statements, and at the risk of being compelled again, some day or other, to change one's views a third time.

Let Mr. Rutter's statements be "*pondered* over by those whose education, and experience, and *habits of thinking qualify* them for the task," and whether true or untrue, for goodness and pity's sake, no hasty conclusions and no hasty words!

I am, Sir, your obedient servant,
H. V. Malan.

Great Cumberland Street,
December 3, 1851.

To the Editor of the Homœopathic Times.

Dear Sir,—Allow me to congratulate you upon the soundness of your remarks in your last concerning the signatures to that petition for the protection of homœopathic students, and as whatever is worth doing, is worth doing well, it will not perhaps be impertinent to remark further, that the idea of our committee excluding females from taking part in the concern seems to be inconsistent with the laws of everlastingly-ruling and never-erring Nature, although it may have been sanctioned by a barbarous custom; that part of the community, men cannot help feeling, being in reality, in their capacity of wives and mothers, the most concerned with the progress of any science, the more so of the science of medicine. This unsound dealing has already created separative and reactive feelings, much to be regretted; it is seriously evidenced in carelessly administering to themselves, their husbands, children, etc., any advertised quack medicine or nostrum (about which, by the way, the "medical authorities" say nothing); and in the choice of a medical man, when this is unavoidable, selecting the practitioner, not for the soundness of his doctrine and skill, which they are forbidden to understand, but from other considerations, such as age, address, looks, garments, equipage, place of residence, or adroitly-acquired notoriety; and medical men, finding this to be the case, attend to these, to the neglect of scientific pursuits. That the agitation for the Charter is a wise and necessary one, there can be no doubt; but I do not think petitioning the Patrons of the Edinburgh University, to correct and prevent a designing mischief of its (it is painful to say) bigoted professors, would at all conduce to obtaining the Charter, or the ultimate success of our glorious science. However that may be, I did my best to collect signatures as directed, and applied to none but my own patients in town, who are all staunch supporters of homœopathy, and had the delicate, the acute, and the persevering females been allowed to express their convictions, by putting their signatures to the petition, instead of filling up a few sheets sent to me (I should thank them to send me a few more), I should have been able to fill twenty or more.

Dear Sir,
Most faithfully yours,
Viettinghoff.

Chadwell Street, London,
25th November, 1851.

Miscellaneous.

"There are such things as black swans — in Australia; and there are such persons as generous opponents to homœopathy among the allopaths of Britain: and the Council of the College of Surgeons has decreed wisely not to interfere with the homœopathists.

Communications.

LETTER TO JAMES Y. SIMPSON, M.D., F.R.S.E.,

AND PROFESSOR OF MIDWIFERY IN THE UNIVERSITY OF EDINBURGH.

No. II.

Sir,—So the students' business was, after all, only a bit of the *Lancet's* gammon. Well! "did I ever, no, I never." Turn that fellow off! he does the cause of allopathy more harm than ever he did it good. He will turn upon you some day for an extra sixpence.

The Sheffield mine has exploded; and such an explosion!!! not a pane of glass left in the town of Sheffield! fired by the Council of the Royal College itself; a spark drawn from the *positive* pole of allopathy; which, charged with fids of plum-pudding, hasn't left its mark in the face of a pat of butter. "*Et tu Brute.*" Now! for the redeeming of a pledge, and the upholding of that high sense of honour which renders it unbecoming in an allopath to walk on the same side of the street with a globulist. The genius of allopathy calls for that pledge being kept. It is a hard case, we shall have no more of them probably. This is an interesting matter for any future post-prandial meeting of the Edinburgh Medico-Chirurgical Society.

It must be exceedingly satisfactory to the public, who possess at least two-thirds, if not three-fourths of the stake at issue in this discussion, to be informed that it was at once declared, at the late meeting of that body, to be "equally unnecessary and inexpedient to offer any exposition of what were called the principles of homœopathy, or enter into any inquiry as to the soundness of their foundation." This announcement is so strictly in accordance with all that has gone before it, that we are by no means surprised that the present occasion has not excelled any former on this point. Had any other resolution been come to but this, what a deal of logic on homœopathy we might have had at this meeting of the Edinburgh Medico-Chirurgical Society! As it is, the subject is almost entirely monopolised by yourself. What quotations and calculations, mystifications, filtrations, approbations, and even perhaps stultifications, we should have had, if each member had got his swing at globulism. As it is, we have *two* resignations!!

"Parturiunt montes, nascetur *ridiculus mus.*"

The Edinburgh Medico-Chirurgical Society is now purified, soaped, and watered, *secundum artem*, and is *almost* as good as new. Is any member sensible of any acquisition of dignity? No doubt this discussion has cast a considerable amount of it over more than one pair of shoulders, which become the garment exceedingly well, only that it is a little out at the elbows, which gives it rather a jaunty air; for I have before me a somewhat stringent pamphlet by a late graduate, wherein he mentions a not uninteresting episode in Dr. Arneth's visit to Edinburgh, in which a fair amount of belief in homœopathy is confessed to by a member.

You will perceive how difficult it is to get out of a morass when once fairly into it. 'Twas scarcely thought possible that we puny globulists were to prove so hard-headed, and that on our account so many great names could get up to the saddle-girths in a therapeutic quagmire.

The members of the Medico-Chirurgical Society having each in his own heart given judgment on homœopathy *before* the *meeting*, as stated by the propounders of the motion, leaves little to be done when the assembly does take place (always excepting the six pages for which mankind is indebted to yourself), unless it be that much to be desired acknowledgment by Mr. Syme that, "as a member of a licensing board, he did not conceive himself entitled to reject any candidate, except on the ground of having failed in complying with the prescribed course of study, or acquiring the expected amount of information."

With this declaration before us, we do not for a moment consider ourselves entitled to analyse the circumstances under which Alfred Crossby Pope is not at this moment a graduate of Edinburgh. But if homœo-

Hosted by Google

pathy had no part in that decision, we should like this declaration to extend to other members of the Faculty; and in the hope that professional nature may not in future filter away its goodness of heart by rejecting a zealous candidate for a *physician's* degree, on a deficiency of one question in surgery, and another in forensic medicine.

Perhaps, to us, the feature of most interest at this meeting is the expression of a deep anxiety to preserve the *principles* of *allopathy* "*pure and unsullied.*" Let us enclose these principles in a bottle; hermetically seal them *just as they are*, and serve them out again ten years hence—you won't know them again, believe me! they may *possibly* be renewed *twice over* in that time.

Now for *your* six pages. *Consultations* are admitted; mixture of treatment also—and with a joyous surrender of opinion to undefined dicta, which nobody *has* defined, *will* define, or *can* define—you shout "Joe Smith!!!" and unfurl your newly-fledged banner—"a *standard of common sense.*" Let physicians adhere to *that* standard, *whatever* doctrine the term may include; if used with judgment, it will stand them in good stead—if made a medical myth of, see where it will hurry *pure allopathy* all the faster!

But you have discussed the *demerits* if not the *merits* of homœopathy; as usual, *we must* be great rogues, and you are therapeutically immaculate. But I see no reference to the case you are said to have reported as cured by you homœopathically, on Dr. Arneth's representation. I can easily believe *that cure;* I have effected *similar* cures twenty times within the last few years at the very least computation. You have now bound yourself never to try *that plan* again. And yet it appears to me that you will not be justified in omitting it, whenever a *similar case* occurs. With many words from you on the *easy credulity* of homœopaths, I can find no repudiation of your own whispered mesmeric exploits, not that I think a belief in the latter is unwarrantable, but simply that homœopathy is quite as much of an entity.

But it is in vain to call for experiments; here is one said to have been reported by yourself; and now that it would be of use to the world it is not given. We need expect none, the time has gone past, or if any are to be, they are dimly seen in a distant future. Fear of persecution will prove a log of wood round the professional neck, and there will be a blank in therapeutics worthy of mediæval times. At last, emerging from this chaos, we shall see the Cave of Adullam vomiting forth apothecaries, all brought to their senses, and gasping for a slice of homœopathic plum-cake.

Notwithstanding Dr. Arneth proved how available homœopathic experiments *might* be at least *in some* cases, you have virtually entered into a bond to abstain from them. It now becomes your duty to declare to the public what your system *can do*, in accordance with your lately raised "*standard of common sense.*"—Tell us in what cases *Opium* is certain to procure sleep; in what cases it is equally certain to prevent it.—Tell us what proportion of a blue pill enters the absorbent system, and how much of it is carried off by the necessary black-draught of next day.—Tell us the *precise* quantities of chemicals necessary to produce chemical compounds within the digestive organs, capable of improving their laboratorial functions, and with which (in accordance with the present Paracelsan theories) medical *savans* inflate themselves to bursting.—Tell us whether the lancet, the leech, and the cupping-glass take vitiated blood *alone*, and if they leave behind *the healthy ingredients.*—And say whether, according to the laws of physics, a local abstraction of blood is not sure to be followed by a rush of that fluid to fill up the vacuum caused by the abstraction.—State how many alvine actions, whether *one* or *fifty*, may be expected from five grains of *Extract of Colocynth* and two drops of *Croton Oil.*—Or rectify this uncertainty by the more simple illustration of a scruple of *Jalap*, or three grains of compound *Rhubarb* pill.

We have for long held up the ever-changing nature of your school, as being the fruitful mother of distrust. That changing nature is still a ruling passion, which is singularly exemplified at the present moment. Whilst a first-class physician broadly asserts his *failing confidence in vaccination*, a continental mind of equal calibre is as strenuously advocating its principle when extended to the analogous operation of syphilization.

I draw your attention and also that of the Colleges, to a consideration of the means adopted for the suppression of what they deem a medical heresy; and more particularly to the single efforts of allopathic authors on homœopathic doctrines. Has one, *only one*, entered on the subject who does not overflow with party bias? Is there one of them who has not shrunk from experiment, with the conviction of its being an ordeal they cannot stand? Self-unction of having *disproved* homœopathy by words and on paper, *may* pass current before a Medical Society *all upon one side;* but our Gallic neighbours over

Hosted by Google

and over again proved in this wise, that we Englishmen were beaten at Waterloo—and yet we on this side the Channel have never been convinced of *that fact.* No more do homœopathists feel themselves defeated by sudden bursts of allopathic logic.

When I remind Faculties and Royal Colleges of the condition of their recognised therapeutics by confession, and when I state that within these realms, overflowing with societies devoted to all other branches of science, the only two devoted to this deficient snbject are the "Hahnemann" and the "British Homœopathic," I state a fact that carries some import with it; and with this acknowledged condition, when we find public bodies and private coalescences arrogating to themselves, and with an imperiousness all but intolerable, even had their cause been good, rights over individual opinion and action that makes the year 1851 stand agape, we may well put on our armour; but when this cause is a self-convicted one of error, the arrogance resolves itself into insolence "*ex-officio*," as claiming *any prerogative* on a doctrine so mythical that no one can tell where it is; that is like a field of grain fast rotting; aged, without having been matured by age; on which a genial sun hath never thrown an illuminating ray that has not been instantly obscured by the sordid intervention of some one's guinea; and which, let it linger as it may, can never be anything but the stone of Sysiphus.

We find the manner in which these bodies have afforded support to a reeling cause worthy of its gigantic littleness. Rushing to a wild rescue, at the summons of a hireling wonderfully beneath their notice, they make it an affair of "*your money or your life?*" They forget that, *failing to disprove our system,* their only chance lies in *the improvement of their own,* yet all shun it as a hopeless task. *Our efforts* were, on the contrary, entirely devoted to the deficient branch; and when our hospitals made allopaths stare, they sneered at them because they were small; and each sneerer looked over towards Bartholomew's and Guy's, turned up his lip, and thought himself a wise man. But time may wear on, and rich bequests may fall in, and the private mansion-looking establishment of *now may* come out a Guy's, and "what a Guy" that will be for some!

To these united and single efforts at resistance we have to add that of "lecturing against the quackeries of the day." We have an instance of this where a physician addressed a literary and philosophical society, with the object of disproving homœopathy by the "inductive method of inquiry." It was a dangerous mode of attack, well calculated to give his audience a great opinion of the infallibility of pills, and the invariably fatal effects of globules. Watt, Dalton, Davy, and Wollaston achieved their triumphs over again; "laborious and painful observation, large generalization, and cautious induction," make every listener who has ever taken a globule shake in his shoes at his own temerity. "Lax reasoning, careless observation, eager credulity," follow this up on the other side, and we "immediately look out for the birth of Hahnemann at Meissen, and sure enough, in twenty lines more, he is born *again* at that place." The allusion to Watt, Dalton, Davy, and Wollaston has gone far to convince the audience that these philosophers had something to do with pills, and that a dose taken according to *their* directions is as certain in its action as the systolic stroke of a piston-rod, and as satisfactory as if warranted on a platinum scale, or thrown off with the precision that hours and minutes are by the hands of yonder clock. *Eheu!!!* Were one-half of that audience to take a dose of *Opium,* and the other half a dose of *Indian Hemp,* we should soon see how much James Watt had to do with any responsibility for the action of these substances. But the lecturer was a calm man, cautious in inquiry, slow to believe, and, contrary to all allopathic custom, gratuitously gave homœopathy a place as "that of a *legitimate medical doctrine, claiming a calm and dispassionate consideration.*" This liberality is not entirely free from leaven, for he states in the same breath that it is more than it deserves. An object was gained, for the audience departed determined to adhere to pills *administered according to the laws of induction.*

The president having invited a discussion, instantly availed himself of his own hospitality, and walked incontinently into the mild lecturer for that gentleman's *deficiency of passion and absence of indignation,* with both of which combustibles he appeared to be gravid, and was probably only kept from going off by a deficiency of oxygen, or a failure in lucifer matches. He then mentioned a lamentable case of brain fever which had been treated homœopathically, and which he had been subsequently called in to attend, and where (as is usual in such cases) *he was "just in time to save life,* but that reason was lost for ever." By a very strange coincidence, we happen to have a similar case, the result of erysipelas, wherein we happened to be consulted at the

Hosted by Google

very same point of difficulty. Reason was lost, life remains in *our* case; yet we do not feel disposed to express a determination of sending our allopathic predecessor "to the hulks," as this gentleman *would* have done, *if* he *could* have done. We know well how to appreciate such lamentable cases resulting in homœopathic patients; the few such scapegoats that *do* occur, are the straws by which allopathy holds on for *very life*.

Sir, the inductive philosophy is not a thing of yesterday. We have a high respect for it when applied to pills—a refinement in expression thereof carries us gratefully back to that youthful philosopher who charmed us with it even from the nurse's arms—

"who sat in a corner,
Eating his Christmas pie."

It is exceedingly comforting to think that this youthful scion, perhaps of a long line of philosophers, ate his pie in strict conformity with the laws of "induction," true to the philosophy of nature, and obedient to the cravings of a youthful stomach, backed up by the digestion of an ostrich—and we sincerely trust that he had an especial hatred to any one labouring under "*a deficiency of passion and absence of indignation.*"

I have the honour to be, Sir,
Your most obedient servant,
Dec. 18, 1851. SIGMA.

ON MR. RUTTER'S MAGNETOSCOPE.

From the Torquay Directory.

IN a curious set of experiments witnessed by a correspondent of the *Torquay Directory*, and described in the number for the 22nd October,—it might seem difficult, from the explicitness of the statements and the superior intelligence of the writer, not to receive, as facts, the apparent phenomena. On considering the nature of the instrument, however, by which the phenomena are said to be exhibited, and which, in other hands, as described by Mr. Vivian, had failed, I was immediately struck with a source of error sufficient to invalidate, at least, some essential portions of the results originally obtained. This source of error, which, though not sufficient to explain *all* that was witnessed by the correspondent of the *Directory*, is, on scientific principles, I believe, fully adequate to account for the ordinary pendulum-like and circular motions of the suspended sealing-wax. And this source of, to my mind, obvious error, is found in the *pulsation* in the hand and arm of the experimenter—the real source, no doubt, of the delusion in the popular experiment of a ring, or piece of coin, when suspended within a glass, striking the sides until, as is supposed, it has struck the hour of the day! For in this case, the regular pulsations render oscillations from the most steadily held hand inevitable, and then, when these have gone to the extent of producing contact against the sides of the glass until the hours on the clock shall have been struck, the surprise of the *credulous* experimenter naturally produces some effect on the steadiness of the hand from which the ring is suspended, so as, by a new and unconscious motion, to interfere with the acquired pendulous motion, and thus to check or counteract the previously regular oscillations. The same cause, I doubt not, exerts an impressive action on the sealing-wax pendulum of the magnetoscope. No matter how tightly the sustaining pillar is screwed down to the table, the elasticity of the materials of the instrument necessarily renders it susceptible of an undiscernible influence, from the pulsations in the operator's arm put in contact with the suspension-arm of the instrument.

If this theory be correct, it should thence follow that the motion in the sealing-wax would be different in degree according to the isochronism, or harmonic relation, of the pulsations of the operator and the vibrations of the pendulum. Where the isochronism might be perfect (from the length of the pendulum being such as to make a complete oscillation in the time of a medium beat of the pulse), the pulsatory impressions would, of course, be most effective, and the motion in the instrument the greatest. Hence a change in the experimentalist should, from the probable difference of the rate of the pulse, produce a change in the quantity of the motion. It should likewise obviously follow, upon this theory, that a relation in the direction or nature of the motion should exist with respect to the position in which contact may be made betwixt the finger of the operator and the inner end of the arm employed for the suspension (by its other and more projecting extremity) of the sealing-wax. Thus, if the forefinger, for instance, were pressed on the top of the horizontally extended suspension-arm, the pulsations might be expected to urge a pendulum-like oscillation in the sealing-wax; whereas, if the heel of the support were taken (by the sides) betwixt the finger and thumb, a gyratory motion might probably ensue. If, again, when the pendulum had derived motion from one operator, another should at the same time make contact with the suspension-arm, the possible difference of the two pulsations should induce discordance in the impulses, resulting, probably, in a state of rest.

These ideas, inductively derived from the probable influence of the pulsatory action in the arm and hand of the operator, had, in their leading particulars, occurred to me before I saw the instrument. And it will be obvious to the readers of the *Directory*, that whilst they carry the explanation of the general phenomena of the magnetoscope to a special and somewhat regular propulsatory action, they are by no means irreconcilable with the observations in, and general tendency of, the instructive paper of Mr. Vivian, published Nov. 5th, on the same subject. The essential difference, indeed, betwixt Mr. Vivian's exposition and that of my present paper, is—in

Hosted by Google

the addition of guidance and regularity to the impulses from the hand of the operator by virtue, as I have supposed, of the arterial pulsation of the human system.

On obtaining a loan of Mr. Rutter's instrument, I proceeded to try its action by experiment, with a view, too, of testing the principles above assumed. The result, taken generally, appeared, to my mind, quite satisfactory. I am not prepared, indeed, to say that all similar experiments yielded exactly corresponding results; but, in the first series I made, comprising six or eight trials by myself and another, everything was almost exactly as had been anticipated. In my own case, with the forefinger placed *on* the inner end of the suspension-rod or arm (the finger being in a horizontal position, and pressing firmly downward on its upper surface) an oscillatory motion of the sealing-wax soon became perceptible, which continued during the time of contact, but not to any great extent. In the first instance, I had taken the pendulum at the full length of the silk string by which it happened to be attached—the oscillations being about 102 per minute (or 51 double oscillations), whilst my pulse was at 76 or 77—a ratio, it will be observed, fortunately harmonic. On shortening the string till the oscillations were isochronous with the pulsations, the same results—and even more decided—were obtained. In like manner, a similar motion was produced by simple contact of the finger, from the friend who was present. And it was specially observable in four distinct experiments, that the *direction* of the oscillations in the pendulum was in a plane corresponding very nearly with the pointing of the finger of the operator! I next took the inner end of the suspension-arm betwixt the finger and thumb of my left hand—pressing it now on the sides—when, just as had been anticipated, a gyratory motion of the wax ensued, an effect, too, which was repeated when the trial was made by a lady. In *my* first trial the gyrations went from right to left; in the second, from left to right. On the whole, I could not determine any rule for the direction.

The experiments I made, whilst thus confirming the views anticipated by theory, were not sufficiently numerous, perhaps, to establish, incontrovertibly the several propositions involved therein; but the principles assumed were, in several other particulars, strikingly supported. Thus, when in one instance a very obvious degree of motion had been produced in an isochronous pendulum, the motion ceased on the suspension-silk being lengthened. As to an actual and inevitable motion in the finger, however carefully steadied, I obtained abundant proof in various ways. Fixing the instrument on a somewhat heavy table with a marble top, on which was a small steel cylinder, held down by a hair, and suspended against gravity by a powerful little magnet, I found the suspended steel in a state of perpetual vibration whenever a finger was placed upon the magnetoscope. Again, I tested the inevitable motion of the finger, however the arm might be supported, by the microscope,—the motion, both with my own finger and that of another, being incessant. And, finally, on holding a finger up near the eye and testing its motions by marks on the paper-hangings of the room, I thought I could perceive a relation to the pulsations in the arm. In one trial there was obviously an accordance; but it was not easy to separate the pulsatory action from the general unsteadiness of the point of the finger.

In conclusion, it may be proper to add, that whilst my own experience with Mr. Rutter's magnetoscope seems thus far to be conformable to an action previously imagined, I would not venture to say that no other influences than that referred to do really exist. As far as science has yet advanced, indeed, we can see no possible connection betwixt the results understood to be realized by Mr. Rutter and the hitherto known laws of electric or magnetic action; yet, where such wonders, from time to time, are actually seen to be developed in scientific researches, it might not be prudent to assume that the asserted phenomena are impossible, much less that any attempt at a particular solution can satisfy all the results elicited by the magnetoscope.

Grosmont, Torquay. WM. SCORESBY.

[The writer of this paper, the Rev. Dr. Scoresby, is one of the great authorities in magnetic science, and we have therefore seen fit to reprint his criticism on Mr. Rutter's magnetoscope. He concludes his letter in the spirit of a cautious truth-seeking philosopher.—ED.]

THE
HOMŒOPATHIC TIMES.

SATURDAY, DECEMBER 20TH, 1851.

THE remarkable progress making by homœopathy is rendered more apparent through the information received of the success attending the practice, not alone in the metropolis, but also in the various provinces. A friend, the other day writing from North Lancashire, speaks in glowing terms of the hearty reception he had met among the inhabitants of the district in which he had settled, with the view of carrying on a professional career in connection with this system. He enthusiastically refers to the consideration with which his statements have been treated among the public, but he anticipates, of course, the oppposition of the allopaths immediately they can fasten upon him. That he may certainly reckon upon, since, whether influenced by the Colleges or private pique, these valiant gentlemen are ready to show

Hosted by Google

fight whenever an opportunity presents itself.

It is under circumstances such as these, that the public themselves can afford to those who are endeavouring to carry out this medical reform the protection they require. The allopaths will presently find this to their cost; since it is not to be borne, that men of education and intelligence, because they refuse to prescribe according to the precepts of a particular school, are to be hunted down like wild beasts, and frightened out of all natural propriety. In the name of common sense and common justice, we exclaim against such a mode of settling scientific differences, and no matter whether they relate to the use of the magnetoscope or the doctrine of infinitesimal doses, it is monstrous in the extreme that they should be further permitted.

The time has arrived for the public to pronounce on the question at issue between the contending parties. It is not a difficult one for solution, if they will set to work in good earnest. The homœopathists have put before them their case; the allopathists have done the same. Both cannot be right in their conclusions; one of the two parties must certainly go to the wall. In the struggle which has occasioned so great a wordy warfare, the disciples of Hahnemann have always professed their readiness to submit to full investigation. Not so, however, the followers of the blister and lancet remedies. This speaks something in favour of faith in our own system. Why will they not adopt a similar proceeding? Because they know sufficiently well that by inquiry their fallacies would be exploded.

THE LANCET.

We reprint from this journal the memorial of Mr. Syme to the Town Council of Edinburgh. This memorial is divided into fourteen clauses.

Mr. Syme fairly starts with saying that he has a direct interest in the Medical School of the University, as its prosperity is a source of emolument and reputation for him. The question, then, between the Medical Faculty and Professor Henderson is a matter of £. *s.* *d.* on their part. This is no very disinterested nor scientific starting point.

In the 3rd and 4th clauses Mr. Syme speaks of the chair of general pathology, and states that great doubts have been entertained as to the usefulness of such a course of lectures. In other words, according to the Regius Professor of Clinical Surgery, abolish the chair, rather than retain the professor.

In the 5th clause he states truly enough, that the present Professor of General Pathology has, for some years past, publicly professed the practice of homœopathy, but he rashly and ignorantly assumes that homœopathy is entirely opposed to, and inconsistent with, the principles which he and his colleagues have been appointed to teach. Mr. Syme should have shown what are the principles in anatomy, in chemistry, in botany, in physiology, in midwifery, in clinical surgery, or in pathology, to which homœopathy is opposed, and with which it is inconsistent.

In the 6th clause Mr. Syme asserts that the medical profession of Great Britain regard homœopathy as a delusion so manifest and mischievous, that none who practise it should be met in consultation by those so regarding it. Mr. Syme so regards it; and yet Professor Henderson has shown that Mr. Syme has met homœopathists in consultation. In this clause he also delights to declare to the members of the Town Council, that the Medico-Chirurgical Society of Edinburgh has expelled Professor Henderson; who might retort on that Society as Coriolanus did on the Roman faction, that expelled him—

——"I banish you!"

For his single name, being that of a man honest in his convictions, will outweigh the names of all those who have acted in a spirit of blind and bitter bigotry.

The *Lancet* has observed: "For seven years the globulist professor continued to occupy the chair of pathology, unmolested

Hosted by Google

by his colleagues. It is true they deprived him of the chair of clinical medicine; but it would appear that they still met him in practice, and took no means whatever to protest against his teaching. As long as nothing was said about it, the other professors were on the most comfortable terms with their homœopathic colleague. Only two or three weeks ago a statement appeared in the *Edinburgh News*, signed by J. R. RUSSELL, a globulist M.D., in which he avers that some years ago Professor GOODSIR 'undertook to write pathological articles in the *British Journal of Homœopathy*.' It was certainly not from anything which occurred in Edinburgh, that the present determination to get rid of the Professor of Pathology arose."

We recommend this extract from the *Lancet* to Mr. SYME's notice, and wish him a good digestion after it.

Let our readers compare this extract with the 7th, 8th, and 9th clauses of Mr. SYME's memorial.

In the 10th clause he tells the Patrons what they already knew very well, that they only can interfere with the Professorship of General Pathology.

In the 11th he informs them of another fact that they were well acquainted with, that the professor was appointed to hold his office *ad vitam aut culpam*, for life, or till the commission of something heinous which should warrant his deposition.

In the 12th clause he assumes that nothing more heinous can be committed by a professor than deserting the established principles of his profession, (what established principles, Mr. SYME?) and therefore that the Patrons have a clear right to depose the Professor of General Pathology.

In the 13th he graciously informs the Town Council, that the Royal Colleges of Physicians and Surgeons (who have denounced homœopathy) will give them excellent advice, if they have any doubt about the case: which is very much like referring a case of supposed leaning to the cause of MONMOUTH to the tender mercies of Judge JEFFREYS.

And in his 14th and last clause, he modestly prays the Town Council to depose Professor HENDERSON.

We are informed that the members of the Town Council of Edinburgh have resolved to take no notice whatever of Mr. SYME's memorial, which we now submit to our readers without any further comment, leaving them to judge of the memorialist's fitness to make such an appeal.

"MEMORIAL OF MR. SYME TO THE TOWN COUNCIL OF EDINBURGH.

"The following memorial has been addressed by Professor Syme to the Town Council of the City of Edinburgh:—

"*The Memorial of James Syme, Regius Professor of Clinical Surgery, unto the Honourable Patrons of the University of Edinburgh.*

"Humbly showeth,—1. That your memorialist has a direct interest in the prosperity of the Medical School of the University of Edinburgh as a source of emolument and professional character.

"2. That the degree of M.D. is conferred by the Senatus Academicus of the University, in accordance with certain regulations enacted by them, which have received the sanction of the Patrons, and are binding upon all candidates for this honour.

"3. That these regulations enjoin attendance upon a six months' course of lectures on general pathology, which is not taught in any other school of the British dominions, and therefore must be taken in Edinburgh by every student who aspires to graduating here.

"4. That great doubts have been entertained as to the needfulness of such a course of lectures, which was instituted about twenty years ago by Government, without the approval or knowledge of the Patrons, who, at the suggestion of the Medical Faculty, on the first occasion of the chair being vacant, recommended the Government to abolish it.

"5. That the present Professor of General Pathology has, for some years past, publicly professed the practice of homœopathy, which is entirely opposed to, and inconsistent with, the principles which he and his colleagues of the Medical Faculty have been appointed to teach.

"6. That homœopathy being regarded by the medical profession of Great Britain as a delusion so manifest and mischievous, that it should render unfit for being met in consultation any one professing it, the Medico-Chirurgical Society of Edinburgh, which comprehends, with few exceptions, all the physicians and surgeons of this city, have expelled the Professor of General Pathology from their body.

"7. That compulsory attendance upon a course of such questionable utility, and conducted by a professor so regarded by the profession, must constitute a serious obstacle to medical graduation in Edinburgh: in proof of

Hosted by Google

which it may be mentioned, that while, during the last six years, the number of medical stu dents attending lectures in the University has greatly increased, the number of degrees annually conferred has sustained a no less remarkable diminution.

"8. That the existence of a homœopathic professor in the Medical Faculty has been eagerly seized upon by interested enemies of this school, to excite distrust in the public mind as to the general soundness of instruction in the University of Edinburgh, with the effect, as it can be proved, of preventing students from being sent here for their education, and of throwing discredit upon all the medical professors.

"9. That the Medical Faculty, immediately upon becoming aware of the homœopathic perversion of their colleague, took measures for removing him from the chair of clinical medicine, which he occupied jointly with some other members of their body, and over the appointment to which rhey possess a complete control, and that he accordingly ceased to exercise this portion of his academic duties.

"10. That neither the Medical Faculty nor any other body, except the Patrons of the University, who possess the power of dismissal as well as appointment, can interfere with the professorship of general pathology.

"11 That the professor was appointed by the Patrons to hold his office *ad vitam aut culpam*, that is, until death, resignation, or the commission of a fault sufficiently serious to warrant deposition.

"12. That as there can be no greater fault committed by a professor than deserting the established principles of his profession, and openly maintaining others directly opposed to those which he and his colleagues were appointed to teach, the Patrons have at present a clear right to depose the Professor of General Pathology.

"13. That if any doubt should be entertained as to this being the case, the Royal Colleges of Physicians and Surgeons could at once remove it by the expression of their opinion.

"14. That the memorialist therefore humbly prays that the Honourable Patrons will take the circumstances into their consideration, and declare the chair of general pathology vacant.

"And your memorialist will ever pray,
"Edinburgh, Dec. 8, 1851. "JAMES SYME."

IN these days a bold and courageous spirit, that frankly speaks out in defence of any truth, or of any principle, is valuable in proportion to its rarity. There is a seeming honesty that is out-spoken enough, but a generous enthusiasm is something very rare.

Much has been written, much spoken, and much done for the promotion of homœopathy in these realms: different degrees of merit must be assigned to different individuals. But we want examples of that generous spirit of devotedness which is so necessary for the satisfactory progress of any great Reform. This kind of spirit is needed to be opposed to the cold questioning of philosophical doubt, and to that halting intellectual faith which will believe nothing that does not admit of a mathematical demonstration.

To one endowed with such a spirit, the beautiful verse of Wordsworth might be well applied—

"Leave to the nightingale her shady wood,—
A privacy of glorious light is thine,
Whence thou may'st pour upon the world a flood
Of harmony, with instinct more divine—
Type of the wise, who soar but never roam,
True to the kindred points of heaven and home."

For, in very truth, such a worker may be felt in what he does, but he boasts not, and from the mind of such an one—even Hahnemann—came the flood of *healing harmony*—and true to his *Phœbean* mission, he acted out his principles, and brought the fruits of his intelligence to every hearth that would receive him; and the spirit of that beautiful intelligence is still able as well as ready to make its home in every family.

If we contrast with this healthy spirit the carking envy and malignant hatred that dogged the Reformer through his mortal life, and now haunt, cur-like, the traces of his followers, we might well sympathise with their painful progress.

At this time all, who are in earnest for homœopathy, require the lively sympathy and active co-operation of those who call themselves friendly to this Cause. In our last number we appealed to the public to judge between the homœopathists and their assailants: these assailants charge our body, calumniously, falsely, and contumeliously, with falsehood aud deceit, and knavery.

We challenge them to the proof; they give none, offer none, but day after day, and week after week, repeat their charges. We have never shown any disposltion to defend the wrong, or apologize for what is not honest. We have a right to our convictions of the truth of the homœopathic

Hosted by Google

therapeutics. We claim liberty of conscience, and we will have it.

That we have not only stood our ground, but made great progress under the hurtling storm of abuse and calumny to which we have been exposed, is no uncertain sign of the vitality of our Cause. But the public must decide, not only whether our therapeutics are, in their judgment, reliable, but whether the balance of good faith and veracity is on our side or on that of our opponents.

Our very able contributor SIGMA has often pierced the camp of our antagonists, and brought off the spoils of victory. Professor HENDERSON has shown that two eminent allopathic professors of Edinburgh cannot invite the public to look into their conduct towards homœopathists, "*Veluti in speculum.*" We demand no favour, but simple justice.

We have this for which to thank our unjust persecutors: we have not only had defenders from our own ranks, but some generous spirits, and many more will soon be added to the number, who are not of our body, have come forward to protest against the unfair conduct of our assailants.

Among them is the writer of the subjoined letter, a retired physician, of a family conspicuous for their ardent love of civil and religious liberty, as well as for their intellectual endowments and eminent attainments. Dr. JAMES RUSSELL is withdrawn from the polemical influences that have excited the wrath and fury of the Medical Colleges and Faculties of Scotland; he is held in the highest esteem and respect by his fellow-citizens, and his opinion will be received with the deepest attention.

His letter to the President of the Royal College of Surgeons of Edinburgh will no doubt make a great sensation in Scotland, and should be as extensively circulated as possible in England.

*A Letter to the President of the Royal College of Surgeons.**

"SIR,—When the billet of the Medico-Chirurgical Society announced a motion 'That the public profession of homœopathy shall be held to disqualify for being admitted or remaining a member of the Medico-Chirurgical Society of Edinburgh,' I sent in my resignation, as I considered such discussion hostile to the object for which the Society was instituted,—the promotion of Medical Science. A perusal of the speeches made on the occasion (with closed doors, since published by authority) has confirmed that opinion.

"The Royal College of Surgeons had previously adopted the following resolutions:—

"'1. The College having considered a series of resolutions transmitted by the Royal College of Physicians, in regard to homœopathy, feel called upon to express their opinion that the system so designated being entirely inconsistent with the principles professed by candidates for the diploma of the College of Surgeons, any Fellow or Licentiate who practises it, or countenances others in doing so, by meeting them in consultation, will justly incur the disapprobation of the College.

"'2. That a copy of the above resolution be transmitted to the Royal College of Physicians.'

"Had I been aware beforehand that it was proposed to submit such resolutions to the College, I should have attended the meeting and entered my dissent. As I knew that the College had never investigated the subject, the resolutions seemed to me, at the time, to be a harmless ebullition of feeling on the part of some members, to which the rest had tacitly yielded, and I have not thought it necessary to take any notice of them since. But when the public interests are sacrificed, and the rights of humanity violated,* when a gentleman of Professor Goodsir's high professional character feels himself constrained to such a course, avowedly on the ground, 'that the College of Surgeons has in its corporate capacity interdicted its members from meeting homœopathic practitioners,' I feel called upon publicly to disclaim these resolutions. They run counter to all the sentiments I imbibed from those under whose auspices I studied Medicine. I have no personal interest in this dispute. I am not a practitioner of homœopathy, nor much versed in it as a system. But I have enjoyed better opportunities than most members of the College, of calmly watching the action of the remedies in a considerable number of acute diseases—I would especially refer to bronchitis, scarlatina, rheumatic fever, and croup—and have been frequently surprised by their rapid and unequivocal success. The public are entitled to the benefit of these means of rapidly cutting short disease, and greatly hastening convalescence, and to the services of those who understand the use of them. Seeing that homœopathic practitioners are men equal, —in respect of scientific education, powers of observing, and personal character,—to other members of the profession, is it not natural to ask why, in this country alone amongst the na-

* A Letter to the President of the Royal College of Surgeons, on the late Proceedings of that Body regarding Homœopathic Practitioners; by James Russell, M.D., F.R.S.E., F.R.C.S.E., etc. Edinburgh: John Greig and Son, Melbourne Place.

* See Dr. Rutherfurd Russell's letter, reprinted from the *Edinburgh News*, in the *Homœopathic Times* of Dec. 6th, to the facts stated in which letter Dr. James Russell here refers.

Hosted by Google

tions, a course so unusual should be adopted towards them by their professional brethren? I cannot understand it. I set aside, as irrelevant, all personalities, and adopt the language applied by a great ornament* of the profession to another controversy:—'Yet have I not so shaken hands with those desperate Resolutioners,—who had rather venture at large their decayed bottom, than bring her in to be new trimmed in the dock, who had rather promiscuously retain all, than abridge any, and obstinately be what they are, than what they have been,—as to staud in diameter and swords-point with them; we have reformed from them, not against them; for—omitting those improperations and terms of scurrility betwixt us, which only difference our affections and not our cause, —there is between us one common name and appellation, one faith, and necessary body of principles common to us both.' All my feelings towards the College are kindly, and the College knows that they are so. With many of its members I have always been, and trust I shall continue to be, on the most friendly footing. In the meeting of the Medico-Chirurgical Society, some were spoken of as holding up 'all the best acknowledged principles of our medical philosophy and practice—principles that have stood the test of thousands of years—as delusions and errors.' I have not so spoken, nor has any one ever spoken so in my hearing. I would have proved but an impatient listener. But while I have been no denouncer of prevailing modes of treatment, I have, as occasion offered, solicited the attention of my brethren to other modes which I had seen to be more successful, deeming it, as I still do, the duty of every practitioner to use the means by which the sufferings of his patient may be most safely and speedily removed, looking to facts rather than to systems. To be told, as a reason for not putting them to the test, that these remedies are called homœopathic, and that homœopathy is absurd, has always seemed to me to be trifling with the best interests of humanity, when eminent physicians, at home and abroad, have given ample evidence of the superior efficiency of these remedies, and courted inquiry.

"Were the position *Similia similibus curantur* the exclusive possession of one party, and *Contraria contrariis curantur* the equally acknowledged exclusive possession of the other, as every remedy may be arranged under one or other of these general laws, a catalogue might be prepared of the articles belonging to each, and a scientific chart of their respective territories laid down; the wide province of Sympathy here, of Antipathy yonder. Our old Scottish Borderers were not good at keeping the marches, under the most vigilant wardens. Will the parties in the present feud reciprocally bind themselves not to trespass on another's domain? So confident are many homœopathists of the universality of the law of *similia*, that they would, I believe, consent to restrict themselves to remedies acting under it. But no allopathist would by any means abide a true subject to the law of *contraria*. It would involve heavy losses,

* Sir T. Browne, Religio Medici.

stripping him at once of vaccination and of all the specifics. By him the homœopathic law is 'reviled and loved, renounced and followed.' He is not wedded to it, but he has no wish to shake himself free of its bonds.

"'One foot on sea and one on land,
To one thing constant, never'

This may be quite right. In politics it is said to be so.* True medical science may require the reverting from one law to the other, as a good citizen may require to be alternately landsman and sailor; but it is not possible, at the same time, for science to hold a position antagonistic to those who are steadfast to one law. There may be the scope of two elements instead of one, but the man who is sometimes at sea is not *contrary* to him who is always on shore. It is a subject for practical investigation, to ascertain out of which of these classes of agents the most successful remedy, for any given disease, is to be taken; and in leading proof on the subject, those who favour the one or the other class of remedies might profitably co-operate, each making out the best case they can, till free discussion has sifted the evidence and matured experience given judgment. Homœopathists may be wrong in so restricting themselves. It may turn out that they are unwarrantably limiting the resources of the healing art; but this is the utmost that can possibly be established against them. While this is under probation, can science lay anything to their charge, to excuse the treatment now bestowed upon them?

"But is there no other distinctive principle of homœopathy? None. Are not the doses always ludicrously minute? The opposite extreme has been no laughing matter to many. British endurance has been sorely taxed by the bulk and nauseousness of the drugs inflicted on the sick. If the homœopathic doses be over small and insipid, the matter might surely be adjusted amicably, for the question of quantity is, on both sides, avowedly regarded as an open one; and perhaps an ill taste might be imparted in any case in which it was urgently wished by the patient. Are the germs of mortal diseases certainly larger than these doses?

"Is it not absurd to expect results from such inert substances as some homœopathic remedies are? Sir E. Home once complained to Sir Joseph Banks, that the natural philosophers would not give a hearing to some speculations and experiments of his about the circulation of the blood, saying the thing was physically impossible. He was encouraged, in a manner worthy of the President of the Royal Society of London, 'Never mind whether it be possible or not, if it be true.' Speculative impossibilities

* "Nunquam enim præstantibus in republicâ gubernandâ viris laudata est in unâ sententiâ perpetua permansio, sed ut in navigando tempestati obsequi artis est, etiamsi portum tenere non queas; cùm verò id possis, mutatâ velificatione assequi, stultum est eum tenere cum periculo cursum quem ceperis, potiùs quàm, eo commutato, quò velis tamen pervenire: sic, cùm omnibus nobis in administrandâ republicâ propositum esse debeat, id quod à me sæpissimè dictum est, cum dignitate otium, non idem semper dicere, sed idem semper spectare debemus." —CICERO.

Hosted by Google

are daily disposed of. Steam-boats cross the Atlantic in defiance of predictions from shallow philosophy; and one navigator sails over what seemed Red Mountains* to his predecessor, having enjoyed a better light and a nearer view. A submarine electric telegraph, reaching to France, would have been counted absurd enough some years ago. Competent observers say they have found these substances not inert. Let them be searchingly tested, and their proper scientific place assigned them.

"I regret that, on this occasion, our College, instead of taking her usual place at the head of every generous movement, has followed in the train of other less dignified bodies, who have in various places been gesticulating of late

> "'With all the prettiness of feigned alarm,
> And anger insignificantly fierce.'

"To stand alone, Sir, in our College, as perhaps I now do, is not an enviable position; but I have occupied it before. The measures adopted by the profession, when cholera first attacked our city, seemed to me so objectionable, that at a meeting of the College of Surgeons I moved a series of resolutions, condemning the steps taken to search out and shut up every one suspected of having been near an infected place, as an unwarrantable interference with personal liberty, and fitted to lead to dangerous concealments. I did not then find a public seconder, though some members privately expressed to me a general concurrence in my motion. During the lapse of years, ere we were again visited with this fearful scourge, sounder views had made progress; and no repetition of the former steps was proposed. I take encouragement from this in the present instance. Allured for a moment from her proper post of shielding from ignorant prejudices (in which the noble-hearted Dr. Chalmers† formerly lent his aid), those who are seeking, by strictly scientific investigation, to promote the health of the community and increase the resources of the healing art, the College has joined in seeking to excite the community with the panic cry,

> .... "'O miseri, quæ tanta insania, cives? ....
> Quicquid id est, timeo Danaos, et dona ferentes.'

But this this will not last. Very shortly I expect to see the profession no longer shunning the persons or slighting the gifts of homœopathists, having signally failed in persuading others to do so. Meanwhile, I trust at least that the public will not be denied the unquestionable benefit of some remedies on which homœopathists have succeeded in fixing attention; for example—*Aconite*, in lessening febrile action; *Arnica*, as an external application; *Belladonna*, in scarlet fever, and, as publicly attested by Mr. Liston, a most competent judge, also in erysipelas.

"I have the honour to be, Sir,
"Your obedient servant,
"JAMES RUSSELL."

"The following resolutions were agreed to by the Royal College of Physicians of Edinburgh:—

"'1. That the Royal College of Physicians of Edinburgh did, several years ago, publicly express its opinion of homœopathy and homœopathic practitioners, by peremptorily declining to admit into its body a candidate for its Fellowship who belonged to that denomination; and, consequently, that no Fellow of the College can possibly be ignorant of the light in which all those who practise homœopathy are regarded by the College.

"'2. The College regrets that, notwithstanding this decided expression of its opinion, more than one of its Fellows, after being admitted in a different character, have endangered the reputation of the College by becoming homœopathic practitioners; and the College expresses an earnest hope that these Fellows, seeing that they have thus virtually separated themselves from the College, will spontaneously sever their further connection with an institution which repudiates them, and from which they can derive, as merely nominal Fellows, nothing else than a false position and a spurious credit.

"'3. The College feels the more bound thus to express its opinion, seeing that those Fellows who have become homœopathists, and any other medical practitioners who follow homœopathy, must necessarily be aliens to the other Fellows, and to the profession at large; inasmuch as no Fellow of this College, or any other physician, can, by any possibility, without derogating from his own honour, and from the honour of the profession, meet practitioners of homœopathy in consultation, or co-operate with them in the other common duties of professional life.

"'4. That although the College has not thought it expedient hitherto to take any active steps for disclaiming those Fellows who have become homœopathic practitioners subsequently to their admission to the College, nevertheless, since it has the power of dealing summarily with those who act in a manner so unbecoming the character of a physician, it reserves its right to exercise that power when it shall be so advised.'"

* Arctic Regions. † Life, vol. iii. p. 31.

ASSOCIATION FOR THE PROTECTION OF HOMŒOPATHIC STUDENTS AND PRACTITIONERS.

THE necessity for such a movement as the present is obvious from the following facts:—

The University and the Royal Colleges of Physicians and Surgeons of Edinburgh, as well as the Universities of St. Andrew's and Aberdeen, have resolved to withhold their diplomas from those students who refuse to pledge themselves never to practise homœopathy. It appears also that the Faculty of Medicine of Glasgow is about to follow their example. The College of Physicians of London has also joined this foray against homœopathy.

The necessary consequence of these proceedings on the part of the universities, etc., will be —That those who cannot conscientiously pledge themselves against homœopathy, will be deprived of that recognised certificate of their qualification which a degree affords; and the public will have no guarantee of their fitness for the exercise of their profession. This is a matter, therefore, which affects the public in general, being an indirect but manifest violation of the right of individuals to the free selection of the kind of medical treatment they prefer.

The aim of this Association is to unite all who are not prepared to submit to this medical despotism. Any one, whether professional or non-professional—whether believing or not believing in the truth of homœopathy, who acknowledges the justice of our cause, is eligible for the Association. So soon as a sufficient organization is formed, and the public are roused to the danger

Hosted by Google

of this arrogant and tyrannical stretch of authority by the universities, measures will be taken for obtaining a board of examiners, who shall be entitled to certify as to the competent knowledge of the candidates; and certificates granted by this board shall be held equivalent to a degree or diploma. The best means of obtaining this board, whether by petition to the Crown, or to both Houses of Parliament, must be matter of future consideration. One thing is certain, that without a previous organization, we never could succeed in having a sufficient number of signatures to such a petition. Our first and obvious duty then, is to unite for the protection of our students; and that each in his own locality shall spare no effort to enlist as many influential persons as possible in favour of the movement. The end is simple, the means are ample. All that is required is a combined effort, and the triumph of freedom for student and practitioner, and security for the public, will be speedily and certainly achieved without injury to any one—not even those universities whose folly has rendered this movement imperative. For the purpose of carrying out the objects of the General Association, a public meeting was held in the board-room of the Manchester Homœopathic Hospital, on Thursday, the 18th of September, when the following resolutions were unanimously carried:—

1st. That this meeting views with regret the course adopted by the colleges and other bodies to put down homœopathy, and denies and protests against the right of any corporate body or association, constituting but a minority of the medical profession, to dictate to others what course of treatment should be adopted in their practice.

2nd. That the course pursued by the universities, etc., towards homœopathic practitioners and students of medicine, leaves them no other means of redress than the seeking to obtain a charter of incorporation of a college which shall be empowered to confer degrees and grant licences to practise medicine.

3rd. That a branch of the Association for the protection of homœopathic students and practitioners be herewith organized, and that the following gentlemen be requested to act as a committee, with power to add to their number:—

Mr. W. R. Johnson, Treasurer; Mr. Phillips, Chairman of Committee; Rev. Canon Slade; Rev. R. Durnford; Rev. C. F. Smith; Rev. A. A. Bagshawe; Rev. R. Fletcher; Rev. J. Gwyther; Dr. Walker; Dr. McDowall; Mr. Harrison, M.R.C.S.L.; Mr. W. Scholefield, M.R.C.S.E.; Dr. Tuckey; Dr. Knowles; Mr. A. C. Pope, Alum. Med. Edin.; Alderman J. J. Parker; Mr. G. Wildes; Mr. R. Needham; Mr. W. McCall; Mr. H. Turner, Honorary Secretary.

The duties of the local committee will be to obtain as many members for the Association as possible, the names of which, together with the enrolment fee of half-a-crown, should be transmitted to the secretary; and it is of the utmost consequence to the success of the movement that it should be rapid and simultaneous. These funds, together with any donations which may be received, will be transmitted to the central committee, after deducting therefrom the expenses incurred by the local committee in issuing circulars, forwarding parcels, etc.

Pamphlets and publications, issued by the Association, will be from time to time distributed to the members.

It is particularly requested that every one who approves of the design of the Association, will lose no time in sending his name, along with the registration fee of half-a-crown, and any donation he may choose to give, to the secretary, the treasurer, or to any member of the committee.

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—In Dr. Dudgeon's letter to Dr. Routh, in your number of December 6th, there is a slight inaccuracy which I beg permission to correct. He states that the source of fallacy in the magnetoscope was first demonstrated by a homœopathist. I venture to remind him that such demonstration was made by "J. H.," at the very time when Dr. Madden first brought his experiments forward at the Hahnemann Hospital, and that although Dr. Madden has since most thoroughly and conclusively investigated the subject, he has not advanced the matter a step beyond the position then maintained by J. H., and subsequently stated in his letter in your journal. But it appears that Dr. Cowan, of Reading, had "demonstrated" the same source of fallacy long before, at the time when the instrument was submitted to the Provincial Medical Association, at Brighton. See his letter to the *Lancet*, of November 22nd. Dr. Dudgeon is well aware that neither of these persons are homœopathists, and I presume he wrote the statement I have noticed, in a moment of temporary forgetfulness.

I take this opportunity of thanking you for the courtesy with which you have inserted my letter to Sigma, and of expressing my perfect satisfaction, *in every respect*, with his reply. If you will allow me, I will supply one deficiency which he notices. In juxtaposition with the statistics of the Hahnemann Hospital I will place my own. I attend habitually some of the patients at a large dispensary, in connection with which many severe cases are visited at their own homes. The mortality among the patients last year was one in about 125. The average mortality for several preceding years was a little greater, but still decidedly less than that which I quoted in my letter.

I am, Sir,

Your obedient servant,

A SURGEON.

PETITION TO THE PATRONS OF THE EDINBURGH UNIVERSITY.

To the Editor of the Homœopathic Times.

SIR,—The letter from Dr. Rosenstein in one of your late numbers took me quite by surprise, and even occasioned me at first some misgivings, hav-

Hosted by Google

ing already obtained some influential signatures to the said "Petition to the Patrons and Senatus of the University of Edinburgh." I now pause to reconsider our actual *status*, and prospects, and wants. Some estimate of our precise position in the eyes of the thoughtful and leading public may be gathered from the subjoined note just received from a clear-headed and independent magistrate of the neighbouring country side, with whom I had left the petition.

"MY DEAR * * *—I concur in the general object of this petition and think homœopathy ought to be allowed to stand upon its own merits and find its own level. It seems to me quite enough for a medical candidate to answer satisfactorily the questions put to him. At the same time, I do not sign the petition. *Ne sutor ultra crepidam* is a good maxim, and I much feel I should be travelling from my vocation if I interfered on the subject. Believe me, etc."

Then, looking within at the small but gathering band of Hahnemann's followers, certain it is that the Materia Medica is acquired; that homœopathy is deeply studied and excellently practised too, without the aid of those colleges, professorships, and lectures, that are deemed so essential to our further progress. Diligent, energetic, and intelligent men master the subject sufficiently without these helps. Clever practitioners of the old school are continually seceding to our ranks. Upon the whole, there appears little in the present aspect of affairs to warrant an apprehension that homœopathy will decay, die out, or even degenerate, if suffered to pursue its present prosperous course.

But, granted that it is obviously desirable, nay, an imperative necessity at once to make a step in advance in the matter of our colleges, how much more congenial is it to the habits and sentiments of every Englishman, how far more in harmony with the expansive character of our glorious political constitution, to bend and adapt to new-born requirements the already existing machinery of the national institutions, than to found a bran-new Homœopathic College of our own. In this case it will take years, and the talents and labours and triumphs which years alone can bestow, to clothe it in half the *prestige* which the meanest of the old foundations already possess. An application to Sir George Grey for a charter to examine and license homœopathic medical men would be immediately met by the remark,—"What a number of licensing bodies there are already."

Talk to members of the House of Commons, some are favourable to homœopathy, most are utterly indifferent to the question; in short, you will soon be convinced that through this channel, it were vain to attempt to press the subject of a charter upon the consideration of the Cabinet.

America and the Brazils, as instanced by Dr. Rosenstein, are in one respect upon a widely different footing. The oldest of these transatlantic institutions was founded within the living memory of man. Still, had we the charter and the professors and a sufficiency of pupils, all ready to our hands, I would no longer object; but in the meantime what is to be done? Why, make the old schools serve our purpose—as is still done in Prussia, at Vienna and at Paris. But, after all, these colleges are amenable to public opinion as any other branches of the legislature; they move slowly, if you will, yet still following their own interest; and they will soon perceive that it is *not for their interest* that young men like Messrs. Laurie and Pope, educated mainly in their lecture-rooms, should be driven across the Atlantic to obtain a degree at the flourishing schools of Philadelphia or Cincinnati. How was it in Edinburgh some years since, when *anatomy* could not be learned in the University—when that chair, I mean, was filled by a superannuated professor? Why, an independent-spirited lecturer, Knox, started up and opened dissecting-rooms just outside the orthodox walls. In my day, "Surgery," "the Practice of Physic," as it is termed, and "Chemistry" were all excellently taught in a similar extra-mural manner; and so already, to a certain extent, has homœopathy been studied up to the present time. But once obtain its toleration in the examining-room, once introduce the attenuated end of the wedge, and my word for it, the students, backed by the support of the public, will soon drive it quite home, and form large classes for the *Materia Medica* and the Principles and Practice of Homœopathy; all protests of Christison and Simpson notwithstanding.

Magna est veritas et prævalebit, is a maxim not alone of consolation, but a prudent hortative to await the coming turn of opinion's tide, nor rashly endeavour to force matters to a premature issue, for "when the fruit is ripe it will fall."

Your obedient servant,
M.D. EDINENSIS.

To the Editor of the Homœopathic Times.

SIR,—In No. 108 of your valuable journal there appeared an article of mine on the subject of allopathic and homœopathic quackery.

Permit me to say a few more words on this subject.

It seems to me that we have to restrict excesses of all kinds, more particularly excess of freedom, otherwise it degenerates into licentiousness. As England has succeeded in suppressing slavery, gambling-houses, etc., I do not see any reason why the nuisance of advertising and selling quack medicines could or should not be suppressed also. People of all classes would not patronise patent medicines, if it were properly understood that they were prohibited on account of their injurious tendency.

I need not refer to Vienna, or to any other place, in order to be informed that homœopathy did more good and saved more lives in cases of cholera; I know this from my own experience.

I do not see why the whole world should not be supplied with qualified medical men of homœopathic principlesin our generation. The educated allopath need but to study the Materia Medica Pura, and read clinical observations, as all physicians of our school have done,

Hosted by Google

and we shall have more than a sufficient number of qualified homœopathic practitioners. I deny also that, in many instances, the patient has as much chance of recovery without the assistance of the practitioner of the old school as with him. I have saved, when an allopath, many a child by an emetic, in the last stage of *angina membranacea;* and have done much good by the local application of leeches in affections of the head, and inflammation of the bowels. Homœopathy, no doubt, possesses superior means, but this does not imply the entire inefficacy of allopathic remedies.

I think I fully understand the character of the English people; and am convinced if they knew the nature and the mischievous tendency of most patent medicines, they would not use them. I have often heard Englishmen and also Americans say, "He does not know anything of our country." Some men always find a hole at which to creep out. It will be found upon inquiry, that foreigners more frequently study the language, customs, and manners of the country of their adoption than the natives themselves.

The Government is surely able to contribute much to the advancement of those appropriate means which should be adopted to restore health.

The physician who has received a regular classical and medical education does not, in my opinion, stand in the same position as the quack; the latter, who uses but one compound in all cases, and under all circumstances, does comparatively more mischief than the discriminating allopath.

The homœopathic chemist should not establish himself as such, unless he has been examined, and shown his competency. The chemist should not prescribe, and undertake the functions of the medical practitioner, *ne sutor ultra crepidam.*

The unscientific man may, it is true, now and then luckily find a well-defined case, one in which the symptoms are so plainly covered by the records of a drug as not to admit of mistake, and that performs a cure which will fill the patient with surprise and gratitude. But he is not a whit the more competent or more fit to succeed as a physician, than is the maker of gunpowder competent and fit to succeed as a chemist. The *amateur* cannot discriminate where discrimination is at all necessary. Take, for example, a case in which twenty-five symptoms are present. If a drug be found, the effects of which cover all these symptoms, in all respects perfectly, it will necessarily be chosen by the *amateur* as certainly as by the physician; but if, as frequently happens in cases of great peril, several drugs be found to cover a majority only of the symptoms, and no one covers the whole case, the former is utterly at a loss, and is just as likely to administer those drugs in the list which have no real relation to the case, as he would be to apply those which the physician would know to be remedies, and promptly select, and apply them as such, for reasons which the other could by no means appreciate.

The attenuations, high or low, are not so much an open question as has been asserted. The high dilutions are preferable in chronic cases, according to the experience of Drs. Hering, Bönninghausen, Perry, and others, whilst the lower dilutions may be used in acute diseases. Every experienced practitioner will agree with me, that one dilution may suit better than another; and he may be called a "*tyro*," if he does not know this before the application.

The protection afforded by the governments of Germany, in a civil point of view, certainly stands very high in my estimation. I did not touch upon their political arrangement. No objection can be urged against a person being compelled to serve an apprenticeship, and to give other proofs of his capabilities, before he is permitted to exercise his profession. He is not forced to travel, unless he chooses to do so for his own improvement.

Men of learning enjoy great protection in Germany; the history of our Hahnemann is a sufficient proof of it. Examinations are there more strict than here.

I can have no objection to the chemists putting up prescriptions — first, if the chemist proves himself competent; and, secondly, if chemists are to be found where a homœopathist resides: at present, this is impracticable, because the number of competent homœopathic chemists is small.

Yours truly, J. G. ROSENSTEIN.
10, Valentine Terrace, Blackheath Road, Greenwich.

BIRMINGHAM HOMŒOPATHIC ASSOCIATION.—The following resolutions agreed to at a meeting of the friends of the system, held at the Dispensary, 13, Old Square, will fully explain the nature and objects of this Association.

1st. That a Society, to be called the *Birmingham Homœopathic Association,* be now formed for the purpose of promoting the establishment of a Homœopathic Hospital in Birmingham for the better enabling medical men, and others, to become acquainted with the value of the system in acute diseases, and for affording such increased facilities for the treatment of the sick as are not attainable in a dispensary.

2nd. That in order to meet any expenses that may be attendant upon the Society, each member be required to pay two shillings and sixpence annually.

3rd. That the Society shall not be considered as composed exclusively of converts to the homœopathic system, but that others who are desirous of seeing it tested on an efficient scale be invited to become members.

5th. That a committee be formed to carry out the objects of this Society, with power to add to their number, and to convene a general meeting of the Society whenever requisite.

Communications.

LETTER TO JAMES Y. SIMPSON, M.D., P.R.S.E.,

AND PROFESSOR OF MIDWIFERY IN THE UNIVERSITY OF EDINBURGH.

No. III.

SIR,—On more mature consideration, I think you will be inclined to admit, that your statement as to homœopathists being ashamed of their creed was a most erroneous one; if you think so, read "Sigma" over again. It was no such sentiment which led homœopathic members to visit the Medico-Chirurgical Society so seldom. It was simply the result of a want of hospitality in that body, coupled with the knowledge that there was not much doing there in the homœopathic line. But the gratification that must arise in the breast of any member of that body at having induced another to resign, or in having expunged the name of a non-resident from the list, is very equivalent to the noble idea of sending a challenge to a clergyman, and threatening to brand him for not fighting. But in that great act of signal retribution and Medico-Chirurgical "common-sense," according to the new standard, we derive some comfort from the knowledge that at one and the same moment the faubourgs and boulevards of Paris trembled responsively with the purlieus of the South Bridge and Drummond Street. Had globulists been in sufficient numbers in Edinburgh, I have no doubt we should have had a barricade at the top of Infirmary Street, and you cannot doubt for a moment that some hard blows might have fallen.

The youth of our therapeutics seems especially to stick in allopathic gills—there is no *filtering through them.* The aristocracy of twenty centuries gilds therapeutic art over as beautifully as if done by a shopman from behind the counter of Savory and Moore's, or as if manipulated by the Editor of the *Pharmaceutical Journal,* in a moment of leisure from his duties in the Lower House. But we are ready enough to admit this youth, which, for that matter, will improve every day. Retentive memory, diligent study, keen appreciation of temperament, diagnostic acumen, are equally incumbent on us as on allopaths; and whilst these young therapeutics, with which we have already *done something,* are maturing, we think ourselves entitled to be heard, and to be borne with until disproved, or until the deficiencies of our system are so evident to the public, that that public desert us. If it is false, as *you say,* it will fall of itself; if it is true, even only in a degree, it is *worthy of preservation,* and may defy your united arms.

That homœopathy may be available to any man, it is of special importance that the inquirer should be blessed with a retentive memory; and really, when we see how lightly you look upon this natural gift, as exemplified by the difficulty you have had in recalling the cases in which "*consultations*" were held with Drs. Henderson, Russell, etc., I am fain to believe that the study of homœopathy would have proved irksome to you. The natural gifts of men differ. One may be wonderfully sharp in detecting at a glance the condition of a patient, and who, nevertheless, cannot by any means recall the appropriate homœopathic remedy without many references. We remember the day when we all whether engaged in allopathic or homœopathic practice, acknowledged Professor Henderson to be *unsurpassed in diagnosis by any man of his day*—the gift *has not left him;* and as regards memory, I have no doubt he has an excellent proportion of it. We homœopathic men rather pride ourselves on our memories, and we have refreshed those of our opponents on sundry occasions. But the gift is not equally acute in all, nor even in the same individual at all times; and this, taken along with the youth of homœopathy, ought to justify any practitioner in modifying his practice, if it seemeth fit. Let him do this according to his conscience; let him use his new light to the extent he can, and doing this, he acknowledges the selfsame flag you have rallied under—"*a standard of common sense.*" No man, or body of men, has any right to say to another, "You have chosen *one* system, or *one* remedy, or *one*

Hosted by Google

dose, and now we shall compel you to abide thereby, and never depart from it." Nor has any man a right to judge of another's success, or the merits of his system, by individual cases of failure, *lamentable*, as they are generally termed, when occurring in our hands, and all "*secundum artem*," when occurring in yours. A general average is the nearest approach by which allopath and homœopath are weighed in the same scale.

With the intention of affording you a simultaneous glance at all the "spirited" achievements in the allopathic ranks, which crowd so thickly upon us that we have some difficulty in chronicling them (and an omission of any of which would be a matter of regret, in so far as historical evidence is ultimately concerned), it seems that there is a blank, which once filled up, we shall be able to keep way with the thrilling medical incidents now of daily occurrence. I beg, therefore, to be excused for disregarding dates when, with a fair amount of anxiety that such a brilliant passage at arms should not be lost to posterity, I think it necessary to allude to that interesting and highly effective series of operations for which we are indebted to the illustrious "Association at Brighton."

It is exceedingly gratifying to find that their financial department was in a condition to enable them to publish those "*resolutions*," the result of their *terrible* period of incubation and labour; and we trust that these "*resolutions*" are weighing with the public in the exact ratio they may be morally and intrinsically deserving of.

When it is remembered that the great object of this meeting was to suppress "irregular practice," it might appear to most people as of some consequence, that the preliminary step to such a proceeding would have been a distinct statement of what "irregular practice consists, by showing the existence of and defining the limits by which "regular practice" is bounded.

But upon reading over the speeches of the members as published, we find that none of them were at all impressed, for even a moment, with the importance of this omission. And we have reasons of our own for not being astonished thereat. But had they only had a copy of Glassford on their table, he would have soon set their minds at rest upon that point. He defines "regular practice" as characterised by being *regular in irregularity*. By the next annual meeting we recommend that authority to their notice.

When the admiration for the materiality of medicine which this Association displayed is called to mind, the mediæval spirit of this our day is not inaptly limned; but a still more winning sketch of it peeps out, by the interesting discovery that they were accompanied by their jester.

Upon this latter fact, so illustrative of a desire to advance a deficient branch, we consider the work of this great meeting, and the results thereof, to have gained a *mighty* fulcrum on which to act on the offensive; and the tinge which this functionary cast over the merits of these great labours will render them the more suitable to be engrossed in medical history.

'Twas but the other day that, passing by St. Paul's, and thinking of patronising the Dean, we took twopence worth; and having reached the top, the bird's-eye view presented brought to our mind the noble scope we have to fight in. That sentiment was not unmingled with regret, for I had that morning read over, for the *third time*, the speech of one of the members, who broadly denounced me as "dishonest," as "a knave." That speech was milk-and-watery enough, no doubt, dull as dough, and flat as a flatfish, and withal only *suitable* for the *mouth it came from*; nath'less I was "dishonest," and "a knave," determined so upon this man's *ipse dixit*, and merely because I had studied that which he had neglected. He bluntly told me that I intentionally squandered away the lives of my fellows; that I "trafficked in the issues of life and death," and "tampered with the elements of mortality;" nay, more, that I "jeopardised *not only the bodies* but *the souls* of my patients," for I gave them no time for repentance. He regretted, he grieved, that such horrors should be, and he did so partly on account of the rich, who were thus despoiled of their money, but *more especially* for the sake of the *poor*, whom it was *easy to see he loved most intensely*. I wonder he had not wept—if he did so, it has not been recorded; *we* might have wept too, along with him, for such a speech might well draw tears from *any one* who heard it. We are not aware, however, that lachrymation prevailed to any alarming extent; if it had, there was a firebrand or two present, hot enough to dry the tears up; if *they* blaze out again, we shall cool them.

The imputation was a bolus strictly in accordance with the schools, nauseating withal; but when I remembered how many cases had terminated unfavourably in my own hands, when treated in accordance with books that had been held up to me as oracles, I said to myself, "when this man and I have arrived at 'that bourne whence

Hosted by Google

no traveller returns,' in whatever talents else he may be found to surpass me, his therapeutic conscience will not be clearer than mine." The cloud passed over, and the sun broke through. 'Twas a bright thought that. I felt that *that member's words had been spoken to the winds.*

The thought carried me to others. There was one man who came, and with a surly mien; he scowled at me, and said, "You are an impostor, for you do not believe in what your father believed; you are a mystic! a madman! *for if your doctrine is true, mine must be false,* and you are sadly interfering with me. Out upon you! I have written you down." And he would have struck me, but he *dared not.* I wonder that he did not *blaspheme,* for there was no one to prevent him from doing that. I turned my back on the recollection; but when I remembered certain severe, and dangerous, and seemingly hopeless cases, that had done well in my hands, when treated homœopathically, the cloud passed over, and the sun broke through. It was a bright thought that. I felt that even moonlight was preferable to darkness.

One of many gifts assailed me, and he told me I was a "knave," for how could it be otherwise when I, *an obscure man,* was such a drag upon *him.* He said I had entered cottages, and crept into castled halls. He said I was too easy of belief, or that I pandered to those whose purses were full. I felt this reproach, for it came from one I respected, and to whom *science* owed something. I was much cast down thereby. But when this gifted individual confessed the deficiencies of his own medical creed, the cloud passed over, and the sun broke through. 'Twas a bright thought that. I felt myself to be as pure as he of many gifts.

But I had also to bear the frequent onslaught of men hired to malign me. They accused me of crimes done with intention, and of deeper dye, because done in cool blood. I must have been a horrid wretch if these men's sayings had been true. Some of these accusations came from silvering hairs; alas! stormy passions boiled beneath them. I was accused then of being *sold* for *gold.* When I read it I laughed, for I knew who accused me. The laugh was but for a moment; there was nothing to laugh at, on deeper consideration. But when I remembered the smiles I had that day been greeted with, on visiting an only child that owed much to Samuel Hahnemann, and even a little to me, the cloud passed over, and the sun broke through. 'Twas a bright thought that. I felt that *accusations from these men were very trifling matters indeed.*

But all would not do: they united with others, and formed themselves into large bodies; they said unto themselves, "*united we shall put you down,*" and they filled the air with denunciations; and a struggle came, and people asked eagerly what it all meant. And when it was explained that the subject of anger was a "broken gallipot," they called upon us to mend it, and be friends; but the gallipot was past repairing, there was only revenge upon those who had broken it, and yet *all agreed* that it was worth very little indeed. Matters looked serious. I bethought me of going to the registrar of deaths, and I asked him *how* my account stood, and if it was *much* behind my neighbours, and he said *it was not.* The cloud passed over, and the sun broke through. 'Twas a bright thought that. Yet I felt sad to think that *all this commotion was on account of a "broken gallipot."*

These sentiments, you will perceive, were rather of a gloomy cast than otherwise, and decidedly opposed to the spirits of the homœopathic faction, which are uncommonly cheerful. It was all owing to that peep from old St. Paul's. They were succeeded by a due appreciation of fine speeches before Associations and Medico-Chirurgical Societies. We shall all be done justice to by some future Rollin, or, at any rate, by some future Joe Miller; there is much comfort in that. The Brighton Thermopylæ and the Punic wars of Edinburgh, will come out very strong.

I felt grieved once more, when I thought that perhaps these generous contests might be lost to future "Rollins" and "Joe Millers," unless some record of them were kept, and as I scorned any downcome from an Homeric age, I resolved to try and spin the subject in heroics, *pro et contra.*

"There was a sound of revelry" by day,
And Brighton's city (looking rather gay),
Contrasted with the groans of the "Contraries,"
Of good three hundred learn'd apothecaries.
Within a palace, on the great Parade,
Each doughty warrior drew his trusty blade,
Ready at once to rush upon his death,
And in defence of pills resign his breath.
Rises a self-styled hero of the hour,
Not quite a Hampden, neither a Glendower,
Who said, "It gives my heart unbounded grief
To say, I think a homœopath's a thief.
For every druggist's axiom of the day,
Is, '*for no bulk in drugs, no bulk in pay*'—
A globulist is *worst* of human clay.
Nay, more! I think it very hard, indeed,
That any patient should forsake his creed,
And take to globules which have nothing in them,
As they all do, when once they do begin them.

Hosted by Google

For I have analysed them o'er and o'er,
Until I think analysis a bore.
I've swallowed them in handsful—folly mine!
I might *as well* have choked upon moonshine.
I've studied Jahr, their guide, with breaking heart;
I've written pamphlets with a shaking heart;
I've treated cases with a quaking heart;
I've pressed my pillow with an aching heart;
And morn has dawned upon my waking heart.
I've given these little globules to my niece,
I've given them frequently to English geese;
From high to low, from cottages to titles,
Without one single twinge upon their vitals;
I've given them now to generals, then to subs.,
Nor did they ever cause the '*mullagrubs*.'
At one *poor* patient, who I thought would die,
I ventured with *Veratrum* a cockshy;
And when I saw *Veratrum* would not do,
And that the patient looked exceeding blue,
I tried *Arsenicum*, their greatest gun,—
Indeed it was most melancholy fun.
I've no opinion of their *Chamomilla;*
I've quite a nausea for their *Pulsatilla;*
I don't believe their boasted *Aconite*
Can bring the pulse one peg from off its height;
I'm sure *Silicea* is a phantasy,
Lyco. a myth, and *Carbo* 'all my eye;'
It quite resolves itself in sordid mammon,
And all their *great specifics* are but gammon."
Up gets a great physician from the crowd,
Who then premised, "Indeed, it does me proud,
To see so many doctors of one nation
Met here to form this great Association.
But I regret that I do disagree
With 'tweedledum'—I side with 'tweedledee.'
I do not think these globules are so tame,
I've seen them play the d—l with the frame;
I've seen them cause phlegmasiæ and cachexies,
Calculous diatheses, and apoplexies;
I've seen them put old ladies in a rage,
And upset young ones from decorum's stage;
I've seen them, when prescribed for married ladies,
Give rise to twins, instead of single babies;
I've seen them cause rheumatics and the gout,
Make thin men thinner, stout men still more stout;
I've seen them cause all kinds of dire disease,
(Alas! I've seen them take away our fees!)
I've seen them vanquish our appropriate doses;
I've seen them quite upset our worst prognosis;
And my advice is strictly for to shun them,
For I am sure Old Nick himself has done them."

I think you will have no difficulty in recognising that these lines embody the *essential spirit of allopathic authorship and speech-making* on our doctrines.

I have the honour to be, Sir,
Your most obedient servant,

Dec. 20, 1851. SIGMA.

NOTES OF IMPRESSIONS AND OBSERVATIONS OF HOMŒOPATHIC PRACTICE AND PRACTITIONERS IN FRANCE AND GERMANY.

BY CARROLL DUNHAM, M.D., of Brooklyn, New York.

IN France, besides Tessier's Hospital and the Clinique of M. Perry, I know not that I saw anything of interest exclusively belonging to our science. The sessions of the Gallican Society, which I regularly attended, proved quite interesting. Discussions were rather more spirited, however, than practical; and the honour which the French nation is conferring on homœopathy and on the memory of Hahnemann, by adopting the one and cherishing the other, were more largely dwelt upon than the converse ideas. A practical communication, of exceeding interest to me, was made one evening by Dr. Petroz, respecting the efficacy of a new medicine, *Asterias*, in scirrhous and carcinomatous tumours of *the left side*. This communication has been published, or should be, in the French journal, together with the proving of *Asterias*. If it have been, I have seen no such notice of it by other journals as I should think its importance might elicit. The interest of the subject one could scarcely exaggerate. Homœopathy ought to be able to deal with cancer, but as yet we have made no very great show. I asked Bönninghausen's opinion and experience. He said he had succeeded in dissipating many tumours which had been pronounced scirrhous, and many which he had not doubted *were* such; but so very possible, in such cases, is error in diagnosis, that he does not deem this sufficient evidence of power over the cancerous diathesis. One case of ulcerating cancer he has had; the ulcer had, when he was consulted, a diameter of two and a half inches; under his treatment, the ulcer was reduced to a diameter of a quarter of an inch, the discharge lost its fœtid character, and the patient all the characteristic discomforts that had previously tormented her. Things were advancing towards a cure, when unable to refrain, as the treatment rendered necessary, from coffee and spices, the patient dismissed him. He saw her two months afterwards, the ulcer had increased again. She had allopathic advice, and in a few months died. Bönninghausen does not give this as a cure or probable cure of cancer, but merely as a temporary amelioration, which it certainly was, and as giving us perhaps reason to hope that perseverance might in a like case lead to a successful issue. And here I cannot

Hosted by Google

help remarking, inasmuch as some among those who do not agree with Bönninghausen in his posological views throw discredit on his records of cases, ascribing to him, if not ignorance of the science of medicine, at least carelessness in observation, and haste in deducing laws from (ill-observed?) individual phenomena, that I have never met with a physician who has seemed to me so severe in his scrutiny of phenomena, and so very cautious in the conclusions based upon them. Every day spent in his society increased my confidence in the justice of whatever opinion he might publish as the result of his own *observation*. Opinion based on observation he himself always carefully distinguishes from conjectures or hypotheses; of the latter, he has doubtless many false and old fashioned, perhaps some foolish. Besides what I have mentioned, I saw or heard in Paris nothing of a practical nature that greatly interested me. Several visits to Madame Hahnemann were as many great pleasures. Had herself no attractions, very great interest must attach to her as the nearest representative of the Master. And, by the way, she seems to be a representative who, as *we* say, has "*taken the responsibility*," for the Master would not have kept from his disciples' knowledge the experience of his latter years, as his widow assuredly did; for no doubt she suppressed a last edition of the Organon, which Hahnemann, in a letter to Bönninghausen, six weeks before his death, said (I saw the letter) was just being put to press. From Paris I went direct to Münster, seeking whatever instruction or counsel Bönninghausen might vouchsafe me. I found him at his retired residence, in the midst of his large garden, just within the city gate—a large, well-formed man of sixty, a fine head, benevolent face, and what we, on this side, call "old courtly manners," and always a pipe in his mouth. A single sentence told him my name and object. He welcomed me to stay my pleasure, said his study and stores of knowledge are always open to all homœopaths who will come, (a pity that many more do not go!) and proceeded at once to discourse to me of his views and methods of practice. After this I sat with him daily six or seven hours, and saw his whole practice for more than a month. Bönninghausen's is almost altogether *office-practice*. The little town of Münster, with its 10,000 people, could scarcely occupy him. The surrounding country, however, is very populous, and it is from among the hardy, simple-lived, and well-to-do Westphalian peasants that a large portion of his patients come. Hence the character of his practice is somewhat peculiar, and so consequently are his reports of cases and his views of therapeutics. His cases are almost all cases of chronic disease, for only such disease permits the patient to visit the physician. Acute cases are with him rather exceptional. As a rule, his cases are chronic, and, therefore, his experience and the views deduced from it might be called chronic. And these facts are made ground of objection to his reports and opinions, with little enough justice. Is the report of a chronic case less reliable, because the reporter does not treat a majority of *acute* cases? (What practitioner does?) Bönninghausen's assertions respecting medication, etc. rest on the foundation of cases observed by himself. His notions apply to chronic diseases, just those with which he himself is most conversant; a fact which he carefully points out in the *Archives*. The fact that his cases are chiefly chronic does not invalidate the credit of his reports; but, on the other hand, the fact that his practice, so long continued and extensive, has been so exclusively devoted to the treatment of chronic disease, gives to his assertions and opinions a weight that attaches to no other man's living, and no man ventures assertions and opinions, I believe, with stricter regard to truth.

It is sneeringly said that Bönninghausen was not educated a physician. Then, so far as knowledge goes, *he has educated himself*, and I have seen very few graduates of Edinburgh or the Josephine whom he need be ashamed to meet. That he has no regular diploma may be a good reason why some should deny him credence and fellowship. What a gloriously good reason it proved in the case of Dr. Good of famous memory! Don't think I don't value my sheepskin as much as any Edinburgh man of them all. But I have a higher reverence for the inward grace, the knowledge, than for the outward visible sign, the diploma, which may, after all, signify nought, and knowledge and veracity I found in Bönninghausen.

It has been also said, that in *office-practice* the physician has no control over his patients, who may either neglect to take his remedies, or may, unknown to him, employ another practitioner, and recover under *his* care, or may never visit the physician again, thus leaving him to *suppose the patient cured, and to report accordingly*, while in reality he has not been benefited, and has despaired of aid, etc. These remarks M. Ægidi made to me, and they are fudge! at least as regards Bön-

Hosted by Google

ninghausen. For, as for a *visit*, it is an interview between physician and patient. What matter whether it be held in the chamber of the latter or the studio of the former? If the patient choose to lie, he can do so as well there as here. Then, that he may, when *visited* by the physician, consult without that physician's knowledge another practitioner, we homœopaths well know, since every day people make their first trembling essays of homœopathy, carefully concealing the while their doings from the old family physician in attendance. Finally, whether a man shall report cases as *cured*, of whose termination he is merely left in ignorance by the cessation of the patient's visits to him (in the one case, or in the other, *by the physician being dismissed*)—that depends on the man's capability of appreciating evidence, and upon his honesty. I have this to say of Bönninghausen. He gave me free access to his journal. I compared with it all his published reports of cases, and found the latter to be *verbatim* copies. I noticed that in the journal no cases are noted as cured, unless the patient has been seen after treatment in a state of health. A case left *doubtful* by the cessation of the patient's visits is *marked doubtful* (*non vidi*), and is so reported (see *Archiv.*, pass.)

So much for the objection against his reports founded on his mode of practice. I took some pains to ascertain whether Bönninghausen's observation is trustworthy, and his reports strictly correct. To this end I did not scruple to visit persons who had been previously patients of his, whose cases were recorded in his journal, and get as accurate an account as possible from them, or their previous state and their cure. You may remember some cases recorded by him in the *New Archiv.*, vol. ii. pp. 89 et seq.) of cures by high potencies. They are alluded to in the *British Journal*, (vol. v. pp, 129, et seq.) rather incredulously too. The first is a case of phthisis so called; rational signs clear enough, the physical not sought; for Bönninghausen is no stethoscopist. The *British Journal* implies that this was not tubercular phthisis. I don't know that it was; *literal* phthisis it was, and the man was almost wasted to death. I saw the former patient, now in good health; he has slight dullness under the left clavicle; no other symptom of malady. I saw his family, the most absolutely and unmixedly strumous family I ever saw; saw his younger brother, just submitted to treatment, who, when I saw him, was expectorating softened tubercle, which occupied considerably the left lung. Whether these facts about the family render tuberculosis probable in the cured elder brother—judge. Several other persons, whose cases had been published, I saw and inquired of, and all others who were accessible, and finding Bönninghausen's statements in all cases *confirmed to the letter*, I gave his records of the rest my confidence.

Homœopathy spreads in the United States with almost incredible speed, and her roots are strong and take deep hold. The Ohio College of Homœopathic Medicine has more than a hundred students.

THE
HOMŒOPATHIC TIMES.

SATURDAY, DECEMBER 27TH, 1851.

PROFESSOR HENDERSON *versus* PROFESSOR SYME.

WHY does the "Association for the Protection of Homœopathic Practitioners and Students" not circulate, as soon as they appear, as many copies as possible of the admirable letters of Professor HENDERSON, Dr. JAMES RUSSELL, and whatever else, in this time of excitement on the subject of homœopathy, may be of use in showing the public the real facts of the case? Why is not a fund raised for this specific purpose? We take a great liberty in reprinting these admirable letters in our columns, but we do so from love of the Cause, that we may obtain as many readers for them as we can. Why do not all those, who sell the homœopathic literature, combine and put these striking and excellent productions into as wide a circulation as possible?

Professor HENDERSON should have the hearty sympathy and energetic co-operation of all, medical and non-medical, who profess faith in homœopathy. As the foremost man of our body in these realms, from his eminent faculties as well as from his position as one of the Professors in the University of Edinburgh, he is assailed more than any man—vindictively, meanly, and most undeservedly. We think that in the nobleness of his nature he will forgive the

Hosted by Google

freedom with which we reproduce his letters. In our last number, we gave at length Mr. SYME'S memorial, which has been referred by the Town Council to the College committee; the subjoined letter is Professor HENDERSON'S reply to Mr. SYME. We will not mar the effect of this admirable letter by making any remark on it.

*Professor Henderson to the Patrons of the University of Edinburgh.**

"MY LORD PROVOST AND GENTLEMEN,

"It has been my lot, more perhaps than that of any contemporary member of the profession to which I belong, to illustrate practically the saying of an eminent divine, 'that truth is a guest that often brings those who entertain her into trouble.' If I feel a little natural chagrin at so unaccountable a consequence, attached, doubtless for wise ends, to the highest of human privileges and duties, still I am neither tired of her good company, nor in the least disinclined to engage anew in her defence, the more especially perhaps, that on this, as on some other occasions, my own cause is identified with hers.

"These reflections are probably too sober as an introduction to the short criticism I am about to lay before you, of what I cannot but regard as the post-prandial Memorial of 'James Syme, Regius Professor of Clinical Surgery, unto the Honourable Patrons of the University of Edinburgh;' but as they are just and true, the incongruity may be pardoned, and all the more readily that the 'Memorial' alone is to blame for the different style of thought which follows.

"It 'humbly sheweth'—*first*, 'That your memorialist has a direct interest in the prosperity of the Medical School in the University of Edinburgh, as a source of emolument and professional character.' At a glance I recognised this passage as something of an old acquaintance. When I first knew Mr. Syme as an author, some twelve years since, he was in the very same key, groaning first over his endangered 'emoluments'—the 'idol seldom of the great and brave'—and next over the damaged honour of his office and his character.† In the present instance, they are put at the head of his memorial as an affecting exhibition of his case, calculated to excite the compassionate concurrence of his readers, in his thirteen following conclusions on the whole subject. It may be cruel, but I am bound in duty to deprive him of the advantage of such an appeal *ad misericordiam*. At least, I can aver that his 'emoluments' have been increasing for five or six years past; and as to his *character*, he knows as well as I do whether it has suffered of late or not—while of this I am certain, that it cannot have suffered, justly, from the cause he assigns in the Memorial—'the existence of a homœopathic professor in the Medical Faculty;' for it is not the conduct of another, however blamable, that can bring merited disgrace upon any man,—*that* can be effected only by his own act, as by a disregard of truth, of justice, of honesty, and similar old-fashioned virtues.

"The *second* and *third* heads of the Memorial call for no particular notice; the *fourth*, referring to the course of lectures on general pathology, runs thus:—'That great doubts have been entertained as to the needfulness of such a course of lectures, which was instituted about twenty years ago by government, without the approval or knowledge of the Patrons, who, at the suggestion of the Medical Faculty, on the first occasion of the chair being vacant, recommended the government to abolish it."

"Although all that concerns the institution and permanence of the chair of general pathology has been settled long since by wiser heads than ours, I may be permitted to remind Mr. Syme that, if opposition to the insertion of a new course of lectures into the medical curriculum be a sufficient evidence of its inutility, his own course is open to the very same condemnation which he insinuates against mine; for his immediate predecessor had to contend with a similar opposition to that which the late occupant of my chair had to deal with. He must admit, therefore, the absurdity of his fourth 'humble' observation, or take the alternative—like the savage who is satisfied with destruction if only his foe perish with him—of accompanying me in that descent from professorial honours and emoluments which he is so anxious I should undergo. It is no less curious than true, that those who need information the most are commonly the very persons who value it the least; and it is just because Mr. Syme knows so little of general pathology and homœopathy that he is so much opposed to both. The estimate which he and the few who agree with him entertain of general pathology, is founded very much on the grounds adverted to in the following passage from my last Introductory Lecture, which was written, however, without any special reference to Mr. Syme: 'It is not many years since professional men, not altogether destitute of information and common sense, objected to such a course as dangerous to the student, by seducing his mind from subjects that were solid and practical to regions of visionary principles and fictitious knowledge. But those who made the objection had looked rather far into the past for their conceptions of the science, and had failed to observe that even since their own education had been finished, a kind of knowledge had sprung up and accumulated which admitted of being sorted and sifted, arranged and laid out on an intelligible plan, altogether different from that which was followed by the lecturer on the details of individual diseases. It is quite true that, half a century ago, a course of general pathology was impossible in which the teacher was not obliged to expatiate at large in the realms of speculation and conjecture, for want of room to exercise his vocation on less debatable or more substantial ground. It is quite

* Letter to the Honourable the Patrons of the University, on the Memorial of Mr. Syme; by William Henderson, M.D., Professor of General Pathology. Edinburgh: W. P. Kennedy, St. Andrew Street. Glasgow: D. Bryce. London; Hamilton, Adams, and Co.

† See his "Letter to the Lord Provost," 1840.

Hosted by Google

otherwise now, and the easiest, the safest, and the shortest way to a knowledge of the ascertained truths of pathology, is just that *general* method which, if it formerly groped its way through a region of cloud-land, where it was liable to be mocked by deceptive shapes and shadows, has now fairly emerged from the mists, to breathe a purer atmosphere, and to cultivate a more productive soil.'

"After adverting to the expulsion of the Professor of General Pathology from the Medico-Chirurgical Society, on account of his public profession of homœopathy, Mr. Syme humbly shows, in the *seventh* place,—'That compulsory attendance upon a course of such questionable utility, and conducted by a professor so regarded by the profession, must constitute a serious obstacle to medical graduation in Edinburgh; in proof of which it may be mentioned, that while, during the last six years, the number of medical students attending lectures in the University has greatly increased, the number of degrees annually conferred has sustained a no less remarkable diminution.'

"That the decline in the number of graduates does *not* prove what is pretended in the above paragraph, appears very plainly from the following particulars. During the last five years there have been 283 graduates, while the number of students that attended the class of general pathology during the corresponding period was 356. There were, therefore, 73 students who chose to attend that class, and did not choose to graduate here; so that the class of general pathology, with all its disadvantages, is in more esteem than the degree! The numbers of graduates, and of students in the pathological class, were as follows, during the last five years, exclusive of the students for the present session:—

"In 1847 there were	58	graduates	from a class of	70
1848	..	..	63	..	..	..	63
1849	..	..	50	..	..	..	73
1850	..	..	67	..	..	..	89
1851	..	..	45	..	..	.	61

"I may add, in further proof of the recklessness of the singular memorialist, that in Glasgow, while the number of medical students was the same in 1850 as in 1844, the number of graduates had declined from 45 to 29.

"In a former letter to the Patrons I pointed out the true causes of the decline in the number of graduates, and quoted from this very Mr. Syme a passage which traced the truant youths to a University 'which possesses no medical school,' and yet, 'by a shameful prostitution of her privileges, confers the degree of M.D. on candidates who have never studied a day within her walls.' This *very shameful* and lucrative behaviour has made, in the six years from 1845 to 1850 inclusive, 304 graduates, and on easier terms than we can afford to make them here.

"I have been, indeed, 'expelled' from the Medico-Chirurgical Society, and bear the intended insult with that

'Patience that softens every sad extreme,
* * * * *
And smiling sees the ingratitude of friends,'

satisfied, when I waste a thought on reputation, that *time*, which 'deals impartial infamy and fame,' will change our relative positions, in the estimate of such, if there be any so ignorant, as now regard the persecuting act of an unmanly and domineering sect as capable of disgracing any one; and that the men of other days, who shall reap the fruits of the hardships and contendings of those who now bear 'the burden and heat of the day' in the cause of truth and humanity, will remember us with gratitude, while those who at present load us with contumely shall be forgotten or despised.

"But this, again, is far too solemn a style for the post-prandial Memorial, and I proceed, for variety, to the only two humorous counts in the whole category. They are Nos. 12 and 13. The former runs thus—No. 11 having correctly stated that the obnoxious professor was appointed '*ad vitam aut culpam*,'—

"'That as there can be no greater fault committed by a professor than deserting the established principles of his profession, and openly maintaining others directly opposed to those which he and his colleagues were appointed to teach, the Patrons have at present a clear right to depose the Professor of General Pathology.' And No. 13 says, 'That if any doubt should be entertained as to this being the case, the Royal Colleges of Physicians and Surgeons could at once remove it by the expression of their opinion.'

"The humour of the latter passage consists in this, that Mr. Syme, who is as well known in the Court of Session as ever 'poor Peter Peebles' was in his best or worst days, and is as constantly on the *qui vive* for an action of damages, (I mean no disparagement to either gentleman,) comically ignores another college—the College of Justice, which most people would be apt to think a very likely party to have something to say in a matter of this sort! But I shall take the proposition as if it were seriously put, and say this in reply, That if Mr. Syme, or the Colleges of Physicians and Surgeons, will tell me plainly what 'the established principles' of pathology are, or were, which the Professor of General Pathology was 'appointed to teach,' and in what particulars he has 'deserted' them, I shall engage for that Professor that he shall *resign his chair*, or give all its 'emoluments' to Mr. Syme, which the latter would doubtless prefer. Appointed to teach 'the established principles!'—as if the Honourable the Patrons, and the staff of Medical Professors, were resuscitated mummies, of that period of Egyptian history when it was enacted that no practitioners of the healing art should depart from the faith of their fathers and grandmothers! The jest is not bad, but as it is uttered with some gravity, it may, though a grave face is an accomplishment in a man of humour, be mistaken by dull people for earnest, so that I must stand to my offer; and if it be not accepted, the same sort of people will be apt to think that Mr. Syme makes his parade of accusations in the full knowledge that they are untrue, and that the Memorial is a mere ebullition of temper, excited by the very awkward disclosures contained in my 'Letter to the President of the Medico-Chirurgical Society.'

Hosted by Google

"Mr. Syme's *eighth* conclusion is, 'That the existence of a homœopathic professor in the Medical Faculty' has, besides other evils, had the effect, 'as it can be proved, of preventing students from being sent here for their education;' and I believe it to be quite possible that there are medical men so bitter on the subject of my opinions, though these have no connection with the proper duties of my chair, as to keep away their relatives and dependents in the hope of starving me into submission to their views, or of maddening my colleagues into memorialists. I have not the advantage of a private fortune like Mr. Syme's, and I can less easily dispense with the emoluments of a chair; but I am thankful that I am able to say, in all plainness and sincerity, that I would far rather see the school without a pupil, than the Medical Faculty of this Scottish capital degraded, and that, too, with the sacred name of Science on their lips, into a catchpenny gang competing for pupils at the sacrifice of independence. Away with the sordid argument of emoluments and number of students, of the opinions of 'interested enemies,' and such idle tales, when the high question is the truth of a grand principle in science, on which depends, in a great measure, the well-being of the human family, and which appeals, in justification of its pretensions, not to ancestral authority, or to the uninformed decisions of colleges, or to the spleeny acts of obscure societies, or to *a priori* absurdities, but to experiment, and to the sane human understanding, as the interpreter and judge of experiment.

"Mr. Syme's only argument against homœopathy is, that it 'is regarded by the medical profession of Great Britain as a delusion;' but he omits to say, that this is a misfortune which is lessening so fast, that almost every month we have to announce the accession of fresh adherents to the new doctrine,—of men, too, who do not pretend to settle for Nature what she can or cannot do, but 'humbly show' their good sense and filial respect by sitting teachably at her feet. New truths, that were far in advance of the intelligence and anticipations of the multitude, have always been at first welcomed only by the few; but as time has ever made amends for such incivility, we confidently expect that our principles will, at no very distant date, be also the principles of the medical profession of Great Britain, and meanwhile we may be pardoned for appropriating a little of this consolation,—Satis triumphat veritas si apud paucos bonosque accepta; nec enim indoles ejus est placere multis.

"In connection with this point, I cannot conclude more triumphantly than by quoting a passage from the writings of an illustrious colleague, whose sympathies I have no doubt are entirely with the minority in this disgraceful persecution, and whose authority, as a philosopher and man of genius, dwarfs into utter insignificance the puny logic of the Memorial:

"'And why,' says Sir William Hamilton, 'should a multitude afford any presumption in favour of the opinions which it espouses? On the contrary, '*argumentum pessimi turba est.*' The height of a crowd is no higher than the highest man in it. This is true, both physically and intellectually. But in a crowd intellectually there is even a tendency to bring down the higher minds to a lower level; for all experience shows that men under the sympathy—the mutual mesmerism—of numbers do enthusiastically in a body what, had they been left to their individual judgments and responsibilities, many of them would have ridiculed or condemned..... Thus it is that of itself the public belief of bodies is far more lightly taken up than the private belief of individuals.'

"I have the honour to be,
"My Lord and Gentlemen,
"Your very obedient servant,
"WILLIAM HENDERSON."

THE MEDICAL TIMES AND MR. SPENCER T. HALL.

IN our journal of December 6, we briefly commented upon an attack made upon our body by the *Medical Times* of November 29, under the title of "Unlicensed Homœopaths," which comments we should have no objection to repeat were it necessary, as we see no reason to change our views as then expressed. Mr. SPENCER T. HALL, the individual alluded to by the *Medical Times*, has excited their ire by publishing a pamphlet, oddly enough inscribed to the Homœopathic Medical College of Pennsylvania, the sole aim of which, he informs the reader, "is to serve humanity, by placing in a fair light such motives for taking up the Cause as must have actuated many besides the writer, but which are often grievously misrepresented or overlooked by those who will not or cannot examine them in a right spirit." We had not read Mr. T. HALL's pamphlet, nor seen his communication of December 2, which appears in our present number, when we penned our observations of December 6, in answer to the wholesale charge of the *Medical Times*, which we now reprint entire from that journal, in order that our readers may understand more clearly the question at issue between the parties. We must say that our moral nature revolts at such unpardonable misrepresentations and wholesale delivery of untruths as our allopathic contemporaries delight in.

"UNLICENSED HOMŒOPATHS."

"In the unanimous protest which the profession is now making against the absurdities and the dangers of homœopathy, one point appears to us to have been somewhat overlooked.

"The question between us and the homœopaths is often looked at by the public, and is always argued by the globulists, as if it were a discussion between two great sections of the body medical. It is, on the contrary, a ques-

Hosted by Google

tion between the medical body and a sect, the members of which have, for the most part, received no medical education whatever. There are, we all know, some few homœopathic practitioners who have been duly instructed in the sciences which form the substratum of therapeutics, and who now cling, with immovable tenacity, to the diplomas of that body whose authority they attempt to undermine. But these men are in the minority. The great mass of homœopathists are individuals who are tampering with the lives of their fellow-beings, without the least knowledge of the structure of the frame they meddle with, or the least insight into the physiological actions they are called on to control. Medically speaking, they are totally uneducated, and have for the most part abandoned trades and callings, often very humble ones, to pursue a more profitable employment in the land of Gulls. It is, indeed, most extraordinary that an educated man, who would take good care that his carpenter or his tailor should be well trained in his calling, and who would not trust the repair of his carriage or his coat except to some one who had been brought up and properly taught to do the work, should not use equal discretion when the thing to be repaired is his own health, or that of those nearest and dearest to him.*

"We would strongly advise our readers to make themselves acquainted, if possible, with the antecedents of the homœopaths who may practise near them, and to make known, temperately but firmly, to their patients, the kind and degree of medical training which these impostors have had.

"Our brethren at Doncaster have at present an opportunity of doing this. A certain Mr. Spencer Hall has been long known as an itinerant lecturer on mesmerism, on phrenology,—on everything, in fact, which could draw half-crowns in his direction. Lately, however, the trade has become slow; the lovers of novelty and excitement have had enough of Spencer Hall, and a change of scene became necessary. Mr. Spencer Hall has turned, of course, homœopathist, and, after a brief sojourn at Sunderland, has decided on honouring Doncaster with the light of his countenance. He announces his presence in that favoured locality by a modest pamphlet, in which he relates a marvellous story of his conversion to homœopathy, which is no doubt about as true as the mesmeric feats of his pristine career.

"Mr. Spencer Hall has no diploma, and has received no medical education. Feeling, no doubt,—for he is a man who knows the world,—that it is well to make people think that he is skilled in all the learning of the Egyptians, he has published his pamphlet to explain how it is he has no degree. He wishes to make it appear that he received his medical education at Edinburgh, but having become an homœopath, that he was deterred, at the last hour, by scruples of conscience, from presenting himself for examination! But, unfortunately for him, he has convicted himself. At the commencement of his pamphlet he states that he went to Edinburgh in the autumn of 1844, while at page 10 he informs us that he left that place in 1845. Now, after some months' residence only, he *could not* have been eligible for examination according to the rules of the University, and therefore, the story of his struggle with himself on the eve of the day of examination, as to whether he should take his degree, must be classed among those other fables which compose the literature of the singular sect which at present numbers Mr. Spencer Hall among its followers. According, therefore, to his own showing, Mr. Spencer Hall could not at the very utmost have attended more than a few months in the classes of the University; and moreover, we are enabled confidently to affirm that the name of 'Spencer Hall' *does not appear in the matriculation book of the University of Edinburgh between the years* 1840 *and* 1850. The attempt, then, to make it appear that he completed a regular medical education altogether breaks down. We trust that the intelligent inhabitants of Doncaster will treat this man as he deserves, and that they will not allow themselves to be duped by representations which are at once seen through by all who are acquainted with the subject. A more disingenuous pamphlet than that published by this man we have never read; and luckily Mr. Spencer Hall, in spite of his experience in the art, must in this instance fail to throw dust in the eyes of the public."—*Medical Times,* November 29, 1851.

To the Editor of the Homœopathic Times.

SIR,—Will you do homœopathy and me the justice to notice the following facts? The Editor of the *Medical Times*, annoyed by my publication of the enclosed tract, but finding nothing in my statements that he can *honestly* object to, has, in his last number, resorted to a gross falsehood, in charging me with having therein professed to have studied at Edinburgh up to the point of *examination;* whilst, on the contrary, what I have said is—that I laid aside my intention of doing so *on the eve of the last day allowed for matriculation.* (See pages 8, 9. 10.) I wish you would, for the sake of truth and justice, glance at that article in the *Medical Times,* and deal with it as it deserves.

First, the custom of such publications is, to denounce all men who, for the liberty to exercise their talents on the homœopathic principle, obtain in the regular way only such diplomas as this country will at present grant; and, next, they attempt to vilify any man who may choose, as a humble medical assistant, to make himself as useful as he can without one. The latter—so far as homœopathy is concerned—happens at present to be my own position; and I never made a profession of being connected with practice in any way that the facts of that position would not fully justify.

* Perhaps the *Medical Times* will be sufficiently honest to inform its readers who are most culpable for their ignorance, the allopaths, who, according to its Editors, are, *as a body*, "deficient in general education," and possessed of "slender abilities," or the homœopaths, who have proved to that Journal their acquaintance with allopathic as well as homœopathic practice.—ED.

Hosted by Google

As to the charge which the *Medical Times* makes of my having taken up homœopathy, because other pursuits were found less profitable, I will only say that Dr. Dunn (with whom I am engaged), Dr. Thomas Hayle, and other gentlemen connected with the profession, well know, and I feel sure would testify, that, partly by their wish, and partly from my own desire to do that which may be most useful to my fellow-creatures, I have resisted inducements to enter other walks far more inviting, had personal ease or pecuniary profit been my object. And though it was not my nature to hoard the money I was wont at any time to gain by my scientific lectures, but to spend it in furthering the cause for which I was labouring, so that often my means were temporarily reduced below par; so far from my having given up that course of action because it had "ceased to bring half-crowns," I can prove my having relinquished highly profitable engagements already made, to deliver lectures in London, at Windsor, and in Russia, to which country my passage was taken for me under most flattering auspices; and even yet proposals of a similar kind are frequently made to me, did I think well to accept them.

The *Medical Times*, and all such publications, may go on with their scurrility, if that be *their* highest mission. I feel persuaded that mere abuse will never permanently harm an honest cause. But when a falsehood, so direct as that now complained of, is palmed upon the public by the recognised organ of any class of the profession, it ought to be duly noted and reprobated.

I am, Sir, yours respectfully,
SPENCER T. HALL.

Doncaster, Dec. 2, 1851.

To assist Mr. S. HALL in vindicating his character, we most willingly reprint the following passages from his pamphlet:

"Is it not universally known that one particle of vaccine may suffice for the infection of a hundred persons *seriatim*, and generate the cow-pock in every one of them? That a particle of musk will scent a large room for years,—affect the olfactory organs, it may be, of a thousand persons,—and this without any perceptible diminution of its original quantity? Or, to use the apt words of my friend, Dr. Thomas Hayle, 'are not the causes of the most virulent plagues which occasionally decimate, and may one day depopulate our globe, equally imponderable, intangible, and invisible; and is there any great absurdity in attempting to meet agents of so subtle a nature by agencies themselves as subtle?' At all events, I, who had so often seen the effects of a single pass of the hand, or even of a silent thought, in zoomagnetism, was hardly in a position to deem any agency impotent, merely on the ground that it could not be cut or weighed; and my mind remained open.

"But here there occurred for me a difficulty*

altogether of another kind. *The latest day on which I could* MATRICULATE, *so as to secure the full privileges of the session, was at hand.* I had already the burden of one heterodox *ism*, and an almost equally heterodox *ology*, to carry through the purposed curriculum; and it was morally certain that if, in addition to these, the bulk of my belief were swelled with a *pathy* more heterodox than both of them together, it would be almost as easy for a camel to pass through the eye of a needle, as for me (*whatever time I might spend*) to make a frank avowal of my real sentiments, and go through a final examination at the University unscathed. Indeed, more than one of my friends suggested the propriety of smothering these new opinions until that ordeal were passed, and told me plainly of the probable consequences, should I disregard their warning.

"The temptation to comply with this suggestion was, in one sense, great. Edinburgh, with its intelligent society, its romantic scenery, and its scientific, historical, and poetical associations, was fast becoming as it were the home of my intellect and ambition. Some of its most enlightened philosophers and literati encouraged me to stay and persevere, and families of considerable influence pledged themselves to support me in the profession if I did. These matters of fact are mentioned by me now, not in the way of boast, but as an honest though inadequate testimony to that truth, to profess which is to incur, from many, the imputation of quackery and mercenary motives. For, on the other side of the question, there spoke a voice from within, around, and above me—in whispers at first—more loudly as the hour drew near—and told me how unfitted I was by my convictions for sustaining so artificial a part; and that, even if successful, all the honours of my position would wither in the reflection, that they were purchased at the expense of a principle which had hitherto been my truest friend in every emergency of life.

"*It is impossible for me ever to forget the wrestling with my* SELF *on the eve of the day upon which I was to take the decisive step;*" and it may be worth noting, as an illustration of the power of the mind over the body, that in this hand-to-hand conflict between two principles, a pulse, ordinarily steady at about 60, had arisen by midnight to 112, the mouth becoming clammy, and the brain compressed, when no alternative remained but to yield to the higher sense of duty or perish; for the liberty of choosing appeared at length to be denied me. The repose of submission—*the feeling of 'Thy will be done,'* which followed—seemed at length to pervade every organ in my frame; my pulse rapidly calmed down to its usual flow; instead of feeling as though the brain were compressed in a leaden universe, my whole being seemed at once enlightened and emancipated; in gratitude I resolved that no inducement on earth should ever make me profess that it was right the image of God should be drugged, and flayed, and drained of its life

* What goes before and after clearly implies to any considerate mind, that the *difficulty* alluded to here means something very different from the construction put upon it by the *Medical Times*.

* Of matriculation—clearly—as indicated by the antecedent.

Hosted by Google

by the lancet, where milder, safer, and more certain means could manifestly be used; and, TO THE REGRET OF MY FRIENDS, I GAVE UP, FOR THE TIME, ALL INTENTION OF BECOMING A 'REGULAR' PHYSICIAN."

After this, we again challenge the *Medical Times* "to produce his list of unlicensed homœopaths." We *now* challenge him to cite *any* example of persons calling themselves *medical practitioners*, who practise homœopathy without diploma or license. At the same time we would remind that journalist how he conducted himself towards Mr. BRADY in refusing insertion to his second letter. We confess our surprise that this recollection did uot arouse within us suspicions. Mr. BRADY'S rejected letter was published in the *Homœopathic Times*, vol. ii. p. 718, and it may afford Mr. SPENCER HALL, while yet *without* a diploma, some consolation to read that letter. Mr. BRADY told the *Medical Times* of 1851, that the *Medical Times* of November 6, 1847, quoted the Ex-President of the College of Surgeons, as having said, in evidence before a Parliamentary Committee, that "the great body of the College members were deficient in general education, and with a very limited stock of general knowledge; that they were, in fact, only fitted to occupy certain country stations, and to exercise their slender abilities on pauper patients!"

The Editor of the *Medical Times* further writes: "We must not disguise the truth from ourselves, that the doctor-making of this empire is a money-making speculation in the hands of a few individuals. Is it wonderful then, that without legal check or surveillance, men become surgeons and physicians who are unacquainted with the very elements of their own language?" After this, Mr. HALL, while simply acting as an assistant, may rest perfectly satisfied with his present credentials. Knowledge is precious, and above all price, come from where it will, as testified by the London Royal College of Physicians, before which august body papers are sometimes read by *non*-professionals. Nevertheless, before Mr. HALL assumes the title of *medical* practitioner, we trust he will obtain a legal document of higher value than that alluded to by the *Medical Times*, and that he will not, like too many of the allopathic M.D.s., pride himself on a bought plumage, but will proceed before an Examining Board, whether in our own country, or in Pennsylvania, should we not have our own Examining Board by the time he is prepared. While we deprecate any one calling himself *medical*, who has not gone through the usual curriculum which confers the right of such title, we cannot conclude, while upon the subject of *privilege*, better than by alluding to the observations of our very able and learned colleague, Dr. G. M. SCOTT, of Glasgow, whose views amalgamate so closely with our own, that we may add, that it was a belief similar to his own that first led us to establish this popular periodical, and the persecution we have had to endure, shows we were not mistaken in our conviction of the necessity for such a paper.

Dr. SCOTT writes thus in his paper, in the *Homœopathic Times*, vol. ii. p. 449:—

"An apology may be deemed requisite for having in any way introduced into popular discussion a subject strictly appropriate to the halls of medical science. To me, this appears the only way of imparting anything like truth and reason to those conversational discussions which are carried on in unprofessional circles. The time has passed, fortunately or unfortunately, when the professional man could stand upon enclosed ground, on which the foot of the uninitiated dare not tread; the professor's cloak is no longer a cloud of holy mystery, which the vulgar eye cannot penetrate—every science is thrown open to the world,—the high walks of theology are trodden with as firm a step by layman as by priest—botany and chemistry, anatomy and physiology, are all open to men of every class—nay, the arduous science of politics and legislation, which was formerly thought more than sufficient to occupy minds of the widest grasp, is now found to involve no question beyond the reach of any casual journalist, whose nightly efforts can render it a fit recreation to amuse the leisure hours of the hardest-wrought mechanic; so rapid (in advance or in retreat) has been our '*march of intellect.*' I do not say that all this is *well;* but that such is undoubtedly the fact. The overwhelming tide of eager inquiry and fearless research has broken down the various distinctions of society, professional and otherwise, and no floodgate now can check its course—it must be *directed*—not *resisted*, but *regulated.* Nor, indeed, to speak truly, do I

Hosted by Google

understand why, of all branches of science connected with medicine, the practical department—that which most nearly concerns all men—should be the only one to which all men are not admitted."

Correspondence.

CORRESPONDENCE BETWEEN PROFESSOR SIMPSON AND DR. RUTHERFORD RUSSELL.

To the Editor of the Edinburgh News.

75, Queen Street, Dec. 18, 1851.

SIR,—Dr. Simpson has thought proper to appeal to the public in a letter addressed to me. Permit me, through the medium of your columns, to contribute the complement of the correspondence of which he has afforded a part. When I saw the advertisement of his intention, I wrote to him, requesting the return of my letters, or copies of them. This obvious justice he has not rendered. Had he done so, I would have shown that the trivial error I made in my first was corrected in my second, of which I did not preserve copies, and on this corrected error he has insinuated a charge of dishonesty against me. As he admits that he was in the habit of meeting me whenever he was asked, it is manifestly impertinent, in every sense of the word, to enter into a detail of the individual cases in which I never should have consulted him had I known him capable of this breach of professional confidence, and I consider that this violation of decorum and delicacy is far more culpable in the occupant of his peculiar chair than could be "the fault" for which Mr. Syme modestly petitions the Town Council to cashier Dr. Henderson.—I am, etc.,

J. RUTHERFURD RUSSELL.

(COPY.)

Dr. Russell to Dr. Simpson.

75, Queen Street, Dec. 6, 1851.

DEAR SIR,—I observe thst in the speech you delivered at the recent meeting of the Medico-Chirurgieal Society, you speak of having met homœopathic practitioners only twice, and on both of the occasions it was Professor Henderson. You must have forgotten that you have met me several times, and that you signed a formal letter along with me, beginning "We met this day in consultation." I take it for granted that you will use the first opportunity of correcting this inadvertence, as of course its correction will come with a much better grace from you than from me. May I request a reply to this.—Yours truly,

J. RUTHERFURD RUSSELL.

Having got no answer, I wrote again on the 9th, directing Dr. Simpson's attention to my former letter, and stating that, having looked at his speech again, I found I was wrong in attributing these very words to him; but that the meaning I had imputed to him was implied by them.

Dr. Simpson to Dr. Russell.

52, Queen Street, Tuesday, Dec. 9, 1851.

DEAR SIR,—Since receiving your letter on Friday, I have really not had ten minutes of spare time to answer it. And, let me add (notwithstanding your second note of yesterday), I do not, after all, see how you could very well expect me to take the trouble of writing a reply. For you state,—"I observe that, in a speech you delivered at the recent meeting of the Medico-Chirurgical Society, you speak of having met homœopathic practitioners only twice, and on both occasions referred to it was Professor Henderson."

Now you must excuse me saying, and I say it with pain, that you never did "observe" any such statement in my speech; for no such statement exists in it.

You add,—"You must have forgotten that you have met me upon several occasions." Not at all; but the subject of meeting or not meeting with you was not in any way, I assure you, before the Medico-Chirurgical Society; and even the remarks about meeting Dr. Henderson were only incidentally, perhaps improperly, introduced, when the real matter of consideration before the Society was, in truth, a matter of principle, and not of persons; and when the question was, not what we had done with homœopathists in times past, but what relations we should have with them for the future.

As you seem in your note to think it desirable that I should state that I had met you at cases, let me add, what of course I have no hesitation in doing, that in former times I have seen, with you, four or five of your nearest female relatives; and a young lady (the case you particularise in your letter) suffering under occasional hysterical mania, to prevent whom from being forced into circumstances of apparent danger to her state of mind and health, I signed a certificate or statement of her condition.

It is possible I may have seen one or two other cases with you; but if so, I have no recollection of them. I have other and far more important matters to burthen my memory with.

And do not suppose, as your letter would seem to imply, that I am in the least degree ashamed to acknowledge having met you at these cases in times past. In this respect, others and I have formerly (and perhaps reprehensibly) erred through mere excess of good-nature and kindness towards you. But that is entirely a different question from the question of meeting you or other homœopathists for the future, now that the Colleges have declared, in their corporate capacity, the impropriety of even *seeming* to admit in any degree the legitimacy of so-called homœopathic medicine, by the members of our profession meeting at cases with practitioners of homœopathy, for diagnostic or other purposes. In that opinion, and in that step, I most heartily concur. You believe that a millionth, or a billionth, or a decillionth of a grain of this or that medicine may cure this or that disease; and I

Hosted by Google

give *you* full credit for your honesty of belief. But at the same time you must accord *me* also full credit for my honesty of belief, that, in all this, homœopathists practise upon their own minds, and upon the minds of the public, the grossest deception. And if others and I have now attained (as the profession at large have) to this conviction, you can neither, I think, feel astonished nor irritated at our coming at last to the conclusion of refusing, both as a body and as individuals, to abet in any way what we conscientiously look upon as a system of consummate charlatanry.

Yours, etc., J. Y. Simpson.

P.S.—As I have stated in the body of the letter, it is possible I may have seen with you one or two cases more than those I have alluded to, without being able to recall any remembrance of them whatever at present. Your friend Dr. Henderson has, in his letter, brought back to my recollection, what I had entirely forgotten,—viz., seeing with him, years ago, a previous patient of his, a member of Mr. Chalmers's family, who was afterwards placed for some time under my professional charge. He states also, that in the case of a patient of his, where I applied potassa fusa for induration of the cervix uteri, he was with me at one of my vi-its: or at least he has brought forward a letter from a relative saying as much. Most assuredly, if such were the fact, I have not the very slightest remembrance of it, and I have quite in vain attempted to recall any recollection of my ever meeting him at the bedside of that patient. Had it been otherwise, I would have freely acknowledged the circumstance, when referring to the case in the speech you allude to: just as in it I freely acknowledged Dr. H. being present with me in a case in which I removed a polypus from the uterus. —J. Y. S.

Dr. Russell to Dr. Simpson.

75, Queen Street, Dec. 10, 1851.

Dear Sir,—I have to acknowledge your letter of yesterday's date. It confirms the statement I made that you were in the habit of meeting with me in consultation. Notwithstanding your petulant remonstrance, I consider myself entitled to obtain from yon a contradiction of the impression your speech made, and which was fully justified by its construction—viz., that you were detailing the few exceptional cases in which you met homœopathic practitioners. If this was not the meaning of the speech, its only design must have been to make a personal attack on Dr, Henderson, and introduce Mr. ——'s name in a way certain to give offence.

I shall be glad to have your opinion on homœopathy after you have studied it, and when you shall have acquired the courtesy of style which is essential to conducting a correspondence in the manner to which I am used, and from which I cannot consent, even for your sake, to deviate.—I am, etc.,

J. Rutherfurd Russell.

[We have given this correspondence that our readers may judge for themselves of the war among the doctors in Edinburgh, and of the different *animus* of Professor Simpson and our colleague, Dr. Russell.]

Chester Homœopathic Dispensary.—*Case. Sick Headache.*—Mrs. —, aged 46, has been afflicted with attacks of sick headache for ten years. She has a miserable expression, is pale, and has a dirty, dark-coloured ring around the eyes. Complains of a numb tingling in the fingers, as if they were asleep, which prevents her holding her needle. As she ought to earn her livelihood by her needle, she feels this affliction severely. The tingling is so much worse at night, that it usually awakens her about two o'clock and prevents her taking any more sleep. Her attacks of headache come on two or three times a week, attended by sickness, drowsiness, and increased flow of urine; her bowels are costive, and the evacuations like marbles. Prescribed *Cocculus* 3, one pilule thrice a day. July 10th. Has had no headache since she was here, ten days ago; fingers the same; bowels less confined. 17th. The painful tingling and numb aching in the fingers continue the same; no return of headache. *Nux* 30, one pilule night and morning. August 3rd. The tingling and numbness the same, or rather worse. Ordered *Sulphur* 30, one pilule night and morning, and to use the galvanic battery for half an hour every day. 15th. Reports that while she holds the wires of the battery, the numbness and tingling entirely disappear, and although there is afterwards some return of the sensation, it is upon the whole much better. She feels more cheerful, and stronger and better generally after the galvanism. Her health is altogether better, and she has had no return of sick headache as yet. Continue *Sulphur* and the galvanism. 27th. Has only been able to take galvanism three times since she was here. The tingling in the fingers she feels slightly at times, and the touch is not yet so fine as to enable her to sew; but considering the numbness has troubled her for three years, she expresses herself much pleased. Continue. Sept. 13th. Has continued the medicine and the galvanism up to the present time. Considers herself quite well; is able to sew as well as ever, and has remained free from her attacks of sick headache. *Observation.*—The writer records this case, in which galvanism cured a nervous tingling of the fingers, and *Cocculus* periodical attacks of sick headache of great severity, because the good effects of galvanism have hitherto been, in his experience, of extremely rare occurrence. A tingling and numbness in the fingers is not an unfrequent complaint, but the degree of severity, as stated above, is unusual.

A VISION OF HOMŒOPATHY AS IT IS AND SHALL BE.

BY E. V. N.

As I sat now musing on the past, and then reviewing the circumstances and difficulties of the present, a spirit of the future descended upon me, and led me twenty years along the pathway of life, thus discoursing as it went,—

You are discouraged and perplexed because of the uncertainties of your profession; tried men and true seem to be falling, and the shades of hesitancy and doubt fast gathering over the minds of many. The character of the times impresses you with the conviction, that the commotions that are now shaking the world of medicine are either the pioneers of a more perfect and fully developed science or the last faint glimmerings of a departing light; that the rancour and bitterness that tinge the words and actions of a thousand of the allopathic medical profession betoken either a thorough contempt for or dread of the hundred and a half of homœopathic practitioners, that globulize and monopolize a vast and vastly increasing portion of the British sick.

You ask what we are against so many? What else can we expect save a life of perpetual drag and dolour? What chance of establishment has homœopathy, surrounded as it is on all sides by men who consider no species of rascality base enough, no measure of vituperation mean enough to hurl against a system they know not; who regard no amount of infamy and baseness bad enough to impute to a class of men infinitely more worthy and truthful than even their vain-glorious and interested detractors are.

But that you may be comforted as to the future, come, see homœopathy as it is and as it shall be.

Standing as you are at the far end of 1851, lift up your eyes, open your ears, exercise your judgment, and tell me if homœopathy is hopeless. See it with hospitals, with dispensaries, with practitioners, with chemists, with patients, with associations, with "journals," with "Times," with lectures, with letters, with tracts, with volumes innumerable. Behold it with statistics; follow it in practice; imagine it in cures; inquire for it at the cottage; ask for it at the palace; hear its loud praises from the poor; listen to the low but audible murmur of applause that falls from the rich. Take it in its height and depth, length and breadth, review its years, ponder its worth, and say may you not go on your way rejoicing.

To see homœopathy as it is, you must get behind the scenes, and above the prejudices of the people. Thousands are reading, thousands are thinking, thousands are convinced, and thousands are hesitating—hesitating *not as* to its truth, undecided not as to its merits, but hesitating whether old associations and friendships are to be broken up. Whether the ill-will of him who for years has drugged the family is to be endured or the child die, or whether globules and the globulist are to be called in and the patient live. Whether Dr. C., whose hatred for quacks is so great and well known, won't withdraw his support from the shop. Whether aunt K. won't disown us for discarding her favourite medicine, *Blue pill* and *Calomel*; or whether the Browns won't despise us as ignorant and mean, for calling in a man whom the whole profession regard as a schemer.

Homœopathy as it is, stands a fixed and settled principle; its days of warfare are over; its struggles are at an end; fifty years' life has given it fifty years' strength, and fifty years' strength has given it a hold in the world which dreads no longer death and destruction; it fears no more the keen inquiring eye; all it wants, all it needs, is light to show itself, and room to move itself. The cry no longer is "homœopathy is false," but "homœopathy is true and we are undone;" the cry rises not from the multitude, but from the few; not from the nation, but from the nation's doctors. The struggle now *is not* homœopathy for existence, but allopathy for *beef and bread*—allopathy for life. Already the stamp of decay has been impressed; already the cold shivers of death are drawing over a system of therapeutics as old and rotten as it

Hosted by Google

is false, and as false and rotten as it is old.

Let us leave "*Contraria contrariis curantur*" to the mercy of its friends and advocates; and look up the stream of time ten years, and see how it fares with "*Similia similibus curantur.*"

1861, what can you tell us, hast thou aught in thy cycle that can interest a traveller from 1851? Little, save men are wiser, doctors fewer, drugs disappearing, and death enjoying a holiday. Between the years '52 and '59, great were the efforts put forth by allopathy to lengthen its days. It pleaded its antiquity; its followers showed its hoary head and demanded reverence; they extolled its wisdom and experience, and entreated support; they predicted universal and everlasting epidemics, and broadly asserted the general adoption of homœopathy to be an evidence that time was drawing to an end; that it was a device of the "Old Serpent's" to hasten the last trumpet's sound; that it was a plot hatched in the councils of hell to draw the world down to the torments of perdition long before its time. Yet all availed not to save the sinking cause—die it would, in spite of all that was done for it; and when homœopathy received the patent of the legislature, and became the recognised doctrine of half a dozen British colleges, allopaths, *en masse*, were heard to exclaim, "Allopathy is gone—fled—vanished,

> "'And, like the baseless fabric of a vision,
> Left not a rack behind.'

As our system is gone, let us save ourselves; as our glory has departed, let us redeem our fortunes; as the evidences of our contempt and bitterness are so fresh and plentiful, let us show, by a complete and unreserved surrender of all hostilities, and a hearty and universal adoption of all the doctrines of homœopathy, that we were but ignorant creatures, with more blindness and selfishness in our thoughts than honesty in our hearts, with less love for truth and progression than hatred for innovation and change. That the world may believe us sincere, let us congregate in thousands and hurl poor old dead allopathy out of sight. Let our 'Lancets,' our 'protests,' our college resolutions, our scandalous works, and contemptuous publications be gathered together and burned as a sin-offering before the shrine of truth. Let those of our number who still cling to '*Contraria contrariis curantur*' be stigmatized as 'quacks;' branded as cheats and impostors; 'despised in consultations;' 'hated in society.' Let our universities, professors, and teachers solemnly declare and publish to the world the utility and splendour of Hahnemann's discovery. Let our students be encouraged to question and inquire. Let all who will, without the fear of 'laughter,' the dread of 'scorn,' or the horror of 'sneers,' be induced to go down into the depths of homœopathy and draw out of its recesses, bit by bit, and atom by atom, the still undiscovered horde of beauties and blessings its theory encircles."

And while the profession at large was thus doing and saying, I beheld the brethren in a certain northern capital no longer fulminating thunder and hurling blasts against the dead man of Meissen,—Hahnemann's name no longer reproached,—Hahnemann's followers no longer outlawed; but each and all striving to render homage to the name the people delight to honour, and rearing, in the centre of the quadrangle of their ancient and popular school, a monument to the glory of the man who first propounded "*Similia similibus curantur.*" And by the side of that same monument I heard a venerable professor, with tremulous voice, utter these words: "Men and brethren, from these halls have gone forth, again and again, the denouncement of apostacy against the man, and the sentence of reprobation against the system of the man, whose praises we are met this day to celebrate. From these halls has gone forth a mighty band, taught by us to revere and cherish the dead system of medicine, and to scout and flee the infinitesimal quackery. We laboured with all our might (with shame be it spoken) to overturn a system we knew not, to consider which we regarded as degradation, the ultimate triumph of which we believed morally impossible. We were among the first publicly to condemn; we have become the first publicly to confess that what we did we did ignorantly through unbelief. And on this spot, which we once thought no such thing would have occupied, we have raised a monument to perpetuate the name of Hahnemann—a monument which this University and its Patrons shall ever preserve and honour, not only as a memorial of departed greatness, not only as an acknowledgment of illustrious talent, nor yet alone as a small recompense for past offences, but also as a standing evidence to generations yet to come that truth will prevail, truth will ultimately triumph—triumph though colleges oppose and professors condemn."

So much for the strictly professional conquest of homœopathy; for a view of its more general effects, let us run ten years further up the course of time.

1871—how changed are the aspects

Hosted by Google

of affairs. What wonders time accomplishes. Twenty years ago, and that wonderful truth-revealing instrument which we now so largely employ, called the magnetoscope, had hardly opened its eyes on the light of the world. Twenty years ago, and mesmerism, that mighty all-pervading power of nature, was a despised and neglected pilgrim on earth, driven to and fro, sometimes sheltered and protected by men of science and learning, and sometimes driven out of house and hall as an unworthy reputation-destroying viper. Twenty years ago, and Britain could only muster 175 true disciples of Hahnemann. Twenty years ago, 10,000 allopathic doctors daily deluged the nation with rivers of "draughts," and buried the people under mountains of "pills and powders." Twenty years ago, our most popular curatives were blisters and bleedings, now lancets are unknown, and mustard only used when eating pork or beef. Twenty years ago, the mortality of our land annually exceeded 100,000; now, though diseases are not extirpated, sicknesses annihilated, or death vanquished, though epidemics still scourge our borders, and fevers lurk in our cellars, though phthisis still devours its victims, and dysentery overpowers its strong ones, still our yearly deaths are reduced by one-half; our limits of life more nearly approach the definite threescore and ten; our strong men are giants, and our weak men are mighty; the eternal druggery of 1851 is altogether unknown here. The only memorial of allopathic doses that exists, is the following copy taken from a framed prescription, hanging up as a curiosity in the hall of a London hospital:

John Thompson.

℞ Liq. Ammon. Acet., ʒj.
Tr. Hyoscyam., ℥x.
Vin. Ipecac., ℥v.
Syr. Papav., ʒss.
Aquæ, ʒx.
Fiat haust. 3tia vel 4ta qq. hor. s.:

and the only memorial of allopathic physic is a box of antibilious pills, which an old doctor's widow has preserved as a remembrancer of the palpable manner in which her poor dear husband was wont to *release* his patients.

"And now," said my seer, "go down to your place, and labour in your calling; be not deterred by vile imputations and hard names; let the frown nerve you to greater diligence, and more elaborate and careful examination of Hahnemann's laws; let the stigma of silliness and obscurity fall carelessly at your feet; let the abuse of the '*Medical Times*,' '*Lancet*,' etc., rejoice your heart as being the precursors of your fame and triumph; and when men revile and persecute you, thank them, and curse them not; and when men sneer at you and would falsely accuse you, answer them in meekness, knowing that the day of their shame is at hand."

PROFESSOR CHRISTISON AND DR. GEORGE E. STEWART.*

WE have great pleasure in calling the attention of our readers to these letters, in which Dr. Stewart has acquitted himself right well. This correspondence should be put into large circulation. We are glad that so intelligent and accomplished a man as Dr. Stewart has been added to our number.

Dr. Stewart to Dr. Christison.

"5, St. James's Square, 21st Nov., 1851.

"SIR,—I have been favoured with notes of a recent lecture by you (taken during its delivery), on the subject of homœopathy, in which I find the following passage:—'Edinburgh has been charged with sending forth eight homœopathic graduaets out of the forty-eight who graduated here last year: but I hardly believe this. If it is the case, they must have concealed from their examinators their true sentiments, and, for base ends, have declared themselves adherents of a system they believed to be false.'

"As I am one of those who believed in the superiority of the homœopathic system, at the time of graduation, I deem myself entitled to inquire whether the passage referred to contains a substantially correct report of what you said.

"I am, Sir, your obedient servant,

"GEORGE E. STEWART.

"To Dr. Christison."

Dr. Christison to Dr. Stewart.

"Moray Place, 22nd Nov., 1851.

"SIR,—I am sorry indeed that any graduate of the University of Edinburgh should have felt the necessity of making such a confession as that which I have received from you this morning.

"The cautions which I considered it my duty to give my students on the subject of homœopathy were only in part written, and that portion in many places not delivered as it was written: consequently, I cannot be certain of the terms actually used by me. I am quite certain, however, that the passage adverted to in your letter was not delivered in the terms in which you say it has been reported to you. As to the purport of the passage, my object was to express disapprobation of the conduct of any candidate for the medical degree of this university—if, indeed, there was any such—who in his examinations should give his examiners to understand that he believed in rational medicine and would practise it, while in his secret

* Correspondence between Professor Christison and Dr. George E. Stewart, on Homœopathy. Edinburgh: James Hogg, 4, Nicolson Street; James Brown, 34, South Castle Street.

Hosted by Google

heart he believed in homœopathy, or, at least, intended to practise according to its principles.

"I shall be sorry if, in expressing this disapprobation, I used language which could be justly interpreted as imputing base motives to one so circumstanced, because, when reluctantly compelled by my position to discuss this miserable subject, my wish has always been to state facts, but to leave it to my hearers to judge of motives for themselves; and if your informant was as anxious to report what might soothe, as to convey what would irritate, those whom I could not but censure, he must have told you that, at the close of my remarks, I begged to recall any statement I might have made which might seem to impute base motives to any individual professing homœopathic principles, and to avow my willingness to believe that many homœopathists are honest men, afflicted with lamentable delusions.

"I beg to add, that our correspondence on this subject must here terminate.

"I am, your obedient servant,

"R. CHRISTISON.

"Dr. Stewart."

We can only find space for some extracts from Dr. Stewart's second and long letter to the Professor; but we hope our readers will obtain and read this correspondence in full.

Dr. Stewart to Dr. Christison.

"In order to correct any false impressions which may have been left either on your own mind or on the minds of your students, I have now to state emphatically, that on no occasion during my examinations with a view to graduation did I ever make the slightest profession of any belief which I did not entertain. I had previously become fully satisfied of the truth and importance of the homœopathic law, and of the efficacy of infinitesimal doses, *given in accordance with it;* but on neither of these subjects was I, directly or indirectly, asked any questions; and it was certainly not my part to propose subjects for examination.

"Indeed, so entirely satisfied am I that, in such examinations, any questions tending to elicit a confession of belief, or of intentions in reference to practice, are entirely out of place and irregular, that I was quite prepared, had any such been put to me, to decline answering them upon that ground, and to abide the consequences, taking my appeal, in case of necessity, to the Senatus and Patrons of the University.

"A candidate for a degree is not, in my estimation, to be regarded as pledging himself to practise at all, much less to follow any particular method. He rests his claim for a diploma on the fact of his having, in the acquisition of medical knowledge, spent both time and money, for which the diploma is the receipt. If the examiners find, by his answers to their questions, that he has prosecuted his studies successfully, they recommend him for graduation, and here their responsibility ends. For his future conduct as a practitioner, he is answerable only to his own conscience and the laws of his country; and to neither of these tribunals need he fear to appeal, when the charge brought against him is that he has investigated a plan of treatment which he had heard stated to be superior to that he had been taught at college, and that, finding this declaration true, he dares to act upon it.

"In regard to the number of graduates, I am quite *certain* that five were believers in homœopathy at the time of graduation, and are now prosecuting its study, with a view to practice. I also know of as many more who had *then* a leaning to it, and who, I have no doubt, are now daily becoming more convinced of its superior efficacy."……

"It appears that in your view homœopathy and rational medicine are opposed; in mine, they are identified. Having pursued, with a fair measure of assiduity and success, my studies at the university—having had the advantage of the lessons of its teachers both as to the theory and the practice of therapeutics, I was fortunate enough to become acquainted with a mode of treatment not taught in the university, and, as it appears, unknown or misunderstood by most of the professors there; among whom, from the terms of your inaugural address, and from the notes I have seen of your lectures, I must believe you to be as *yet* included. I have thus had an opportunity of comparing for myself the homœopathic with the more generally received modes of treatment—which you appear not to have enjoyed—and the result has been a firm conviction of the vastly superior efficacy of homœopathy. But, in thus learning homœopathy, I have unlearned nothing valuable; and I am anxious to express my sense of obligation to those teachers from whom I have derived so much useful knowledge, without which I could not have occupied my present position. Surely a rational medicine, or, as I understand the term, one derived from reasoning on *facts*, is more likely to be found when the individual in search of it tries the merits of all the systems of medicine brought under his notice before he adopts any, than when, without such inquiry, he clings blindly to that which his fathers believed, and which he happens to have been first taught.

"I do not see, however, why, because I believe the homœopathic method of treatment so superior to all others as to consider it my privilege and my duty to practise it, I am at all bound to maintain that every other must of necessity be useless. Because I hold that with small doses, administered on the principle *similia similibus curantur*, cures are effected most speedily, and with greatest certainty and safety, I am by no means to be considered as denying that large doses, administered on some other principle or variety of principles, are capable of, to any extent, promoting recovery, far less as refusing to acknowledge that an amount of benefit may flow in some instances from the use of blisters, etc.; in fact, I am rather inclined to look upon blistering, and other means of counter-irritation, as a coarse kind of homœopathy. There is as much ground for the conclusion that, because I believe the affluent now cross the Atlantic in steamers, I must deny that sailing vessels also carry their human freight."……

"In your 'Dispensatory,' in speaking of belladonna as a prophylactic against scarlatina,

Hosted by Google

you say—'The alleged property [of preventing the invasion of scarlatina] has, however, been generally disbelieved in this country, mainly, perhaps, in consideration of the individual who first announced it, and who made use of the facts in his own way to support his wild theories respecting homœopathy. But, as the treatment is simple and safe, it seems irrational not to give it a fair trial, so long as there are hundreds of public institutions for children in Britain that every now and then are overrun and decimated by scarlatina.'

"In regard to your statement in the above extract, it is gratifying to observe that you award to Hahnemann his due; for we have found several journalists denying his claim to the discovery, and thus, by the by, fulfilling one of the conditions of a true discovery which you gave us in your inaugural address, that it must be denied before being generally accepted."....

"Have you taken the system of therapeutics given you by your teachers, and kept it sacred in the state in which it was when committed to you? Does any allopathist profess to do so? Have no alterations, no improvements, been made on it? Why, then, all your investigations, all your writings in favour of changes in formerly received notions? If all who were at one time your fellow-students, and who received the same instructions from the same teachers, had acted on this plan, how could there have arisen among them so many opposite views in regard to the treatment of the same cases"....

"I may also mention to you, that even your colleague, Dr. Simpson, has publicly in his class-room confessed to the efficacy of a medicine administered by him in accordance with the homœopathic law, at the suggestion of a homœopathist, and in not *very* small doses either.

"Towards the close of last winter session, when Dr. Arneth, of Vienna, was in Edinburgh, he was in the habit of attending Dr. Simpson's lectures. On one occasion, in Dr. Arneth's presence, I recollect that Dr. Simpson told his class of a case of vomiting during pregnancy then under his care. He had launched forth in succession all his allopathic appliances—opium, naphtha, prussic acid, etc. (I forget if chloroform was also used)—but without relieving the patient. He had either taken Dr. Arneth to see it, or had told him about it, and the latter recommended him to try either a quarter or half a grain of ipecacuanha, I do not recollect which. He acted upon this suggestion, and with decided good results. Dr. Simpson made a remark to the effect, that this, no doubt, looked very like homœopathy, but yet that he was bound to acknowledge the fact".....

"I must say, it is not obvious to me how reason either must, or can, reject the theory of infinitesimal doses. Reason has nothing to do with it; it is to be tested by observation and experiment. If you witness undoubted curative effects produced by these quantities, you are forced to believe that they are not powerless. There is no room for, no need of, reasoning; it essentially belongs to the category of axiomatic truths. No doubt, if you appeal to common sense—by which, in this case, I mean the sense common to allopathists, that large doses of medicines are necessary for the cure of disease—the response must be, that infinitesimal doses are no doses at all, in so far as the capability of making any impression is concerned; but still in this there is no reasoning. Here there is a mere *petitio principii*—a begging of the question. If large doses are *alone* capable of influencing a disease, small doses *must* be ineffectual. No doubt of it; but first show that the notions of allopathists on this point are right, then the whole matter will be set at rest—the dispute settled.

"The question is *not* whether the human mind is capable of conceiving a clear idea, or *any* idea, of a trillionth; but is it capable of *seeing the effects* of a trillionth of a grain of medicine administered homœopathically? To establish that lightning is a powerful agent, and capable of producing great destruction, it is not necessary to conceive an idea of the weight of a flash, or of the ingredient in it (if it be compound) which has the strength. It is enough to see the effects, or even to hear them related by credible witnesses. If you differ from me on this point, pray favour me with a statement of the exact weight, so that I may have a more perfect realization of the devastating power so often displayed during a thunderstorm."....

"The testimony of Professor Jörg, of Leipsic—an *allopathist*—may also be adduced in favour of *small doses* administered *homœopathically*:—

"'On the other hand, medicines operate most powerfully upon the sick when the symptoms correspond with those of the disease. A very small quantity of medicinal arnica will produce a violent effect upon persons who have an irritable state of the œsophagus and stomach. Mercurial preparations have in very small doses given rise to pains and loose stools when administered in an inflammatory state of the intestines. * * * Yet why,' he exclaims, 'should I occupy time by adducing more examples of a similar operation of medicines, since it is in the very nature of the thing that a medicine must produce a much greater effect when it is applied to a body already suffering under an affection similar to that which the medicine itself is capable of producing'"*

"From a still more recent work, I extract the following remarks, which appear to me to be particularly appropriate:—

"'For, on the whole, the idea of medicine itself is homœopathic; it does not give health-producing agents to engender health, but poisons which would issue in disease: it is, therefore, the general application of the law, by which like is to be cured by like. It is in the particulars that medicine does not recognise the application of the Hahnemannian formula; and thence, whenever it comes into details, it is in contradiction with its own idea. It is homœopathic in theory, and allopathic in application—a house divided against itself. And in the matter of doses it is subject to the like remarks; for no one gives physic in the same quantities as food, but a few grains of calomel, or a few fractions of

* British Journal of Homœopathy, 1845, p. 48.

Hosted by Google

a grain of arsenic, are considered sufficient even by "heroic practitioners" of the old school. Why is this, but that there is a working in these poisons which takes them out of the category of the ordinary materials which we put into our mouths? And if a grain will produce results upon a man of fourteen stone weight, where is the absurdity to end, without experiment, which may choose to show that the millionth or decillionth of a grain will have even better results? I marvel how men who lift fourteen stone by the equipoise of a skilful grain, can sneer at other men who do the same nice balance by incalculably lesser weights. For it is evident that all medicine is on this railway of smallness, and is more perfect and harmless for every fresh terminus that it reaches. If the allopathists were accustomed to give calomel porridges, their wrath against small doses would be consistent; but when they are themselves reduced to grains, why should they cavil at other healers who, by experiment, have found out the value of grains?'"*.....

"In conclusion, I have a few remarks to make on your statement, in the notes, that 'there are no existing facts which go to support the truth of homœopathy.' Have you ever tried to obtain any? From what I have already said, you will now allow, perhaps, that there are *at least* a few; but I can even give you some from your own 'Dispensatory.'

"To begin with tartar emetic, of which you say, in the notes, that 'it has been adduced as an example of the homœopathic method of cure; but it is very difficult to prove that it acts by producing inflammation.' In your 'Dispensatory' (p. 149) I find the following: 'Internally, tartar emetic is, in large doses, an irritant poison, which produces *inflammation* of the alimentary mucous membrane, and also, it appears, *of the texture of the lungs*,' etc. Farther on, in the same page, you write—'The same doses which, in the healthy state produce in general symptoms of irritant poisoning, unless speedily discharged by vomiting, appear frequently to exert a sedative or *controstimulant* [!] action during the presence of general reaction or active inflammation. * * * This singular action, and the cure of *pneumonia*, pleurisy, and other acute internal inflammations, through its means, are facts in therapeutics, to the truth of which, however much they were at one time doubted in this country, it is now almost unnecessary for any author to bear personal testimony. The diseases in which the *controstimulant* plan has seemed most beneficial are *pneumonia*, pleurisy, and erysipelas.' Instead of adopting the large dose system, you consider that small, nauseating, and diaphoretic doses are equally effectual. But although nausea and diaphoresis precede the cure, I think it would be 'very difficult to prove' that they cause it. Indeed, if you would select a case of pneumonia, the symptoms of which are completely covered by those of tartar emetic, and give this substance in smaller doses, even infinitesimal ones—you would find that recovery may take place without either nausea or increased perspiration. Every case of pneumonia is not, however, suitable for tartar emetic. Homœopathists have several other remedies, which are much more frequently found applicable.

"Again, in speaking of the actions and uses of arsenic (p. 184), you write—'A great multiplicity of secondary affections has farther been observed, among which the most frequent and most remarkable are partial palsy, *epileptic convulsions*, and *dyspepsia with emaciation*.' In page 136, however, you admit that 'it is one of the *standard remedies* in *epilepsy*, and is perhaps fully as often successful as any other method of cure;' and (in p. 134) that it 'is in *small doses* a *tonic*.'

"In speaking of the 'troublesome effects apt to accrue from its physiological operation,' you say—'Among other phenomena in such circumstances, *desquamation of the cuticle*, dropping of the nails, and falling out of the hair, have been observed,' and yet 'it is now a *staple remedy* in some of the more obstinate species of *scaly cutaneous disorders*, such as lepra and psoriasis.'

"Camphor (p. 257).—'When taken largely in coarse powder, it commonly occasions *pain in the stomach*, *sickness*, and *vomiting;* and animals die chiefly with symptoms of irritant poisoning. But when in a state of fine division, or when dissolved, large doses excite little else than narcotic symptoms, such as giddiness, staggering, obscurity of vision, confusion of ideas, and *delirium*—a state, in short, which considerably resembles intoxication, is attended with *increased frequency of the pulse*, and ends in *stupor*, *interrupted by occasional convulsions*.' Again (in p. 258):—'While these phenomena would appear to indicate a *stimulant action on the circulation*, *and still more on the nervous system*, with a secondary depressing effect, the current doctrine refers the *therapeutic influence* of *small doses* to a *primary sedative operation upon the nervous system*. It is held to *allay nervous excitement*, *subdue pain*, *arrest spasm*, and sometimes to induce sleep. At the same time it acts as a gentle diaphoretic, and induces a sense of coolness and refreshment; so that *where the pulse is excited*, *especially in connection with an excited state of the nervous system*, *depression of the circulation*, and even also of the animal temperature, may ensue. On account of these virtues, *camphor is used in continued fevers of the typhoid type*, *especially when nervous symptoms*, such as *delirium*, *watchfulness*, tremors, and starting of the tendons, prevail *in the advanced stage;* and by some authors, such as Dr. Cullen, its utility in such circumstances has been considered undeniable. It *does not accelerate*, but, on the contrary, *rather reduces the frequency of the circulation in fever*,' etc. [that is, when it is already increased].

"Chlorine (p. 310).—'If chlorine gas be somewhat diluted, it may be inspired, and then causes a painful sense of rawness in the throat and down the windpipe into the lungs, with coughing and expectoration, which may be followed by *bronchial inflammation*.' Again,

* The Human Body and its Connection with Man, Illustrated by the Principal Organs. By James John Garth Wilkinson, Member of the Royal College of Surgeons of England. London: Chapman and Hall, 193, Piccadilly. 1851.

Hosted by Google

speaking of its therapeutic applications (p. 311), you observe—'It has been held to be an astringent, in consequence chiefly of the property ascribed to it of diminishing chronic *bronchitis* when inhaled;' and in the same page, 'Chlorine inhalations have been found serviceable in chronic *catarrh*.'

"Creasotum (p. 376).—'In the human subject, its poisonous action has been sometimes manifested by *nausea*, *vomiting*, headache, etc.' And again, on next page—'Its most striking effects, however, as an internal sedative, are shown in the arrestment of *vomiting*. * * * It allays *vomiting*, from functional disorder of the stomach, or nervous irritability of that organ; and even in that which depends on organic disease in the stomach itself, it is not unfrequently of *great temporary benefit*. It has been found by accoucheurs a valuable remedy for the *chronic vomiting* of pregnancy. Others have observed it to be useful in *the most obstinate of all kinds of vomiting*—sea-sickness.'"

WAR AMONG THE DOCTORS.

(From the Edinburgh News.)

THE war among the doctors continues to rage with unabated violence. A correspondent in the *News* is supplemented with a correspondence between Professor Christison and Dr. Stewart. A doctor (Kein Thaler, *alias* Lackpenny) has come to the rescue of his craft in the pages of *Tait*, and this week a petition from James Syme, professor of clinical surgery, has been delivered to every councillor, in which he calls upon the Town Council to extrude Professor Henderson from the pathological chair. The magazine article demands our first attention, as the latest specimen of argument on behalf of present medical perfection. We are not homœopathists, but we have an intense love of freedom of discussion, mingled with fair play, and should we even seem to verge towards the new medical heresy so-called, it is not because we support it as true in medicine, but because we feel deeply interested in the cause of all men, be their station or profession what it may, who are heroically braving and suffering persecution either for the sake of truth, conscience, or their country.

When Luther fancied he saw the devil, he battled him with ink-bottles, and Dr. Lackpenny has attempted to meet the new heresy after the same heroic fashion. But, like Palmerston in last week's *Punch*, this penniless doctor shows his greatest strength when getting away from his opponents. He finds his homœopathic rivals being stoned to death with guineas by an incensed community, and he offers his paper shield to turn their blows towards his own empty coffers. The very cognomen assumed indicates the sore point of the case, and inferentially implores a discerning public not to continue sending antiquated practitioners empty-handed away, while new men are by means of their heresy obtaining such "lucrative incomes."

This paper in *Tait* presents a fair specimen of the treatment which heretics receive from the orthodox. We, of course, being unprofessional, know little of the right or wrong of the medicinal dispute, but we are not therefore to accept sophism as argument, or misstatement as well-accredited reality. When two "professionals" put their opinions in print, even unprofessioual men may judge whether each fairly meets the statements of his opponent. That is our position. Nor will the two smartly written pages, parading as these do a profuse knowledge of Greek and Adam Smith, of Rabelais and Earl Aldborough, of Sterne and a Greenwich showman, be allowed to "captivate us quite." It is true "that every old error has its modern parallel," as this writer asserts, but why he did not—as the public involuntarily will—take the strongest example of the fact which our day has furnished, the putting down all medical investigation by "order of authority," as his latest illustration, it seems difficult to comprehend. This writer and his friends have voted homœopathy a delusion, just as the Council of Trent voted abstinence from flesh on Friday a religious duty, and both have equally declared the violation of their decision not only a mortal but an unpardonable sin. This, truly, is an "old error," one which, in this country, has been exploded everywhere but among the Medical Faculty for fifty or a hundred years, and which neither the unintelligible philosophy of *Tait*, the petitions of "deeply interested" parties, nor the decisions of royal colleges, will ever again render respectable to our countrymen at large.

So far as we can judge, this writer in *Tait* obtains an easy triumph over his opponents by the cheap expedient of first setting up his straw man and then demolishing him. We are told, and that as if quoted, that these medical heretics propose to cure disease "by the artificial production of a similar one." Now, this appears to us a mere ingenious, although no doubt unintentional, misstatement. Homœopathists pretend, we take it, to produce no disease either similar or dissimilar in patients, but give what in *health* would produce symptoms akin to those exhibited by the disease they are called upon to cure. To say that this is producing a "similar disease," when the disease is already there, is very like laying a trap for catching the momentary consent or applause of the unthinking. On this misstatement hang the whole of Dr. "Lackpenny's" ill-digested illustrations. Thus we have a frozen nose and a burnt finger put forward only to show what every schoolboy knows, that the one by being rubbed with snow is not again frozen, and that the other by the application of heat is not a second time burnt. Marvellous discovery! To discover him who said they were would have been a still more astounding feat. This writer, "doubtless," makes a homœopathist say so, but writers who draw so largely upon the gullibility of their readers concerning what these may be supposed to know, are no very sure guides upon subjects more recondite. After a reference to common sense in the treatment of apoplexy, an admission and a solemn assurance that the writer takes his stand upon a fact, the following is the first evidence of his dead halt, at least in thinking:—"Many of

Hosted by Google

the more visible phenomena of disease are with justice regarded as forming parts of its essence." What may be the precise meaning of these words we cannot pretend to determine. The writer must have either become a homœopathist in dispensing his intelligibility, or a victim of that "prostration," not "functional" but mental, to which this paragraph seems to have a reference. The discovery that visible phenomena is any part of an essence is at least equal in novelty to that of the new medical heretics; and should any chance bur len it with an equal success, it would no doubt secure for its author persecution equally relentless, certainly more justifiable than what he now dispenses to his professional rivals.

There are twenty other statements equally important, and equally true in this effort to support the present medical Diana, and the mass of small Demetriuses must be delighted with the defender of the craft from whence comes their wealth. But whatever the profession may determine, the public will never be satisfied by writers who only charge their rivals with dishonesty, cupidity, and ignorance. Men who so act cannot now content themselves by pointing to "a faith which has been the architecture of ages," or a suppression of the facts that professors equally eminent, we dare believe, with the writer in *Tait*, are to be found both in Paris, Vienna, and Edinburgh, and that some 200 practitioners, holding University degrees, are at this moment practising this despised delusion.

But there are stronger facts and greater difficulties with a non-professional public than even these. If you find a man who, by the power of thought, has raised himself to eminence in Great Britain, almost ten to one you find him patronising these heretical doctors. The people of this country will not believe that such men as Archbishop Whately, Richard Cobden, the Chevalier Bunsen, and Edward Miall are fools, because some known and many unknown men in Edinburgh have voted the medical advisers of these powerful thinkers knaves; neither will the Town Council stamp present medical practice as the appointed boundary of healing knowledge, because Professor Syme and his colleagues have a deep interest in upholding things as they are. That the patrons will return such an answer to this presumptuous and truth-stifling memorial as will put the brand of public detestation upon the persecuting spirit lately and still evinced by this now, as heretofore, intolerant profession we cannot for a moment doubt. If necessary, the public must themselves move in this matter. With us, they may be unbelievers in the new system, but they have the deepest interest in seeing that no mere authority should stay the progress of investigation, and that no one class of the community, whether practitioners or patients, should in a matter so serious be put down by the mere votes and bigotry of professional rivals.

THE
HOMŒOPATHIC TIMES.

SATURDAY, JANUARY 3RD, 1852.

THE year 1851 is now numbered with the years that are past. At the conclusion of every successive year a thoughtful person, who has a care for his *inner* life, but is constrained to pass most of his waking time in the toils, and amid the turmoils of the world, *fumum strepitumque Romæ*, is disposed to ask himself how he has lived during that year. Public bodies may be aptly interrogated in like manner.

In our capacity, as an energetic and devoted organ of the medical reformers known as homœopathists, we may be allowed so to question our own body, medical and non-medical.

The year 1850 was memorable in our annals, on account of the establishment of three homœopathic hospitals in England; the year 1851 has been no less memorable, on account of the bitter, relentless, and insensate persecution of our doctrine and practice by our opponents; and the year 1852 has opened with this hostility unabated, and not less insensate and implacable.

Our journals and a few distinguished men have manfully done battle in our behalf; but there is still wanting that thorough union and cohesion of our body, medical and non-medical, which are necessary in our present position, and for the future advancement of our Cause.

We ask each individual to put the question to himself what he has done, and what he has left undone, that it was in his power to do, to defend homœopathy during the persecution that is still raging. What self-denial has he practised? What self-sacrifice has he achieved? What has he done in support of our defenders, and in the beating down of our assailants? What combination has he originated or taken part in? What prejudice has he vanquished? Has he shown any generous sympathy? Has he, in any one instance,

Hosted by Google

or in any one particular, shown himself on the side of our defenders, or contributed to our defence?

Let each answer it to his conscience, and if *that* reproaches him, let him resolve to do better during the current year.

The dignity and the importance of our Cause require, on our part, discipline and cohesion. We have so often pointed out the necessity of union, and co-ordinate action, of sympathy with the *workers*, and of the large distribution of pamphlets, essays, and tracts, illustrative of the homœopathic doctrine, and setting forth the facts of the case which concern the persecution of the homœopathists,—that we need not now enlarge on the subject.

As our best efforts have been directed, feeble and unequal as they may have been, to the defence of homœopathy, we confidently calculate on a continuance and increase of the public favour which has heretofore animated and sustained us.

We once again claim, from our medical homœopathists, contributions, hospital and dispensary reports, and active assistance. Brief but complete reports of well-marked cases, whether the treatment has had a successful issue or not, will be thankfully received.

We hope the writer of the leader of the *Homœopathic Times* for the new year, 1853, will be able to congratulate our readers on the continued progress of our good Cause—as we now congratulate them.

PROFESSOR SIMPSON ON MODERN HAHNEMANNIC THEOLOGY.

THE renowned accoucheur of Edinburgh, and the no less renowned surgeon of that city, which, no doubt, contains other men-wives and surgeons as good as they are, though not so celebrated—have personally entered the field against us. When Celebrities like these advance into the thick of the fight, we may conclude that their faction is alarmed for the fate of the day.

Professor SIMPSON has quoted an insane passage from a foreign enthusiast, and takes it as the text of a sermon of his own, on what he is pleased to call "Modern Hahnemannic Theology;" but that merry philosopher and obstetric sage knows very well that his medical brethren of Edinburgh, who profess and practise homœopathy, if not so deeply read in metaphysics as himself, are at least as reverent receivers of the doctrines of Divine Truth. The cause must be bad indeed that is so advocated by one who wields such weapons. 'Twere better to be a modest baker and make and sell small loaves than to be a presumptuous obstetrician and indulge in such *tacticks*. We cannot suppose that the writer or his cause can gain any advantage from that sort of writing.

But in proportion as our opponents are fierce and truculent, should our opposing force be firm and united.

We must teach Professor SIMPSON and others the necessity of modesty and caution in their attacks on us. The famous Professor of Midwifery has thought proper to indulge not only in the *odium medicum*, a sufficiently bitter thing, but also in the *odium theologicum*, which is something worse. What theology has to do with him or the question between him and us, with chloroform or homœopathy, with *specula* and *uterine sounds*, or with triturations and globules, he has not enunciated. The time has not long gone by when it was popularly believed that most medical men were infidels—we believe most falsely; for we doubt not that our profession has contributed its full proportion of humble and reverent believers, when compared with other educated classes. We protest, however, against the introduction of theology into our controversy; and we trust that the Professor will spare us any more such notes. Let him write a systematic work and collect proofs, if he can, against homœopathy; but let him abstain from such missiles as that on Modern Hahnemannic Theology. *Ne sutor ultra crepidam;* he is a first-rate accoucheur, but is no theologian; a man of genius in his special art, but no prophet; an inventor after his kind

Hosted by Google

and degree, but not an admirable Crichton —possessed of every kind of knowledge.

THE LANCET AND THE MEDICAL TIMES.

THE *Medical Gazette* has ceased, and is henceforth to be merged in the *Medical Times*. The *Lancet* is very irreverent on this subject: and we do not think the able and accomplished Editor, and the liberal proprietor and publisher of the *Medical Times*, will feel particularly pleased with the passage we quote from the notices to correspondents in that journal.

"JUSTUS.—It is precisely as we predicted. The two papers, called the *Medical Gazette* and the *Medical Times*, are both dead, and their fœtid remains are to be entombed at the literary cemetery, known by the sign of the *Black Flag*, in Princes Street, Soho. Of course, poor *John Churchill* is to be the undertaker on the occasion, as every sinking, dying, or dead medical work appears to fall into his hands. John, we are told, is doing so much business in the 'literary funeral line,' that he is in want of an active little person who will perform the double duty of sexton and *clerk*. John *offers* liberally; but some caution on the part of *candidates* is necessary, as it has been known to be possible for a 'sexton' to dig his own grave."

In the prospectus he has issued of what the Editor of the *Medical Times* says may virtually be considered a new journal, we have this passage.

"We have had occasion to devote many articles to a subject of the importance of which to the profession we are deeply convinced. We have not dreamt that we could by any arguments, however cogent, or by any facts, however incontestable, destroy the extraordinary faith of some portion of the public in that singular and incomprehensible fanaticism, which sees truth in an absurd hypothesis, and miraculous power in an inappreciable atom. He who believes, without evidence or thought, that the dogma of Hahnemann is true, is not likely to be convinced of his error by any amount of either evidence or thought. But we are happy in the knowledge that our articles have been found useful in strengthening the hands of those numerous practitioners, who have now to contend, in their several localities, with the mercenary and unlicensed advocates of a quackery which is disgracefnl to the intelligence and sagacity of the age."

This is prettily written, the sentences are well balanced, and the choice and allocation of the words are not infelicitous: but the admission is valuable from this Editor, who, some two years ago, notified the extinction of homœopathy in the metropolis, and its flaring up, just before extinction, in the provinces, that his powerful aid has been necessary to enable numerous practitioners to make head against it. We should be obliged to him for a brief summary of the arguments he has adduced, and the facts he has collected against homœopathy; and we should be thankful for his modest estimate of the amount of evidence he has brought forward, and of thought he has expended on this subject. But we challenge him to produce his instances of mercenary and unlicensed advocates of homœopathy.

Contrast the pretty passage we have quoted with the following one from the same prospectus, by the same Editor, of his "virtually new journal."

"Dissatisfaction has been felt by some at the meagre benefits which have resulted to the most important part of medicine—the art of curing—from the labour of the microscopist and the chemist; but such reproaches are unfounded. It is premature, at present, to condemn chemists as powerless, or physiology as useless in the improvement of therapeutics. Even if we already could not cite instances to the con trary, it would be sufficient to say that these sciences are still in their infancy, and display as yet scarcely any of those forces which will incontestably be the attributes of their maturer development. It is the function of the present generation to cultivate these sciences; and it will probably be the office of the next age to apply them. But the application will be made, and already we see traces of its coming. *The first results may be destructive, deep-rooted maxims may be shaken, and time-honoured beliefs dishonoured; but the revolutions of science are*

Hosted by Google

not like those of the political world, and old creeds are seldom swept away until their place has been supplied with better attested truths."

We accept the omen. We have in this eloquent passage an acknowledgment that the art of curing is yet, according to this champion of allopathy, to be sought and found; and that the first effects of his microscopical and chemical pioneers may be destructive—of what? clearly of the present system of allopathic practice. We are also taught that deep-rooted maxims may be shaken, and time-honoured beliefs dishonoured; in other words, that the doctrine of the allopathic art of curing will soon not be worth a rush—

"——Sic transit gloria mundi,
Omnia sic pereunt, forma venusta, decus."

Why not at once, Mr. Editor, encourage your "numerous practitioners" to try homœopathy? the truths thereof, so far as the art of curing is concerned, we homœopathists fully believe are better attested than any facts or evidence you can produce in favour of allopathy, or of any other method of treatment that has ever been devised and practised. We cannot do otherwise than wish well to the virtually new journal, which promises us such excellent help for the defence of our Cause, and so much material for the columns of the *Homœopathic Times.*

Correspondence.

MR. RUTTER AND THE MAGNETOSCOPE.

To the Editor of the Homœopathic Times.

SIR.—I am induced to keep the current connected with the magnetoscope in motion, not only because it seems fraught with interest to others as well as myself, but because I have just received and read Mr. Rutter's *brochure* on the subject,* and I think it is but justice to him, that an outline of his discoveries, in his own words, should be brought under the notice of the many who have hitherto received them only at second hand through your pages, and the majority of whom may not think it worth while to order and read Mr. Rutter's pamphlet.

But first I must refer to a very able and interesting letter which you lately borrowed from the pages of the *Torquay Directory.* The signature would be a sufficient guarantee that the subject had been treated in a philosophic manner, and such we find to be the case. I would particularly draw attention to the concluding paragraph, as proving that the more extended the mind, and the deeper the research, the more liberal and the less dogmatic the individual.

"Read," says Bacon, "not to contradict and confute, nor yet to believe and take for granted, but to weigh and consider." Credulity is no doubt a weakness, but I am by no means sure that the converse is equally true. "Nothing," says Bacon, in another place, "makes a man suspect much more than to know little." I remember when the stethoscope was first coming into vogue in England, it was abundantly laughed at and pooh-poohed. I happened to know that the first of modern physicians looked upon it with a very suspicious eye, but he was not above applying himself to its investigation, and he convinced himself of the truth and the value of the indications to be derived through a simple tube of wood, and that long before lesser minds would even entertain the possibility of any truth in such a thing. But to return. Dr. Scoresby says, "it might not be prudent to assume that the asserted phenomena are impossible, much less that any attempt at a particular solution can satisfy all the results elicited by the magnetoscope." I quite concur in this; and whilst I think I fully appreciate the light which Dr. Scoresby has thrown on the subject, yet I confess that it appears to me to go but a very small way towards elucidating *all* the mysteries to which our attention is invited by Mr. Rutter. I see no reason whatever for doubting the correctness of Dr. Scoresby's observations or arguments; but I am sure that no one will see more clearly than himself how far they fall short of the requirements of the case. Nay, granting as I do the truth of the Doctor's observations, they appear to me absolutely to limit themselves, and to render it still more incomprehensible how the immense varieties of results could have been produced by such means. Granted that the natural pulsation in the finger and thumb, or either, should produce a given motion—granted even that that motion should be influenced by certain agents which notably influence the circulation,—how can we account for an almost unlimited variety of motion occurring under circumstances which, so far as we know, cannot possibly influence the circulation, a difference, for instance, arising from one metal or another being held in the non-operating hand? No; as far as I can see, such explanations only force upon us more closely the question, are these things as Mr. Rutter represents them, or has he deceived himself, and is he deceiving us? There can be no doubt as to the exhibition of the phenomena in Mr. Rutter's hands. Has he then deceived himself, and is he deceiving us? If so, he not only wishes to prove facts contrary to, or at least beyond, the ordinarily observed course of nature, but he sets about it in a manner no less contrary to the usual course of things. Men do not usually bestow every moment of

* Magnetoid Currents and the Magnetoscope, by J. O. N. Rutter, F.R.A.S. Parker and Son.

Hosted by Google

their available time upon making up a case which shall not only have no practical bearing upon self, but which shall not even have for its object the bolstering up of any given theory or opinion,—which, indeed, can scarcely lead to any as yet. "Oh, but the love of notoriety!" Well, if Mr. Rutter's general and well-known character as a quiet matter-of-fact man, with a simple and sincere love of science, did not put him above such a suspicion, what a very odd method he has adopted for immortalizing himself. Was it wise in him to propound a subject which could not but startle if not rouse the opposition of men of science,—confessedly, too, starting with a borrowed idea? Taking this bold step, and bent upon notoriety, was it in keeping with this object to continue patiently plodding on, and communicating his ideas *only* to the most scientific people he could find; and even seeing these ideas promulgated, more or *less*, as his ideas by others? And now, finally, what sort of a book does he write and send forth on the subject? Why one which lays claim to nothing, save the honour of teaching others how to read in a volume of nature, to which he thinks he has found a key. He does not give us his own interpretation of his own readings, but he invites others to *verify* his readings, and to use the results as they best may, probably in various ways. In other words, out of the hundreds, perhaps thousands, of experiments which he has tried, and of which most have been verified over and over again, he has selected such as are most significant, placed them clearly before his readers, and invited them to repeat them, so as to investigate fully the subject he has opened up. "Next to the pleasure," he observes, "of discovering, or of doing something new one's self, is that of imparting a knowledge of it to others. The instrument hereafter described will be of assistance, and I hope the instructions, as respects manipulations and the required conditions, will be found sufficiently plain to ensure success. The following pages contain only a register of facts. I am more anxious to supply materials for thought and action than I am to express opinions. There is plenty of work for heads as well as hands. If it be set about in a right spirit, although aims may be different, the end will be the same. The prevalence of the truth must do good; and the establishment of what is to us a new truth is almost always accompanied by the displacement of error. We believe many things we do not understand and cannot explain. In this case we had better keep clear of theory until we are more familiarised with practice." This tallies, I think, with a caution given by Paley when speaking of the mechanical contrivances in the animal bodies. "Whether the distinction I have alleged be thought of importance or not, it is certainly of importance to remember that there is neither truth nor justice in endeavouring to bring a cloud over our understandings, or distrust into our reasonings, by suggesting that we know nothing of certain properties of living organizations, for our ignorance of these concerns not at all our knowledge of the properties of which I am treating."

"A little practice gives great command of the hand. A careful operator, with a steady hand, can always perform the experiments to his or her own satisfaction. There is a consciousness that the motions are involuntary, *i. e.* perfectly independent of the hand as regards their directions. It is not so easy to satisfy an observer that the motions are not produced solely by the hand. This is more especially the case when it happens that, by the same means, the person looking on is not able to produce similar motions, and thus realize the same results.

"All persons do not possess the power of producing the movement in the same degree, and there are some who appear to be entirely without it. Beginning by testing the capabilities of the members of my own family, I found some of each sex who could perform the experiments successfully at the first trial, whilst others have never been able to produce the slightest movement .... In using the magnetoscope, the principal conditions are, that the operator should stand at the side of it, placing the thumb and finger of the right hand, one on each side, in contact with the brass cap, where the arm joins the upright pillar of the instrument, his attention being fixed on the pendulum. Let it be observed that the instrument must be held loosely; if it be grasped too tightly, the circulation in the finger and thumb will be impeded, and no current will pass. (This accords with Dr. Scoresby's theory.) The hand should be kept open, *i. e.*, the unoccupied fingers should not be closed upon the palm of the hand .... I have mentioned the fact of some persons being unable to influence the instrument, by way of warning, to prevent disappointment; but I wish to adhere strictly to my purpose of not encumbering a sufficiently difficult subject with any theoretical explanations. The moleeular arrangements produced by the transmission of electric and magnetic currents is not to be denied. When working with constant batteries of low intensities, and with the means of measuring with extreme accuracy the amount of duty performed, I have invariably found that the current, when passed only in one direction, through a definite quantity of wire, say 2,000 feet, would do a vast deal more work, with a given battery power, than when the current was occasionally reversed. Magnetoid currents are subject to a similar law. At first, they pass feebly through the body and hand of the operator. Let no one be dissatisfied, or consider his own an exceptive instance until he has given the process a fair trial. Let him have patience, and try for a few minutes at a time, three or four times a day, and for several weeks in succession. This is what I mean by a fair trial. Let it be remembered, that every person, without exception as to sex or age, has the power of changing the direction of the currents by contact with the operator.

"Abnormalities, *i. e.*, slight variation in the directions of the currents, and the different effects produced by similar substances on different individuals, presented themselves at the commencement of these investigations. I have never attempted to explain them, because I be-

Hosted by Google

lieve, by the exercise of a little patience, they will eventually explain themselves. It is better to go on observing and recording than to waste time in leaping hastily at conclusions. These matters are not in my way. Let them be pondered over by those whose education, and experience, and habits of thinking qualify them for the task. . . . . If all persons, on first touching the magnetoscope, could influence it alike, I should have less confidence in its indications. When I find that those most anxious to set the pendulum in motion have no power over it, whilst others impart to it the proper motions, though feebly, in a few minutes, I feel convinced that wishing is one thing, and realizing, another. The conditions are exceedingly simple. There has been no haste in preparing these pages. This has had its advantages. The experiments have been witnessed by hundreds of persons; and it is probable that I have received more hints and have listened to a greater number of objections than are likely to fall to the lot of any other operator. Practicable objections have been thankfully received, and objections have naturally caused greater caution and watchfulness. The subject is confessedly surrounded with difficulties. There are plenty of theories, diverging in all directions; the mechanical, the muscular, the mental, and the combination of all; *but still leaving the most remarkable, and by far the most interesting, incidents in the phenomena wholly untouched and unexplained.* A fact is no less a fact because it is not understood, or satisfactorily explained, or even believed. I have referred to these phenomena as dependent on what is analogous to magnetic and electric currents, or influences, because on that principle there appear to be fewer difficulties and discordances than on any other with which I am at present acquainted."

I am exceedingly sorry that this paper should have extended to such a length, but it really seems but fair that Mr. Rutter should be heard in this matter. I have little wish, and less ability, to add anything of my own. I cannot, however, but observe, that Dr. Prout, in the outset of his admirable Bridgewater Treatise, claims, as it were, a *locus standi* by reminding his readers that human knowledge is of two kinds—one founded on reason, "the other, a simple knowledge of what *is*, but how or why we know not, and for the existence of which we can assign no reason but our experience."

Mr. Rutter, I understand, is fully sensible of the necessity of extending his observations and experiments, so as to test the validity of the objections which have been raised to the value of the magnetoscope; and should these objections tend to throw light on his path, eventually, I doubt not, he will be obliged to those who have made them in a spirit of candid but rigid philosophy. In the meantime he may say with Silvio Pellico, "Egli è dovere, di confessare un importante verità in ogni tempo, perocchè se non è sperabile che venga subito riconosciuta, può pure dare tal preparamento all' anima altrui, il quale produce un giorno maggiore impartialità di giudici ed il consequente trionfo della luce." And again, he may feel with Gioberto: "Gli ostacoli che si attraversano che spaventano il volgo, perche ne vengono stimati insuperabili, non che arrestare il savio ideale, gli aggiungono stimolo e sprone, perchè trova in essi il modo di vincerli, tramutandoli in aiuti ed in propugnacoli."

Your obedient servant,
INVESTIGATOR.

DR. MADDEN AND THE MAGNETOSCOPE.

To the Editor of the Homœopathic Times.

SIR,—Dr. Madden is one of the most ill-used and unfortunate of experimenters. He was first unjustly accused of taking all the credit of Mr. Rutter's so-called discovery to himself; then his manly and straightforward recantation is, with equal injustice, imputed by your correspondents in No. 124, "Knuckledown" and "H. V. Malan," to unworthy motives; and finally, in No. 125, "A Surgeon" denies my statement that Dr. Madden was the first who demonstrated the source of fallacy in the Rutterian instrument, and claims this honour for "J. H." and Dr. Cowan.

As regards Dr. Cowan's claim to such honour, I may only remark that his letter in the *Lancet* appeared nearly a month after Dr. Madden's recantation, and that all he says is, that he attributed the movements to "muscular unsteadiness and non-suspected volition"—a most indefinite assertion, which, not being supported by any proofs, cannot be regarded as anything like a "demonstration." Further, "J. H.'s" remarks, as they appear in your 119th number, are merely a pyrrhonic view of the whole matter, but are certainly as far from being a "demonstration" as are Dr. Cowan's.

It may be interesting to "A Surgeon" to know that as early as May last, consequently long before Dr. Cowan or "J. H." had seen or attempted to explain the cause of the movements of the Rutterian pendulum, a writer in the *North British Review* had "demonstrated" experimentally the source of fallacy in Mayo's odylic indicator, which is essentially the same as Mr. Rutter's magnetoscope; and it is a curious circumstance that this North British reviewer is, as I know, a zealous homœopathist.

I am, Sir, your obedient servant,
82, Gloucester Place, R. E. DUDGEON.
Dec. 20, 1851.

THE ENGLISH HOMŒOPATHIC ASSOCIATION.

To the Editor of the Homœopathic Times.

SIR,—Permit me, through the medium of your journal, to call the attention of your readers to a circular issued by the English Homœopathic Association, with the object of procuring statistics to illustrate the extension and the results, positive and comparative, of homœopathic and other treatments.

I am not a member of this Association, but the circular being addressed to all, calls not the less for a rejoinder, especially as I believe the

Hosted by Google

publishing of any such crude statistical tables to be extremely injurious to our Cause. Statistics bearing on therapeutics are liable to numerous sources of fallacy; they may be drawn up with all candour, but from such deceptive sources as to create very erroneous impressions. The schedule issued by this Association teems with numerous sources of error. One object appears to be to give an idea of the extension of homœopathy from the number of patients prescribed for. Is such a demand likely to be generally answered? If answered, of what value is it? The comparative results are to be drawn from the tables of patients treated homœopathically, that is, from the rich and poor classes, with a large proportion of chronic cases, as compared with the results of neighbouring allopathic dispensaries, where the patients are all poor, and too many placed in the worst possible circumstances for recovery.

I need not dwell further on the very evident inutility of such statistics. The English Homœopathic Association, in its lay capacity, should remember that statistics so drawn up may be turned as readily against as in favour of homœopathy. They should remember that an eagerness to prove too much is injurious to any cause, however good. Such baseless statistics, as these promise to be, tend to provoke and confirm unbelief among our allopathic brethren. Homœopathy is now in that condition that it has less cause to dread its enemies than its over-zealous friends. There is such a thing as zeal without knowledge.

I hope, therefore, that the Association will, on further consideration of the matter, be induced to recall their statistical schedule.

I remain, Sir, your obedient servant,

Dec. 22, 1851. FRANCIS BLACK.

To the Editor of the Homœopathic Times.

SIR,—Of late I have noticed with regret that your excellent journal has lost what I considered one of its most valuable features, frequent contributions by homœopathic practitioners, detailing the successful treatment of cases. You have repeatedly called upon them to furnish such papers, and it is unfortunate for the progress of the Cause which we all have at heart, that this call has not been cordially responded to. We have two or three hundred professional men on our side, whose daily avocation it is to deal with the very materials that are needed for your pages, and surely it would be demanding no great sacrifice to ask that fifty of them transmit to you, once a year, an account of one or more interesting cases that occur in their practice.

This would enable you to insure that every number of your journal should contain those great *facts* by which alone a favourable impression can be made on the public mind. Argument in behalf of homœopathy is ever acceptable; but while we justly condemn our opponents for assailing the new system by argument, where facts are available, consistency requires that we shun their example, and that we practically show them how the truth is to be established. Your readers have been much interested by the alleged disclosures of the magnetoscope, and should it turn out that infinitesimal quantities of matter do thus affect the human organism, this will at most dispose people to give a fair hearing to homœopathy; but present an authenticated case of recovery by being treated with infinitesimal doses, then we have direct proof that this influence may be so applied as to be *curative*. We cannot expect to make daily converts to our views unless we are continually furnishing sufficient reason for such a change; and certainly no amount of argument, however ingenious, would justify such a change if not substantiated by facts. Of course we look to the professional homœopaths for the contribution of these facts, and, if forthcoming, they will give a double value to the other interesting and important, yet at best accessory, matter of your journal.

A BORDERER.

[We have again in this number invited our medical brethren to furnish cases. The fault is not ours but theirs. Indeed, our correspondent has done us justice by acknowledging our frequent invitations. Like any other artisan, we can only make the best use in our power of the materials we have. We have asked for hospital and dispensary reports, and reports of cases till we are weary. We shall be glad if the eloquence of our correspondent be more effectual than our own.—ED]

To the Editor of the Homœopathic Times.

SIR,—By inserting these few lines in your columns, you would direct attention to a subject which I believe to be of considerable importance.

In decayed teeth there are some cavities so large and exposed to wear, as to render leaf gold useless: for these, M. Lemaile's hard and very beautiful amalgam would be invaluable, but for effects which have been experienced by others as well as myself, namely, pains in the face, and irritation of the fang of the tooth when under the influence of medicine; besides which, the formation of what I suppose to be an oxide of cadmium on the surface, which doubtless must have some medicinal property. If any of your readers could give information of a stopping combining the necessary qualities of softness *before*, with great hardness *after* use, expansion rather than contraction during the change, and purity in the mouth, they would do me, and I believe many more, an important kindness. I am, Sir, yours obediently,

J. J. C.

LETTER TO JAMES Y. SIMPSON, M.D., P.R.S.E.,

AND PROFESSOR OF MIDWIFERY IN THE UNIVERSITY OF EDINBURGH.

No. IV.

SIR,—If the verses which concluded my last letter were not spoken at the Brighton Meeting, we might extend the doggerel to a good deal that was spoken, without any departure from the "*laborious and painful observation, large generalization, and cautious induction*" which so thoroughly pervaded it, thus—

But listen now! a rumbling from afar
Heralds a crisis in this globule war;
Choice spirits (rectified?) in hundreds three,
Bent on a Brummagem Thermopylæ;
And history, no doubt, will say there was
Full many a Brummagem Leonidas;
But on the principle, though rather stale,
On which "*a cloud looks very like a whale.*"
Before them *what* a load of tricks and tracks!
Palmed on mankind by "homœopathic quacks."
With every druggist now, in every town,
Asking them *why they cannot put us down?*
Or if afraid, with numbers on their side,
To brave the rushing of our globule tide;
When old Hippocrates, and Galen, too,
Fight side by side on this *our* Waterloo.
And many an M.D. fiercely used his brand,
And many a speech was *spoken second-hand;*
And many an allopath turned up his nose,
And thought he thus had vanquished all his foes,
And clutched each wight within his vengeful coil,
Who gave *Nux vomica* for *Castor oil,*
Or henceforth poached upon the public pelf;
But here is one will speak out for himself.
"Believe me, that, among the anti-quacks,
I've done *my best* towards 'licking them like sacks.'
I've done my utmost to expose the twiddlers,
(Uriah Heaps and Jeremiah Diddlers);
And I rejoice to see the healthy tone
Pervading allopathic flesh and bone.
I view this homœopathy with awe;
Indeed it has a most insatiate maw—
Quite a phenomenon of dire intent,
Which gives me now a sad presentiment.
'Tis not the pill-box that is now at stake,
Merged in a psychological earthquake;
It is the doctrine I would firmly ground
Of '*soundly thinking*' (*not* digesting sound).
If we supplant experience of ages
By theories proposed by mushroom sages,
Resign to phantasies the human mind,
Give them as facts to man and woman kind,—
We then surrender quietly our status,
And make for homœopaths a *nice hiatus.*
A question 'tis of *morals, not* of *doses,*
Which makes us allopaths turn up our noses.
"That man, believing in this mystic creed—
Between a rogue and fool a kind of breed—
Has lost the balance of his upper room,
And for his chimney sadly needs *our* broom.
If there is any man within this realm,
At sea, '*hard jammed upon a weather helm,*'
His ballast shifted, a tremendous sea,
A rock-bound coast just looming on his lee,—
I beg to tell him I distrust *his* creed—
He'll find his '*law*' is but a broken reed.
"Preferring zeal anomalous and blind,
Amorphous products of an inflated mind,
The founder of this globulistic band
Upset the best and wisest of the land;
If he be true, then *we believe a fable,*
And need the broom for *our Augœan stable.*
"We have amongst us now the church of Rome,—
A precious sight indeed, too close to home;
But more than that, a greater paradox,
Young M.D.s living now like fighting cocks,
Garnished with titles; looking out for pigeons,
Casting their nets and netting golden gudgeons;
Were *one of them* upright he would retire,
And *dis*claim him he would *pro*claim a liar.
"I say it is no tyranny to thrust
Such human clay with *kindred* human dust;
If not for self-respect, for self-defence
I'll try our allopathic '*trick of fence.*'
Without discussion on this knotty point,
(Which puts our noses sadly out of joint,)
I banish it at once beyond our ken,
Lest it contaminate a virtuous pen;
If any man says 'two and two make five,'
'Tis plain a greater goose is not alive;
Indeed, *I never speak to that man twice,*
The man is gone, sirs, gone within a trice;
If from a myth like this he doth not sever,
I am apart from him, 'apart for ever.'!!!
'Tis true we read, in many a middle age,
That '*mental epidemics*' were the rage,
Where sober judgment had no easy task
To keep *out*side the *right* side of her mask;
The dancing mania is come again,
And many a polka overheats the brain.
Wildly we rush o'er scientific tracts,
Mistake our fancies, thinking we've got facts;
Our hopes, for principles, are kept on brooding,
And soon we swell deluded and deluding.
"But few words more; yet I must say again,
Our duty now appears exceeding plain;

Hosted by Google

Cast forth this rubbish—add it to the past!
Stand by our flag, and nail it to the mast!
And sink or swim!"
* * * * You're speaking far too fast;
But, stay! you little know, until you try,
Such flashes in the pan are "*all my eye.*"
Are those who thrashed the *Lancet* and *his* law,
Proved Glassford merely to be man of straw,
Taught old Hippocrates, and Galen too,
They were not *quite* the men they seemed to you,—
Do they, I say, seem much inclined to run?
No! they will stand or fall beside *their* gun.

I beg to apologize for freely versifying the spirit of the Provinclal Medical and Surgical Association, but the lofty sentiments displayed on that occasion could not be well rendered in the tameness of prose. Heroic composition has been a stranger to my pen and ink, nor would the idea of such have now come uppermost, had one single case of disease treated homœopathically been placed before that body as a basis for an argument. But this was a very excellent average specimen of the speech-making at Brighton, and as it was entirely spoken in reference to opinions which are mine, and not over and above complimentary to my upper storey, I consider it the more deserving of remark in this letter; but still more so, as one of the most original expressions has been quoted by yourself, and forms a very nice peg indeed to hang a speech upon. When he tells us that he is no "raw recruit in the anti-quackery ranks," he leads us to suppose that he has done some very puissant deeds, hitherto unrecorded. We hope in future he *will* record them. But he is sadly afraid that "*sound-thinking*" is about to disappear from the mundane physiognomy, whereas if he directed his attention to sound digestion, the sound-thinking would be pretty sure to be preserved in spite of homœopathy.

It is plain enough that the man who could hit upon the words "*amorphous products of an inflated self-esteem,*" and just off-hand before three hundred, must have no common genius for spinning—for six words embodied chemistry, pneumatics, and psychology, jammed as close as pigeons in a pie; he was "*just the character*" to note the fallacy of the magnetoscope at a glance. He illustrates homœopathic miscalculation by insinuating that some gentleman of globules insisted that "two and two make five," indeed, that it was a very common assertion, and that whenever he heard it, he never spoke to that man again, for "*the man is gone.*" Now, Sir, this is an obscure passage, and I would much like to have your explanation of it—"*the man is gone!*" Where is he gone to, may I ask? It seems pretty clear that this philosopher has no homœopathist living within his hail, or he would be unpleasantly sensible that he is *not gone*, and that he might conjure them off in this wise every day of his life, without having any effect whatever in removing the obnoxious globulist. Upon this word "gone," and "two and two" making "five," are based an argument worthy three hundred men to listen to, and you to make a second-hand use of; and when we read it, we are the less astonished at the rapid advancement of homœopathy; half a dozen *such speeches every year* would make fortunes for a few of us, and we will make the speakers welcom to the "*Applause,*" the "*loud applause,*" the "*long-continued applause,*" and the "*great applause,*" and *add* thereto in so far as we are able. Had we but Dr. Malden's power of cachinnation we might do justice to it; without that genius we cannot, but that is not our fault, and by next year's Association we may have arrived at it. But the

"Amorphous products of inflated mind"

remind us of a line equally comprehensive and annihilating,—

"Quadrupedante *putrem* son itu qualit ungula campum,"

and after *such a brace*, we might reasonably expect a small earthquake; had we been at the meeting and taken the anti-homœopathic side, we could not have hit upon anything at all like it; most probably we should have squashed Hahnemann by reminding the meeting that—

"There was a little man, and he had a little gun,
And his bullets were made of lead,
And he shot Johnny Sprigg, but *only* through the wig," etc. etc.

And if after that a homœopathist dared to show his name upon a door-plate, it would be more than any one might expect.

But the labours of the Association towards preserving the principles of "regular practice," remind us of the parturient throes of a still greater Association, that has for twenty years worked hard in *as good* a field. A few years have passed over since, on occasion of the annual meeting of the greatest Association of philosophers known, a fair proportion of whom might have been supposed to have an interest in the advancement of therapeutics, a very clever, but then comparatively obscure, man volunteered to read a paper, and illustrate it by cases, and produce the cases,

Hosted by Google

with witnesses thereto, to substantiate the therapeutic value of mesmerism.

But the Association was quite well satisfied with the condition of therapeutics, and too deeply engaged in science to pay any attention to a man who has done much for suffering humanity; he could not be listened to; there was no time. The disappointed practitioner attended, anxious to know the importance of the subjects which superseded the neglected field of therapeutics, and, lo! three mortal hours, which never could be recalled by the united science of a thousand philosophers, were consumed in a hopeless endeavour to determine the age of a spider; and so nearly had they joined issue upon this point, that those spiders which were considered by some members to be babies, were by others asserted to be octogenarians.

Another philosopher, on a similar occasion, detained these *savans* with an elaborate and highly-finished paper on an insect imported from Asia, and endowed with a generic term which must have astonished him hugely had he known of his advancement in the insect peerage. We by no means profess to remember this term in its *scientific dress*, but its domestic representation we can stretch a point for—it was a "*bug;*" and had it not been that the most fitting nomenclature for this particular specimen was reserved by accident for the accommodation of those who now take delight in applying it to the homœopathist, it might been called the "*Humbug! par excellence.*"

Man has for ages plumed himself on intellectual powers, which, directed to specific objects, resolve themselves into what is termed a matured judgment, and in this he rises superior to all other animals; but it is highly artificial and not without leaven, for it blunts the faculty of instinct, in which the lower animal is his superior, and for which deficiency a highly matured judgment does not make up. Instinct tells a man, but only to a trifling extent, what will benefit his inner man, and what will injure his mucous membranes; but that instinct tells him nothing in respect to what will benefit others, for whose benefit his mature judgment is *alone* called into play. When a physician is sick, he wavers and hesitates, and often refuses treatment; his *instinct* is in action. A non-medical patient has no business to *have an instinct*, and the physician's matured judgment does duty for it, supported by Paracelsus and a laboratory.

I have the honour to be, Sir,

Your most obedient servant.

January 2, 1852. SIGMA.

PROFESSOR MACDONALD AND HOMŒOPATHY.

(From the Fifeshire Journal.)

SIR,—In a late number of your excellent journal there is an article on the subject of the University of St. Andrew's and homœopathy, ostensibly for giving an expression of opinion on the part which was taken in the name of the University, after it had granted the degree of M.D. to Dr. Hale of Norwich, last May term. As a very considerable mystification, clothed in the coarsest and most virulent abuse, has for some time raged in some of the medical journals, and more especially in the *Lancet*, it might be necessary to explain some of the grounds on which it truly rests; and although the *Fifeshire Journal* may not be the fittest arena to discuss medical topics in a professional point of view, yet, as you have already taken up the subject, it may not be out of place to correct the misapprehension that exists in the published attacks on all and every one acting on his deliberate conviction of the truth of homœopathy as a great and fundamental principle, and which has often been pointed out as known, and to a certain extent acted on, since the days of Hippocrates—not, indeed, to the extent which Hahnemann and his followers have more recently adopted, who, in addition to the fundamental principle, have, after a long and patient course of experiment, proved that many of the medicines long used in large quantities, may, by a more careful and elaborate preparation, become more efficient in relieving the pains and diseases with which suffering humanity is so often afflicted. As in most new theories, when first promulgated, homœopathy was assailed as *not true*, but when it was shown that the principle had been acted on since the days of Hippocrates, the attack assumed the second phase of antagonism, that it was *not new*. Under this strong prejudice it has been denounced as absurd, "because we cannot conceive how it is possible for such infinitesimal globules having any effect when larger quantities have so often failed." This objection is not advanced on any proof, but the grounds are merely the want of the power of mental conception in the adversaries. Starting with this assertion, not only is the principle itself denounced as "*contrary to truth and absurd*," but all "*who have publicly professed homœopathy*" are also denounced as unprincipled quacks, unworthy of credit, and fitted only for being abused and turned out of all and every society or corporate body, of which they may be legally constituted as members. Loud and long have been the complaints which have been made against all homœopaths, and anxious has been the attempt to stir the colleges of medicine and surgery to the unjust and illegal act of depriving their members, who may differ on this subject, of their rights and privileges; and such has been the urgency of their demands, that the Scotch Universities have been at last induced not only to express themselves strongly against homœopathy, but by the excited urgency of the Medical Faculty, the Edinburgh University have during the last summer refused to give

Hosted by Google

their diploma to one of their students, who, after examination on all the subjects which have been included in their curriculum of medical study, and who passed such an examination on most of the subjects as would have entitled him to receive their diploma, but from his not avowing his decided opinion on the practice of homœopathy, was remanded for a week or two to make up his mind, and give in his adhesion to the dogmatic and overbearing demand of the leading members of the medical examiners, requiring a disavowal on the part of all candidates of any intention under any circumstances of practising homœopathically during their whole life. While all physicians who have adopted homœopathy as their rule of practice are denounced as dishonourable, because they do not resign their medical professional rights, from the now pretended assumption that these can only be enjoyed by those who have given their continued adherence to the creed of the present scholastic teachers, every means of annoyance and vituperation have been most industriously seized by the hostile antagonists to free discussion and the improvement of medical treatment by the progress of discovery; and in the unfair crusade to check the progress of the healing art, it is now attempted to prevent any one from receiving the University degree or the College license, till on examination they deny and abjure the principle of homœopathy, and as there are no instructions delivered on this subject, there seems no more legal right or propriety than if the Autocrat of Toxicology should demand a full knowledge of Arabic, because the knowledge of medicine was early extended from Arabia.

I would not have troubled you to insert this rather long article on the subject, perhaps not altogether in accordance with the pursuits of your general readers, but for the prominent notoriety which your correspondent has given to my name in a previous number. Supposing, for the sake of argument, homœopathy to be as false and absurd as it is unceremoniously declared, whether really believed or not by our antagonists, what possible disadvantage can arise to the public from a professor, who lectures on natural history, adopting homœopathy as a sound principle of medical treatment? Nothing but a personal animosity can account for so unfair and uncalled-for an attack on my name, so forcibly intruded, and with a malevolent and pertinacious perseverance to injure me, and interfere with my usefulness in my present sphere of action, and attach discredit to the University now anxiously exerting itself to extend the boundaries of useful physical knowledge, as the best means of uprooting prejudice and ignorance, and benefiting mankind.

Although I consider the personal notoriety conferred by your correspondent through your columns as unfair and uncalled-for, I would by no means evade stating my convictions and responsibility for adopting the homœopathic treatment of disease, as at once affording in many, if not in all cases, a safe and gently acting mode of efficiently relieving the distress of symptoms which have been nosologically classed together as constituting particular diseases, and with special names have been systematically arranged by Cullen and others. The daily extending practice now interfering with the money-making practice of medical practitioners of all classes, in all parts of the country, from the success so frequently following homœopathic treatment, is one cause of the present rage—*hinc illæ lachrymæ*. The facility which is so often exhibited by the non-professsional practice of those who have themselves both received and seen the benefit in extensive districts, both here and on the Continent, is with some show of reason objected to by the body of medical men, who have devoted a life of labour and study to acquiring a sound knowledge of the animal economy in health and disease, without which sound practice can never be firmly depended upon nor improved; but at the same time, although it may in some degree interfere with the lucrative practice of the doctor, it has tended much to restrict the boundaries and check the ravages of disease in many families at the period of infancy, to the lasting benefit of mankind. Their mistakes should make them cautious, till they have acquired both knowledge and experience, and if not at once successful, professional advice should at once be taken. Another very common objection is put forth, that homœopathy cannot and never does cure disease, and that all their reports are drawn from cases of pretended maladies. Is it to be believed that men of established character and education would be guilty of such false practice? and nothing but the ungenerous and unfounded assertions and accusations of the allopaths could countenance the least suspicion of such a possibility that all homœopathic cures were fabulous. Is it the doctor that brings the patient? Is it he that makes the disease? Does the entrance of the house of Dr. Henderson or Dr. Russell relieve the applicant of disease, or extinguish its claim to that character, which would be converted into disease by going to the house of the profound Toxicologist and Pharmacian, or entering the precincts of the successful Obstetrician, whose dexterous use of the speculum and the various instruments is so strongly denounced in the *Lancet*, under the signature of Isaac Irons (which, if not a false signature, turns out to be a Lee)—instruments designed by great ingenuity, and used with dexterity by that eminent accoucheur, but which, in the hands of less dexterous or cautious men, have often been attended with many bad consequences, but which, under the medical treatment of the distinguished professors above alluded to, have first converted the complaints of the applicants into disease, and then cured them—at least when they really do succeed? Such an idea is preposterous; but if this really is the fact, it must be consoling to all patients who would at all times and seasons receive the benefit of Siloam, and the porch of Solomon, by at once going to the house of the homœopath to be relieved of all their complaints. Once more, and then done. It is often objected to homœopathic treatment that it depends on diet and regimen, and is assisted by nature, without which such infinitesimal doses could have no effect. We are

Hosted by Google

astonished at such frivolous objections. As there is no prescriptive or exclusive right inherent in homœopathy to judicious dietetic treatment, and the *vis medicatrix naturæ* often referred to, but more frequently antagonised (from its own homœopathic tendencies I suppose) by the allopaths, is it not astonishing that they should neglect the means lying open before them—do this, and *live and let live?* Let them consider the advice of Gamaliel—if it be true their attacks are vain; if it be false, it will fall to the ground of itself.

I trust this will not be too long for your journal, as I consider it necessary that some account should be given to your readers on a subject of such importance to their well-being and health, although introduced to their notice with the worst intentions towards the writer, who has been so unnecessarily dragged forth from his study of physical science, to enter unwillingly into the field of newspaper controversy. I have the honour to be, yours obliged,

W. MACDONALD, M.D., P.

St. Andrew's.

SUCCESSFUL APPLICATION OF THE HOT-AIR BATH AS A CHOLERA REMEDY.

From the Cornwall Chronicle (Jamaica Paper).

IN our paper of the 21st instant we published a foot-note in explanation of the "Hot-Air Bath" recommended in the "Second Notification of the Central Board of Health;" and we feel pleasure in announcing that Mr. Wilson, manager at the Sunderland Estate, in his treatment of Mrs. Wilson, who was seriously attacked with cholera a few days ago, applied the remedy most successfully. Mrs. Wilson was seized at three o'clock in the morning, and suffered excruciating pains, with other malignant symptoms, notwithstanding the many efforts made to alleviate suffering, until eight or nine o'clock, when the cold stage of the disease came on with clammy perspirations. Mr. Wilson then placed saucers of strong rum (18 proof), with pounded ginger and other fumigating aromatics of the country, under the bed on which the patient was lying, and having ignited the spirit, he enclosed the lower part of the bedstead so completely with blankets, that no portion of the hot air could escape. In a short time, the mattress became warmed, and a change for the better was apparent. The more completely to ensure the desired effect, the patient was then raised up in blankets, and the part of the mattress that had been in the greatest contact with the heated air was turned upwards, and the patient was laid on it. In a few seconds after, animal heat was restored over the whole body, the pulses resumed their functions, and a warm perspiration suffused the entire surface of the skin. We are happy to say that Mrs. Wilson is now in progress of recovery, and we trust that the treatment observed in her case will be but one of the many successes for the preservation of life, by means of the remedy we published. We would recommend, however, that time be allowed for the heated air to penetrate the mattress, rather than risk the movement of the patient, which, in all stages of the disease, is considered to be very dangerous. Whenever there is a canvas stretcher at hand, it is best that the sick be laid on it with a blanket, which, for convenience in every respect, is preferable to mattresses in cholera cases, more especially at that stage of the disease when the hot-air bath should be used. With the labouring people, no difficulty can arise in the application of the remedy, because those who do not lie on the ground usually have sleeping platforms easily rendered vulnerable to the heated air.

In the edition of "Buchan's Domestic Medicine" of 1850, a "Valuable Recipe is recommended," in corroboration of what we have been describing, as follows:—

"To prevent the cold stage coming on, order the patient to bed, and place there Sir H. Davy's safety lamp, properly mounted for the purpose, whereby a temperature of 120 degrees and upwards, if required, can be commanded; and the danger incurred by moving the patient too much in this sinking state is avoided, which is always risked by putting him into the hot bath. The lamp is also preferable to overloading the patient with blankets, to attain the same object."

THE
HOMŒOPATHIC TIMES.

SATURDAY, JANUARY 10TH, 1852.

WHAT DOES '52 PROMISE FOR HOMŒOPATHY?

A GOOD general has always a starting-point, a fixed base for his operations. We homœopathists, at least the medical, are too much like the "*disjecta membra poetæ*"—not united into one vigorous entity.

But notwithstanding this great disadvantage, and notwithstanding the hostility of the *triumvirs* of Edinburgh, Professors CHRISTISON, SYME, and SIMPSON, and taking into fair account the rancour of the bulk of allopathic practitioners, and the envemoned fury of their subservient press, homœopathy is looking up.

There must be great vitality in the plant of Hahnemann, if it not only has endured this sharp winter of discontents, but is absolutely full of foliage and fruitage.

There is a talk of a hospital in Edinburgh, and of another at Birmingham.

Dublin, Liverpool, Glasgow, and Bristol

Hosted by Google

are still lingering in the race. They also should have their hospitals. The number of adhesions of medical men is on the increase; the fear of ridicule and of abuse notwithstanding. Of the prosperity of the now-existing hospitals we can pronounce no opinion, for we have been furnished with no facts, no statistics, no reports. Of the dispensaries we can also say nothing, and for the same reason. The agitation of the subject of homœopathy, meanwhile, proceeds vigorously; and as there is an indestructible power in truth, and as free discussion cannot be denied us, our auguries of the future are of the brightest colour.

We think that in 1852 the first attempt will be made to obtain a charter for the homœopathists; and that the medical men, from the instinct of self-preservation, will be compelled to unite more closely than they have yet done.

We believe that our good Cause will make satisfactory progress through the current year. We have no apprehension that homœopathy will find itself in the cave of Adullam; and we suspect that more respect will be paid to its upholders by those of the opponent faction. We cannot conclude that its bigoted adversaries will learn wisdom, even though they should have been "*brayed in a mortar*," but we may and do conclude that the people of England will be prepared to receive our evidence.

We have every reason to believe that the *borderers* will be compelled to come into our camp; and that the Editors of the *Lancet* and the *Medical Times*, and the Triumvirs of Edinburgh, will be compelled to capitulate.

We earnestly trust that those who have a well-founded faith in homœopathy, and who have for themselves or their families, derived benefit from it, will give largely of their substance for its propagation. Heretofore scarcely anything has been done in a large and comprehensive spirit. But the times do not admit of the reputation of martyrs unless there be martyrdom—of benefactors unless there be benefactions—of self-denying philanthropists unless there be self-denial and genuine philanthropy.

We are very hopeful that the year 1852 will see animosities subdued—a generous spirit of honourable rivalry between opposing schools, and a hearty manifestation of zeal for the common good shown by the contending parties.

THE MEDICAL TIMES AND GAZETTE.

A SERVANT'S RIGHTS.—I was told in Boston of a gentleman in the neighbourhood, who, having engaged a farm-servant, found him very satisfactory in all respects, except that he invariably came into the house, and into his master's room, with his hat on. "John," he said to him, one day, "you always keep your hat on when you come into the house." "Well, sir, haven't I a right to?" "Yes, I suppose you have." "Well, if I have a right to, why shouldn't I?" This was a poser from one man to another where all have equal rights. So, after a moment's reflection, he shrewdly asked, "Now, John, what'll you take—how much more wages will you ask, to take off your hat when you come in?" "Well, that requires consideration, I guess." "Take the thing into consideration, then, and tell me to-morrow morning." The morrow comes. "Well, John, have you considered what additional wages you are to have for taking your hat off?" "Well, sir, I guess it's worth a dollar a month." "It's settled, then, John, you shall have another dollar a month;" and the gentleman retained a good servant, while John's hat was always in his hand when he entered the house in future. So works democracy. The Kentucky people cast in the teeth of the Bostonians that they worship the almighty dollar. At all events, even in a democracy, the stiffest has his price, and wealth cannot be deprived of a certain amount of influence.—*Johnston's Notes on North America.*

This "amalgam" of two anti-homœopathic journals, and the *Lancet*, have made a sort of *Bostonian* contract with their subscribers and supporters. They are to be allowed to *wear the hat*, that is, to be considered as the organs of the great bulk of medical practitioners, on condition of their faithful service in browbeating and attempting to down-tread homœopathy. We wish them joy of their bargain. Instead of having an extra dollar a month, they will probably have an extra pound a day for their service; and while they vaunt their independence, they will be

Hosted by Google

allowed to do so, provided they attack homœopathy tooth and nail.

It would be impossible to show more emphatically the rising importance of homœopathy than by this systematic warfare of these opponent journals.

The vulgar but vigorous coarseness of the *Lancet*, and the refined though somewhat *lack-a-daisical* scholarship of the *Medical Times*, are both *enlisted* against homœopathy. Each journal has taken *bounty-money*, in the shape of support from their subscribers, if they attack homœopathy. Both journals bid for the superiority in this notable adventure.

The *Lancet* boasts of its readers among the aristocracy, which has been vilified in their pages, on account of the aristocratic support of homœopathy; of the bar, many of the most distinguished members of which are homœopathists; of the church, with which the members for Finsbury are not supposed to have any remarkable sympathy.

What good do they by their weekly attacks on homœopathy? Is either Editor superior to those who conduct our journals? And, after all, what occasion is there for this *inter-necine* war?

After all, we will each of us wear, and each of us doff our hat, as we think proper.

The public is not so easily hoodwinked as these worthies imagine. It has been calculated that homœopathy withdraws something like a million a year from the *till* of allopathy. *Hinc illæ lachrymæ.* More allopaths are in the Cave of Adullam than homœopaths, erudite Editor of the "Amalgam." We are sorry that it should come to this—that it should be a question of *coin;* but you make it so, not we.

Is not the world wide enough for allopath and homœopath — for great physicians like Quin and Latham—for the Queen's household brigade and for the *extra-palatial* medical advisers of many of the Queen's household?

The world *is* wide enough. But do not let us have a Caffre war; let us fight it out like gentlemen and scholars, if there be scholars in the medical profession — a matter somewhat doubtful.

The allopaths appeal to Antiquity—poor old Antiquity! the Antiquity of allopathy is like that of dear old Tithonus—age without vigour—protracted physical existence without any of the functions of vitality. Did not sweet Aurora regret that she had asked for such age for her Tithonus; and was she not willing that he should be turned into a—grasshopper?

The poets have some pretty lines on this subject; and the Editor of the *Medical Times* is a scholar. We cannot bring such an impeachment against the hero of the *Lancet.* He is more of a Pollux than an Æsculapius.

The world is starting anew on a fresh course. It would be monstrously odd if old prescriptive Physic, dressed up like an old woman, with an academical cap on her head, and in a scarlet nightgown, should be allowed to go on in her usual jog-trot.

Can't these old bodies—these medical corporations—read the signs of the times? Can't they see that a new order of things has commenced? Alack! they want *innervation*—vital force—resuscitation. But what can galvanism do for them? They are effete, worn out; they have the thick lip and cretinism of the Austrian House; they have the fatuity of the worn-out Capetian.

The *Medical Times* has denounced them. The microscopist and the chemist are to extinguish them; and our cock is to crow over their remains.

Correspondence.

ORIGIN OF THE HAHNEMANN HOSPITAL.

To the Editor of the Homœopathic Times.

SIR,—It is possible that the Hahnemann Hospital may survive its present system of management—it is possible that it may flourish—it is possible that it may rival, in fame and extent, St. Thomas's, Guy's, St. George's—it is possible that five hundred or a thousand years hence, everything connected with its early history may be a subject of intensest interest, and that its origin may be as much a matter of dispute

Hosted by Google

as is the birthplace of Homer. There is, in fact, scarcely anything that is not *possible*, and hence it is *possible* that the accompanying letter (which is given away gratuitously at chemists' shops) may one day become a matter of importance, and be regarded as throwing some light on the formation of the Hahnemann Hospital.

I may be wrong, but it appears to me that the antiquarian of five hundred or a thousand years hence might be led by this circular to suppose that the London Homœopathic Medical Institution founded in 1838, had some connection—possibly very remote, but still some connection—with the Hahnemann Hospital.

Of course, this was not the writer's intention—nothing could have been further from it; because no one knows better than himself, that between the two Institutions there is not a single thing in common, except the accidental fact, that the physician of the defunct London Homœopathic Medical Institution is also one of the physicians of the Hahnemann Hospital.

So loosely, however, is this document worded, that it admits (as I think) of this conclusion being drawn by an ingenious antiquarian; as for instance—to connect two parts of the sentence widely separated,—"The principal object for which the London Homœopathic Institution .... was originally founded .... *having been at length happily accomplished by the organization of the Hahnemann Hospital*," etc. etc.

To guard against misleading so praiseworthy a philosopher, allow me to give you as well as I can from memory—for my papers of the period are not at hand—the history of the rise and progress of the Hahnemann Hospital; and permit me to request its insertion in your journal, for I feel a sort of conviction, that should the presumed research be made, the investigator would consult your periodical for authentic information.

It was in the month of September, 1849,—on that terrible day—a Monday, I think—when the *Times* had shaken the nerves of every soul in London by an awe-bearing leader, commenting on the alarming fact, that the deaths the day before amounted to some 500 or 600, and adding, that whether the cholera had attained its maximum of virulence, and would gradually subside, or whether it would go on devastating the metropolis, no human being could tell—it was on that day, that an individual I know—it was no one connected with the London Homœopathic Medical Institution—resolved on two things,—first, to save, if it were possible, the lives of some of his fellow-creatures; secondly, to afford a public demonstration of the power of homœopathy to deal with acute disease in its most virulent form.

With this view he called on Dr. Curie, and suggested to him the possibility of extemporising a cholera hospital, and intimating his opinion that the crisis was one which should call forth the noblest and most generous sentiments, in the presence of which all party and personal feelings must sink into nothingness.

With a zeal and good feeling which did infinite credit to Dr. Curie, he immediately replied, "As to extemporising an hospital, I think it may be done; as to co-operating with my brethren for the sake of homœopathy, *that* I have always been ready and willing to do."

The individual in question then called on Dr. Quin, who, with his usual force and perspicuity, expatiated on the immense advantages conferred on homœopathy by the British Homœopathic Society; pointed out the importance of upholding that Institution, and contended that any homœopathic hospital, to be successful, must select its medical staff from the members of that Society.

Agreeing most cordially in the first of his propositions, my friend differed *toto cœlo* from the second and third; maintaining that homœopathy had outgrown the necessity of the times in which the British Homœopathic Society was founded; that there were eminent homœopathic practitioners not members of that Society; and that it would be to exclude the public from the benefit of the services of such distinguished homœopathists, were an hospital founded on so narrow a basis.

Dr. Quin, however, was not to be moved by such reasoning. Admitting to the full the necessity for an hospital, and the impossibility of establishing one at that moment, by the means then at his disposal, he, nevertheless, seemed resolved to abide by a principle he had laid down for his own guidance, rather than to succumb, as he appeared to regard my friend's view of the case, to expediency.

Whether he was right or wrong in acting as he did at that time, it becomes not me now to inquire; but I may perhaps be permitted to say, that if he would avail himself of the new light that has since been poured upon the case, and enlarge that restrictive rule of his, I verily believe that the London Homœopathic Hospital would very speedily occupy one whole side of the square in which it is situated.

And why, let me ask, should he not alter that restrictive rule? Was not the late Sir Robert Peel an advocate at one time for a restrictive commercial system, and did he not live to alter his opinions, to change his policy, and to acknowledge his error? And why are we now erecting statues to his memory in every part of this great empire? not so much that he carried certain great measures, as that he had the nobility of soul to avow that he had been in the wrong, and to alter his course!

Pardon this digression—to continue. On leaving the presence of Dr. Quin, in the anteroom, adorned with sculpture and paintings, my friend had the pleasure to meet with Mr. Wilson, of Brook Street, Grosvenor Square, to whom he related the object and result of his mission. With his characteristic frankness Mr. Wilson told him he feared his efforts for the establishing an hospital at that time would be fruitless; adding, however, with great emphasis, "I hope, and think, that ere long, a state of things will be brought about, that will lead to the establishment of a large hospital on broad principles."

Nothing daunted by the discouragement he had just encountered, my friend proceeded again to Dr. Curie's, where he accidentally met with

Hosted by Google

Mr. Leaf, who was then introduced to him for the first time. My friend mentioned his plans. Mr. Leaf said money would be required. My friend said, he had already the promise of some £60 or £70, and that if Mr. Leaf and his friends would subscribe in like proportion, the object would be effected.

Subsequently to this my friend had several interviews with Mr. Leaf and Mr. Warne—advertisements were inserted in the daily papers—circulars were printed—a Mr. James, a friend of Mr. Leaf, was employed at a weekly stipend to wait with these circulars on influential homœopaths; my friend addressed letters to various noble patrons of the science, and amongst others, to Lord Robert Grosvenor, who thought the time for an hospital had not yet arrived—in which view, as it turned out, he was perfectly right. In a word, every means was taken to accomplish the end, viz. "A Cholera and General Hospital," but without effect. A few only responded to the advertisements and circulars, and amongst the number was, I believe, the Honourable Augustus Moreton, who forwarded, I think, the largest subscription received, £3 3s., for *preliminary expenses*, begging it might not be considered as his subscription to the *hospital*. The result, then, was failure; the day on which my friend commenced operations turned out happily to be the climax of the cholera; from that day it gradually subsided: the idea of "A Cholera and General Hospital" was abandoned, and the expenses of this abortive effort fell on my friend, and the two or three benevolent individuals who had responded to the advertisements.

This effort, however, although abortive so far as the immediate object was concerned, was very far from being fruitless of good. It led to numerous interviews between Mr. Wilson and my friend, the former of whom—aided by three distinguished homœopathic physicians, viz. Drs. Chapman, Dudgeon, and Chepmell—did not cease in his endeavours to bring about that state of feeling amongst his professional brethren,—who, at this time, were pretty equally divided between the broad and the narrow gauge—which enabled him, in the month of February or March, 1850, to say to my friend, "The time has now arrived for an hospital on a broad basis—we must have a grand dinner on Hahnemann's birthday, the proceeds to go towards founding the hospital—and you must be the secretary."

Although deeply immersed at this time in professional pursuits, my friend obeyed the summons, Mr. Sandoz, to whom he had on this occasion the gratification of being introduced, promising him his aid. And well and nobly did he fulfil his engagement (as did also Mr. Phelps), without whose united aid not one tithe of the secretary's duty could my friend have performed. Nor must I omit to mention—in speaking of the causes that contributed to make the 10th April, 1850, what it became—the immense service performed by your own journal, in advocating our noble cause, entreating all classes to lay aside all party and personal feelings, and to join hand and heart in this stupendous undertaking:

Of the vast and brilliant assembly that congregated in the great room of the London Tavern on that occasion, there is no need that I should speak; the proceedings of that evening are graven imperishably on the memory of those who were present, and the record of such things as admitted of being recorded is still to be found in the pages of the *Homœopathic Times*. All that it is necessary for me here to state is, that at the close of that grand festival, it was arranged that a certain number of the laymen composing the dinner-committee should meet at the mansion of Lord Robert Grosvenor the following week, to determine on the best course to adopt for the immediate founding of an hospital. The honour of the secretaryship was offered to my friend, who agreed to accept it, provided Mr. Sandoz would join him; but, on applying to that gentleman, he found it was incompatible with his other engagements. My friend then addressed himself to Mr. Warne, but he declined a joint-secretaryship. My friend was consequently obliged to refuse the office altogether, fearing to undertake so serious a responsibility with his already over-taxed energies. At the first meeting of the provisional committee, Mr. Warne kindly volunteered to perform the duties of secretary, *pro tem.*, from which the secretaryship *in perpetuum* was a very natural transition.

Such, Sir, is, I believe, the authentic history of the founding of the Hahnemann Hospital, which I now take the liberty of very respectfully dedicating to the Antiquarian Society of 2850. And by this brief and imperfect sketch it will be seen, that the London Homœopathic Medical Institution had nothing whatever to do with the formation of the Hahnemann Hospital. The members of the former, indeed, joined us after repeated interviews between our board and theirs, which resulted in their handing over to us the funds (some £200 or £300, I think) of their Association. But no greater mistake could be committed, as will be seen by the foregoing narrative, than to suppose that the Hahnemann Hospital owes it origin in any respect whatsoever to the London Homœopathic Medical Institution, from which it is totally distinct, as to both its birth and its education—its origin and its aim.

I am, Sir, your obedient servant,

F. J. SMITH.

74, Old Broad Street,
London, Jan. 3, 1852.

P.S. I am not to be understood as writing a history of the Hahnemann Hospital. Were this my object, it would be necessary for me to expatiate on the zeal and devotion of our Noble President; to explain the absence from our initiatory meetings of one of the brightest ornaments of our Board—the Honourable Augustus Moreton; to dwell at length on the noble sacrifices of many homœopathic practitioners and laymen (not mentioned above), to the great detriment of their pecuniary interests. Nor would any history be complete that did not assign to the ladies (and amongst them, pre-eminently to Mrs. Dudgeon and Mrs. Laurie) a

Hosted by Google

more important share in the success of our operations. My object, however, is not to write a history, but to give such details of the rise and progress of the Hahnemann Hospital as may serve to guard the uninitiated against drawing an erroneous conclusion from the accompanying circular. I now subjoin the letter or circular, which has caused me, a member of the Hahnemann Hospital Board of Management, to give you this outline.

(Circular.) "39, Old Change,
"January 1, 1851.

"The principal object for which the London Homœopathic Medical Institution, under the direction of Dr. Curie, No. 17, Hanover Square, was originally founded by me in the year 1838, viz., the *advancement of Homœopathy, by the gratuitous treatment of the poor, and the formation of a Medical School in which the homœopathic student might be instructed*, having been at length happily accomplished by the organization of the Hahnemann Hospital, No. 39, Bloomsbury Square, I have much pleasure in informing you, that the London Homœopathic Medical Institution for the Poor has been discontinued in favour of the Hahnemann Hospital, for which I respectfully solicit the continuance of the patronage and support which you have hitherto conferred on the London Homœopathic Medical Institution.

"I have the honour to be,
"Your very obedient servant,
"WILLIAM LEAF."

UNION—HOW IT MAY BE EFFECTED.

To the Editor of the Homœopathic Times.

SIR,—In your editorial summary of Saturday last you rather mournfully allude to the disunion and want of co-operation which are doing so much harm to the Cause of homœopathy at a time when the hostility and acerbity of allopathic opponents daily increase. The theme has been a favourite one for the last two years. The cry for union has been re-echoed from London to the provinces, and from the provinces back upon London. It has been heard grumbling in the plodding Aldermanbury; it was domiciled in and coquetted with in the sentimental Islington; and at last it wended its way northward, like a giant refreshed, from its metropolitan and suburban dalliances, to receive a home in hospitable but a little pantheistically inclined Brummagen. A whole host of lay, classical, and alphabetical anonymes have made it their temporary property, and now it is jobbed by a somewhat modest questioner, rejoicing in the playful cognomen of "Q in a Corner." During the whole of its two years' pretty extensive peregrinations, I suspect that laymen or non-medical men have had more than a fair share in keeping it moving, and, poor souls! I don't wonder at them, for they are so dreadfully and terribly in earnest, that they were just the sort of people to drop into the trap of anybody that chose to cram them.

That laymen should espouse the cause of their own doctor, or of their own parson, or of their own lawyer, is of every-day occurrence, and not to be wondered at with such an oddity as John Bull. There is just that sort of chivalrous sentiment in feeling which begets respect, and it is, moreover, so generally deserved, that it is a pity even to see it put upon or abused.

But I suspect that in this matter of disunion the real offenders have been the doctors themselves, and that the honest non-professionals who have been moving heaven and earth in the affair, would have saved themselves much unnecessary labour, if, at the outset, they had had the sagacity to say, "Physicians, heal yourselves, but if ye won't, don't bother *us* with this narrative of wrongs, which are of your own creation, and must be of your own mending." Previously to 1850, that ever memorable year in the annals of English Homœopathy, the body of homœopathic practitioners were, with one exception, disorganized, lying here and there throughout the kingdom; the *disjecta membra* of what should have been a compact, firmly-knitted-together association, to which inquirers might have turned for advice and aid, and which, by that power of self-government, the inborn quality of the Saxon, would have made itself heard and respected by every one attempting to be a practitioner of the new system. In the increasing disorganization the attempt was made to cure the evil,—an act of public amnesty was patched together, bygones were to be bygones, and peace and Hahnemannian good fellowship and no cliquishness were made the order of the day, in opposition to the alleged cliquishness and jealousies of the British Homœopathic Society. But "quid vanæ leges, sine moribus" seems the purport of your and others weekly musings, even after the fusion which was to save homœopathy, but which, to all appearance, has saved it much in the same way that the fusion was to save France the other day.

Let us, however, not give in. Much has been done in gathering up the shreds and scraps of homœopathy, and although the British Homœopathic Society *still* lives and remains unannexed to the "young giant," it is compact, and thus there are now two associated bodies, which is a great advantage over the one association floating about in a huge weltering chaos of anarchy and confusion. Moreover, the old grievance, that the laws of the elder society were childish and impracticable, is cured; for on a reference to and comparison of the laws of both associations, I find that there is a correspondence and agreement the most agreeable and refreshing. Then why not unite the two?

Had I, like M. Dictator Bonaparte, been blessed with an uncle who had done something worth talking about, and who had left me a name, a pair of jack-boots, and a tame eagle with which to start, I would soon manage to complete what remains to be done in this "battle of the doctors;" but as I have to deal with men of honour and strict probity, I fear that a midnight arrest of the generals would not advance the fusion a bit more than the past attempt at pooh-poohing their quiet resistance has succeeded in putting them down.

Hosted by Google

I have been much struck with the manly, the almost dogged but still gentlemanly, standing aloof on the part of the president and members of the British Homœopathic Society, and I was sure that there was more than a cliquish holding together implied in the resistance they maintained. I have made it my business to inquire into the whole matter, and what I have learned completes my admiration and respect for men who risk so much quiet and good fellowship for what they believe is of vital importance. To a man, they feel that union would be most desirable; but if it is to be a mere carting together and shooting out what should never in their opinion be mixed up in the same mass, they feel that weakness not strength must be the result. These are not only scruples but convictions, which I fear have not been dealt with as they should be, and as one would hope to have one's own scruples or difficulties met. They have been, and may be still shared by others, who have, however, out of deference to the general desire, suppressed what their former associates still feel bound to avow and act upon. This is no time for recrimination or for *coups d'état* to enforce submission or agreement. Truth must be allowed its utterance, and its requiremeuts must be sternly obeyed at all costs. If there are blots to be erased from the fair scutcheon of homœopathy, be assured they must be fairly looked at and removed, not slurred over with heroic daubings, which won't stand much wear and tear. No one, whatever his prepossessions may be, can have an interest in protecting professional delinquencies such as have been over and over again made public, particularly when, as I solemnly believe, the omission to judge is the hindrance to that healthy action which all desiderate.

Union we must have, for without it much of the ground on which to found our appeal for a charter of medical incorporation is wanting; but union there will never be, unless by an immediate effort those complaints to which I allude are honestly and truthfully met. In demanding inquiry and mutual confidence, I would be understood as prejudging nothing. My prepossessions are strong, but if undeserved, I am ready to resign them, even in spite of that most significant event which transpired at the great Paris Congress, and which you alone of British homœopathic journalists had the manliness to record for our edification, and perchance for our sorrowful acknowledgment, that if there is a prophet with us, whom others cheerfully own, even England at this time of day offers no exception to the proverb divinely spoken for man's instruction to the end of time.

But who may decide when doctors differ? Here is one remedy for want of a better. Empanel a lay jury, with power to inquire and to sift evidence. Let the two societies select their representatives to act as medical referees in the investigation; and further, in case of a difference of judgment, provide arbitrators, men unconnected with homœopathy, but acquainted with the laws which govern other professional bodies in matters affecting the reputation of members or fellows, and to whom a decision absolute and final should be accorded.

Were this done in a true spirit, the evidence would be forthcoming, and, God helping the right, I should then anticipate that real professional union which, if now existing, would give to homœopathy all that it wants to make it a great and efficient fountain of public blessing.—I am, Sir, your obedient servant,

PHILALETHES.

January 5th, 1852.

[The gentleman to whom our respected correspondent sent this note is not the Editor, but he has transmitted it for publication. We agree with our correspondent in the necessity of union, and of the desirableness of the incorporation of the Medical Homœopathic Society, and also of the two metropolitan hospitals. We take his prophet to be a justly distinguished personage, but not to be a prophet. We approve of our correspondent's plan, and we wish he would set it afoot, and at once. We do not love *dirt* and *disagreeables* any more than our correspondent; and we shrink from a knave as instinctively as a certain historical personage is said to do from holy water. But "Philalethes" must remember that a spirit of *exclusivism* is as hard to deal with as the other spirit of *democratic liberalism*. Let him get his prophet to descend from his oracular seat, and to be *par inter parés*, and to work with a will for the good Cause, and with all effective instruments, and much good will at once be done. He would have his place, and he would have hearty supporters round him, a few even of whom would be of more real worth to him than "a wilderness of monkeys"—or of sycophants. A great experiment has been tried, for the fusion of parties; if it has failed, or should fail, the noble spirits that made the attempt have their reward in their own self-respect. We believe that the union of the two London hospitals and of the two medical societies is practicable *at this moment*; and that the arrangements may be completed before the next 10th of April. Let our correspondent see to it.—ED.]

CASE IN WHICH THE WILL PRODUCES NO EFFECT ON THE ODOMETER.

To the Editor of the Homœopathic Times.

SIR,—The experiments with the odometer are matters of such extreme delicacy, and there are so many disturbing conditions, that I am not surprised at many and repeated failures. The great disturbing cause is the will or expectation, another is the position of the operator. I think the following experiments, which I have made very carefully, will be found instructive in these respects, while they are of the utmost importance in *establishing that there is an action independent of the will* of an operator, who is generally able to produce motions at will.

The odometer I employ is a piece of sealing-wax, about one inch and a quarter long, flat at

Hosted by Google

the lower end and tapering upwards, where it is stuck to a lady's hair. I have not found the sex of the hair make any difference in the result, but I mention it on account of Dr. H. Mayo's statement, that a man's hair changes the motions. This I suspend from the first joint of the forefinger of the right hand, so as to leave about ten inches of hair between the finger and the wax. I sit by a table, with my legs apart, and holding my right hand so that the right forefinger points to my left arm, across and in front of the body, the fingers and thumb being all separated. The left hand I repose on the table, palm upwards, with the fingers extended directly before me, and separated. Rings must be put off, and the finger on which they were well washed with water. It is always safer to wash the hands or rinse them in water before making any experiment, and after having had substances in the left hand. The position above described I call the normal position, and it must be understood for all experiments where the contrary is not mentioned.

An oscillation directly towards or from me I call *normal;* one transverse to my body, *cross;* one like the up-stroke of an A, *left diagonal;* one like the down-stroke of an A, *right diagonal.* Motion from left, from me, round to the right, I call *clock rotation,* and the contrary motion, *reverse clock rotation.*

The following experiments were made over three saucers containing distilled water, spirits of wine, and mercury, the diameter of the liquid surface being three to five inches. Strict attention was paid to the *cæteris paribus* condition.

I. *Experiments over Distilled Water.*—1. When the pendulum was held close over the water the motion was normal, and very free; but (2) as I removed the pendulum higher and higher from the surface of the water the motion became diminished. 3. In any place where I was able to make the pendulum oscillate at all, it was obedient to the will. 4. The clock circle that I could thus make was three to five inches in diameter; I could not consciously produce such a motion without very perceptible motions in my finger or forearm. 5. On joining the first finger and thumb of the left hand, the motion became cross. 6. On joining the middle finger and thumb, the motion returned to the normal. 7. On joining the fourth finger and thumb, the motion was in the left diagonal. 8. On joining the little finger and thumb, the motion was in the right diagonal. As, however, I could produce or change all these motions at will, those who do not understand or feel that the will can, so to speak, be willed to remain inoperative, will attach but little value to these experiments. The oscillations were three to five inches in length, according to the diameter of the water-surface.

The following experiments show the influence of a change of position in the operator. The right hand being held in the normal position (9), the left hand is pointed directly to the ceiling or floor of the room; result, *rest,* but obedience to the will, as in all experiments with water. 10. The left hand pointed direct to the right or left (hands parallel); result, *cross* oscillation. 11. The left hand pointed in the right or left diagonals; result, right or left diagonal motion. 12. The left hand pointed directly backwards; result, normal motion. In the next experiments the left hand is in the normal position, but the saucer is placed somewhat to the right hand for convenience, instead of immediately in front of the body. 13. Right hand in normal position, but considerably to the right side of the body; normal motion. 14. Right hand in the right or left diagonal; motion in the right or left diagonal. 15. Right hand pointing directly from the body; *rest.* This result is important. The hands are now both parallel, and pointing outwards. In addition, I may add, that (16) the normal position of the hands being assumed, and a sovereign placed in the left palm, clock rotation ensued.

I omit many modifications of these experiments for want of space. The delicacy is evident. The results were unexpected, and, when the will was well controlled, uniform.

II. *Experiments over Spirits of Wine.*—The experimenter should be careful not to get any of the spirit on his fingers, as a single drop, if not well washed off with water, vitiates all the experiments. This simple fact is sufficient to show that the results are not all due to expectation, as the expected result fails to ensue. 17 The pendulum held close over the spirit; result, *rest,* although the hands are in the normal position. When the surface of the spirit extended to five inches, I found *rest* at a height of twelve inches; when the surface was three inches I got motion, which I attributed to the action of the surface of the saucer, etc., extending beyond the spirit; the motion, however, could be produced at will, but not so freely as over water. 18. The right hand pointing directly from the body; *normal motion.* This was the position of *rest* over water, in 15. 19. Right hand pointing in the right or left diagonal, right or left diagonal motion, the same as for water, 14. 20. Right hand in the normal position, left hand pointing out to left or right, indistinct cross motion. Obedience to the will in all cases.

III. *Experiments over Mercury.*—21. Normal position, the pendulum close to the centre of a surface of *Mercury* three inches in diameter; result, *rest,* WHICH I COULD NOT DISTURB BY THE STRONGEST EXERTION OF MY WILL, continued for some minutes. It seemed impossible to make the pendulum move, when held quite close to the surface, without contact, and the surface of the *Mercury* was large. When the diameter of the *Mercury* was only one inch, and the pendulum was not held close, very obscure motions could be produced at will, and these became freer as the distance between the pendulum and the *Mercury* was increased, owing perhaps to the influence of the large portion of saucer which then formed the margin to the *Mercury;* but when the bob of the pendulum almost touched the *Mercury* the result was rest, immovable by the will. Now in this case the position of the body was the same as in 17, where there was rest, but obedience to the will, over spirits, and as in 1, over water,

Hosted by Google

where there was original motion and obedience to the will; hence the position of the muscles is insufficient to account for involuntary rest. In fact, there is only one point in which experiment 21 differs from 17 and 1, namely, the presence of the *Mercury*, and that therefore must be assigned as the cause, according to all the canons of inductive reasoning. In a long review, headed *Odyle, Mesmerism*, etc., in the *British and Foreign Medico-Chirurgical Review*, for October last (p. 411), the reviewer states that he has "repeated these (Dr. Mayo's) experiments, and finds that all the phenomena are suggested." Here is a case where suggestion is vain. *The fact of odometry, therefore, is now established as an objective phenomenon.* 21. Now place a sovereign in the left palm, the pendulum immediately *moves normally, and is obedient to the will.* Hence in the former experiment I was not labouring under a temporary impossibility to produce motion at will. It has happened to me more than once that I could produce no motion whatever either by glass or will, but that was clearly attributable to my state of health. Here, however, inability is immediately changed into ability to produce motion at will. Obedience to will was produced by gold, lead, zinc, or brass in the left palm; but *silver, iron, copper* placed there *produced no effect*, that is, I was not able to influence the pendulum by the will in these cases; and as they were quite unexpected, there could have been no influence of suggestion. It is obvious that this part of the experiment may be indefinitely extended, but great care is necessary in trying all experiments with substances in the left hand, as they are very delicate. Care must be taken to wash the hand constantly, and to place the substance precisely in the same place. For instance, a gold ring encircling a finger produces a different action from a sovereign placed on the same part of the finger, but of course only touching one side.

22. Now resume the normal position, and after the pendulum is at rest, point the right hand outwards as in 15, over water, and 18, over spirits; result, *cross* motion (it was *rest* over water, and *normal* over spirits), and *obedience to the will*, as in all cases in which I have yet produced motion at all. 23. On pointing the right hand in the right and left diagonals, right and left diagonal motion was produced. 24. The right hand being in the normal position, the left hand being pointed up or down, gives normal motion; right or left, gives cross motion; in the right or left diagonal, gives right or left diagonal motion. These results show the extreme importance of observing the normal position.

The real objective action of the odometer may now be considered established, and I hope those gentlemen who possess magnetoscopes will try similar experiments, as at present the facts of the case are not sufficient for the theories broached. I am sorry to find no allusion to the disturbing action of the will in Mr. Rutter's pamphlet on the magnetoscope. It is possible for the operator to feel conscious that he is not willing, but if he allows himself to will and refrain very often, he will find his difficulties much increased.

The following experiment is worth trying. Take 100 persons at different times, try each with the same odometer over water, without suggesting anything, and mark the changes of the experiment 5 to 8. A tabular view of the results would be very important in eliminating chance. Many may know result 1, few, if any, know 5 to 8. It is most probable that differences will occur in different individuals, and hence the necessity of an average.

Apologizing for the unexpected length of my communication, I am, etc. etc.

ALEXANDER J. ELLIS.

Nov. 28, 1851.

HOMŒOPATHIC EXPERIENCE.

To the Editor of the Homœopathic Times.

SIR,—Eliz. T—, aged twenty-five years, every autumn and winter, had severe acute rheumatism or tic. The pain began in the back of the head, reached to the forehead, down the right side of the face and glands under the ear; it affected the eye, and teeth in drinking; the face was swollen and extremely painful; the attack generally lasted four or five months. The winter before I undertook her, she had had the advice and been under the care of three of the first doctors in the island without relief, or the term of suffering being up. She had been suffering about a month when I was induced to try and relieve her, as she was a valuable servant of an intimate friend of mine. The winter of 1836, on a Monday, at twelve o'clock, I gave her two globules of *Belladonna* 30. Tuesday following, early in the morning, one globule more; the sufferings were great, so I repeated the dose at one o'clock in the afternoon. Wednesday, felt much relief; on Thursday morning I gave one globule more, which entirely cured her, though the weather was extremely against her, and the season was that of her severest suffering in former years.

N. M—, aged about thirty years, had been under the doctor's hands nearly three years, without receiving benefit. Most of his family are subject to the same disease, which generally terminates in decline, causing death. He was, at the time my husband recommended him to try homœopathy, attending his brother's funeral, who died under the same symptoms as he was himself suffering from.

1. Violent, stupefying headache.
2. Violent toothache, which was increased by heat or cold.
3. Bitter taste in the mouth as if from bile, which remained fixed in the chest.
4. Swelling and weight in the stomach.
5. Flatulence, and noise in the bowels, as if they were full of wind and water; after which violent diarrhœa, with pain and nausea.
6. Want of appetite.
7. Want of sleep.
8. Great weakness, with pain all over.

He came to me on the 7th of October, 1836.

Hosted by Google

I gave him two globules of the 30th dilution of *Helleborus niger;* on the 11th, one globule more. On the 13th he was cured of the symptoms Nos. 1, 2, 4, and 5. On the 14th I gave one globule more; and on the 21st another globule. On the 28th he came, looking so well that I did not think he required more medicine, and gave him a bottle of water instead, to take in doses. On the 1st of December, he returned the empty bottle, and said he had continued quite well since the 28th of October. He is now alive, and has had no return of his complaint; 1851.

Atrophy.—E. F—, aged eighteen years. Her illness was brought on by a fright; she was witness to a frightful accident, which caused the death of several persons, whose bodies were carried across the street in which she lived, and passed the door at which she was standing. The effect on her was such that she lost her appetite and sleep, and was reduced to skin and bone; she was so weak that she could not walk without support. She had been for many months under the doctor's hands; the doctor was much interested in her case, and did all his medicine could do, which was nothing! At length he declared that she was beyond the power of medicine. On this, her mistress, who was a friend of mine, brought her to me. I gave her two globules of *Aconite* of the 24th dilution; one globule of *Pulsatilla* of the 18th dilution, the next day, which last dose was repeated weekly, for six weeks; after which she was perfectly restored to health and her employment. This was in the year 1837 or 1836. I saw the young woman in service in the year 1848; she had enjoyed good health all the intervening time.

Mrs. Le Pridwin, aged forty years, from sitting in the cold market in winter, had become subject to rheumatism, in her arms particularly; she complained of giddiness, weakness, and sleepiness in the daytime; the most violent pain was from the right shoulder to the fingers. October, 1837, I gave two globules of *Antimonium crud.* of the 9th dilution, which was repeated in weekly doses for three weeks, and entirely cured her.

Mrs. W. Tucker, aged thirty years, 1837, had violent pains in her head, accompanied with pains in the arms and legs; the pains in the head sometimes kept her in bed for two days; there were no other symptoms of disease. One globule of *Pulsatilla* of the 18th dilution, repeated every three days, cured her in a week (three doses).

Nancy O—, aged eight years, 1837. Her body was covered with small pimples, itching violently, which caused her to scratch them till the blood came. I gave her two globules of *Mercur. sol.* of the 12th dilution, which cured her without more medicine.

P. P. La Cache had been for many years afflicted with a nervous complaint; he had in vain been under the care of the first Guernsey doctors, and by their advice had tried if those in England, France, and Jersey, to whom they recommended him, would prove more successful. It was all useless, and for years he had dragged on a painful existence. He kept away from his family and neighbours, stayed by himself, could not bear to move or speak to any one; he was very much depressed, anxious, and fearful, and could not bear to be noticed by any one; they had the greatest trouble to persuade him to accompany them when they came to me, and I had as much trouble to get him to answer my questions when he did come. He looked pale and haggard; complained of constant giddiness; his head appeared doubled; dreadful shooting across the skull as if it would break; violent gnawing pain in the bones of the head, of the face, and teeth, sometimes with violent heat; sometimes a sensation of extremely cold water falling from the top of the head down the face; noises in the ears, with dullness of hearing; sensation of bruising in the eye, with smarting pain; pain and great weakness in the sides; a great pain as if something were driven between the shoulders, from which loads of pain were drawn over the sides to the stomach, which they entered, and tightened the heart, which produced a violent feeling of sickness, without being able to vomit; no appetite, with dislike to food; weight in the arms; great heat along the arm; great weight and *sensation* of swelling in the legs and feet; great fatigue; very sleepy in the daytime; trouble to sleep at night; on closing the eyes he sees frightful figures, with starting and shiverings; throbbings of the nerves. He was a married man, about fifty years of age. He came in the autumn of 1837. I gave him two globules of the 30th dilution of *Belladonna;* two days after one globule more, which was repeated twice (every seven days), making five globules in all. In a month he joined his workmen and neighbours in their ploughing.

St. Sampson's Rectory, H. C.
Sept. 2, 1851.

To the Editor of the Homœopathic Times.

SIR,—I beg to remind all who have not sent in their petitions for the Edinburgh Town Council, that they must be lodged by the middle of next week at the latest.

I remain, your obedient servant,
75, Queen Street, J. RUTHERFURD RUSSELL.
Dec. 31.

Miscellaneous.

EDUCATIONAL MEANS AND SUPPORT IN GREAT BRITAIN.—According to the returns of the Committee of Council on Education for the past year, we observe that there are now in Great Britain 1,717 schools receiving annual grants; 4,660 pupil teachers; 950 certified masters; £96,190 10*s.* 10*d.* expended annually in payment of the salaries of them and their apprentices; and about £23,000 in aid of building, improving, and furnishing books and apparatus to schools.

LETTER TO JAMES Y. SIMPSON M.D., P.R.S.E.,

AND PROFESSOR OF MIDWIFERY IN THE UNIVERSITY OF EDINBURGH.

No. V.

Sir,—"The Memorial" was the last effort of the Universities in the cause of collegiate despotism; and Faculties, and Royal Colleges, and Professors have found out, but too late to avail them, that Samuel Hahnemann has founded as hard a stone wall as any in Mid Lothian; and that even the greatest names cannot charge it point blank without leaving their knee-caps on the top. But once more a battle is over, and a tough one it has been; and we see many helms in the dust, and many saddles empty, and confusion and ruin instead of building up; many rueful faces are turned up, and many hearts laid bare that had been better unexposed. When we look on all this, that which led us to resistance resolves itself in another thought, regret that resistance should ever have been needed; let us cover the vanquished with a fitting pall, the colours they have served under,—"a standard of common sense."

We claim the victory; and in order to prove it to the public, we show them that standard we have wrested from your grasp, and we have now a trophy furnished by yourself, which will, with others, hang in our festive halls; for, up to the last six months, we were wont to illustrate the inutility of the allopathic system, as a method of cure, by the evidence of Dr. Forbes; he was a single pillar, but a good one. But the last campaign has enabled us to convert that pillar into a tripod, to which Dr. Christison has, by his address, added one leg, and you, by your speech, have added another, and if we place this tripod on the top of Mr. Syme's vanquished "Memorial," we have got as pretty a view of the present condition of allopathy as if viewed in a "Mirror of Medicine"—"veluti in speculum;" a mode of examining a subject singularly in vogue in the present day, be the topic blooming as a spring flower, or merely the stale episode of sixty seasons' withered leaves.

We draw towards a conclusion (and no doubt you will not be very sorry thereat), but previous thereto we have a few words to say on that moral condition of allopathy which has been the boast of her small and great men, and to preserve which she has exposed herself too much, and proved herself to have too little.

Medical ethics, under the mythological dignity of which the ignorance of the practitioner was screened when necessary, and the public blinded to the condition of medicine, having yielded the ground she held to a more lively genius of modern growth, who heeded not his parents' menaces in bye-corners; he shot forth suddenly, a phœnix, a white stalk grown in the dark, dubbed "a high sense of honour," and launched, a genius of the very first water, upon open-mouthed society; the promising *protégé* of chartered and unchartered bodies, which latter have, without exception, made him the pivot upon which they have so successfully spun round for the edification of an astonished public.

Having proved "legitimate medicine" and "regular practice" not to be had at any price, I went a-searching for this "high sense of honour," which allopathy insisted was hers alone, and of which she seemed exceedingly jealous, and I expected to find it easily, for every pettifogging gentleman who charged three and sixpence for a compound worth three halfpence, stoutly proclaimed that he had a large proportion of it; but when he produced the ware it did not answer to the invoice, and I had to go to another shop. I had many a search in this wise, and expended thereon some "*laborious and painful observation, large generalization, and cautious induction,*" and I am now of opinion that this attribute, when possessed to a very unlimited extent, may be highly inconvenient, and may possibly place a man in a position of extreme difficulty, and the more so the more refined, as it may be easily seen through, and then it makes but a flimsy garment, and certainly would not suit for pantaloons.

But we were told that it was to preserve this puppet from indignity, that the medical profession made an aggression on *our social position,* which has clad her fully in that

Hosted by Google

cobweb garment, and which may ultimately prove itself a cloak of Dejanira, which she cannot cast off.

When small allopathic authors made literary ventures on us and our doctrines, they declared they were led to do so by a "high sense of honour," and such a desire to possess it (without reference to *meum* and *tuum*) burnt within them, that they invariably filched it from those they wrote against, and whose hearts they could not read. These little guns in type and ink carried away an unusual amount of "*spolia opima*," in "laurels;" they enjoyed them even unto diaphoresis under the burthen—meet compeers for weekly editors, but wretched supporters in this *our mêlée*, which they could *only* edge better men on to; where are they now?

—Echo answers, where?

We are told that it was this sentiment which induced a physician to screen, and entirely at his own expense too, a ghost of a tradesman who was *such* a ninnyhammer as to confess himself a *rogue*. Herein was great magnanimity; but when I reflected that this continence was preserved at the expense of the feelings of a whole body of tradesmen, whose reputation was implicated thereby, I felt less charmed than I might have been at a man voluntarily becoming the victim of misplaced confidence, and shutting himself up in a cage, from which, like "Sterne's starling," he "*wants to get out*," and cannot. But with a light thus kept under a bushel by him who struck it so clumsily, it has nathless lighted some of our later opponents, and among them no less a personage than yourself, to base thereon their rejection of infinitesimal doses—*a glare of illumination being thereby cast over the problem.*

Still somewhat disappointed in our search, we did not give it up—for we homœopathists don't give up things so easily, as you no doubt perceive; and we listened to a member of the Brighton meeting, who held the "high sense of honour" in such respect that, to screen it from contamination, he set you the example of mixing up a medical question with theology, and a very pretty plagiarism you have made of it. He unhesitatingly accused a clergyman of prostituting his sacred calling, who, by advocating homœopathy, could have no object save the highest, and who did so according to his conscience, and after much observation and experience; and in sympathy with this member, all the listeners fell into an ague fit of horrors equally laudable, and intended to be expressive of Christian feeling on the subject. We have already prescribed for some of these invalids; we shall *note* their condition at the next provincial meeting.

I thought a genuine spark might have been accidentally struck, when a physician petitioned a council to remove a homœopath from the body to which he belonged, for however absurd was the request, and how little soever it spoke for that petitioner's appreciation of the true condition of medicine, it was accompanied by a promise of sacrificing his own qualification to the *manes* of a request unattended to; and the promise brought him great admiration from his brethren, and complimentary epistles on his spirited achievement swelled the pages of the *Lancet*, and one correspondent, in the height of his enthusiasm, proposed a testimonial to this physician, and wrote himself down for £5 on the spot. But when we remember that upwards of four weeks have elapsed since that petition was refused, and that the despised diploma, which it was a disgrace to hold in common with a homœopath, is still in the study-drawer of that petitioner, we think that the admiration was premature, and that the *testimonial will be altogether unnecessary.*

Had Mr. Syme promised to resign his surgical chair in the event of his "Memorial" meeting the fate it has so well merited, we think he would have kept his promise, but he made none, and it is not incumbent on him to resign; but the "*honour*," in the one case, and the "*emolument*," in the other, were expressive of the very same heart's beat to a shaving.

That this professional "high sense of honour" is a most peculiar variety of the sentiment, is curiously proved by a peep I took, during my search, into the proceedings of the London Medical Society. I found a spark of it quite genuine, and it burnt healthily in the breast of an opponent who signed the "*Resolutions*" against me; but he urged his view of the rapid advancement of homœopathy as depending upon the lamentable amount of drugging prevalent; and he brought forward a case, wherein a bill for £48 for drugs to an infant had been sent in, and "*three or four visits only having been paid.*" A sense of honour led him to bring it before the Society, and a *still higher sense* instantly led the Society to squash the matter as irrelevant, which term meant an awkward subject for investigation at the present moment. But the public have been taught to appreciate such a case, in reference to domestic economy as regards coin; to physical economy as regards bulk; and to the economy and specially to the *importance*

Hosted by Google

of diagnosis, when the number of visits is compared with the number of draughts.

Where, may I ask, was weazel-eyed law upon that occasion? Was the coroner's wig upon a barber's block, and his official robes out at the washerwoman? Had he who drugged that infant been placed on that day at the bar, and side by side with the "greengrocer of Islington," they had met on equal terms, as far as science was between them; and the tradesman would have had much the advantage on the point of humanity.

These, Sir, are illustrations of the laws of honour, as it exists in medicine, which must form a little code for allopathic guidance alone, for by no standard can they be estimated, so as to be made serviceable to mankind generally—not even by that "standard of common sense" so lately raised by you, and waved by your own arm o'er the memory of *Joe Smith*" !!! Nor do they call up to our minds any very elevated thoughts, but on the contrary try back to old times, when we laughingly deemed *him* the most puissant who had courage to run the gauntlet of the closes of the High Street after the hour of ten p.m.

At all events, this order of it fails to rouse *us*—it does not reach our *ears*; nor could the cross of its legion, if it had one, stimulate us to the zeal of defunct soda-water. But there is many a small voice from many a nursery that can call it forth in us, by lisping the name of Samuel Hahnemann; and many a mother's lingering bedside hours, chimed over and over by the sombre night clock, light up a spark of it within us; and many a father's prayers for our success mail us for a contest *we will not give up*; for these hours were spent and these prayers were uttered where the great law enunciated by the maligned Hahnemann was, in our hands, meeting stern disease successfully. Allopaths may sneer—let them; we can afford it. But there is a memory that can recall all that—it belongs to many a mother—that can tell how the feverish lip was cooled by the billionth of a grain; it belongs to many a child—that can recall heart-rending medication; it belongs to many a husband, and many a wife, and many a sister. If, then, Samuel Hahnemann has done aught to mitigate suffering, to shed *even one ray of light* upon a subject far too dark in virtue of men's prejudices, let his followers repay him by asserting *his* "*standard of common sense*," and by defending *his* integrity as well as *their* own. "Truth was never yet hurt by free discussion. Like the precious metals, the more it is rubbed the more brightly it shines." In conclusion,

I have the honour to be, Sir,
Your most obedient servant,
SIGMA.

January 10, 1852.

A LAYMAN'S REASONS FOR EMBRACING HOMŒOPATHY.*

I HAVE had a little experience of doctors—being a family man; and I have made use of my opportunities of observation to test the principles of their practice, and its results. My faith in medical science grew less and less with every opportunity of putting it to the test, until I was brought to the conclusion, that a true *science* of medicine there was none. (This conclusion your own impolitic admission proves to have been correct.) I found the practice of medicine to consist in a series of *experiments*, based on no accurate knowledge of the effects of drugs, or of the symptoms of disease. A pain in one region, and a stiffness in another, an eruption here, a chill there, and a heat elsewhere, were prescribed for as if each were a primary cause of disease; and the conflicting antidotes were jumbled together into a powerful potion, that, if it did no good, was sure to produce mischief. The absurdity of this mode of prescribing was manifest to my common sense; and I have watched the sage prescriber to see if he himself had any definite faith in the virtues of his multipotent doses. I found that, from day to day, the same game of symptom-chasing went on; every day brought out something new in the patient, and every prescription something new to battle with it in the potion. I never could ascertain that the doctor had a definite expectation with reference to the effect the medicine should produce. A convenient mystery shrouded his true opinions and concealed his ignorance. "He had given so and so—he hoped his patient would be relieved from such and such a symptom by his next visit—he would call in the evening to see the effects of the morning's medicine," etc. etc. Thus a round of visits was kept up, each rendering more necessary the continuance of the same doctor, who, knowing best what he had given his patient, should have been

* Common Sense, in its Relations to Homœopathy and Allopathy: with a Layman's Reasons for Embracing Homœopathy: a Letter to James Y. Simpson, Esq., M.D., President of the Royal College of Physicians, and Professor of Midwifery in the University of Edinburgh, on the subject of his "Speech at the Medico-Chirurgical Society." By L. D. H., a Lay Disciple of Homœopathy. Edinburgh: James Hogg, 4, Nicolson Street. London: R. Groombridge & Sons.

best acquainted with the nature of the mischief he had to correct; for, by this time, the original disease had merged into some other—a DRUG DISEASE, which abstinence from medicine, probably from baffled skill, was ultimately the chief means of curing, unless a worse result followed in the shape of chronic disorder or premature death. This hazardous experimenting I have witnessed and watched again and again, with the result I have stated—a total want of faith in the existence of a true science of medicine.

This was not a very comfortable state of mind, considering the uncertainty of health, and the daily liability of the strongest constitution to be assailed by disease. In the event of illness, it would be rash to reject all assistance, and to what quarter could I turn in confidence for such aid as would give me a chance of benefit without the possibility, if not certainty, of the "cure" proving as bad as, or worse than, the disease? Nostrum specifics for single ailments or for definite categories of disease, and patent medicines for the cure of "every ill that flesh is heir to," were vaunted as infallible, and their efficacy testified to by hundreds of *names* at least; and, however unwilling I might feel to trust myself in the hands of those whom diplomaed practitioners denounced as ignorant quacks, I could not look on them with less distrust than experience had compelled me to entertain with regard to the regular "faculty." The difference I shrewdly suspected to be one more of "cloth" and privilege than of principle; one, chiefly, between quackery unlicensed and quackery licensed and respectable.

Of systems of medicine professing to have a true *rationale*, there were not wanting many, founded too, or practised by M.D.s and F.R.C.P.s; and grand Latin, Greek, or Greco-Latin names distinguished the rival systems. These friends of humanity denounced each other in good, set, bookish terms, and the Regulars denounced them all—on such occasions, at least, employing plain language, and eschewing mystery; so that I, a poor patient, could not venture to decide where doctors so widely differed. The various exotic "opathies," etc., labelling so many opposite systems, might be no more than classic translations of the plain English word "nonsense;" and the safest course really seemed to be, the perhaps not quite secure expedient of "throwing physic to the dogs," and vowing, in general faithlessness, "*I'll* NONE of it!"

Among my friends were *hydropathic* converts, who had been revivified by the revolutionizing water-cure, and *homœopathic* converts, who were equally loud in proclaiming the magical virtues of their milder system; and each vied with the other in hearty condemnation of the "old-school" doctors, and in urgent proselytising zeal for the new "opathy." The Regulars spoke of hydropathy as highly dangerous, and of homœopathy as simply ridiculous. There really seemed to be sense in what they said, if they represented the do-too-much water-cure and the infinitesimal do-nothing sugar-pill system correctly. Of good effects resulting from both modes of treatment, I had undeniable evidence; but then the patients of the Regulars did not all die. Nature might, in the one case as in the other, have cured in spite of the doctor, rather than the doctor in spite of nature. All was uncertainty.

Among other publications, I read a striking pamphlet in exposition of certain "Fallacies of the Faculty," which so far strengthened my distrust in the ordinary practice, that I resolutely set my face against the reckless phlebotomy in which the Regulars indulged in almost every case of serious illness. I clearly saw that bleeding—however useful to the doctors, by retarding convalescence, and protracting the period of medical attendance—was, to the patient, a most dangerous expedient; and Dr. Dickson satisfied me that it was also an unnecessary one.* The doctor had a medical theory, too, of his own. His "Chrono-thermal" method of treatment was based upon striking facts of general periodicity in disease; and, on the whole, seemed vastly preferable to the old-school mixed-symptom-drugging and blood-letting. But Dr. Dickson was not ubiquitous, and, unless other doctors heartily adopted his system, I could not satisfy myself that it might not be only another form of "fallacy," or obtain any advantage from it in case of necessity, residing, as I did, at a distance from the doctor.

The nature of a layman's education, which altogether, but very foolishly, neglects the study of physiology and pathology, rendering one so dependent on professional medical men in every case of illness, I was fain to look round me for some rational ground of trust for the next emergency that might arise, either in my own person or that of any member of my family. I was led to peruse a work on the "Principles of Homœopathic Treatment," which included articles by various authors, by Hahnemann himself, and by several well-known medical men. I was surprised

* Fallacies of the Faculty, by Samuel Dickson. London.

Hosted by Google

to find that the only objection which I had ever heard urged to homœopathy formed no essential part of it at all. The Regulars and others whose denunciations of it I had heard or read, had generally left the *principle* of the system altogether unnoticed, and attacked what I now found to be merely one of the practical peculiarities which experience had shown to be expedient in following out the homœopathic law. I was more than struck with the beautiful simplicity of this law—an argument *per se* of its truth—attested, too, as it was by so many illustrations, some of them as old as observation itself. I was convinced, by the facts adduced, that Shakspere's principle for curing love was the natural one for curing more ills than those of the heart:

"Tut, man, one fire burns out another's burning!
Take thou some new infection to thine eye,
And the rank poison of the old will die."
Romeo and Juliet.

Whatever the operative cause of the efficacy of the law—*similia similibus curantur*—that it was naturally efficacious, could not rationally admit of question. I found that the most potent medicines used by the Regulars were homœopathic in their mode of action; and that their exhibition to persons in health produced the very form of disease for which they were known to be the most powerful curatives. Doubt on this point was over. Homœopathy was a law of nature, gainsay it who would. In examining the details of its application to therapeutic practice, I was delighted to find that it utterly rejected as fundamentally erroneous those mixtures of medicines which I had before so much disliked in the licensed quackery of the Regulars; and also that its practitioners repudiated the common abuse of the leech and the lancet, trusting to the specific action of proved medicines for the removal or abatement of every form of disease. I had now discovered a system of medicine founded on a natural law, and simple, intelligible, and perfectly rational in its application.

Knowing that a feeling of distrust with reference to ordinary medical practice is even more prevalent than openly expressed, and that very many doubters are kept, by misrepresentations and false prejudices, from examining the subject of homœopathy; knowing also that many who do embrace it are driven to it, not from conviction, but in despair, when blistering, bleeding, and violent drugging have all but extinguished the flickering life, I have thought it a duty which I owe to the cause of truth, to do my best to remove obstructing prejudices, and to set the subject of homœopathic principle in a true light, for the benefit of those who are so far prepared for conviction as to have been led to entertain doubts of the rationality or efficacy of the ordinary medical practice.

All medical treatment proceeds on the assumption of a specific potency, inherent in certain substances to act on certain tissues or organs of the living frame; one acting on the nerves, another on the kidneys, a third on the stomach, and so forth. *How* they produce their effects is not known; but that they do possess a specific action is a fundamental fact in medicine. Now, in the "old school," the exact effects of drugs on the body in health and disease have not been studied with any accuracy; least of all, their effects on each other, which, chemically, especially at the high temperature of the stomach must be considerable. They have been prescribed in a set routine, according to a set theory, for symptoms and nomenclatures of disease, and with too careless a diagnosis of the antecedents of the malady; and they have been administered, not singly, to produce their specific effects with observable precision, but in various mixtures of from two to half a dozen, or more, at a time, in such a way that the nature of their combined action could not be anticipated, or the proportion of effect due to each ingredient in the heterogeneous mixture ascertained with even approximate correctness.

Now, homœopathy has less to do with *names* of diseases, and more with the simple specific action of medicines. Every article in its Materia Medica has been tested again and again upon the healthful body, and the symptoms which it produced have been noted with carefully minute exactness by observers in various parts of the world; and, in practice, it is administered in such disorders as, on a minute diagnosis, present the nearest approximation to the *totality* of the symptoms produced by the medicine on the healthy subject. This simply is the homœopathic principle and its application. THE QUANTITY OF THE MEDICINE ADMINISTERED HAS NOTHING TO DO WITH THE PRINCIPLE. Experience has shown, that greatly smaller doses than are usually given suffice to produce the required effect on the diseased organs; and, of course, it would be folly to administer more than is found to be enough to create the curative reaction. But the opponents of homœopathy have fixed on this peculiarity of minute doses to ridicule the whole system, and declare, that (facts to the contrary notwithstanding) it is IMPOS-

Hosted by Google

SIBLE for the "infinitesimal" exhibition of a drug to produce any effect whatever. The principle they say little about; nay, they quietly act upon it in many cases, and, while they denounce the homœopathic system as an absurd imposition upon credulity, they at the same time adopt its essential principle in their own practice. And the small-dose system, too, against which they so awkwardly stumble theoretically, has to a certain extent been practically adopted; for it is a fact well known to every druggist, and happily to many a suffering patient, that medicines are now administered more simply, and in greatly reduced quantity, than they were before the homœopathic "heresy" was introduced, Important reforms are gradual in their establishment, and this reduction of medicine and simplicity in drugging are but the beginnings of a reform which will in time become universally extensive. There can be no doubt of this, for, when homœopathy is in favour with the public, doctors will not fail to court public favour by its means.

[We extract this paper from a candid and spirited letter, which we recommend to the attention of our readers.—ED.]

A GLANCE AT THE CONDITION OF HOMŒOPATHY.

(From the North Western Journal of Homœopathy.—Chicago, Illinois, U. S.)

WE are told by our adversaries that homœopathy is "going down" in Europe, Great Britain, and the United States. Such is not the fact, as is well known by the most superficial observer of passing events. From every quarter of the world where it has been introduced *cheering tidings* are received of its warm reception, and of its rapid growth in public favour. This fact is corroborated by testimony drawn from allopathic sources. Why are their journals filled with bitter denunciations and tyrannical resolutions against the *new system?* These efforts must have some significance, some definite object in view, or why bestow so much labour for no purpose? If it be a shadow, the system will soon pass away, without leaving a trace on the surface of society. No exertion will be required to hasten its downfall; it will die of itself. There is much meaning in all this opposition not to be misunderstood, and full of instruction to us. Let the matter be disguised as it may, there is a settled plan to overthrow it, if possible,—with what prospect of success, is best shown by the present condition of homœopathy. Instead of losing confidence, it is rapidly gaining favour among the most influential and intelligent. If the system be inefficient and unmeritorious, why has it shared so largely the attention of allopathists? From the amount of fear manifested by them, the fact is disclosed of the deep concern felt for the safety of their craft. There is no compromise in this contest,—such a term is unknown to *truth;* it is the overthrow of an old dynasty, as despotic as any that has ever existed, and the establishment, in its place, of a new one, founded upon a law of nature. We do not labour so much to convince physicians: if they are really anxious to find out the merits of homœopathy, the means are within their reach; if prevented by interest or prejudice, it is unworthy of man, and discreditable to his noble nature. It is to the people the appeal is made; nor has it been made in vain, as is attested by the approval of thousands who are enlisted under its banner. The army of reform is daily gaining new recruits, much to the dismay of our opponents. We are not discouraged by abuse and persecution, but stimulated by them to greater diligence in the attainment of our noble aim.

Judging from the signs of the times, the science of homœopathy bids fair to be extensively established in all countries. Implicit confidence is no longer placed in the aged system of allopathy. Mere antiquity alone is not sufficient to secure public favour. The time was when this circumstance was a potent sanction,—it is now past. The old system has not the first attribute of science; its claim to this dignity is mere assumption, without any evidence to support it. Science is a collection of facts in harmony with each other. The relation of these facts to each other is definite and uniform. Any one at all conversant with allopathic writers upon the subject of the practice of medicine, cannot fail to discover the discordance of their views. So much has this condition of their school been felt and deplored by the ablest of them, that they have repeatedly exclaimed, in despair of improving it, "The world would be better off without physicians." We concur with them in this verdict, and believe there cannot be found a dissenting juryman. No two authors agree upon any one subject, except it be the overthrow of existing systems, and the establishment of their own upon the ruins. This want of agreement among them results from an absence of any law by which to be governed in the administration of remedies. Unless

Hosted by Google

there is a fixed rule to refer to and observe, susceptible of uniform application in every part of the world, of course there cannot be *unity* among physicians.

Although homœopathy is in its infancy, yet it is the oldest *theory* extant, because the therapeutic relation existing between drugs and diseases is fixed and unchangeable; and as this relation is the guiding-point in the practice of the system, it must continue in *identity* through all time what it now is under the present order of nature. Of course, reference is here made to the *great law* upon which the system rests; leaving to time the perfection of its details. If the law is misapplied at the bedside, the fault is not in the system but in the administrator, who does not understand its application. We have often noticed with regret the injustice done it by pseudo-homœopathists combining the two systems in practice, alleging that the new mode is not sufficient for every case of disease,—attempting, by such artifice, to justify their conduct, when, to tell the truth, they are either ignorant of its literature, or base enough to sacrifice it for the sordid purposes of lucre.

What is the state of the case with allopathy? Not less than two hundred theories have been promulgated since its existence as an *art*; their fate is too well known to require any recital at our hands. It does not require the eye of a prophet to describe its future condition; the dullest intellect can tell it by perusing the history of the past. If two thousand years have failed, with the best minds in its employ, to give it a rational and consistent mode of practice, what prospect is there now of better success? None. That it is doomed to decay, is as plain as the "handwriting on the wall." The sooner it falls, the better it will be for mankind. The sickle of death has cut down thousands, yea millions, brought to premature graves by this insatiate monster, under the guise of science. Away with *such* science! instead of mitigating the pains of disease, they are augmented by it tenfold. The physician would have an easy task, if required to combat natural diseases alone, but add to them the legion of artificial or drug diseases, and his labours are more than quadrupled, with much less prospect of removing them. We verily believe that all the plagues, however malignant, ever visited upon men, have not destroyed half as many lives as this great destroyer, popularly termed allopathy.

May not the physical ills of life be greatly multiplied by our misdoings? Most assuredly they may. It behoves the guardians of health to point out the causes of diseases, so that they may be timely avoided, whether they arise from natural or artificial sources. It is as rash to expose one's self to the influences of the latter as to the former; indeed, more so, as it is well known that morbid conditions produced by drugs make up the greatest amount of human suffering, while they are more difficult of removal than the effects of the ordinary causes of sickness. An explanation of this fact is to be found in a deficient knowledge, on the part of allopathists, of pure drug effects. Drugs upon the healthy man must first be studied, or it will be impossible for any one, however skilful, to distinguish or separate their effects or symptoms from the symptoms of disease. Without this knowledge of the primary effect of drugs, the practice of homœopathy would not only be impracticable, but could not exist as an art. It is the duty of every physician to use those means only of which he has perfect knowledge, or he will become an engine of death instead of a messenger of mercy. Drugs cannot be used as they are by the old school without injury; a moment's reflection ought to convince any one of this truth. It is owing to the ignorance or the blindness of its physicians of this fact, that so many chronic maladies are produced, and so many lives lost to society. They are slow to learn wisdom. The mere knowledge that *Calomel* will purge as well as *salivate*, *Opium* lull pain, *Ipecac.* vomit, etc., is not sufficient to constitute the safe physician; his mind must be deeply stored with all the minutiæ of therapeutics, or he will fail to grapple successfully with every form of disease to which "human flesh is heir." So long as physicians make use of implements of which they have no knowledge, the community must suffer for it. As well might it be expected of a child to handle sharp-edged tools without inflicting serious wounds, as to suppose the habitual practice of swallowing large quantities of *Calomel*, *Quinine*, and *Opium* (to say nothing of Cayenne pepper) can be continued without the most deleterious results.

If the old school were not so bigoted and self-righteous, their condition would not be hopeless. But they have become so wise in their own conceit as to presume to put limits to medical literature, and any one who dares to dissent from their teachings is branded with heresy. What right has any Faculty of men, with the imperfections of nature common to all of us, to say that the acme of medical science has been reached? that no other theory than the one

Hosted by Google

they worship is true? Such dicta are more in unison with the ravings of madmen than the language of sane minds. No man, by authority of any sect, whether in religion, politics, or science, has any right or power to bind the conscience or fetter the mind with any conditions incompatible with rational liberty; and he who has the hardihood to undertake it, as exemplified by the transactions of the old-school colleges, "reckons without his host,"—his arrogance cannot pass long unrebuked, or his name escape the blight of infamy. We believe with the sage of Monticello, that "error may be safely tolerated when reason is left free to combat it." Such is the language of wisdom, and is as applicable to this subject as to the circumstances which suggested it. We only claim the privilege of setting forth our doctrines to the world, believing an impartial public will do them full justice. We desire to impose no unjust restrictions, or seek the aid of the law to prop up our system, being fully convinced that such a course would not only be wrong, but indicate the weakness of our cause.

THOS. HAUGHTON, M.D.

St. Louis, Mo., Nov. 1, 1851.

REPLY TO PROFESSOR SIMPSON'S SPEECH ON HOMŒOPATHY.

(From the Dundee Advertiser.)

SIR,—Your speech at a recent meeting of the Medico-Chirurgical Society of Edinburgh having gone the round of the local papers, I now take the liberty of making a reply to it; and, in order to save time and space, shall merely take up the various topics of the said speech *seriatim*, without repeating your own words.

If there are any follies which attach to Hahnemann's character or his writings, you would be fully justified in exposing them. No one has yet done so. As homœopathists, we profess our belief in the law of cure which he discovered and promulgated; but in doing so we do not pin ourselves to his coat-sleeves and feel compelled to believe everything that he may advance on any subject. None of us believe in his infallibility any more than we do in yours, and we are as willing to give you all due credit for any valuable discovery you may make, as we now do Hahnemann; without at the same time having anything to do with any of your follies. We select for imitation and personal improvement whatever we see to be really good and valuable in any one's character or system, even though he may have had his follies. Who is without them?

You, then, as a society, compare the right you have to deal with your members, to that which a Christian congregation has to do with theirs. But, Sir, allow me to tell you that you have no *such* right. A Christian congregation, of whatever denomination, is in possession of a Bible containing the law and testimony, to which it can appeal, and by which standard it can judge of those who differ from them. You, on the contrary, have no Bible—no infallible law nor testimony, to which you can appeal, and by which you can judge any one. How, then, can you have such right? As a school having any relation to a Christian congregation, you are more to be compared with infidels than anything else. You profess to be without law—you say there *can* be no fixed principle or law by which to regulate the practice of medicine—and yet you assume the position of being our judges!

That the homœopathic and Mormonite heresies have many points in common may be seeming to one with filmy eyes, but they are not real. The following detestable Popish ideas, although cautiously expressed, ought to have been kept to yourself,—"That physicians should choose the *kind* of medical treatment *for* the public, and that clergymen should choose their religion!" Never! The red flag of persecution in the hand of a foreign despot may be again unfurled on our shores, and the terror and gloom of the dark ages again threaten to overwhelm our country, but never shall the people of Great Britain surrender that liberty of conscience which their forefathers bled to purchase, and which they have long struggled to maintain. They have made up their minds for ever that, in matters of conscience, they shall act for themselves. They will not allow any set of clergymen to judge or choose a religion for them; neither will they passively hand over their right of private judgment in medical matters to you nor any of yours. Divest your system of all its Latin jargon, theoretical dogmas, and vain speculations—give it out to the world in a language which can be generally understood, and let it stand the test of a discriminating public—common sense if you will. The non-professional public have heads as well as professors; and, rest assured, they can see as far into a bag of sawdust as you can, with all your appliances to boot.

That some have believed Hahnemann to be actually inspired, requires more than your own *ipse dixit* to prove. That he was a man possessed of the highest mental endowments, I know from the testimony of those who knew him intimately; but that he laid any claim to being inspired is not true. You confess that the heresy is extending: yes, it is, and you can't stop it. The war has been kept up with unrelenting bitterness on the part of the old school for half a century; and yet year after year bears testimony to our triumphant and victorious career. Hahnemann, single-handed and alone, braved the whole army of the Philistines, and came off a victor, crowned with laurels. In our own country homœopathy arose like a small cloud on the horizon, which the old school thought the first breeze would dissipate; and now, look at it. It has spread over the whole length and breadth of the land. A few months ago a leading medical journal of the old school gave out that homœopathy was on the decline in the metropolis, and almost extinct in the provinces. What will some men not say?

Hosted by Google

Now a professor of the same school says the heresy is extending.

In the course of your speech you are next led to refer to the basis or foundation of practical medicine, to the law by which all sound practice ought to be regulated. On this head your words are necessarily few, though I suspect your thoughts have been numerous, and strangely perplexing. Like the Mormon prophet, I think I see you betaking yourself to that mysterious box, or repertorium of medical science, containing the past, present, and future history of medicine; and after raising the lid, you search eagerly among its rusty records for the revelation of some law to help you in your present emergency, but in vain. All the time you maintain that this box actually does contain the *summum bonum* of practical medicine. At length, by means of the prophet's wonderful *urim* and *thumim* spectacles, you bring forth a plate on which is inscribed a law of great antiquity, which had been lost for many generations. As proof of its originality, it is written in some strange characters which the followers of the prophet call the *glyph* of *stolum*, and which no one can understand without the aid of the strange spectacles. The literal translation of this law, as given in your own words, is *the standard of common sense.* As it is evident you purpose being the sole proprietors of this rare commodity, perhaps you will be after taking out a patent for it; so that all who are desirous of possessing this article shall be compelled to purchase it from you, and receive your stamp upon it, without which all others must be spurious. It is evident, Sir, that you assume yourselves to be the sole proprietors of common sense; and by virtue of this prerogative you become our judges. Is not this a piece of barefaced presumption? I consider myself to be in possession of as much sound common sense as you; and, so far as that is concerned, have as much right to judge in regard to the truth of homœopathy as you have. In this matter, I fear that any common sense you may be in possession of is sadly perverted. If you are in any measure to be led by this standard yourself, you ought certainly to give homœopathy a fair and honest trial. And if you do not find that it answers better than the old system, then just give it up. That would be a thorough common-sense way of deciding the matter for yourself. You did try it once, according to your own confession, and in that case you were successful too; why not give it a further trial? Every one of you are conscious that the old system is wofully deficient, and you are constantly trying experiments with new, doubtful, and dangerous remedies. You have even tried mesmerism; why not try homœopathy? Not a few of the most eminent men in the old school have tried the expectant or do-nothing system—many others have tried bread pills—and all these have declared that they were fully as successful by these methods as they were by bleeding, blistering, etc. Why, then, not try homœopathy? But, Sir, before doing this, you would require to be at some trouble. You are not born with an intuitive knowledge of this system any more than other people are; and your eminence as an obstetrician is no reason why you must necessarily know everything else. You would require to study it patiently and perseveringly before putting it to a rash trial.

You next come to the subject of the so-called infinitesimal doses. What you say on this head is a thrice-told tale, without even a shade of originality on your part. In making such quotations you resemble a certain class of heroes, who take special delight in setting up men of straw to make a show before the public in knocking them down again. You are quite well aware that the truth of homœopathy is not at all connected with these doses. It was practised successfully long before these doses were known, and is still practised successfully without them. The truth or error, in regard to infinitesimal doses, does not in the slightest degree affect homœopathy. This I beg you, and any who may have read your speech, to bear in mind as an established fact. With every homœopathist the dose is distinctly an undecided and open question. What we maintain on this matter is this:—That doses of medicine much smaller than those which you are generally in the habit of using are effectual in curing disease, when given in accordance with the law of cure, *similia similibus curantur*, though such doses may have no perceptible effect upon the healthy body. In proof of this we appeal to thousands of facts. Against this law of cure you have not attempted to advance a single argument; for a very good reason, you could not.

You next refer to the number of our medicines, the cost of a chemist's stock, and the preparation of our remedies,—on each of which heads your statements are incorrect. In the first volume of our Pathogenetic Cyclopædia there is a list of 323 medicines; and there are several new remedies added since then. As to the cost of a chemist's stock, you may be able to form some more correct idea when I inform you that I saw one single invoice for undiluted medicines from a wholesale drug-house which amounted to £48. As to the different dilutions, many of us prepare these ourselves from the crude drug, so that we know to a certainty what and how much they contain.

Your speech, as a whole, does you anything but honour. Drowning men catch at straws, and certainly you have got hold of nothing better. Truths, the most precious and important ever revealed to man, have often been made the subject of ridicule by those who could not overturn them by an appeal to reason and facts. You are an eminent man in your own department, highly talented, no doubt, and, like the Greeks of old, perhaps seeking "after wisdom," but unfortunately too like them in despising and overlooking facts. You are not, however, altogether unreasonable, and I would take the liberty of pressing upon you the claim which homœopathy has to a patient and impartial investigation. The testimony in its favour is of the highest and strongest character. You have reports of hospitals, dispensaries, and other public charities, all of which combine in show-

Hosted by Google

ing that a far greater amount of success is attainable under the new method of treatment than under the old. And several thousand physicians, practising in every civilized country in the world, unite in testifying to the great superiority of the homœopathic mode of treatment, in private practice, over that of the allopathic. It will not do to judge of the subject *a priori*, by any preconceived notions, and say that it is ridiculous. You, in particular, can't do this with any show of good grace. You know that there are many learned people who still ridicule and reject all those palpable and astounding effects produced by mesmerism. A few passes with the hand—a mere look at the patient to produce such effects! Nonsense. And yet you are a believer in mesmerism; a thing far more improbable-like, and ten times more ridiculous than homœopathy. What more improbable and ridiculous-like than to say that the ticking of a clock in London could be distinctly heard, and the vibrations of the pendulum correctly registered in Edinburgh? The efficacy of small doses is not nearly so ridiculous as this. And how do we establish the truth of these; by an appeal to common sense? By no means; but by referring to incontestable facts. How would you prove that the earth revolves on its axis, or that there is such a planet as Neptune, or that the asteroids Flora, Iris, Metis, Hygeia have any existence? By an appeal to common sense? No, but by observation and facts. In the same way, Sir, ought you to deal with homœopathy and small doses. Investigate, judge for yourself, and dare to be wise.

S. C.

Dundee, December 23, 1851.

THE
HOMŒOPATHIC TIMES.

SATURDAY, JANUARY 17TH, 1852.

WE published in our last number a letter signed PHILALETHES, in which the writer adverts to the scheme of uniting the two medical homœopathic societies and the two metropolitan hospitals. We have so often recommended one large and effective one in preference to two small and comparatively ineffective hospitals, that we have only to repeat that such an union is a consummation devoutly to be wished. We think the governors and subscribers to both Institutions should take the matter in hand.

Some rumours have reached us, and some facts are known to us, which induce us to think that the scheme is practicable, and that even now some steps may be taken towards it.

The banns may be at once published, and let the opponents to the union, if there be any, declare if there be any just cause or impediment why these hospitals should not come together. We can discover no just cause, and no impediment that may not be got over.

We think the medical men of the hospitals should stand apart, and leave the discussion to a committee formed as PHILALETHES has proposed. We believe, however, that no negotiation can come to a successful issue, if the fundamental rule of the London Homœopathic Hospital be maintained. Let that rule be altered, and the plenipotentiaries will have a comparatively easy task.

THE ROSS DISPENSARY.

IN the *Homœopathic Times* for Nov. 1 was reprinted a report from the *Hereford Times*, of a special meeting of the governors of the above charity held at Ross, to consider and decide the question whether Dr. Strong, a homœopathic physician, should be sanctioned in introducing that system of treatment into the Dispensary; he having for a long time previously, with the tacit consent of the governors, supplied his patients there with homœopathic medicines from his own private stores.

The question, then left in doubt, was to be finally decided on the 7th of January last, and as the time drew near, the violence of the opposition increased. The two surgeons of the Institution notified to the committee their intention of resigning their appointments, in case "the heresy" was admitted, whilst the more serious withdrawal of a large section of the supporters of the charity was openly threatened.

It also appeared, in collecting the views of the most influential governors, that of those who were willing to enlarge the scope of this medical institution, by a liberal reconstruction of the rules, a considerable number were not prepared to support a public sanctioning of homœopathy *eo nomine*,

Hosted by Google

since they possessed but little knowledge of its intrinsic merits. In this state of things, and with a numerical certainty of suffering a defeat upon any point relating to the introduction of homœopathy, the following letter was sent by Dr. Strong to the chairman of the annual meeting.

"MR. CHAIRMAN,—May I beg the favour of you to read to the meeting to-day the following statement from me, upon a subject of considerable importance.

"Since the meeting held on the 20th of October last, calling my attention to Rule XIII., I have found myself virtually precluded from admitting any more patients under my care, without a violation of the strict letter of that rule. Such a position must needs be very unsatisfactory to the governors, and injurious to the charity, while it is not only derogatory to myself, but disables me from fulfilling, according to my own conceptions, the proper duties of a medical officer, viz., to apply those remedies, and adopt that mode of treatment which experience and conviction lead him to believe the most effectual for the well-being of his patient. From what then passed, I have been induced to wait patiently until the time came round for holding the annual meeting, in the expectation that some of the governors would propose an alteration or modification of the rules, so as to enable homœopathic medicines to be ordered at the dispensary, for the use of such patients as may prefer that mode of treatment. Upon this point I fear, and indeed know, that there exists a wide diversity of opinion among the governors. But whatever determination you may in your counsels this day come to, I trust it will be of such a nature as will either leave my judgment wholly unfettered, or lead me to the only other alternative, that of resigning a situation in which my professional services can no longer be made available in promoting the welfare of a most excellent Institution.

"I am, Sir,
"Your obedient servant,
(Signed) "GEO. STRONG, M.D.
"Jan. 7th, 1852."

Upon this being read to the assembled governors, it was formally proposed and unanimously resolved—

"That the thanks of the governors be returned to Dr. Strong, for his zeal and ability in the cause of the Institution during many years; but that his resignation, conditionally tendered on this day, be accepted, on the ground, that the governors of the Ross Dispensary do not feel justified in giving to his recently announced medical views and practice such sanction as he desires.
(Signed) "C. A. OGILVIE, D.D., Chairman."

YORKSHIRE AND LANCASHIRE HOMŒOPATHIC ASSOCIATION.

THE first meeting of this Association will be held in the Board-room of the Homœopathic Hospital, Bloom Street, Piccadilly, Manchester, next Thursday, the 22nd inst.

We hope that these Associations may be multiplied, and much benefit arise from the zeal and energy of their members. Perhaps the secretary will kindly send us a report of the proceedings, a list of the officers, and the members of the Association, and a list also of the homœopathic practitioners in the northern counties, with their addresses.

Would not the Northern Counties Homœopathic Association be a more comprehensive title, so that Cheshire, Durham, Cumberland, Westmoreland, and Northumberland may be included?

Correspondence.

THE HAHNEMANN HOSPITAL.

To the Editor of the Homœopathic Times.

SIR,—I have read in your paper of the 10th instant the letter of one of my coadjutors, Mr. F. J. Smith, detailing the history of the rise and progress of the Hahnemann Hospital, but as a history, to be valuable, should be correct, I will, in all friendliness, point out some errors into which Mr. Smith has fallen.

This history has, it seems, been excited by an utterly inoffensive and well-intentioned letter of Mr. Leaf, *suggested by the Board of Management of the Hahnemann Hospital*, addressed to the subscribers of the London Homœopathic Medical Institution, informing them that the Institution established by Mr. Leaf, in 1838, had been discontinued in favour of the Hahnemann Hospital, and soliciting the continuance of the patronage and support to that Hospital, which had been hitherto conferred by them on the London Homœopathic Medical Institution. This circular, independently of being sent by post to all subscribers whose addresses were known, was also left at Mr. Headland's, that it might fall into the hands of those whose addresses were not known; and how or why it should, after twelve month's distribution (for it is dated 1st January, 1851), give rise in January, 1852, to feelings of dissatisfaction, or how it can be assumed to claim the merit of originating the Hahnemann Hospital, or of being connected with it, or for what purpose the assumption of Mr. Smith, but in no way warranted by the letter, should be disclaimed by him, I for one am at a loss to conceive. It

Hosted by Google

should be added, that on the fly-leaf of the circular was printed the prospectus of the Hahnemann Hospital, the names of its patrons, president, vice-presidents, trustees, board of management, and *medical officers, with their days of attendance;* the objects of the Hospital were briefly detailed, and, as usual, the necessary information as to the receipt of subscriptions by the bankers and others, etc., was given. I doubt not Mr. Leaf will be content to leave this circular to the judgment of the homœopathic public, without fear of any *sinister motive* being attributed to him.

Every homœopathist is, I fancy, aware of the large expenditure incurred by Mr. Leaf, in the introduction and advancement of homœopathy in this country, on this it is unnecessary for me to enlarge; I will merely briefly mention some other facts in connection with his efforts. In 1836, Mr. Leaf established, at his own expense, the first homœopathic dispensary in London, under the direction of Dr. Curie, where the poor might be gratuitously treated. In 1839, at his own cost and charge, Mr. Leaf took the mansion, No. 17, Hanover Square, when the dispensary was not only enlarged, but subsequently a hospital, with twenty-one beds, was established, in which, as many now eminent homœopathic practitioners can testify, a medical school was formed, of the advantages of which they were themselves, as students, partakers. Mr. Leaf was aided in his good work by some few hundred subscribers, amongst whom might be reckoned the first names in this country; the Duke of Wellington, the Earl and Countess Wilton, Lord and Lady Robert Grosvenor, etc. etc. etc. The hospital, not the dispensary, was, however, discontinued in the year 1846, from the want of that necessary management which the ill health of Mrs. Leaf, and the multifarious occupations of Mr. Leaf, in the failure of other assistance, prevented being given to it. The Dispensary, or Institution, was continued until after the Hahnemann Hospital was organized, when its subscribers were, as I have mentioned, at the instance of the board of management, solicited by Mr. Leaf to transfer their support to the Hahnemann Hospital.

Mr. Smith has confounded the London Homœopathic Medical Institution with the English Homœopathic Association.

Mr. Smith says that the London Homœopathic Medical Institution is totally distinct from the Hahnemann Hospital "in its birth and its education, its origin and its aim." No one has asserted or insinuated, nor does the circular insinuate, to the contrary, with respect to "its birth, education, and origin;" but as to its aim, the "aim" of the London Homœopathic Medical Institution could only be identical with that of the Hahnemann Hospital, for the poor were gratuitously treated *there*, a medical school *was* formed *there*, where students *were* instructed, and finally, no one can deny that the progress of homœopathy was materially forwarded by the Institution.

Mr. Smith says that the members of the Institution joined us, after repeated interviews, and that their funds, £200 or £300, were handed over. In this he is certainly in error,—there was no board, there were no funds; on the contrary, Mr. Leaf was largely, very largely, in advance. But the party which did hand over their funds to the amount stated was the English Homœopathic Association, an association of laymen and professional men, originally promoted by Mr. Sampson, in conjunction with many of his then friends, which had for two years previously been collecting funds for the establishment of a hospital on broad principles, and which, when the Hahnemann Hospital was established, lent their best aid to promote its success; yet not after repeated interviews, as I, a member of both committees, am not aware of even a single interview.

As to the "*individual*" whose praiseworthy efforts Mr. Smith describes as having been so energetically directed to so good an object as the foundation of a homœopathic hospital, it is only fair, as so many names have been mentioned, that the veil should be raised with respect to him, and when the history of the Hahnemann Hospital is written, "an individual I know," "my friend," and "F. J. Smith," as one and the same, must, according to his account, prominently occupy a niche in that history.

I have only to add, that, cordially agreeing in the encomiums bestowed on two ladies, there is at least one other lady whose noble efforts in our good Cause deserves a notice, and whose untiring zeal in behalf of our Hospital and the bazaar not even a delicate state of health could quench.

I am, Sir,
Your obedient servant,
9, Gresham Street West, W. WARNE.

THE ETYMOLOGY OF OD AND ODYLE.

To the Editor of the Homœopathic Times.

SIR,—On further reflection, I fear that I have not by any means seized Reichenbach's idea in supposing that by the "Od" force, he means to designate a force which proceeds from points. I suspect that he had something much more comprehensive in his mind when he applied that expression to his new imponderable. I do not wish to turn your medical journal into an arena for philological discussion, but as I lately sent you an explanation of Reichenbach's word, which I now believe to be only partially correct, I hope you will permit me to enter on the matter a little more at length.

The name of the Deity, among the ancient inhabitants of the North, was Od-in or Oth-in, or Vod-in. The Anglo-Saxons and their neighbours called him Vod-an, Ved-a, Vod-en, Vod-a, Vod-ha, etc.; the Carelians, Vod-en; the Tunguses, Od-in; the Arabians, Vodd and Vudd; the Persians, Bud-asp; the Indians, Buddhah, Bod-a; the Thibetians, Vod or Wod; and many other nations adopted the same or nearly the same word to express the Supreme Deity. Our own name for the Deity contains the same expression.

Hosted by Google

The original meaning of the word "Od," as applied to the Deity, is explained by learned men (and could, I think, be easily proved, if I did not feel too much reluctance to encroach on your space with such discussions) to be "Spirit." The whole of this is apparently derived from the passage in Genesis, in which it is said that God breathed into man's nostrils the breath of life. The great Spirit gave of His spirit—imparted to the frame of dust a force of "Life," differing entirely from the electricity, magnetism, etc., of the earth, and then, having thus received from Deity what none but the Deity could communicate, man became a living soul. The name of "Spirit," "Od," "Bud," "Ved," G "od," was therefore given to the Supreme Divinity—"the Breath," in fact.

This I presume, then, to be in reality Reichenbach's meaning. He calls his new imponderable the "Od" force, that which was breathed into man when he became a living soul—the force of "Life" in fact.

I may add, that when once the name Od was applied to the Supreme Governor, it was soon used to signify any eminence, and after that a "point," as it is found in Icelandic, Swedish, Danish, etc., and in the obsolete Greek word, *οδειν*, pungere; and in this sense it harmonises well with the crystalline force of which Reichenbach speaks. Is one to presume that in earlier times people were acquainted with this peculiar quality of crystals?

And it is not a little singular that the same theme "Od" is found in some other words: Odour, *e. g.*, where it signifies, as Count de Gebelin informs us, *Les Odeurs qui s'exhalent du corps.*

I beg to apologize to you, Sir, and your readers for this long notice.

I have the honour to be, Sir,

Wickwar, Your obedient servant,

Dec. 18, 1851. THOMAS R. EVEREST.

To the Editor of the Homœopathic Times.

SIR,—Sir I. Newton once said, that "a man had as good be engaged in lawsuits as have to do with philosophy." Such is the litigious character which those who engage in its pursuit have acquired. I have no wish to form one of this number, but as the claims of the magnetoscope continue to be advocated in your journal, I am tempted to address you once more upon that subject. May I be allowed to call attention to a paragraph in my letter, published in your number for November 15th, page 245, for the purpose of making an inquiry respecting it.

Among the experiments there described is the following. "I connected various *flexible* substances, some metallic, and others not, with the brass ball, but I could produce no motion in the pendulum, *unless I stretched these connecting links so as to make them rigid.*" May I take the liberty of asking, if any of your correspondents have been able to obtain any results with a *flexible* connection (a gold watch-chain, for example) with the instrument? This would seem to be an *experimentum crucis* as regards the explanation of the movements produced. All the known phenomena of electricity and magnetism can be produced by flexible as well as by rigid conductors, whereas it is well known that every mechanical effect is dependent for its production upon the rigidity of the instruments, and is immediately destroyed by rendering that instrument flexible.

The above experiment added to another independent circumstance, namely, that all definite movement is prevented, either by blinding the eyes of the operator, or by placing substances in his hand, the nature of which he is ignorant of, can hardly fail to convince persons accustomed to the investigation of natural phenomena, that, *as yet*, the magnetoscope is no indicator of magnetoid currents.

I am, Sir,

Your obedient servant,

WILLIAM SHARP.

Rugby, December, 1851.

To the Editor of the Homœopathic Times.

SIR,—As there appears at present to be some agitation respecting the necessity of a Charter, or some means of licensing those who practise homœopathy, and seeing that the Association for the Protection of Homœopathic Students and Practitioners have this week arisen from their slumbers, I venture to address that body through the medium of your columns, with the view to stimulate them to some immediate and permanent action.

There are two schemes at present afloat. One to petition a college to admit the study of homœopathy within its walls—the other, to obtain an independent Charter. The first appears to me a waste of time, for how can we expect those in power to allow a fair, impartial trial to a system they deride and condemn without a test? it is useless to waste words where the proof of action is not admitted, even the discussion of the subject seems to make friends enemies, and cause respectable men to charge each other with falsehood; every engine of abuse has been brought into play, absurd calculations attempting to show how many doses make a grain, and a long string of figures to argue the impossibility of any one individual of the human family being able to get rid of a grain of medicine during his whole life—Mormonite comparisons. The writings of Hahnemann are declared to be a tissue of the strangest contradictions and the wildest absurdities; to believe in them is sufficient evidence to fit one for a lunatic asylum. Now, all this raillery may have its advantages or disadvantages, but no good can come of an appeal to such bodies corporate at the present time; the day may and, no doubt, will arrive, when they will be sorry to see such statements registered in type against them, and they will be most happy to be allowed to take the sponge and wipe out these evidences, with the humble acknowledgment that they too are but fallible men. We must bide our time.

As to the second—that of obtaining a special Charter—this may be fraught with much difficulty, inasmuch as it is only for one branch of study, that of therapeutics, for which it would really

Hosted by Google

be required, and I am disposed to fear the legislature would not advise a grant; indeed, I cannot think it would be wise for them at present to interfere in the matter—homœopathy is the adopted child of the public, to the public it must look for protection, and in the hour of difficulty it will not be forsaken; all that we now want is some guarantee that those who practise it are qualified for the task, so that the public may safely rely on obtaining the advantages of this system exercised by skilful and experienced physicians. To obtain this in a speedy and easy manner, I beg to propose that the Association do call a meeting to consider this subject, that every exertion be made to increase its numbers, and that, at the earliest possible period, the members of the Association be invited to vote, to constitute a Board of Examiners for the purpose of granting certificates, on the payment of a certain fee, to all who pass such examination, and are pronounced duly learned and practised in the several branches of medical science. I conceive such a body, elected by that part of the public who are homœopathic from conviction, would be of great advantage at the present moment, and would have some weight in advancing the progress of this much-abused science. Trusting that these observations will induce the Association to exert every influence to establish homœopathy on a firm basis,

I am, Sir, yours, etc.,
H. B.

Miscellaneous.

THE TELEGRAPHIC SYSTEM OF THE UNIVERSE.—From the principle, long since settled in mechanics, that action and reaction are equal, it will follow that every impression which man makes by his words, or his movements, upon the air, the waters, or the solid earth, will produce a series of changes in each of those elements which will never end. The word which is now going out of my mouth causes pulsations or waves in the air, and these, though invisible to human eyes, expand in every direction until they have passed around the whole globe, and produced a change in the whole atmosphere; nor will a single circumgyration complete the effect; but the sentence which I am now uttering shall alter the whole atmosphere through all future time. So that, as Professor Babbage remarks, to whom we are indebted for the first moral application of this mechanical principle, "the air is one vast library, on whose pages are for ever written all that man has ever said, or woman whispered." Not a word has ever escaped from mortal lips, whether for the defence of virtue or the perversion of the truth; not a cry of agony has ever been uttered by the oppressed; not a mandate of cruelty by the oppressor; not a false and flattering word by the deceiver; but it is registered indelibly upon the atmosphere we breathe. And could man command the mathematics of superior minds, every particle of air thus set in motion could be traced through all its changes, with as much precision as the astronomer can point out the path of the heavenly bodies. No matter how many storms have raised the atmosphere into wild commotion, and whirled it into countless forms; no matter how many conflicting waves have mixed and crossed one another; the path of each pulsation is definite, and subject to the laws of mathematics. To follow it requires, indeed, a power of analysis superior to human; but we can conceive it to be far inferior to the divine. The same thing is true of the waters. No wave has ever been raised on their bosom, no keel has ever ploughed their surface, which has not sent an influence and a change into every ocean, and modified every wave, that has rolled in upon the farthest shores. As the vessel crosses the deep, the parted waves close in, and every trace of disturbance soon disappears from human vision. Nevertheless, it is certain that every track thus furrowed in the waters has sent an influence through their entire mass, such as is calculable by distinct formulæ; and it may be that glorified minds, by the principles of celestial mathematics, can as easily trace out the paths of the unnumbered vessels that have crossed the waters, as the astronomer can the paths of the planets or the comets. The solid earth, too, is alike tenacious of every impression we make upon it; not a footprint of man or beast is marked upon its surface, that does not permanently change the whole globe. Every one of its countless atoms will retain and exhibit an infinitesimal, but real, effect, through all coming time. It is too minute, indeed, for the cognizance of the human senses. But in a higher sphere there may be inlets of perception acute enough to trace it through all its bearings, and thus render every atom of the globe a living witness to the actions of every living being. In view of these facts, we cannot regard the glowing language of Babbage an exaggeration, when he says, "The soul of the negro, whose fettered body, surviving the living charnel-house of his infected prison, was thrown into the sea to lighten the ship, that his Christian master might escape the limited justice at length assigned by civilized man to crimes whose profit had long gilded their atrocity, will need, at the last great day of human accounts, no living witness of his earthly agony: when man and all his race shall have disappeared from the face of our planet, ask every particle of air still floating over the unpeopled earth, and it will record the cruel mandate of the tyrant. Interrogate every wave which breaks unimpeded on ten thousand desolate shores, and it will give evidence of the last gurgle of the waters which closed over the head of his dying victim. Confront the murderer with every corporeal atom of his immolated slave, and in its still quivering movements he will read the prophet's denunciation of the prophet king."—*Britannia*, *Oct.* 18.

ON TOOTHACHE.

BY DR. VON BŒNNINGHAUSEN.

An Essay read by him, in 1835, *before the Allopathic Medical Society of Münster.**

I BELIEVE that this learned Society, of which I have the honour to be a member, expects that the subject of my paper will bear some relation to homœopathy. In answer to this supposed expectation, I will endeavour, briefly, to prove how a medicine, producing a disease in a healthy subject, will relieve a like natural disease. To fix your attention on a suitable instance, I choose a complaint which, indeed, is not dangerous, but often, from the intensity of pain, reduces the patient almost to despair. This complaint, under ordinary treatment, can only be cured completely by the removal of the offending part; but for its relief the Materia Medica contains a great number of remedies, and it will never permanently disappear without the application of the specific remedy;—I mean the *toothache.*

There are certainly not many in the civilized world who are not more or less affected by this complaint, and it is well known how little relief can be brought by the so-called rational medicine. In addition to the extraction of the bad tooth there are very few other remedies, and these are applicable only in some cases, and even in these the results are very uncertain. Therefore all the known house-remedies are at first applied, often to the great detriment of the health, and when they have been taken without relief, the patient goes to a dentist, to get relief by the extraction, though he knows that it is a tooth lost for his whole life, and experience has shown us that after such sort of relief the next tooth often becomes affected.

Homœopathy does not pretend to cure all the different kinds of toothache, either quickly or for ever, but it can give relief in the greatest number of cases, and acts in the same manner as in the cure of all other diseases. According to the principles of homœopathy, the toothache is merely a symptom of an internal uneasiness of the vital power, which never exists alone, but is followed by many other symptoms, though the latter are so few and obscure, that they are not remarked but by accurate observation.

The totality of the symptoms of a disease gives a perfect picture of the disease itself, and indicates the most useful remedy in accordance with the great principle "*similia similibus curantur.*" As a painter cannot draw a perfect picture by the delineation of one feature, as the eyes, or nose, or mouth, so neither can the homœopathist cure a disease by looking only at one symptom. The great characteristic of a good homœopathic practitioner is to take together all the present symptoms, and then to analyse the most prominent of them. The difference, therefore, between allopathy and homœopathy is that, in the former, numbers of remedies are mixed together for a cure of disease, and in the latter only one remedy is employed, which meets the demands of the case, that is, of the symptoms present. It is therefore necessary that the homœopathist should know all the pathogenetic effects of the remedy he selects.

Homœopathy has many remedies which in the healthy state will produce toothache. As it is impossible to enumerate now all the different kinds of toothache, and their homœopathic treatment, I will only give a few examples how homœopathy acts in such cases. I choose for this purpose a peculiar kind of toothache, but still of common occurrence, viz., *the throbbing pains in the teeth, the pulsative pains,* which are produced by thirty-five remedies, but for the relief of which kind of toothache I have used only sixteen, and with the best result.

I. After a cold, produced by exposure to an easterly wind, a fever with great congestion towards the head frequently takes place, together with a burning heat in the face, frequent and hard pulse, and great agitation of body and mind. To these symptoms may be added, violent

* [Translated from the fifteenth volume of Archives, by Dr. Süss, to whom we tender our best thanks. It would redound much to our credit if we, in 1852, could show such available and comprehensive acquaintance with the Materia Medica as the veteran Bœnninghausen showed himself master of in 1835.—ED.]

Hosted by Google

throbbing toothache, chiefly on one side, and occupying the whole jaw, with redness of the cheek. In snch cases *Aconite* is the only specific.

II. Another kind of throbbing pain in the teeth, produced also very often by cold, but without fever, will be cured by *Causticum*. It is almost always accompanied by painful sensibility, swelling and ready bleeding of the gums, with dragging pains in the muscles of the face, in the eyes and ears.

I was myself affected last winter for *several days* with this complaint, because I did not understand, from the absence of the other principal symptoms, which was the right remedy to select. After having employed, without relief, many remedies, I was cured in two hours by taking one dose of *Causticum*, and from that time I have not suffered from a similar toothache. The toothache to which *Causticum* is appropriated is always of a chronic nature, *Causticum* having a long medicinal action; but remedies whose action is limited to a short period will never affect this kind of toothache.

III. *Chamomilla* is very useful in throbbing toothache, affecting especially women and children. The kind of toothache which is relieved by this remedy is almost always insupportable at night, and increased by the warmth of the bed, and causing despair to the patient, who runs about, and keeps moaning; there is generally redness and swelling of one cheek; the hair is moist; there is great thirst, and swelling of the submaxillary glands.

Some years ago, I remember my wife was seized with violent toothache of the kind I have just described. As I was absent from home Dr. B., who attended at that time my suffering wife, gave her at first *Aconite*, in consequence of the feverish symptoms; as they were not diminished, on the next day he gave her *Pulsatilla*, which did not produce the slightest effect; the third day *Bryonia* was administered; but this remedy also gave no relief. Dr. B., who now thought that homœopathy was insufficient, applied, on the fourth day, eighteen leeches, and gave a mixture, which produced for the first time a short relief; but after a quarter of an hour the same violent toothache returned, and became insupportable. The fifth day I returned, at four p.m., from my journey, and found my wife suffering from the intensest pain. After having inquired into what had been done for her, and having well examined her state, I gave her at once a dose of *Chamomilla*. At five o'clock the pain ceased and the swelling of the cheek disappeared.

IV. The kind of throbbing toothache cured by *China* is not of frequent occurrence.

I remember chiefly one case, which happened to me whilst travelling through the country. A young girl, well featured and pleasant to look at, had become, when I saw her again, pale and thin. She suffered from violent throbbings in the teeth, increased chiefly after meals and at night, and were slightly relieved by strong pressure and biting on the teeth, while a slight touch rendered the pains insupportable. In the meantime she had continual diarrhœa and profuse night-sweats; she was very weak and could scarcely walk about.

As she begged me to relieve her suffering, I gave her a small dose of *China*, and the next morning, when I set off, she told me, highly delighted, that she had had a very good night, had no toothache, and had been free from night-sweat; and when I called on her some months afterwards, I found her again nice-looking and handsome. A quite similar toothache can be produced by the abuse of *China*, as I have observed already twice, in young men who were in the habit of taking every morning *China-brandy*. It is clear, in such a case *China* would not be applicable.

All the symptoms were cured, in one case, by *Arnica*, in another by *Pulsatilla*, two remedies which answered more the general symptoms than the throbbings.

V. Persons who are accustomed to suffer very often from a throbbing pain in the teeth are, after the nature of the accompanying symptoms, almost always cured by *Aconite*, *Chamomilla*, *Ignatia*, *Nux*, or *Pulsatilla*. But there are also throbbings in persons who never take coffee, and for which toothache the *Tincture of Coffea cruda* is the specific.

Last Christmas I called upon a friend's family, who lived strictly according to the rules of the homœopathic diet, and never took coffee. I found the housewife suffering from violent toothache; the pain was throbbing, and the patient ran crying from one room to another, complaining of insupportable pain; though she confessed that sometimes the pains were not so intense, yet they affected her very much. The account of her sufferings was inrupted by crying, and she behaved herself with a certain hastiness, like a person distracted, which last symptom struck me the more, as I knew her consistent and firm character when she was in health.

I gave her at once a small dose of *Coffea cruda* 6, and after two minutes the throbbings disappeared, and the remaining sensi-
