bility of the part affected was taken off in five minutes afterwards by *Ignatia*. The whole evening now passed in the usual way, and during the week I stopped there nothing similar happened. Some days ago I saw her again, when she told me that she had not had any attack of toothache since.

VI. A remarkably quick-acting remedy for a kind of throbbing pain in the teeth is the north pole of the magnet.

This throbbing is almost always accompanied by burning, and has its seat in the lower jaw, followed by a hot and red cheek; it becomes worse from warmth, and after meals. Generally there is a chilliness over the whole body; great irritability; trembling and quivering of the limbs. In spring and autumn this kind of toothache is very frequent. Its cure is soon accomplished, the patient touching with the forefinger the north pole of the magnet as long as the pain seems to be increased.

I cannot forbear mentioning an application of the magnet, which, however, was not followed by success, yet shows its strong effect.

A servant of mine came into my study one evening, and begged me to give him some relief for his toothache, which had pained him since four p.m., and was always increasing. The pain was throbbing, and was in the upper jaw. As all the symptoms, except the last one, indicated the north pole of the magnet, I applied it at once (power of magnet capable of lifting two oz.); but he had scarcely touched it with his finger, when he grasped his cheek with his other hand, and cried out, "Oh! it springs downwards!" The pain was merely removed from the upper jaw to the lower one, but continued with the same intensity. It is certain that this metastasis was produced by the north pole, and cure could not be expected from it. I then allowed him to touch the south pole, which, by experience, we know takes away the effect of the north pole. What I expected happened; he had only just touched the south pole, when he cried out, "Oh! it springs again upwards!" So my purpose was answered; and shortly afterwards I gave him *Pulsatilla*, which cured him completely: that was no imagination.

VII. I do not know whether there is a syphilitic toothache of a throbbing character for which *Mercurius* would be the specific, because it has the power to produce in a healthy person all the chief symptoms of syphilis; but there is a throbbing in the teeth which comes on from abuse of *Mercury*, and is worse towards the evening, in bed, until midnight, and even through the whole night, and prevents the patient from sleeping. *Acidum nitricum* is generally the specific for this kind.

I attended, two months ago, a young man, who had some time before contracted gonorrhœa, and had applied for relief to a young physician, who had probably very little experience in such cases. This patient came into my room in the greatest despair; talked at first only of his unfortunate position, without mentioning his complaint, and spoke of committing suicide. After having consoled and encouraged him, he told me his sufferings, and showed me his palate, which was corroded by chancres, his gums lacerated by ulcers, and covered with thick, swollen, yellow-coloured crusts, and his tongue with ulcerous margins, with a sensation of the tongue falling off; the dread of the loss of this organ, which he thought could not be avoided, gave him the greatest anxiety, and impelled him to think of suicide. The gonorrhœa had disappeared, but in its stead the above-mentioned symptoms occurred. I perceived at once that this was a case of mercurialism.

I therefore gave him at first a small dose of *Hepar sulph.*, after which remedy the palate and gums looked quite different the next day, and the patient began again to enjoy his life. Two days afterwards the above-mentioned kind of toothache came on, for which I ordered him *Acidum nitricum*, in a high dilution, and the *fourth* day the hitherto suffering patient called on me, comparatively cured. I saw him again several times, when he felt himself as well as ever, after I had cured in eight days, with one dose of *Petroleum*, the gonorrhœa which had again made its appearance.

VIII. In only one case of throbbing in the teeth was *Platina* the specific remedy. The pain was like a pulsative digging through the whole right jaw, increased especially towards the evening, and by rest, whilst the patient several times began involuntarily to cry out. At first *Pulsatilla* seemed to me indicated, but it did not answer.

The next day, when a friend of hers brought me the report of the case, I asked her more particularly for the accompanying symptoms, and I soon perceived why *Pulsatilla* had no effect. The throbbing was followed by a clammy numbness, which affected the whole suffering part. In the mean time the monthly period was too early and abundant, and in her mind had been lately observed a pride, with conceit, and contempt of all about her, which had

Hosted by Google

never before been seen. Here every homœopathist would have administered, as I did, *Platina*, which cured in a few hours, not only the whole toothache, but ameliorated her spirits, and restored the catamenia to their former regularity.

IX. With a cure of throbbings in the teeth by *Pulsatilla*, which frequently occurs, is connected a very pleasing recollection, which I will now relate.

About three years ago, when travelling, I arrived towards evening at an hotel, where I found some friends from the neighbourhood assembled, and among them the landlord's doctor. Some minutes after my arrival, the eldest daughter of the family begged me to relieve her toothache, telling me that for more than a fortnight she had experienced an attack, which came on after sunset, and lasted till midnight; that nothing had been found to give permanent relief, only that by walking in the open air, or standing at an open window, the pain was somewhat mitigated. This statement was confirmed by the doctor. As it was not the proper place to question her minutely about her other complaints, I gave her from my own box one dose of *Pulsatilla* 30, the result exceeded my expectation; for before I could return the box to my pocket, she cried out, to the astonishment of the whole company, "The pain is all gone." The young physician, who had but lately taken his degree, surprised by this fact, said that this cure, if it should last, would be most remarkable.

I then reasoned backwards: where *Pulsatilla* acted so quickly, there must be also its characteristic symptoms; and replied to him, if the patient followed only a week the rules for the homœopathic diet, she would not only lose the toothache for good, but be cured of any other complaints she might have. The young Æsculapius was quite puzzled at this, and asked what complaints.

I told him now some characteristic symptoms of this remedy, viz. the prevalent shivering, great thirst, low spirits, insupportable heat, want of sleep before midnight, want of appetite, and dislike to fat food, etc. He then pretended I had ascertained all these particulars before, and when it was proved that I had just arrived, and had not previously examined the patient, he exclaimed, in some displeasure, that her relatives agreed with me out of courtesy.

I replied that I would tell him something more in private, and he should afterwards ask if it was true. On his assenting, I told him that the patient was also suffering from mucous diarrhœa; that her monthly period appeared too late, at intervals of five weeks, and were only of a few days' duration, with pain in the back and cramps in the abdomen. He then went to her, and pretended I had told him that she suffered from constipation, and that the catamenia were too early and abundant; to which she replied that in these respects I was mistaken, for she complained just of the contrary, and all that she answered to his inquiries agreed exactly with what I had before told him. Some months afterwards, when I saw this young lady again, she joyfully thanked me for having cured her of all her complaints. Whether this young physician afterwards studied homœopathy I do not know, but I doubt it, as I have never heard of him since.

X. To the more rarely-employed remedies against the throbbing in the teeth belongs *Sabina*. Several cases occurred to me in which it was the only specific. This kind of toothache appeared also towards the evening and in the night, especially when the patient was warm in bed, and after meals, and with a sensation as if the tooth would burst, followed by a throbbing in all the vessels, frequent empty retching, and especially in females; abundant discharge of light-coloured blood, even not at the time of the catamenia. In one case, a pain like that of gout in the right toe was taken off by an external remedy, and afterwards this kind of toothache appeared, which by one dose of *Sabina* was quickly cured, and neither the toothache nor the pain in the toe ever returned, precisely as I had foretold, the pain in the toe as well as the toothache being covered by *Sabina*.

XI. A malady of more frequent occurrence is a chronic throbbing in the teeth, with shooting pain, for which *Sepia* (not *ossa* but *succus sepiæ*) is the only specific. This kind of toothache occurs generally in persons of a yellowish complexion, and extends to the ears, down the arms to the fingers, with a tingling in the latter, and is very often accompanied by difficulty in breathing, swelling of the cheeks, cough, and swelling of the submaxillary glands. This remedy is particularly indicated in throbbings affecting pregnant women. The patient will soon get relief from even the smallest dose.

XII. Nearly connected with this *Sepia* toothache, both by sensation and the other symptoms, is the throbbing cured by *Silicea*, but the latter is known by the swelling of the lower jaw and its periosteum, instead of the glands. The pains are more in the bone of the jaw than in the tooth itself, and the patient cannot sleep, on account of general heat. Connected with

Hosted by Google

this is usually an unhealthy skin, which festers on the slightest injury. I myself was complaining some months ago of such a toothache, accompanied by a swelling of the lower jawbone to the size of a walnut. As soon as I perceived it, I took one small dose of *Silicea*, on which the pain immediately ceased, and the swelling of the bone the next morning had disappeared.

XIII. One of the most efficacious remedies against throbbing in the teeth is *Spigelia*. Where this remedy is the specific, a kind of prosopalgia is always found, with a stirring, griping, and burning pain in the zygomatic bone, accompanied by paleness and swelling of the face, with a yellowish areola round the lower eyelid. Besides this, the patient suffers generally from an aching pain in the eyes; violent beating of the heart, often with a sensation in the chest like the purring of a cat; frequent desire to urinate, with abundant secretion of urine; shivering, with inquietude. Last year, I cured, by a single and very small dose of this remedy, a robust woman, who was affected with the above-mentioned symptoms, among which the toothache and the prosopalgia were the most prominent; both of which symptoms, and especially the latter, had for some years returned twice every week, and were almost insupportable. Neither of them has recurred since I gave her the dose of *Spigelia*.

XIV. A more frequent kind of throbbing is that for which *Hyoscyamus* is the specific. It appears generally in the morning, and is almost always caused by a cold. There is throbbing in the tooth itself, whilst in the gums a tearing sensation prevails, and in masticating, the tooth seems loose, as if it would fall out. There is always a congestion of blood towards the head, with great heat all over the body. In violent attacks there is a sense of strangulation, with difficulty of deglutition, and cramps, with a sense of mental fatigue. One small dose of *Hyoscyamus* will cure this complaint in a very short time. Two years ago, when travelling, I cured, with this remedy, a young lady, who had become very ill on account of jealousy and rage about her former lover, by whom she had been forsaken. She complained of throbbing in the teeth, especially after midnight; she had fever, with great redness of face, and long fits of delirium, in which she tried to run away, so that it was necessary to watch her. The first dose of *Hyoscyamus* took away the toothache and delirium; the second dose, which I left for her, to be taken a week after the first, cured her of all the other complaints.

XV. *Sulphur* is also a very good remedy for throbbing in the teeth, especially when eruptions of the skin have been suppressed by any kind of ointment. The gums are almost always swollen, and throb like the tooth itself. There is connected with this a great irritability of the crown of the tooth, congestion of blood to the head, and pulsative headache; towards the evening red inflamed eyes and nose; shooting in the ears, frequent but insufficient desire to go to stool, constipation, and shivering. But it happens often that all these symptoms are caused by abuse of *Sulphur*, and in such a case *Sulphur* would aggravate all the symptoms.

XVI. Lastly I will mention *Veratrum*, a remedy very seldom indicated in throbbing in the teeth. It is useful in cases accompanied by swelling of the face, cold perspiration on the forehead, sickness, and vomiting of bile; a bruised sensation in the limbs, great prostration of strength almost to fainting, and coldness of the whole body, with internal heat, and great desire for cold drinks. All these symptoms were completely cured by *Veratrum*.

As this brief exposition of the different kinds of throbbing in the teeth has already given a great variety, it is easy to be understood how much this variety, together with the difficulty of determining the proper medicine, must increase, when other kinds of toothache, pressing, burning, shooting, cutting, boring, etc., are added, which embrace a far larger circle of remedies. Hence may be drawn two conclusions:—

First. That there is no reason for pretending that homœopathy requires no study, and that to spell through a mass of symptoms, in order to select the appointed remedy, is a mere pastime, unworthy a man of intelligence.

Second. That it is never the fault of the principle of homœopathy, when the remedy, erroneously selected, does not answer. "That many remarkable facts have been collected," says Professor Eshmeyer, of Tübingen, in his pamphlet, 'The Principles of Allopathy and Homœopathy Compared,' "is beyond all doubt; but notwithstanding that the science is in its infancy, and the reasonable and intelligent man cannot and will not expect from it what he is entitled to demand from a doctrine that has borne the examination of centuries, homœopathy not only *stands the test of a strict scientific examination*, but presents us with several new principles, which introduce us to a higher physiology and pathology. *Let us therefore acknowledge what it is able to do.*"

Hosted by Google

With these words, "*Let us therefore acknowledge what it is able to do,*" I finish my short and too imperfect paper, with the cheerful acknowledgment of the noble and worthy conduct of all those members who, though not yet favourable to the new doctrine, in harmony with the words of that philosopher, *acknowledge what homœopathy can do,* until the truth or error of the doctrine is more clearly shown.

HOMŒOPATHY AND THE TOWN COUNCIL OF EDINBURGH.

THE petition anent Mr. Pope's case, and for liberty of conscience in the medical therapeutics, has been remitted by the Town Council to the College Committee. It seems then to have had a hearing, and nothing more: but a hearing, at present, is a significant fact.

We subjoin the report, and add thereto the letter of Dr. Rutherfurd Russell to the Lord Provost of Edinburgh.

"A petition was read from certain graduates of the University of Edinburgh and others, relative to the granting of medical degrees to intending homœopathists. It stated that a student, named Alfred Crosby Pope, having in the middle of June undergone the usual written examination on the practical branches of medicine and surgery, was subjected to an oral examination on the same subjects. His surgical knowledge, it was stated, was evidently defective; but his answers on his examination on Materia Medica and clinical surgery were satisfactory. Mr. Pope was then interrogated as to the truth of a rumour of his intention to become a homœopathic practitioner after graduating, when he replied, 'I am not now a homœopathist; but, after graduation, I mean to inquire into the truth of it.' He further avowed his intention, in the event of his becoming a homœopathist, to keep his diploma, to show that he had regularly studied. In medical jurisprudence, as in surgery, Mr. Pope was found to be defective; and the case having been referred by the examiners to the whole Medical Faculty, they unanimously resolved, as grave doubts were entertained as to the soundness of Mr. Pope's principles of practice, and from his insufficiency on some subjects of examination, that he should be remitted till the end of July, by which time he would have ample opportunity of making the inquiry into the truth of homœopathy which he said he contemplated. The result was, that Mr. Pope withdrew from the list of candidates; and the petitioners alleged that, in requiring from any candidate an explicit pledge limiting his future course of study and practice, the Medical Faculty have made a fundamental change in the conditions under which degrees in medicine have hitherto been granted. The petition, therefore, prays the Council, as patrons of the University, to cause the irregularity complained of to be brought under the notice of the Senatus, that such attempts to interfere with the free liberty of students of medicine may be prevented in future. A circular, signed by Dr. J. Rutherfurd Russell, accompanied the petition, stating that it (the petition) has been signed by 3337 men, most of them heads of families; among whom are nine Peers, viz., the Earl of Airlie, the Earl of Wilton, the Earl of Roden, Lord Gray, Lord Kinnaird, Lord Lindsay, Lord Colville of Culross, the Earl of Erne, and the Bishop of Down and Connor; five Members of Parliament, viz., Lord Robert Grosvenor, Lord Newport, Mr. Elliott Lockhart, Mr. John Ellis, and the Hon. C. P. Leslie; one hundred and one Physicians and Surgeons, twenty-six of the former graduates of the University of Edinburgh; one hundred and ninety Clergymen (one of them being the Rev. Alfred Pope, Leamington, the father of the aggrieved student); forty-seven Magistrates, and sixty-seven Military and Naval Officers.

"Bailie Fyfe said, the only thing which could be done with the petition was to send it to the College Committee for consideration. He thought it would save trouble if they were also empowered to communicate with the Senatus on the subject, if they should see fit. Without a careful examination of the petition, it would be premature to say anything on the subject.

"Professor Dick said, with regard to the principle involved in the petition, he could not speak decidedly. He was not a homœopathist, but he had been trying its effects for some time past, and as far as he had adopted the principle, he thought it was a mere humbug, but he would not decide definitely upon it till he had tried it farther. He might mention, that one of the principal medicines which was used by homœopathists in the millionth part of a grain, viz., *Belladonna,* he was in the habit of giving in quantities of two or three drachms to horses.

"Mr. Sclanders.—But, Mr. Dick, remember that it is to horses, and there is a difference between a man and a horse.

"Professor Dick.—There is not such a great difference between some men and a horse (laughter).

"Mr. Ridpath thought it was full time that the patrons were taking up this matter. It was absurd to say that, when a man came to be licensed as a medical practitioner, he was to be bound to say in what way he was to practise. If he was qualified to pass the necessary examinations, the Medical Faculty had no right to ask him whether he was to be a physician, a confectioner, or a grocer. He agreed in the propriety of sending the matter to the College Committee but he disapproved of their having any communication with the Senatus on the question.

"Mr. Gray concurred in the latter part of Mr. Ridpath's speech. The Town Council had been told they knew nothing about these matters, but he (Mr. Gray) would show the Senatus that the patrons could manage the matter without going to them at all.

"After some remarks from Mr. Wilson, the matter was remitted to the College Committee."

(Copy.)

" Edinburgh, 75, Queen Street,

" January 12, 1852.

" My Lord,—The petition which I have the honour of delivering into your Lordship's hands, for presentation to the Town Council, is probably, both in number and weight of names attached to it, without parallel in the records of the City.

" It has been signed by *three thousand three hundred and thirty-seven* men, most of them heads of families. Among the most elevated classes have been noted, nine Peers, viz., the Earl of Airlie, the Earl of Wilton, the Earl of Roden, Lord Gray, Lord Kinnaird, Lord Lindsay, Lord Colville of Culross, the Earl of Erne, and the Bishop of Down and Connor; five Members of Parliament, viz., Lord Robert Grosvenor, Lord Newport, Mr. Elliott Lockhart, Mr. John Ellis, and the Hon. C. P. Leslie; one hundred and one Physicians and Surgeons, twenty-six of the former graduates of the University of Edinburgh; one hundred and ninety Clergymen (one of them being the Rev. Alfred Pope, Leamington, the father of the aggrieved student); forty-seven Magistrates; sixty-seven Military and Naval Officers.

" Great as the numbers and important as many of the persons are, they form a mere fraction of those interested in the object. The agency employed to procure signatures to this petition was only occasional and gratuitous, and in many productive quarters no efforts whatever were made. Many friendly to the object refrained from signing; some because they thought the Town Council could do no good in the matter; others, and these the most influential, on the ground that, the University having issued its manifesto against all students intending to devote themselves to homœopathic practice, our strength ought to be directed towards the establishment of a separate institution for their education, or at least of a Board of Examiners, with power to grant degrees in medicine.

" Your petitioners assent to neither of these views. On the contrary, it seems to us that the Town Council, as representing the community and invested with large powers within the University, is the legitimate and appointed authority for the redress of any public wrong which may occur there, even should it be of such a nature that they can give redress only indirectly; and we are of opinion that any separate institutions will be premature, until all efforts to secure free use of those now existing have failed. At present the general impression on the minds of the medical profession, the students, and the public, is that our University has declared all who intend to practise according to the principles of homœopathy inadmissible to graduation. This impression may be erroneous, I believe it is so; but it is yet inevitable, so long as there is no public disavowal of the obvious and just inference from the public statement of the Faculty of Medicine in regard to Mr. Pope's examination *embodied in the petition*. And equally inevitable will be the consequences; the honest and bold students will abandon a school from which they are warned, by hearing from the lips of the Examiners that there is a trap between them and their diploma, although not more than one in ten may fall into it; while the timid and less scrupulous will avoid the pitfall by disguising their real sentiments. In either case, the University and the interests of medicine and the public will suffer serious damage.

" Representing as we do so considerable and influential a portion of the community, we think ourselves entitled to obtain, in some form, through your honourable body, an explicit assurance as to the intentions of the University in this matter, and to know whether or not this unprecedented Test Act is to be enforced against any students disposed to study or to practise homœopathy; and we cannot for a moment entertain the thought that the rulers of the highest educational Institution in the kingdom will hide their purposes in ambiguous phraseology.

" To you, then, my Lord, and the Town Council, we look for a definite reply. We are prepared for either alternative; and according to the response shall be our future line of conduct.

" I have the honour to be, my Lord,

" Your most obedient servant,

J. Rutherfurd Russell.

" To the Right Hon. the Lord Provost."

" List of the Graduates of the University of Edinburgh whose names have been noticed among the signatures to the petition:—C. B. Ker, M.D., Richard Frith, M.D., Henry R. Madden, M.D., George Rogers, M.D., William Wright, M.D., John Stewart Sutherland, M.D., C. Acworth, M.D., David Crawford Lawrie, M.D., Neville Wood, M.D., George Cochran, M.D., Charles Ransford, M.D., William Gully, M.D., J. S. Marsden, M.D., Samuel Brown, M.D., D. Wielobycki, M.D., James Russell, M.D., George E. Stewart, M.D., William Traill, M.D., Francis Black, M.D., Robert Ellis Dudgeon, M.D., James Davenport, M.D., J. J. Drysdale, M.D., John Blyth, M.D., A. Lyschinski, M.D., J. Rutherfurd Russell, M.D., Wilson Cryer, M.D."

ONE WORD MORE ABOUT JENICHEN AND THE HIGH POTENCIES.

(*From the British Journal of Homœopathy.*)

In our last number we gave a brief account of the peculiarities of Jenichen's mode of preparing his renowned potencies, as far as we could understand that from the rambling account furnished by his successor and heir, Dr. Rentsch. In the 42nd vol. of the *Allgemeine homöopathische Zeitung* we have a more connected account from Dr. Rentsch, which we think it right to lay before our readers, wherefrom they may themselves judge of the rationality of the stall-meister's method and in general of the claims of their originator to the confidence of the profession.

Caspar Julius Jenichen was born in 1787, and destined by his father for the legal profession, but his inclination led him to devote himself to the study of the veterinary art, and

Hosted by Google

he soon acquired a tolerable reputation as a horse-doctor, and got the charge of the Duke of Gotha's *manége*, with the title of Stall-meister or Ecuyer. He afterwards gave up this appointment, and after becoming a convert to the homœopathic method he finally settled in Wismar, where he did not confine his practice to beasts but operated likewise on human beings. It was in Wismar he invented the high potencies which have become so notorious. It is said that the labour and fatigue caused by their preparation made him fall ill of a very painful disease of the foot and leg, to free himself from which, finding that his high potencies did not suffice, he took an allopathic dose of *Plumbum* by sending a bullet into his brain.

He soon became convinced (we are not told how) that the decillionth dilution, as prescribed by Hahnemann, was not the best potency in which to administer the medicine, and he forthwith began to dilute still higher and higher in the ordinary manner with but indifferent success, until accident one day revealed to him the mode in which he could make the most effectual preparation. He wished to dynamize the 29th dilution of *Plumbum aceticum* still higher, when he found that the cork of the bottle in which that preparation was had got loosened, and the whole of its contents had evaporated. He resolved to ascertain if in this dry bottle there still existed medicinal power, and accordingly, adding the requisite quantity of alcohol, he dynamized it up to the 200th. He soon had an opportunity of testing its virtue, for a patient appeared suffering from fetid sweat of the feet, whom he allowed to sniff once at some globules moistened with this wonderful preparation, and behold! in a few days he was quite cured! From this case he most logically inferred that the best mode of preparing all the earths and metals must be to allow the 29th dilution to evaporate to dryness, and from this dry bottle to go on preparing the higher dilutions. Dr. Rentsch cannot say for certain if he applied the same rule to his preparations of the other medicines besides the earths and metals. The vehicle employed for the dilution was, up to the 800th, alcohol of from 70 to 80 degrees, beyond that, water from the Lake of Schwerin. The proportions used were: for the dilutions up to 200, 6 drops of the previous dilution to 294 of the vehicle; from the 300th to the 800th, 1 drop to 300; for the higher dilutions, 2 drops to 12,000. The lowest dilution of the Jenichen scale was 200, the highest we cannot tell. In the preparation of his potencies he used eight bottles. These were $4\frac{3}{4}$ inches high and $\frac{3}{4}$ of an inch wide. When he diluted beyond 800, he used much larger bottles. The succussion he performed in the standing or sitting position, with the upper part of his body naked. He held the bottle in his fist in a slanting direction, from left to right, and gave the strokes perpendicularly with all his force, so that the fluid in the bottle made a noise like the jingling of silver coins. At first the violent muscular action caused, after three days' work, so much pain in the arm, that he was forced to discontinue it and rest for a week or a fortnight. Afterwards, when he got regularly into training and his muscles were in condition, he ceased to feel any bad effects from his violent exercise. By a minute calculation made by Dr. Rentsch, from the quantity of alcohol stated by Jenichen to have been employed by him to make the 200th potency, and from various other assertions of Jenichen's, it appears that he reckoned his potencies quite differently from Hahnemann, and that the following was the way in which he made them. He had, as before observed, eight bottles. In the first of these he put the vehicle and medicine in the proportions above indicated; gave to this 250 succussions without stopping, and considered that he had potentized it 25 degrees, ten succussions counting as a degree of potency. He then rested a little and proceeded to the next bottle, into which he poured 6 drops of the preparation he had just made and 294 drops of alcohol, gave to this 250 strokes and considered he had increased its potency by other 25 degrees, and so he went on through his eight bottles, $8 \times 25 = 200$; so that if this be true, and we have no reason to doubt its accuracy, Jenichen's 200th potency corresponds to the 38th potency of Hahnemann, only made with the proportions of 1 to 50 instead of 1 to 100. and the last 8 potencies having received 2000 succussions in place of 16. The higher potencies seem to have been made in a precisely similar manner, except as regards the proportions of the vehicle indicated above and the amount of succussions given to each so-called potency, which were increased as he ascended the scale. Thus it is altogether a misnomer to speak of Jenichen's preparations as the 200th, 400th, etc. dilutions, at most they are only the 38th, 46th, etc.

It even appears, from what Rentsch says, that he latterly contented himself with increasing the potency in one bottle only, by merely succussing and not diluting further; so that his later preparations all represent only the 30th or 31st dilution of the Hahnemannic scale, to which a more or less enormous amount of succussions had been given. Nay, more, Dr. Rentsch surmises that he latterly abandoned the 29th dilution as his starting-point, and commenced with the 6th or 3rd dilution, or perhaps even still lower, designating the potency not by the amount of dilution he gave it, but by the number of succussions he communicated to it. In this case the highest Jenichen preparations may represent the very lowest dilutions, to which his enormous number of succussions has been given. If this be the case, and we have no reason to mistrust the accuracy of Dr. Rentsch's inferences, it is absurd to talk of the Jenichen preparations as the 200th, 800th, etc. *dilution; potency* is the name he gave them, and he always denied that they were *dilutions*. These preparations are somewhat similar to those introduced by Wahle, of Rome, who prepared high potencies simply by shaking the 6th dilution some thousands of times. That we have as yet any proof that either his or Jenichen's potencies act better than the or-

Hosted by Google

dinary preparations we must utterly deny. If the account we have given of Jenichen's preparations from Dr. Rentsch's rambling surmises be correct, and more especially if it should be true that most of the preparations were made from low potencies without further dilution, the most obvious inference we can draw from the whole Jenichen controversy is this, that those who delighted to call themselves pure Hahnemannists, among whom the high-potency heresy chiefly spread, had found that sticking to decillionths was not the very best mode of curing their patients, and that they eagerly caught at Jenichen's preparations, which they conceived to owe their efficacy to their greater dilution and dynamization, whereas the better results they obtained were referrible to their employment of stronger doses of the medicine under a deceptive name.

We have said that Dr. Rentsch's statements as to the Jenichen potencies are only inferences or surmises from the documents and letters which he inherited. Dr. Hering, of Philadelphia, however, stated so long ago as the year 1847 (vide *British Journal of Homœopathy*, vol. v.) that he knew the secret of their preparation. We think it might have saved a world of controversy and acrimony among the disciples of Hahnemann, and have saved homœopathy the scandal of dealing in nostrums and arcana, had he long ago published the secret which he alone has hitherto professed to know for certain. It is evident that as long as the mode of their preparation remained secret they were treated with disdain by the great majority of homœopathic practitioners, and we have expectation that the revelation that we have given, or that Dr. Hering could give, relative to them will have the effect of making them more esteemed; but it is important that all suspicion of secret processes or secret remedies should be banished as speedily as may be from our system, which professes to be in the vanguard of medical science.

STOPPING FOR TEETH.

We have received the two following communications on this subject:—

"In answer to J. J. C., asking for information of a stopping, combining the necessary qualities of softness before, with hardness after use, I have seen the gutta percha answer very well; it can be readily softened in boiling water, and moulded into the hollow tooth with much facility."

"In answer to the inquiry of J. J. C. in your last, I may state, from pretty considerable experience, that the best stopping for decayed teeth, when the carious cavity is too large to be filled up with gold-leaf, is gutta percha. A small piece of the leaf gutta percha, sufficient to fill the cavity of the affected tooth, is to be softened, either by putting it in hot water or by holding it for a few seconds before the fire, and the hollow of the tooth being first carefully dried with a piece of cotton, the soft gutta percha is to be moulded into the cavity with the fingers; in a few minutes it becomes quite hard, and may be chewed with for years without being displaced. As gutta percha possesses no medicinal qualities, it does not hasten the decay nor cause the discoloration of the neighbouring teeth, like most amalgams, nor does it interfere with the action of homœopathic medicines, and as it resists the action of moisture it remains unchanged in the cavity for an indefinite period. Not being a dentist, I have recommended this simple stopping with the most satisfactory results, in hundreds of instances.

Your obedient servant,
DENS SAPIENTIÆ.

THE
HOMŒOPATHIC TIMES.

SATURDAY, JANUARY 24TH, 1852.

EVERYTHING that we see or hear of the progress of homœopathy is most favourable. The hospitals in being, and those projected; the number of the dispensaries, and the rapidly increasing number of medical converts; the very agitation of the medical heresy, as the more courteous of our opponents term it, and the pestilent quackery, as the less gentlemanly denominate it—are all favourable circumstances.

As in a war with invaders all true patriots combine, so all true advocates of such a reform as ours should be united—medical and non-medical.

It is confessed that the war between the old school and ours is on one subject, that of therapeutics,—whether there should be a fixt principle, or that drugs should be given with the uncertainty that has always characterised allopathic practice.

We have read with great interest some of the writings of Hippocrates; and we say it honestly, we do not observe that the allopathic practitioners of to-day are more successful in their treatment than the illustrious Coän was 2,000 years ago.

The history of the plague of Athens, however painful, as given in immortal prose by Thucydides, and in no less immortal verse by Lucretius, is paralleled by the description of cholera in modern times, as it has been treated by allopathic

Hosted by Google

measures, and according to the best resources of the allopaths.

The surge of public opinion is being felt on the time-honoured shores of medieal antiquity. Homœopathy, formerly ignored, is now acknowledged to be a power by the Medical Faculties of Scotland, and by the pharmaceutical President of the College of Physicians of London.

We want in London a large and effective hospital. Let those who profess to care for homœopathy look to it.

Review.

British Journal of Homœopathy, No. XXXIX., January 1st, 1852. London: Aylott and Jones, Paternoster Row.

Dr. Scott gives us his third lecture, characterised by his usual ability, learning, and elegance of style, on the history of medicine, which he brings down to the conclusion of the era of Galen.

This is followed by a paper on mesmerism, by Dr. Rutherfurd Russell, who takes a philosophic review, as well as a practical view of this interesting agent.

We have next a practical paper, with cases, by Mr. Leadam on uterine diseases; next an essay on scurvy, hæmorrhage, and the homœopathic law, by Dr. Hayle, of Newcastle.

The question of a homœopathic college is next discussed with great propriety and impartiality. For our part, we do not see the practicability of such a college at present, and so far are agreed with the Editors; but the college question is one apart from that of a charter. We give the concluding remarks of this paper.

"Our aim should be by all possible means to extend the basis of medicine, and to establish its foundations. We are in constant peril of allowing ourselves to be confined within too narrow limits; of learning to regard the homœopathic law as the sum of medical knowledge. Beyond the administration of drugs, there is much, much to be regulated. The inspired air, food and drink, the use of water (hydropathy), of movements (kinesipathy), of electricity, the whole mode of life,—in short, all the influences that may conduce to the continuance or restoration of health. As we have already said, it is the policy of our opponents to drive us into an isolated sectarian position; let it be ours by all means to maintain a wide catholicity; to welcome new truths from every quarter, and embrace them, even should our old doctrines be thereby modified or even abolished; for thus shall we not only be adding continually to our resources, but we shall also have the best security for the genuineness and efficacy of our remedial means."

There is an amusing account of his conversion to homœopathy by Dr. Acworth, written in the *Shandean* vein, no small merit. This gentleman is one of the converts, of excellent standing and experience as allopaths, who have not been able to resist the testimony in favour of homœopathy. We are glad to see that he continues as a homœopathist in the same town where he practised as an allopath—Cheltenham. This is as it should be.

The odometer and the magnetoscope are then summarily disposed of, and Mr. Rutter is advised to "unlearn all that old coinage of animal-magnetic, odylic, and magnetoid fluids, of odometers and magnetoscopes, for it is the vocabulary of mere hypothesis, unworthy of currency among men of observation." With us this is an open question. We do not think anything conclusive will be obtained by the magnetoscope; but we think great light will be thrown on the whole class of imponderables by the prosecution of such experiments as Mr. Rutter's. New instruments will be invented; new views opened up. The vocabulary will then do very well; as we find that of the old Greek physicians still answers very well, though an artery does convey blood, and not air.

Dr. Ozanne contributes a paper of cases, which he treats with his usual skill, and records with his usual precision.

There is a valuable case by Dr. Sharp, of Rugby; an interesting case of phlebitis by Dr. Walker, of Manchester; and of erysipelas by Dr. Wielobycki, of Edinburgh; and a case showing the prophylactic efficacy of *Belladonna* in scarlet fever, by Dr. Rutherfurd Russell.

The allopathic triumvirate of Edinburgh, Professors Syme, Christison, and Simpson, are capitally passed in review, and their "trial and confessions" should be reissued for general perusal.

This Journal is now the oldest medical quarterly of Great Britain; and in the scientific and literary reports even our opponents must acknowledge, if they are candid, it bears comparison with the best of theirs; of course we cannot expect them to believe in the practice.

Correspondence.

THE HAHNEMANN HOSPITAL.

To the Editor of the Homœopathic Times.

Sir,—I can scarcely regret the necessity I am under of again addressing you, because it affords me an opportunity of supplying an

Hosted by Google

omission in my former letter. I stated that Mr. Wilson, in conjunction with three distinguished homœopathic physicians, viz, Drs. Chapman, Dudgeon, and Chepmell, mainly contributed to bring about that state of feeling in the medical profession which resulted in the formation of the Hahnemann Hospital. To these names should most certainly have been added that of Mr. Hering, for his private exertions.

On rising from the perusal of Mr. Warne's letter, which appears in your impression of this day, the first general reflection that will suggest itself to every one's mind will probably be this—what had Mr. Warne to do with the matter? It is Mr. Leaf—Mr. Leaf—Mr. Leaf—from the beginning to the end of his letter. What Mr. Leaf did;—what Mr. Leaf gave;—what mansion Mr. Leaf bought. Nay, Mr. Warne goes further, and undertakes to reveal the very motives of Mr. Leaf. Well, this is extraordinary, no doubt; and I regret to say I can in no way aid in a solution of the matter, unless it be after the following fashion. There is a strange similarity between the style of Mr. Leaf's letter on which I commented last week, and the ordinary style of Mr. Warne. To take one example only: if we compare that letter of Mr. Leaf's with Mr. Warne's letter of the 12th inst., we have the same distance between the nominative case and the verb, the same parentheses, the same involution—slightly Brougham-ick, in fact, only that it is not quite so clear, terse, forcible, or original. This almost identity, however, proves nothing, for there is a great similarity of style between Stephen and Macaulay, and yet they are disinct personages. And nothing is more natural than that Mr. Warne should have acquired the style of a man for whom he appears to have conceived so extraordinary an admiration. Never having had the pleasure of seeing any of Mr. Leaf's composition, I am not prepared to give any decided opinion on the point—whether there is internal evidence to prove the celebrated letter of the 1st January 1851 (signed by Mr. Leaf) could not have been written by him, and that it must be the production of Mr. Warne. Should this turn out to be the case, the surprise will cease that Mr. Warne, rather than Mr. Leaf, should have written to you, as in that case he was only vindicating his own production.

I have been informed, however—nay, if I recollect rightly, have seen the fact announced in Mr. Warne's handwriting—that Mr. Leaf is the author of a pamphlet, published in 1840, entitled "Homœopathy Explained, and Objections Answered." Surely this cannot be the same pamphlet which we find alluded to by Dr. Luther in the preface to his second edition of the "Concise View of Homœopathy," in the following manner:—

"Having been requested by the Committee of the Irish Homœopathic Society to prepare a second edition of 'A Concise View,' etc., the author thinks it may be well to preface it by meeting the frequently-repeated assertion—that the plan of the work, instead of being original, was taken from a small pamphlet published in London, in 1840, entitled 'Homœopathy Explained, and Objections Answered,'—with the explanatory observation, that the publication alluded to, *having also proceeded from his*" (not Mr. Leaf's) "*pen*, he was at full liberty to make such use of it as he pleases in the present work." It follows from this, that there must be two pamphlets, both having the same title—"Homœopathy Explained, and Objections Answered"—one by Dr. Luther, the other by Mr. Leaf; *or*, that Mr. Warne has ascribed to Mr. Leaf the authorship of a pamphlet which was the production of Dr. Luther.

But to turn from general reflections to the actual details of Mr. Warne's letter. The disclaimer contained in the first paragraph can have deceived but few of your readers; and such as were acquainted with the laws of criticism, it must have prepared for the tone and tenor of the whole letter. "A disclaimer," says Lord Brougham, "is not unfrequently the best clue to the designs of the party employing it."

In the second paragraph we have it asserted (and the assertion is in italics), that Mr. Leaf's letter was "*suggested by the Board of Management of the Hahnemann Hospital.*" As some palliation for my ignorance of this point, I have to state that the only three members of that Board to whom I have spoken on the subject, viz., the Honourable Augustus Moreton, Mr. Gill, and Mr. Phelps, were as ignorant as myself of any such suggestion having been made. Mr. Warne will, therefore, I am sure, excuse my asking him the date when the Board so "suggested," or confirmed the adoption of, such circular. Mr. Warne then proceeds to give the particulars of Mr. Leaf's letter, and the mode of its distribution, and continues thus—"How or why it should, after twelve months' distribution (for it is dated 1st January, 1851), give rise in January, 1852, to feelings of dissatisfaction, or how it can be assumed to claim the merit of originating the Hahnemann Hospital, or of being connected with it, *or for what purpose the assumption of Mr. Smith, but in no way warranted by the letter, should be disclaimed by him, I for one am at a loss to conceive.*"

That part of the sentence I have *italicised* has defied my best efforts to construe; I, therefore, leave it unnoticed. The other part contains—First, the assertion that Mr. Leaf's letter has been distributed twelve months; and secondly, expresses surprise at the construction put upon it. As to the first, I can only say for myself, and two of the members of the Board already cited, that we did not see the letter till this year, and considered the date, 1851, a typographical error, and the other gentleman saw it for the first time in December. As to the second point, I must beg leave to refer the reader to my former letter, with this remark—that all my friends who read Mr. Leaf's letter, regarded it in the same light as myself. Having said this, I am content, with Mr. Warne, to leave "to the judgment of the homœopathic public" to decide whether I was justified in my interpretation; or, to quote his own words, whether any "*sinister motives*" (the italics are not mine) should be attributed to Mr. Leaf.

We come now to the third and by far the most important paragraph in Mr. Warne's let-

Hosted by Google

ter. It is here asserted that to Mr. Leaf is to be ascribed "the introduction and advancement of homœopathy in this country." Its introduction I have always understood to be due to other distinguished individuals.

As to "the large expenditure incurred by Mr. Leaf in its advancement," I have to observe—1st, that large and small are relative terms. Besides, unless it shall turn out that so extraordinary an occurrence has taken place, as two writers fixing on precisely the same title for a pamphlet—and that title consisting of no less than five words, "Homœopathy Explained, and Objections Answered"—unless this extraordinary occurrence has taken place, Mr. Warne has ascribed to Mr. Leaf literary fame which did not belong to him, as I have already shown; and, therefore, the words "large expenditure" must be taken *cum grano salis*. 2ndly, Whether the steps taken by Mr. Leaf to advance the cause were calculated to effect that object is a question which has at least two sides, as I shall show hereafter.

The following part of the paragraph on which I am now commenting is extremely interesting, furnishing, it is alleged, a history of the first dispensary founded in London, tracing its career to its aristocratic quarters in Hanover Square—its enlargement—its change of form into a far more important institution, an hospital—its patronage by the great and noble—and then, alas! its decline and utter extinction.

Now, this, as I have said, is very interesting; but, in order "*to be valuable, it should be*" *complete*—you will observe I avoid the offensive expression ("correct") employed by Mr. Warne.

The rise, progress, decline, and fall of empires are the peculiar study of statesmen. By the lessons thus furnished, they learn how to advance their country's glory, and how to guard it from decay and ruin. A Board of Management should be composed (if I may use the expression) of hospital statesmen. But we must remain mere tyros at our work, unless some Livy or Gibbon arise to furnish us with the requisite information.

It would appear, from the brief sketch he has given, that Mr. Warne is in the position to furnish a history of the rise, progress, decline, and fall of at least one Homœopathic Medical Institution. This cannot fail to be of immense service to us. May I ask the favour, then, of his writing a complete history of *that* Institution, and pointing out the lessons which it furnishes. And if he will condescend to dedicate the work to our Board, I am sure we shall consider ourselves highly honoured.

To be *complete*, this history must inform us, *inter alia*, the *amount* subscribed, as well as the names of the subscribers—the cost of the establishment—the number of in-door patients (stating particularly the maximum, minimum, and average number)—how the medical school was formed—how many lectures delivered—where the record of these lectures is to be found—how many pupils were taught in that school—the names of the "*eminent homœopathic practitioners*" who received their first lesson there, etc., etc.

When he comes to the decline and fall of that noble Institution, he may possibly find the following letter useful, which I beg, therefore, to place at his disposal for insertion in his history. Its perusal may suggest to common-sense, reflective minds whether the decline of the Hanover Square Medical Institution, and its failure as a *Hospital*, did not depend upon a more vital point than the painful fact of the "ill-health of Mrs. Leaf," and the momentous consideration of "the multifarious occupations of Mr. Leaf."

"Dec. 16th, 1846.

"SIR,—We, the undersigned physicians to the London Homœopathic Hospital, having come to the determination to resign the offices which we hold in our medical capacity at the above Hospital, will thank you to hand in our resignations to the Board of Management.

"We do so, in consequence of the principle involved in the passing of certain resolutions with regard to the medical management of the Hospital by a large majority of the governing body at the last meeting, for the following reasons—

"First. Because the original conditions upon which we accepted office, viz., that of perfect equality amongst the medical officers, has been entirely set aside on the part of the governing body, by conferring a title on one of our body, which, in the mind of the public (lay and professional), conveys an idea of medical superiority.

"Second. The title of '*Consulting Physician*' which has been so conferred being one of high honorary distinction, is only given to physicians upon their retiring from the active duties which they have fulfilled in a hospital for a long series of years, and therefore such a title cannot be conferred upon any physician of this Hospital, who (no matter of how high an order of merit) has declared his resolution to retain a post of activity, without an unwarrantable departure from medical custom and precedent; a step the more unjustifiable, seeing that it was taken in direct opposition to the earnest remonstrance of a vast majority of the medical portion of its governing body.

"Third. Because we believe that the interests of homœopathy will not be advanced in the proper quarter (we allude to the medical profession), unless medical custom and precedent be rigidly adhered to by the governing bodies of the hospitals, where homœopathic treatment is adopted exclusively; and, moreover, because we also believe that no physician can retain an active part in any hospital, homœopathic or otherwise, whose governing body persists in the legislation of medical matters, irrespective of medical opinion and custom, without a compromise of professional dignity, both in the opinion of his fellows and of the public at large.

"We beg you will convey to the governing body of the Hospital our courteous sentiments, believing, as we do, that all the individual members (irrespective of private opinion) are actuated by the same good feeling, the same disinterestedness, and the same desire to forward the cause of homœopathy, which we trust we *possess*, (?) whilst we cannot help being at issue with the

Hosted by Google

majority of its members as to the principle involved by the late resolutions.

"We have the honour to be,

"Your obedient servants,

(Signed) "E. C. CHEPMELL,
"ED. HAMILTON,
"J. LAURIE."

"To the Secretary of the London Homœopathic Hospital, Hanover Square."

A complete history, such as that I have just indicated, could not fail to be of great service to our Board at the present moment. I trust, therefore, Mr. Warne will lose no time in preparing it.

The fourth and sixth paragraphs of Mr. Warne's letter have reference to a mistake of mine, in using the title London Homœopathic Medical Institution, instead of the English Homœopathic Association, in one instance. As this error does not at all affect the argument of my former letter, it is only necessary for me to express my regret at the mistake, and to thank Mr. Warne for correcting it. Mr. Warne denies that "repeated interviews" took place between members of our Board and those of the English Homœopathic Association, before their funds were transferred to our Hospital. I am still, however, of opinion that such was the fact *in substance*; at the same time this is not material, nor worthy of any further remark.

In his fifth paragraph Mr. Warne admits the accuracy of my statement as to the London Homœopathic Medical Institution being totally distinct from the Hahnemann Hospital, as to "its birth and its education, its origin and its aim," so far as respects the first three particulars, but denies the fourth. Of the first three he says, "no one has asserted, or insinuated, nor does the circular insinuate to the contrary." This is, of course, a manifest *petitio principii*. Of the fourth particular, viz., the aims of the two Institutions, he says, "they could only be identical." Now, this I altogether repudiate, on the authority of the letter just cited from Drs. Chepmell, Hamilton, and Laurie. The aim there charged on the managers of the London Homœopathic Medical Institution is, that they sought to elevate one physician to the disparagement of the rest. While it survives I will not cease to guard our Hospital, and to warn our Board against an *aim* such as this. And having a great regard for Dr. Curie, who did for me in six weeks, what Ware, Guthrie, Travers, Tyrell, Alexander, Southwood Smith, Lawrence, and Macmurdo—eight allopathic practitioners—had failed to do in fifteen years! and as I am fain to believe that Dr. Curie will repudiate being a party to such a proceeding, I will not cease to warn him also of the fatal consequences that must ensue to the Hahnemann Hospital and to himself, from any such attempt or *aim* as this on the part of his supporters.

On the eighth and last paragraph I have only to say, that it is my misfortune not to have the slightest idea who the lady is to whom Mr. Warne refers.

I have thus, Sir, devoted that attention to Mr. Warne's letter which the subject merits. And I now leave to the homœopathic public to determine—calling on you, as the exponent of their sentiments, to pronounce the verdict—whether the statements contained in my letter which appeared in your journal of the 10th instant, have been in any, even the slightest, *material* point shaken, or disposed of by Mr. Warne; and whether, therefore, he was justified in using these words in the outset of his reply—thus prejudicing the public against my statements and in favour of his own—that "history to be valuable should be correct."

I am, Sir, your obedient servant,

F. J. SMITH.

Member of the Board of Management of the Hahnemann Hospital.

74, Old Broad Street, Jan. 17, 1852.

[We regret this controversy and the occasion of it, as well as the circumstances attending it. We shall be glad to give Mr. Warne the opportunity of answering, in our columns, Mr. Smith's two questions, at what meeting the Board of Management suggested the publication of Mr. Leaf's circular, and what is Mr. Warne's history of the London Homœopathic Institution: and we should like to have an explanation of the "*unwarrantable departure from medical custom and precedent*," referred to in the letter of Drs. Chepmell, Hamilton, and Laurie.—ED.]

To the Editor of the Homœopathic Times.

SIR,—I am not a practitioner, but I am infinitely more interested in the contest between allopaths and homœopaths than if I were one of the belligerents; *I am one of those practised upon*, "think of that, Master Brooke." When I am ill I send for a physician and I am desirous of seeing a *fair stand-up fight* in argument, in which no such foul blows as "rogue," "liar," "impostor," "knave," "conscience seared with guilt," "infamous," and several others, are to be allowed, for they are worthy only of a "*rough and tumble*." The allopath has thrown his castor (I do not mean oil) into the ring, and with a good deal of bounce, seems confident of flooring his juvenile antagonist; his temper, however, seems to be none of the best, and the loss of that is apt to lose a man the battle, and I cannot help thinking that the odds are at present greatly in favour of the homœopath.

I will, however, drop the figurative, and ask seriously whether I am to be subjected to a tyranny, worthy only of the Pope and his priesthood? Am I to be forced into submission to that practice which has been described as "*full of errors, and abounding in mischief*," by some of its most scientific members? Am I to be denied the right of private judgment, founded upon experience of facts and results, upon my own sufferings; it is as bad as the shoemaker, who never will allow that the shoe he has made for you pinches, as if he, knowledgeable as he is about shoes, can know so well as he that is pained. I care nothing about all the theories brought forward by either side, I look to facts; and pooh-poohing homœopathy, and saying it cannot do this and cannot do that,

Hosted by Google

is like the man who, being in the stocks, was asked by one of his associates, what he was there for, and having told him, "Pooh pooh," said he, "they *can't* put you there for that." "I don't know," said the prisoner, "whether they can or not, but I know that I am here." So it is with me; I have sought relief from homœopathy, and found it, notwithstanding its power is denied, and its theories ridiculed by its opponents, who had a fair trial, and could not produce the same beneficial results. Have those medical gentlemen who are so loud in their condemnation of homœopathy studied it? if not, what can their opinions be worth? Prejudices are of strong growth in vulgar minds; and a knowledge of the opposition experienced by inoculation, and how many refused to adopt vaccination, should make men of enlightened minds examine thoroughly before they condemn. Homœopathy is spoken of as an "*innovation*," so are railroads, and thankful we are for them. I am not the less grateful to those who gave me the benefit of their scientific attainments as far as they went, because time and science have combined to produce a system much more beneficial (as I have found it) than the old one. But to speak of a "*legitimate practice*," is to claim one of the most intolerable monopolies that can possibly be conceived, as it is seeking to put down every other. I have no wish to suffer for the cause of "legitimacy" or "orthodoxy;" and those opinions which in one age are at the top of the tree of knowledge, may in the succeeding one be displaced by others still more enlightened, for science cannot stand still; and those who think to annihilate homœopathy by foul language and abuse, might as well try to destroy the diamond by putting it under a dunghill. Your obedient servant,

F. S.

DR. GOODSHAW.

(*From the British Journal of Homœopathy.*)

HOMŒOPATHY has to lament the loss of one of its most earnest and successful practitioners in the death of Dr. Goodshaw, at the comparatively early age of fifty-four. This melancholy event occurred rather suddenly, on the 27th September ult., at Fairbrook, near Dublin, where he had been living during the summer months for the benefit of his health, which during the last two years had been in a very critical state, from the existence of unequivocal valvular disease of the heart.

The post-mortem examination revealed an amount of cardiac disease incompatible with any prolongation of life; the heart was enormously hypertrophied, but especially the left ventricle, the muscular tissue of which was softened, and almost friable; the free edges of the mitral valve were studded with cartilaginous excrescences, which necessarily interfered with its proper function; there was also considerable serous effusion into both pleuræ and the pericardium.

We cannot dismiss this brief notice of our departed fellow-labourer without adverting to the fact, that Dr. Goodshaw must have been considerably beyond forty years of age before he commenced the study of homœopathy, and thus, when the opinions of most other men are *stereotyped*, he appears not merely to have mastered the new system of therapeutics, but to have had the moral courage to avow his convictions, and carry his principles into practice. His success in his district soon brought him crowds of patients—and in order to extend the benefits of his newly-acquired powers of healing as widely as possible, he established the Homœopathic Dispensary in Abbey Street, Dublin, in the year 1844, at his own expense. This was the first institution of the kind in Ireland; it has continued open ever since, and is still in vigorous operation. He visited this Dispensary on three days of every week for some time, but finding that it thus occupied much of his time, and necessarily interfered with his other practice in the country, he finally resolved to resign his public appointments as Physician to the Clergy Sons' School at Lucan, and also the Dunboyne Dispensary, and confined himself entirely to his practice in Dublin. Here he rose rapidly into fame and public favour; he possessed all the attributes which were likely to conduce to a successful career; his knowledge of disease, and its varied manifestations, had been acquired during many previous years of constant intercourse with the sick. He was naturally endowed with the finest perceptive powers, and the rapidity and precision with which he could grasp the *specialities* of a case appeared like an intuitive process, but was in reality the result of a high intellectual appreciation, combined with rare practical sagacity. His energy was unbounded—he threw himself into the performance of his professional duties with all the ardour and buoyancy of youth; his natural warmth of character and a certain refined but racy humour made him a great favourite with all classes; and his remarkable success as a physician established their confidence in the new system, of which he was such an eloquent and enthusiastic advocate.

Of course this success made him an object of dislike and almost persecution amongst his allopathic brethren, who could not believe in the purity of his motives, or the sincerity of his convictions. Their aspersions often wounded Dr. Goodshaw's feelings, which were of the most sensitive character; and the death of a well-known individual under homœopathic treatment gave the public and the profession an opportunity of denouncing both him and the system with the most unmeasured violence. We have no doubt the effect of this was most baneful to our departed friend. Soon afterwards he suffered from an attack of fever, from the effects of which he seemed never to have perfectly recovered, and in all probability the seeds of that disease were then sown which have since germinated, and been finally developed in the event which it has been our melancholy duty to record.

"RESPICE, ASPICE, PROSPICE."—St. Bernard.

No. 131. Vol. III.] SATURDAY, JANUARY 31, 1852. [Stamped 4d. Unstamped 3d.

Communications.

A FEW NUTS FOR THE EDINBURGH PHYSICIANS TO CRACK.

Collected by a Non-Medical Observer from Dr. Gregory's Translation of Baron von Reichenbach's Researches on Magnetism, etc., Parts I. and II., published in 1850.

The excellent man and Christian gentleman who has favoured us with the following extracts is right in thinking that it is hardly necessary to apply these extracts to the subject of the reception of Hahnemann's discoveries and disciples by the medical profession, especially by the wise men of Scotland. The application seems to us as well as to him to be almost self-evident, and we heartily thank Dr. Gregory for the translation of Reichenbach's pungent attacks on his unfair opponents, and for his own able and sound advocacy of an honourable and conscientious examination of all new discoveries.

While Dr. Gregory shoots his arrows so well into the midst of the rash and self-conceited opponents of the great doctrine "*similia similibus curantur*," we agree with a Non-medical Observer in thinking that it is not worth while for any homœopath to loose a shaft at them. But we live in times when all who favour our reform must act; we wish we had many on our side like the Non-medical Observer,—men of action as well as of speech; men prepared to make any sacrifice in their power for what they believe to be true and right. One of our most admired and admirable advocates has lately shown this excellent spirit. Under the pressure of severe domestic affliction, he has not hesitated to do his *devoir* as a champion of homœopathy.

As Professor Gregory has confessed his adhesion to homœopathy, there can be no doubt that had the *triumviral* cabal of Edinburgh succeeded in getting Professor Henderson out of his chair, whether by resignation or deposition, they would next have attempted to void, in like manner, the chair of chemistry.

With respect to the magnetoscope, it is with us an open question. We believe the investigation of the magnetoid currents will issue in great good to our race; by what instruments or in what direction the investigation may be brought to a practical issue we pretend not to determine. Reichenbach, or Gregory, or our correspondent, may succeed; or some labourer, to come after them, may be the successful experimenter. That there is a subtle force in all animated organized beings, which is paramount to brute matter, we fully believe; that man should have this in an infinitely higher degree than the lower animals may be at once inferred, as he is the lord of this creation.

Dr. Gregory had published an abstract of Part I. of Baron von Reichenbach's work, in 1846, which he states was favourably noticed in various scientific and literary journals, as well as in the daily press. Contrasting this favourable reception with the unfavourable manner in which it had been received by various men of science in Germany, he adds (page x), "It is pleasing to reflect that a work so truly scientific in its character has, in spite of the startling nature of the facts recorded in it, received from the British public that respectful and becoming attention to which, from the known scientific reputation of its author, it was justly entitled."

Page xiii. "I have not felt justified in omitting any part of the author's preface, or of his notes, both of which are controversial, and may appear to some rather energetic in their tone. But as they contain the author's replies to attacks of a very violent and unjustifiable kind, which have been widely circulated in Germany, and may possibly have influenced such as have read them in this country, I thought it but just to let him be heard. It is at all times deeply to be regretted when scientific discussions assume an angry or acrimonious tone; but in this case there was nothing in Part I. to justify the style in which it was treated, and, consequently, the introduction of unscientific language into the discussion must be ascribed to those who so unsparingly employed it in their criticisms, if indeed we can truly give that name to such productions, written as they are, without due knowledge either of the subject or of the work. I might here conclude, but although in this country no

Hosted by Google

such irrational and unwarrantable attacks have appeared, yet I have occasioually met in private with persons disposed, like the German critics, to reject the whole investigation without even giving it a careful study, or, indeed, any study at all."

Page xiv. "It may be safely laid down, that no well-ascertained fact or series of facts can possibly exist in nature, which are not worthy of our earnest study. It is no answer to say that there are many facts of no practical value, for the fallacy of such an assertion has been too often proved by the unexpected application of apparently trifling facts to important purposes, theoretical as well as practical. When Liebig and Soubeiran first described a peculiar volatile fragrant liquid, produced by the action of bleaching powder on alcohol, this fact was recorded, and stood for many years in our manuals as a mere curiosity of science. Yet when the time came, this insignificant compound, under the hands of my accomplished colleague, Dr. Simpson, started up into the highest practical value as *Chloroform*. Had *all* the properties of this body been at first *carefully studied*, we should not have had to wait till 1846 or 1847 for this boon to suffering humanity. It would be easy to fill a volume with parallel cases, from the steam-engine to gun-cotton, all proving the great truth that no natural fact is insignificant or unimportant."

Page xxi. "I maintain that, under such circumstances as those of the present case, to assert the existence of fraud on the part of persons of blameless character, without evidence of the fact, and simply because their statements, in an obscure and difficult matter of physical science, appear at first sight absurd and incredible, is to sin against common justice and good feeling in a manner for which no justification can be found. And to do this, as it will be seen by the author's preface certain authorities have done, without any investigation of the subject, or even of the work criticised, is a mode of proceeding in questions of natural science, against which every one who values truth, and has the progress of human knowledge sincerely at heart, is bound in the name of science most energetically to protest. Dr. Dubois Reymond has thought fit to express, *without quoting one word to justify it*, an opinion of the work and of the author, the only effect of which, if it had any effect, would be to disparage them, unexamined and unheard, in the public opinion. But it will, sooner or later, have a very different effect, namely, that of proving to the world the incapacity (from want of acquaintance with the subject) of the critic for the task he undertook, or rather, with most insulting expressions, declined to undertake."

Page xxv. "The objections so commonly urged against mesmeric observations are the very same as those which we have discussed above, in reference to the researches of the author; namely, the impossibility or incredibility of the facts, and the supposed existence of fraud and imposture. I need not repeat what I have before said, but I may here add, that nothing can possibly be more contrary to all scientific rules than to reject a fact simply because it appears to us incredible or impossible, or because we cannot account for it."

Page xxvi. "As to the cry of fraud and imposture, it is in a scientific investigation utterly inadmissible, for the reasons formerly stated, and many others. Let us for a moment try to imagine the possibility of all the hundreds and thousands who have been and daily are mesmerised being all impostors, while all the operators, if not equally deceitful, are themselves deceived. Let us bear in mind that this accusation is commonly and recklessly brought by those who have never investigated the subject, not only against those who have done so, but against persons of great ability and of unblemished character and honour, and generally without a shadow of evidence; let us do this, and we must come, I think, to the conclusion that such a line of argument is as irrational, unjust, and dishonest in itself, as it is void of all cogency in opposition to observed and established facts."

Page xxvii. "Without the most stringent proof, the charge of fraud is not for a moment to be tolerated."

Page xxix. "Until scientific men take the trouble to investigate mesmerism, they are not entitled to pronounce an off-hand judgment, still less an injurious judgment on the labours of those who, perhaps, with fewer qualifications, but certainly with equal love of truth, have undertaken the investigation which they have themselves neglected."

In a note (page 356), referring to the unwarrantable attacks made by a Committee of Physicians in Vienna upon the integrity of some of Baron von Reichenbach's witnesses, Dr. Gregory observes, "It is painful to think that parallel cases have not been wanting in England." Speaking of the reception of some cases of spontaneous somnambulism, he goes on to state, "There was the same predetermination to find the patient an impostor, the same utter absence of all cogency in the

Hosted by Google

judge is not ashamed to send forth without evidence adduced, and the same rash and unjustifiable, as well as unmanly accusation of imposture brought against persons of whom no evil was known, apparently because the authorities chose to assume the facts to be impossible. It is the duty of every lover of truth and science to protest energetically against the system of reckless accusations of imposture preferred against persons of blameless character, because their statements appear to us incredible."

Extracts from Baron von Reichenbach's preface to second edition of Part I.

Page xxxiii. "It was easy to foresee that a matter of so strange and peculiar a kind as the subject embraced in these researches would meet with objections. The new field of investigation here opened up, advances its limits so near to the bulwarks of existing and established doctrines, that it was not to be expected that it should be allowed to take its place in the crowded domain of science without much resistance. Yet I was only prepared for rational judgment and criticism; I was not, I confess, prepared for an attack (which every friend to science, possessed of good feeling and good manners, must agree with me in considering ill-bred in the extreme) made on my work and on myself personally, by a Dr. Dubois Reymond, in Karsten's *Progress of Physiology in the year* 1845. This philosopher does not think it necessary in the smallest degree to enter into my experiments and deductions, but from his lofty eminence entitles my labours, curtly enough, 'an absurd romance;' to enter into the details of which would be fruitless, and to him impossible."

Page xxxiv. "Ever since science has existed, ignorance has assumed the right of judging and condemning that which it could not understand. The polite and well-bred Berlin physiologist is then pleased to cast in my face a few common-places, such as—my work is 'one of the most deplorable aberrations that has for a long time affected a human brain;' my statements are 'fables which should be thrown into the fire;' and many similar learned vulgarities.

"He who assumes the right publicly to sit in judgment and to pronounce sentence on a scientific work, is, before all things, bound in duty to inform himself thoroughly of its contents; and he is further bound to support his sentence, as all public judges do, by the reasons on which he thinks himself justified in pronouncing it. But a judgment affecting the truth and honour of the author of such a work, and which the fulfilling any one of these conditions, is, in one word, nothing but impudent; and that too in a degree perhaps unexampled in modern or in ancient literature. For surely, it never before happened in any country that a reviewer had the audacity, or rather the folly, to treat a scientific work without giving any reasons, without quoting a syllable of its contents, merely with gross and ill-bred abuse."

Page 259. Dr. Nied, Practising Physician in Vienna, aged thirty-two, was to me an invaluable case, because he is a physician, and must necessarily testify to the existence of the odylo-luminous phenomena in a caste, namely, that of medical men, in which my researches, contrary to all expectation, have often met with the most unfriendly reception."

[Here follows a note by Dr. Gregory.]

"I am not at all sure, in this country at least, such a result would have been contrary to the expectation of any one who has experience of the medical profession, as a body, in the reception given by them to new and startling truths. There are, of course, many exceptions, but I speak generally.—W. G."

Page 274. "Every *rational* doubt or hesitation must give way before the variety and trustworthiness of the observations made on so many persons, differing so widely in age, sex, rank, position, and occupation; and of the facts confirmed, as they are, by persons of the highest possible character; facts, moreover, which I have furnished the means of everywhere and easily testing, controlling, and confirming by repetition in other places. I well know that, notwithstanding all this, people enough will be left, to whom all that I have done will not appear enough; for there are such things as *irrational* doubts; there is an *absurd* incredulity; and, lastly, there is also an *evil-minded* scepticism. These I am unable, and do not wish to refute. I only concern myself with thoughtful, reflecting, and rationally-judging people, with those who are friends to the quiet progress of science."

Page 327, note. "Nothing is easier and more convenient, as a cloak for ignorance, than to get rid of, by declaring it to be imposture, a phenomenon, which, for want of knowledge, we cannot underatand."

Page 356, note. "No one has a right to set up himself as a judge in a matter, in which, at the same time, he so thoroughly exposes his own ignorance."

Our readers will at once perceive that these extracts apply, with the exactest fitness, to the uninquiring and bigoted opponents of homœopathy.

HOMŒOPATHY.

Resolutions of the Provincial Medical and Surgical Association.

Report on Irregular Practice.

"The following Report was brought up and unanimously agreed to.

"Your Committee have, after consultation with numerous members of the Association, maturely considered the subject referred to them, and beg respectfully to suggest the adoption of the following resolutions:—

"That it is the opinion of this Association, that homœopathy, as propounded by Hahnemann, and practised by his followers, is so utterly opposed to science and common sense, as well as so completely at variance with the experience of the Medical Profession, that it ought to be in no way or degree practised or countenanced by any regularly educated medical practitioner.

"That homœopathic practitioners, through the press, the platform, and the pulpit, have endeavoured to heap contempt upon the practice of medicine and surgery as followed by members of this Association and by the profession at large.

"That for these reasons it is derogatory to the honour of members of this Association to hold any kind of professional intercourse with homœopathic practitioners.

"That there are three classes of practitioners who ought not to be members of this Association; viz.—1st, real homœopathic practitioners; 2nd, those who practise homœopathy in combination with other systems of treatment; and 3rd, those who, under various pretences, meet in consultation or hold professional intercourse with those who practise homœopathy.

"That a committee of seven be appointed to frame laws in accordance with these resolutions, to be submitted to the next annual meeting of the Association.

"That the thanks of the Association are eminently due, and are hereby given, to the Presidents and Fellows of the Royal College of Physicians and Surgeons of Edinburgh for their determined stand against homœopathic delusions and impostures

"That the thanks of the Association are also due, and are hereby given, to the Universities of Edinburgh and St. Andrew's for their resolution to refuse their diplomas to practitioners of homœopathy; but the Association feels imperatively called on to express its disapproval of any School of Medicine which retains among its teachers any one who holds homœopathic opinions.

"That these resolutions be printed and transmitted to all the Medical Licensing Bodies and Medical Schools in the United Kingdom, and that they likewise be inserted in the *Times* newspaper, the *Morning Post*, the *North British Advertiser*, *Saunders's News Letter*, all the British and Irish medical periodicals, and in such other journals as the council may sanction upon the recommendation of the branch Associations.

Counter-Resolutions of the British Homœopathic Medical Society.

Dr. Quin, President, in the Chair.

A series of Resolutions on homœopathy passed by the Provincial Medical and Surgical Association, at Brighton, on the 14th of August, having been read, it was resolved—

"That this Society deeply regrets that a body of gentlemen belonging to a liberal profession should resort to invective in place of argument.

"That the merits of homœopathy being a subject of dispute between two parties in the medical world of equal professional standing, it is impossible that a resolution of one of these parties, that the views of the other 'ought to be in no degree countenanced,' can have any influence in facilitating the settlement of the question in dispute.

"That, in stigmatizing homœopathy as an 'irregular practice,' as a 'delusion,' and an 'imposture,' the Provincial Medical and Surgical Association resort to terms of abuse which are at the command of every one; and which, while they are in every case inexcusable, unless accompanied by proofs, are especially valueless when employed to silence a new doctrine in opposition to the preconceived views of the persons by whom such terms are used.

"That the differences between homœopathic practitioners and their brethren of the old school being simply differences of opinion, a resolution not to hold professional intercourse with them is nothing more than the announcement of an inability on the part of the members of the Provincial Medical and Surgical Association to tolerate in others the same independence of judgment they claim for themselves.

"That, while the legislatures of two of the most important States of the American Union (Pennsylvania and Ohio) have granted Charters of Incorporation to Homœopathic Universities—while the Chambers of the Kingdom of Bavaria, of the Grand Duchy of Baden, and other German States, have authorized professorships of homœopathy in the public Universities—while the Imperial Government of Austria has sanctioned the establishment of Homœopathic Hospitals in different parts of its dominions—while, in Berlin and Moscow, similar hospitals exist—and, while one hundred beds in the Hospital of St. Marguerite (a branch of the Hôtel Dieu, in Paris) are devoted to patients who are openly treated in accordance with the homœopathic system by Dr. Tessier and his hospital assistants, it is to be deplored that so large a portion of the medical body in England and Scotland should not only commit themselves to personal animosities against all who may entertain the system, but should record their thanks to the Royal College of Physicians of Edinburgh for having endeavoured to expel from their body those of its members who practise homœopathy, and to the Universities of Edin-

Hosted by Google

"In proposing these resolutions for the adoption of the Association, your Committee are anxious to state that they are actuated by a strong sense of the importance of the subject in its relation both to humanity and morals. They most conscientiously believe that the countenance afforded to the form of charlatanry herein alluded to is detrimental to the true interests of the public, as it is subversive of that strict integrity which ought to characterise practitioners of medicine, and which has ever distinguished the profession in these kingdoms.

"JOHN ROSE CORMACK, M.D. Edin., Fellow Royal College Phys. Edin., of Putney.
"JAMES TUNSTALL, M.D. Edin., of Bath.
"H. H. RANKING, M.D. Cantab., of Norwich."

burgh, Aberdeen, and St. Andrew's, for having indicated an intention to deny their diploma to every student who shall refuse to give a pledge that he will not publicly profess himself a convert to its truth.

"Finally, that the British Homœopathic Society have never, as a body, either 'through the press, the pulpit, or the platform,' endeavoured to heap contempt upon their allopathic brethren, their conviction being that nothing could tend more to retard their Cause than the use of taunts and imputations, in lieu of the calm statement of such evidence as from time to time it may be in their power to furnish.

"For, and in the name of the British Homœopathic Society,

HOMŒOPATHY.

To the Editor of the Ruyby Advertiser.

SIR,—When I sent you an advertisement of the "Inquiry into the Truth of Homœopathy" I did not anticipate that you would also insert a critical review of the pamphlet; but as you have done so, perhaps you will allow me to point out a mistake of considerable importance into which, in common with the majority of persons at their first acquaintance with homœopathy, you have inadvertently fallen. You speak of the difference between the old and the new practice of medicine, as if it consisted in merely a difference of dose,—and of homœopathy, as if it were merely such a reduction of the dose as to come to "the silence of pure innocence." Permit me briefly to point out the following advantages of the new system:—

First. It possesses a principle. It is admitted by all well-informed medical men that hitherto we have had no *principle* to guide us in our treatment of disease; that our best practice has been simply a matter of *experience;* that, to use the words of a popular medical writer, "Medicine is an *art,* not a *science.*" The doubts and difficulties, the disappointments and unsatisfactoriness of such a state of things may be imagined better than described. Now the great advantage proposed by homœopathy is, that it offers a *principle* for our guidance—a rule never to be departed from, alike applicable to all cases, and not more difficult of application to a new disease than to those we are most familiar with. It is this *principle* which changes the art of medicine into a *science;* which introduces an approach to certainty and satisfaction such as could not have been anticipated before, and could never have been attained under the old method.

Secondly. Homœopathy "lets well alone;" whatever part of the frame remains healthy is allowed to continue so. This is notoriously not the case on the old plan; our blisters, and issues, and purges, etc., etc., were all directed to *sound* parts. Homœopathy attacks only the organs which are diseased.

Thirdly. Homœopathy takes away no strength. The injury frequently done to the constitution by bleeding, mercury, and other severe remedies in large doses hitherto made use of, is a melancholy truth experienced too often not to be well known.

On the contrary, no sooner is an acute malady overcome by the new treatment, than the patient is well; there is no tedious convalescence, requiring wine, bark, and other tonics. This fact I have already often observed.

Fourthly. The plan of giving only one remedy at a time leads to a much more certain acquaintance with the properties of the drugs we use, and the smallness of the dose doing away with what is disagreeable in it, is, at least in the treatment of children, no inconsiderable advantage.

Fifthly. Homœopathy aims, wherever it is possible, to effect a *radical* cure, not a mere palliative relief. This will be allowed to be a matter of importance. It is not meant to insinuate that radical cures are never met with under the old treatment, many are; and frequently, if not always, this is accomplished on the homœopathic principle, though in ignorance of it; but it is asserted that such radical cures may now be much more frequently obtained, and that, consequently, a more prolonged state of health may be looked for, after relief has been afforded by the new method than by the old.

Other advantages might easily be enumerated, but I feel unwilling to trespass further upon your pages, and it does not require to be pointed out how much every one is seriously interested in a reformation of medicine laying claim to such great improvements as these.

I am, Sir, yours obediently,
WILLIAM SHARP.

HOMŒOPATHY AND PROFESSOR SIMPSON.

To the Editor of the Edinburgh News.

SIR,—The independent and rational course

Hosted by Google

you have pursued regarding the medical controversy that is at present commanding the attention of all classes of the community is deserving of the highest approbation of every lover of free discussion and truth. Will you allow a working man to enter the list of combatants? I have just seen Professor Simpson's speech against homœopathy, and I should like to make some observations upon it.

Observe, in the first place, this gentleman's "confession of faith," and "standard" by which to try homœopathy, viz., "common sense." This is *his* standard, and now let us see how he applies it. Some eight or ten years ago, this professor says, an old schoolmate of his having begun business as a homœopathic druggist in Liverpool, kindly sent him a present of a small box of homœopathic medicines. During the time it was in his possession he put it *only to one use*, viz., he gave it as an occasional plaything to his eldest son, who was then a *child*. I ask any rational man if this was not an insult to "common sense?" His duty as a philosopher was to know, in the first place, the medicinal effects of the drugs contained in the globules, and this he could have done by referring to the "Homœopathic Materia Medica," and then, in the second place, to have administered them in such diseases as manifested similar symptoms. By these means he would have arrived at knowledge to have enabled him to judge whether the homœopathic law was sound in theory and the globules had a curative action.

But does this gentleman understand as a philosopher the meaning of his own standard, "common sense?" His long rigmarole about infinitesimal doses proves to demonstration that he does not. It is wholly hypothetical, and assumes that because the doses could not affect men in health, that therefore it is absurd to suppose them to have a curative effect in disease. What, then, is the philosophical meaning of "common sense?" It means that facts should precede inferences—that the perceptive faculties should take in all the known phenomena of a given subject before the reflective faculties pronounce judgment. Well, has this medical Pope tried homœopathy by this standard? Was giving his child the box of globules to play with at all conformable to it? Or what has his long trumpery of calculations to do with it? But how could this gentleman try homœopathy by a standard which it has been proved he did not understand? His ignorance and presumption in attempting to settle this grave question reminds one of the manner in which the Emperor of China pronounced judgment on phrenology. This august monarch was once asked his opinion, regarding the truth of the system, and he gravely replied that there was no truth in it, founding it on the assumption that the Chinese had *no brains!* He was asked further to give some proof of his opinion, and he replied—"I judge infallible judgment *without evidence.*" Now, this kind of reasoning may do well enough for the Chinese, but it will not do for thinking men in Great Britain. What we require are well-established facts and a system of therapeutics founded on them. If the professor imagines that his speech will have any effect in preventing the laity from examining homœopathy in a practical way, he will find himself miserably mistaken; and so far as my own knowledge goes, I can say that it has had the opposite effect. I have heard working men discussing his statements, and laughing at their absurdity; and, moreover, taking a good laugh at him also, as either being a great gull or a great impostor, for attempting to pawn such *un*common sense upon the public.

It is quite obvious from his speech that he has never, like a man of science, investigated homœopathy, but has just taken an outside view of it, and comparing it with his acquired knowledge, has without any more ado concluded it to be a baseless fancy. And while this has been his unwarrantable procedure, are non-medical men to fall down and worship him, and believe all that he is disposed to assert? He would seem to like such obeisance, for he tells us that the clergy should determine what is truth in religion, and medical men in physic. Poor man; he mistakes the country and the age in which he lives. It is a doctrine of the Popish Church that the laity receive the law from the priest's mouth, but Protestants require every man to think and judge for himself regarding religion. And although this is not the "common sense" of Professor Simpson, yet it is the established "common sense" of this country.

But homœopathy is extending, this oracle informs us; he is right for once. I have seen much of it and am grateful; for I have heard restored suffering humanity rejoicing over its healing virtues, and therefore I defend the right.—I am, etc.,

RUSTICUS.

January 12, 1852.

PROFESSOR HENDERSON'S REPLY TO PROFESSOR SIMPSON'S PAMPHLET ON HOMŒOPATHY.*

PROFESSOR HENDERSON has again vanquished Professor Simpson. We hope all our readers will obtain this admirable reply, carefully read it, and happily digest it. We quote some passages.

"Once upon a time, says Æsop, a man and a lion were journeying together, and came at length to high words which was the braver and stronger creature of the two. As the dispute waxed warmer they happened to pass by, on the roadside, a statue of a man strangling a lion. 'See there,' said the man, 'what more undeniable proof can you have of our superiority than that?' 'That,' said the lion, 'is your version of the story; let us be the sculptors, and

* Reply to Dr. Simpson's Pamphlet on Homœopathy, and Second Edition of the Letter to the President of the Medico-Chirurgical Society, with a Postscript: by William Henderson, M.D., Professor of General Pathology, Edinburgh: W. P. Kennedy, St. Andrew Street. Glasgow: D. Bryce. London: Hamilton, Adams, & Co.

Hosted by Google

for one lion under the feet of a man, you shall have twenty men under the paw of a lion.' This little fable is not only an appropriate introduction to a critical essay on the fables lately submitted to the public by Dr. Simpson, but may serve, as fables are an approved manner of giving important warning and instruction to persons of slender abilities and scanty information—the only persons liable to be imposed upon by the medical fabulist—to convey in a form best suited to their tastes and capacities the familiar truth, that the mere allegations of an avowed enemy ought always to be regarded with distrust. The educated and intellectual portion of his readers will have discovered for themselves the fallacy of his arguments, and will have suspected, when the subjects introduced have lain out of the course of their studies, that a purpose which presses into its service details that are usually either impertinent or monstrous can be neither good in itself, nor the offspring of a mind that has any claim upon their confidence.

"I scarcely know how to express myself, in adverting to what is termed 'Modern Hahnemannic Theology.' If the author meant to insinuate that the 'wild statements' he notices under that designation, have the smallest appearance or shadow of encouragement from the writings, the system, or the life of Hahnemann, I am constrained to say, that anything more slanderously untrue was never uttered by man. I have no hesitation in affirming that in Hahnemann's works—nay, in but three of even his lesser writings—there is more evidence of piety towards God, and of love to man, as well as of sound and beautiful philosophy, than in all the other medical works this age can boast of. And to me it is not matter of surprise that one so venerable for the purity of his life and the dignity of his sentiments, so admirable for the vast reach of his learning and his wisdom, and so pre-eminent in his claims on the gratitude of mankind for his researches in the most important of practical sciences, should have some disciples whose reverence should rise to adulation. The tendencies of men under powerful excitement have been in all ages the same, and those of this age whose temperament inclines them to ecstasy, and whose judgment affords too scanty a ballast for the force which carries them away, are apt to repeat almost any of the follies of early superstition in respect to the objects of their wonder; and why should that special folly be excepted from repetition, which made Pythagoras a messenger from heaven, and led his followers to regard themselves as equal to the gods; which paid divine honours to Empedocles, and thought Epimenides inspired! This was the folly of the progenitors of the common sect of physicians; and when it is considered that the Mormonites, and thousands of crazy people besides, are disciples of allopathy, we can account for the absence of a similar folly in our own days, in reference to physicians of their school, only by the circumstance that there is no allopathic physician great enough for even insanity to revere."

"Far be it from me to palliate irreligion, or even the appearance of irreverence to the Most High; but it is no palliation of either to say that, were Hahnemann, instead of the reverential worshipper he was of that God whom he delighted everywhere to recognise, not merely a wrong-headed zealot, but even a cold and thankless infidel, the most shameful ignorance alone could regard that as an objection to his scientific labours, when the author of the 'Mécanique Céleste' is understood to have been a sceptic, and D'Alembert had notoriously no faith but in mathematics. If the author of the pamphlet knew these facts, and were at one with all men of sense and education on the subject, how shameful of him to pander to the bigotry of the weak and the ignorant by attempting to introduce religious prejudices into a field peculiar to science! And if he knew, as he must have done, the monstrous injustice of stigmatizing Hahnemann and his system with the smallest tendency to any form of impiety or irreligion, what are we to think of the man who, in contempt of all that is manly and upright, seeks to gratify his passionate animosity against opponents in a scientific controversy by insinuating imputations which he knew to be as groundless as he meanly wished them to be hurtful?"

"Dr. Fleischmann, of the Homœopathic Hospital of Vienna, at various periods has published the results of his treatment of inflammation of the lungs between the year 1834 and 1848—the latter being the last period for which his statistics have reached me. Dr. Reiss, of the Homœopathic Hospital at Lintz, Dr. Schweitzer, of the Homœopathic Hospital at Kremsier, and Dr. Tessier, of the Hospital of Sainte-Marguerite of Paris, also have published the statistics of their homœopathic treatment of the same disease, and the collective results are as follows:—728 cases of inflammation of the lungs, 35 deaths, or one death in 21 cases; less than five per cent. In my letter to Dr. Forbes, I have given an account of the comparative success, in the same disease, of the best hospital physicians, who use allopathic remedies, in Paris; they furnish 531 cases, of which 81 died, or one in six and two-thirds, or about fifteen per cent. In the 'Introduction to the Study of Homœopathy' (to which and to the letter to Dr. Forbes the reader is referred for a more detailed discussion of this most important subject) various allopathic authorities are referred to as furnishing 909 cases of this disease, with 212 deaths, or 23.32 per cent.; nearly one death in every four cases. In the same work is contrasted the mortality under each system of treatment, in pleurisy and peritonitis, and the same vast superiority of the homœopathic practice is exhibited—the mortality of the former disease having been in Fleischmann's practice, among 224 cases, only one in 72, and of the latter, among 105 cases, one in 21; while under the ordinary system the mortality was from 8 to 16 times greater. The absence of sufficiently large statistics on the allopathic side renders these last comparisons less satisfactory than in the instance of inflammation of the lungs; and in regard to other acute inflammations, we have no data whatever from allopathy to enable us to

Hosted by Google

form an estimate of its inferiority. I may add, however, that besides the diseases mentioned above, Dr. Fleischmann's table for the eight years prior to 1844 shows 181 cases of erysipelas of the face, and only two deaths; 31 cases of inflammation of the membranes of the heart, without a single death; 44 cases of dysentery, and two deaths;—results which are far beyond the reach of any other known method of treatment."*

"Dr. Forbes, apparently surprised at the results published in one of Dr. Fleischmann's tables, yet combating the notion that the cases must have been slight which recovered under what are commonly believed inadequate means, observes, 'It would be very unreasonable to believe that, out of 300 cases of pneumonia (inflammation of the lungs), 224 cases of pleurisy, and 105 of peritonitis (in all 629 cases), spread over a period of eight years, *all* the cases, except the fatal cases (27 in number), were slight, and such as would have seemed to us hardly requiring treatment of any kind. In fact, according to all experience, such could not be the case. But independently of this *a priori* argument, we have sufficient evidence to prove that many of the cases of pneumonia, at least, were severe cases. A few of these cases are reported in detail by Dr. Fleischmann himself, and we have ourselves had the statement corroborated by the private testimony of a physician (not a homœopath) who attended Dr. Fleischmann's ward for three months.'† And he says of Dr. Fleischmann, that he 'is a regular, well-educated physician, as capable of forming a true diagnosis as other practitioners, and he is considered by those who know him as a man of honour and respectability, and incapable of attesting a falsehood.' Of the whole 728 cases to which I have alluded above, 616 occurred in the hospital of this trustworthy observer. From my own experience in the treatment of inflammation of the lungs, and other acute diseases,‡ I have not a doubt of the thorough accuracy of the accounts given us by the physicians to whom I have referred. But how do allopathic physicians get rid of these remarkable statements? Some by denying their truth (for there are men who will deny anything), and some, Dr. Forbes among them, by ascribing all to the bountiful hand of unassisted Nature! If this latter view of the subject be the correct one, then it is obvious that the medical men who believe it to be so should cease from all medical treatment in acute diseases. That it is not, however, the correct view of the matter appears very clearly from the cases published by M. Grisolle. He left eleven *mild* cases of inflammation of the lungs to follow their natural course;* and we find that the consequences of the disease were not gone in any till the end of the third, and in some not till the end of the fourth week, whereas under the homœopathic treatment every trace of the disease is usually gone, in severe cases too, in a third of that time,† proving that homœopathy is not a merely passive system."

* "Since 1844 the German hospital statistics give us 164 cases of erysipelas, without a death; 84 of peritonitis, with 4 deaths; 75 of pleurisy, with 1 death."

† "Brit. and For. Med. Rev., p. 243, No. 41."

‡ "I have treated homœopathically throughout 16 cases of pneumonia, with one death; 10 cases of croup, without a death; besides a few cases of pericarditis, pleurisy, peritonitis, and many of dysentery, bronchitis, and erysipelas, with only two deaths, one from dysentery in an old man long in bad health, the other from general bronchitis in an infant. In one case only was blood-letting adopted. Of other acute diseases, I have treated homœopathically 39 of measles, without a death; 45 of hooping-cough, with one death; and 36 of scarlet fever, with 2 deaths. Among the last 2 deaths, one is included of a gentleman who, having recovered from the fever, was seized with inflammation of the chest, and was treated during the greater part of that, his last, illness by Dr. Alison."

* "See Letter to Dr. Forbes."

† "See for ample details, 'Recherches Cliniques,' par J. P. Tessier. Paris, 1850."

THE
HOMŒOPATHIC TIMES.

SATURDAY, JANUARY 31ST, 1852.

THE HAHNEMANN HOSPITAL.

WE who are engaged in the anxious toils, which must be the portion of all who are employed in the work of establishing in this country a thorough, root-of-the-matter Medical Reform, like homœopathy, know that not only the *first*, but *every step counts*.

Some of the correspondence that has lately appeared in our columns is suggestive of the "worm in the gourd" in one instance, where we hoped for the display of union and cordial co-operation.

We have always maintained that there should be, at present, one large effective hospital for the treatment of patients on the homœopathic principle, rather than two or more small and ineffective ones. We hope that the homœopathic public who pay the piper, will take the matter into their own hands.

We do not enter into the subject to which we have alluded, but which must soon come before our public, when we shall probably pass the whole matter under review.

We heartily regret that while the external foe is silenced, or at all events silent, for the present, there is evidence of the

Hosted by Google

same spirit of disunion within our camp, which we have so often lamented.

We suppose this condition of things is inseparable from mortality, and from every human work. We know that Hahnemann was often grieved by the occurrence of similar circumstances among his immediate pupils and followers. But after all, and notwithstanding the numerous disputes and differences among some of our advocates and supporters, the cause of homœopathy is making progress.

We hope that by the 10th of April we shall be able to announce a calm in the quarters now visited by storms, and to be able to congratulate our readers on happy and goodly meetings of the admirers of Hahnemann and the friends of homœopathy.

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—Your readers will, I doubt not, pardon me if I decline the invitation of Mr. Smith to enter at large into a history, for which I have not professed myself qualified, and if I as briefly as possible reply to some few of the points in his letter of the 17th inst. Mr. Smith must excuse my passing over many as utterly unworthy of any notice.

I stated in my letter of the 10th inst. only what was strictly true. The circular which Mr. Smith has made the subject of such *unnecessary* comment *was* suggested by the Board of Management of the Hospital, and though the members named by Mr. Smith may be as ignorant in the matter as Mr. Smith himself, *the fact* remains as I have stated. I now give you an extract from the minutes of a meeting of the House Committee of the Hospital on the 20th February, 1851, in which the following resolution is entered:—

"Present, Messrs. Sugden, Sandoz, Hanson, Glover, Warne.

"Resolved, that a poundage be allowed to the collector of the late London Homœopathic Association (the word Association was an error of the gentleman who proposed the resolution, and was overlooked), now merged in the Hospital, and that a paper should be drawn up, signed by Mr. Leaf and Mr. Warne, as his authority for collecting."

And at the meeting of the Board of Management on the 6th of March following, *at which Messrs. Smith, Phelps, and Gill were present*, the above minutes *were read and approved.*

The circular so warranted was consequently drawn up by me, and was seen by Mr. Leaf *only* when so drawn up, and, if I recollect aright, was also seen and approved by more than one member of the House Committee previously to its distribution, at the end of March.

The circular was predated to the period at which the subscriptions to the London Homœopathic Institution were considered due.

Mr. Smith, as it would seem, for the purpose of two gratuitous insults in the course of his letter, states, "I have been informed, however, nay, if I recollect rightly, have seen the fact announced in Mr. Warne's handwriting, that Mr. Leaf is the author of a pamphlet, published in 1840, entitled "Homœopathy Explained and Objections Answered," etc. *Where* Mr. Smith may have seen what he says he has seen I know not, for, though it is possible, I am not aware that I have ever so announced *the fact;* but I have merely to remark, that the only two editions of the pamphlet which I have seen, have each an introduction bearing the signature of "A Non-Medical Homœopath" *as the author.*

The virulence of the unprovoked and insolent attack on Mr. Leaf I *now* leave to the merited reprobation of every friend of homœopathy.

I know not what authority Mr. Smith has to pledge the Board of Management to the acceptance of any dedication; it will be time enough when I know that he has that authority, to consider whether I shall attend to his entreaties. In the interim, if Mr. Smith really requires any information about the Institution, of which he professes himself so anxious to have the history, the "individual," who has already given him so many hints for his letter, will doubtless obligingly supply it, as well as the names of the now eminent homœopathic practitioners, who were to my knowledge (for I have seen the cases taken in their handwriting) partakers of the benefit of clinical instruction there. Mr. Smith misquotes me, I *did not* state "*first lesson*"

My object in my previous letter was not to criticise the abundant defects in taste, style, and composition in Mr. Smith's first letter, which certainly afforded ample latitude to any one critically inclined, but to correct him in points on which he was in error. Whatever then the demerits of my letter of the 12th inst., the composition, the style, is at all events my own; but it would be "interesting" to ascertain where and by how many individuals Mr. Smith's letter of the 17th inst. was concocted; whose critical, logical, philosophical, and professional acquirements were put in requisition; by whom the *venom* was supplied, for, as "*nemo repentè fuit,*" etc., I so far do Mr. Smith the justice to believe that, though the letter bears his signature, like his Honorary Secretaryship previously to April 1850, the work is not wholly his own—Mr. Smith has no objection to work by deputy.

As to the verdict he seeks, Mr. Smith's own admissions are sufficient to warrant my remark that his history needed correcting.

I have now to observe, in reply to your note at the foot of Mr. Smith's letter, that I have complied with the request to furnish you with the "date"

Hosted by Google

when the Board "suggested" or "confirmed" the adoption of the circular, but I do not recognise your right to require of *me* a History of the London Homœopathic Institution; and for "an explanation of the unwarrantable departure from medical custom and precedent" referred to in the letter of the three medical gentlemen dated December 16th, 1846, I can do no better than refer you to Mr. Sampson, the originator and proposer of the "objectionable resolutions," and to Mr. Heurtley, the then secretary of the Institution or Association.

I have only to add, that as *my* time *can be* better occupied, and your columns *ought to be* more agreeably filled than with a correspondence so profitless, no representations or misrepresentations to which the *cacoethes scribendi* of Mr. Smith may impel him will hereafter induce me to reply to them in your journal.

I remain, Sir, your very obedient servant,

W. WARNE.

9, Gresham Street West, Jan. 26, 1852.

[Our observations were merely suggestive with a view to terminate a dispute. Mr. Warne, who was the Honorary Secretary of the late London Homœopathic Institution, we presume, is fully acquainted with all the circumstances that led to the premature decline and fall of that Institution as a hospital. We referred to another for our wished-for explanation of "the unwarrantable departure from medical custom and precedent," avouched in the letter of Drs. Chepmell, Hamilton, and Laurie; and whose duty, we maintain, it is to furnish the desired explanation.—ED.]

THE HAHNEMANN HOSPITAL.

To the Editor of the Homœopathic Times.

SIR,—The Board of Management of the Hahnemann Hospital, if we may judge from the sharp correspondence between some of its members which has lately appeared in your columns, seems to be divided in opinion on many material questions. There is, however, one point of difference which appears to me so vital to the well-being of the Institution, that it ought to be well understood, calmly considered, and deliberately voted upon by every subscriber who has the interests of the Hospital at heart. Should this letter, by your courtesy, be published, and become the means of conveying such information to the subscribers as will enable them to arrive at correct conclusions upon the subject, I shall have accomplished all I propose to myself in thus addressing you.

The founders of the Hahnemann Hospital had *avowedly* three objects in view, in the establishment of that Institution. (I say *avowedly*, for it may appear hereafter that the zeal of some was actuated by motives of personal interest). Those *avowed* objects were—

First. "To relieve the poor who suffer from acute diseases, by receiving them into the Hospital."

Secondly. "To give relief to out-door patients."

Thirdly. "To afford facilities to the medical student or inquirer, for obtaining a knowledge of the homœopathic theory and practice at the bedside of the patient; by clinical lectures; and by lectures in the Hahnemann school (to be attached to the Hospital) on the homœopathic therapeutics and Materia Medica."

Now the question at issue is, whether one of these objects, viz. to afford opportunities of clinical instruction at the bedside of patients, will be best promoted by the appointment of *clinical lecturers*, so entitled, from among the members of the medical staff, or by the delivery of clinical lectures by all the medical officers on duty, *in virtue of their office*, as at other hospitals, and without any other *title* than that of Hospital Physician—Surgeon—or Medical Officer. "What does it matter?" you will probably exclaim; "a mere question of title cannot involve much that is of consequence." You may argue as Romeo did, that the fragrance of a rosebud is still the essence of roses, call the flower by what name you will; but I am prepared to prove, Mr. Editor, that the odour in which the Hahnemann Hospital is to stand with the public,—nay, its very existence as an effective Institution,—essentially depends upon the adoption or negation of this question of "mere title."

Let me place the proposition before your readers in three points of view: first, in its relation to that numerous and talented body of men, members of the medical profession, who practise according to the homœopathic law; secondly, its relation to its ultimate object, the formation of a medical school for the dissemination of the homœopathic theory, and the universal introduction of its practice; thirdly, its probable action upon the welfare of homœopathy and upon that of the Hahnemann Hospital in particular.

A bye-law of that Institution enacts that "the Medical Council, in conjunction with the Medical Staff, are to advise the Board of Management or Committee on all matters connected with the medical arrangements of the Hospital." When, therefore, the question of establishing a medical homœopathic school was first discussed at the Board, the opinions of the Medical Council were very properly sought for, and on the 18th of July last, a circular was addressed to each of the twenty gentlemen composing that body, requesting their advice on, amongst others, the two following points:—As to the then system of medical service with reference to the delivery of clinical lectures, and as to the best mode of ensuring a continuous course of lectures during the session. To this circular *fifteen* replies were received, out of which number the tenour of *thirteen* was to the effect that oral instruction was most desirable, and that for the present, until a charter for a college could be obtained from Government, the hospital physicians and surgeons should give clinical lectures during the term of their appointment, *but without any title*. One member was for establishing a paid professorship, but this opinion he has since retracted as premature, and now coincides with the

Hosted by Google

views of the majority; and one was for the election of a physician and surgeon, to be specially appointed as clinical lecturers. You would imagine, Sir, that with so strong an expression of opinion, the Board of Management could be at no loss to decide upon what course to pursue. What, then, will the subscribers think, when they are informed that the Board quietly ignored the united opinion of fourteen members of the Medical Council, and—on the pretence that at a subsequent meeting (at which *only five* of that body were present) no definite decision was arrived at, and the matter left to the Board of Management to decide—adopted the views expressed by that solitary one who advocated the election to a titled lectureship? The fact is so! but to comprehend the principle (or want of it?) upon which they acted would require a deeper initiation into the hidden mysteries of the Board of Management than I am at present at liberty to afford.

The objections of the majority of the Medical Council to this course are very obvious, and must be allowed to be most sound. It is notorious that the office and title of clinical lecturer to a large hospital is virtually that of "Physician in Chief," and carries with it the *prestige* of a decided superiority, and upon a question so important, and involving so much as that of medical superiority inevitably does, no body of laymen could be considered competent to decide. The Medical Staff of the Hahnemann Hospital, as a body therefore, were compelled to decline becoming candidates for an office whereto the election depended upon non-medical suffrages, but the title of which conveyed to the public the notion of great medical superiority in those holding it. They contended, and I think most fairly, that inasmuch as each and every member of the Staff, in his turn of duty, cheerfully dedicated his time, his energies, and his talents to the real work and actual service of the Hospital, it would be but an invidious distinction to confer a title upon any one or two of their number—a just cause of dissatisfaction in the minds of those who were not so distinguished. "If," said they, "all are willing to give clinical lectures, why select any one more than another upon whom to confer the title of clinical lecturer?" And it will be incredible, if one member of the profession can be found of delicacy sufficiently obtuse to put himself forward as candidate for an office which is to proclaim him, if elected, the chief of all his fellows—one who can so far prostitute his independence and the dignity of his profession to his interests, as to solicit suffrages from electors incompetent to judge of his fitness or unfitness for the office to which they pretend to elect him.

The object which the delivery of clinical lectures was intended to promote—the ultimate formation of a homœopathic medical school—next claims our attention. I presume that the chair of clinical lecturer to a hospital is, or invariably ought to be, filled by some man of pre-eminent talent, of mature experience, and unsullied reputation, who is both able and willing to devote his time and talents to the task of studying cases *in the hospital*, and giving instruction, by lectures upon them at the bedside of the patient; moreover, he should be a man enjoying the confidence and esteem of the profession generally, and in this particular instance it would be necessary that he should teach *pure* homœopathy: previous active service in the hospital for a long period would form another ground of selection.

If this be the case, it must be obvious to all your readers, that the character of any future school to be founded in connection with the Hahnemann Hospital would be seriously emperilled by the hasty election, at this present moment, of any member of the medical profession to a clinical lecturer's chair in that Institution who did not possess in himself all these requisites. Nor do I think it possible, from the short time that the Hospital has been established, that any fair conclusions whereon to ground an election can be arrived at. Let a charter, based on broad and comprehensive principles, be first obtained: let it rigidly exact a full and sufficient acquaintance with medicine in its most advanced state; it will then be for the medical profession to elect from among themselves the most worthy to fill such professors' chairs as homœopathy demands. For it must never be forgotten that the existing medical schools abundantly supply the most perfect instruction on *all* subjects *except* the principles and practice of homœopathy and its Materia Medica Pura. Clinical instruction will result as a matter of course from properly conducted hospital practice and teaching. In the mean time, let an ample number of medical officers be appointed, *upon the recommendation of the Medical Council*, as acting officers to the Hospital for a period of not less than three years, with the understanding, that they shall arrange among themselves to give, at least, twelve clinical lectures per annum, or as many more as they can find subjects and audiences for. Thus may many an old-school practitioner, distracted by doubts as to the efficacy of his practice, which the success of homœopathy cannot fail to engender, and many an inquiring student determined to know the truth, gain a beneficial insight into the glorious truths of the homœopathic law, by attending the bedside (or classroom) lectures of the physicians and surgeons of the Hahnemann Hospital.

Not to occupy more of your space, Sir, I will conclude by shortly remarking the effect which the influence and acts of the present Board of Management are likely to produce upon the interests of homœopathy and the Hahnemann Hospital. The first direful result of their proceedings was made manifest by the immediate resignation of four of the medical staff, which is now diminished just one-half: four have recently resigned; one resigned some time ago; and a sixth is abroad. There has been also a decided intimation from the medical body generally, that they did not approve of or co-operate with the Board. Five years ago, a similar proceeding at the London Homœopathic Hospital, in Hanover Square, lost that Institution the services of some of its best officers, and it will be well to observe

Hosted by Google

that in the letter of resignation of those gentlemen, the very same reasons are urged which I have been endeavouring to place before your readers. I subjoin it for their perusal.

"Dec. 16th, 1846.

"SIR,—We, the undersigned physicians to the London Homœopathic Hospital, having come to the determination to resign the offices which we hold in our medical capacity at the above Hospital, will thank you to hand in our resignations to the Board of Management.

"We do so, in consequence of the principle involved in the passing of certain resolutions with regard to the medical management of the Hospital by a large majority of the governing body at the last meeting, for the following reasons—

"First. Because the original conditions upon which we accepted office, viz., that of perfect equality amongst the medical officers, has been entirely set aside on the part of the governing body, by conferring a title on one of our body, which, in the mind of the public (lay and professional), conveys an idea of medical superiority.

"Second. The title of '*Consulting Physician*' which has been so conferred being one of high honorary distinction, is only given to physicians upon their retiring from the active duties which they have fulfilled in a hospital for a long series of years, and therefore such a title cannot be conferred upon any physician of this Hospital, who (no matter of how high an order of merit) has declared his resolution to retain a post of activity, without an unwarrantable departure from medical custom and precedent; a step the more unjustifiable, seeing that it was taken in direct opposition to the earnest remonstrance of a vast majority of the medical portion of its governing body.

"Third. Because we believe that the interests of homœopathy will not be advanced in the proper quarter (we allude to the medical profession), unless medical custom and precedent be rigidly adhered to by the governing bodies of the hospitals, where homœopathic treatment is adopted exclusively; and, moreover, because we also believe that no physician can retain an active part in any hospital, homœopathic or otherwise, whose governing body persists in the legislation of medical matters, irrespective of medical opinion and custom, without a compromise of professional dignity, both in the opinion of his fellows and of the public at large.

"We beg you will convey to the governing body of the Hospital our courteous sentiments, believing, as we do, that all the individual members (irrespective of private opinion) are actuated by the same good feeling, the same disinterestedness, and the same desire to forward the cause of homœopathy, which we trust we *possess*, (?) whilst we cannot help being at issue with the majority of its members as to the principle involved by the late resolutions.

"We have the honour to be,

"Your obedient servants,

(Signed) "E. C. CHEPMELL,
"ED. HAMILTON,
"J. LAURIE."

"To the Secretary of the London Homœopathic Hospital, Hanover Square."

Yet in the face of such a warning, in spite of repeated remonstrances from individual members of the Medical Council, and of a strong, because *independent and disinterested* opposition at their own Board, the Management have carried out their obnoxious resolution and appointed two clinical lecturers. Is it any wonder, Sir, that the medical gentlemen are disgusted? and if they do not (as a body) resent the insult offered to the dignity of the profession, but swallow their disgust in silence, and content themselves with looking with distrust and suspicion upon the Board of Management, with whom it is essential that they should most intimately co-operate, instead of at once sending in their resignations, it is only because a dread of compromising the very existence of an Institution destined for the most charitable of all purposes humanely deters them. What must they feel when they learn that even this sentiment has been calculated on by the Board? Outrage their honour as you will, insult them at pleasure, they will not leave us for the sake of the good Cause.

The question was big with meaning which was put by a member of the Medical Council at one of their meetings, "If the conferring of titles be not *solely* for the benefit of the Hospital, why confer them?" It is not for me to answer it, still less to accuse any member of the Board of being influenced by personal motives. But I will not hide from the subscribers my convictions, that the sooner their Executive Council is purged from the gross taint of personal influence which now seems to pervade it, the better it will be for the prosperity of the noble Institution which they patronise and support.

The government is vested in the General Meeting of the subscribers, with whom rests the sole *legislative* authority; the duties of the Board of Management being merely *executive*. I contend then that the latter body have overstepped their power and usurped the prerogative of the former; that they are incompetent either to appoint or dismiss any *medical* officer whatever (it being merely "in the power of the Board of Management to *suspend* any officer until the next general meeting of the subscribers"), and I am sure a reference to the sixteenth and seventeenth laws of the constitution will support the position. Yet the Board of Management have not only accepted resignations, but have filled appointments of medical officers, and that too, *without any recommendation from the Medical Council,* in direct defiance of a most important bye-law to the contrary.

It will therefore devolve upon the next meeting of subscribers to decide whether, by an invidious pre-eminence given to one or two members of the profession, *without the sanction of the Medical Council,* the whole medical body is to be estranged, the duties of the Hospital neglected, or at best, but hurriedly performed, and the Hahnemann Hospital, with its much-talked-of clinical lectureship, held up to the scoff of allopaths and the ridicule of the world, as an abortive Institution; or, whether, by a well-balanced

Hosted by Google

and reciprocal interaction of the *whole* Medical Council and the Board of Management, an efficient staff of *willing* medical officers be kept on foot, and a course of clinical instruction established which shall form the nucleus of a future school of homœopathic medical practice, and become the means of developing homœopathic truth and transmitting its blessings to another age.

Apologizing for having occupied so much of your time, I remain, Sir,

Your most obedient servant,
WILLIAM GILL,
Member of the Board of Management of the Hahnemann Hospital.

To the Editor of the Homœopathic Times.

SIR,—Though I have had the pleasure of taking in and reading the *Homœopathic Times* since its commencement, I am not aware that I have ever seen the subject of homœopathy treated of in connection with dental surgery. Possibly, by mentioning my non-medical observations, I may persuade some homœopathic dentist to step forth and tell your readers of the benefits to be obtained in his line of practice by the use of our medicines. I know that in Exeter there is at least one eminent dentist who is a homœopath, and no doubt there are many more in other places. Without going into the question of toothache, I will confine my observations to tooth-drawing. About four years ago, as near as I can remember, I was obliged to have a tooth out, and knowing the soothing and healing properties of *Arnica*, I mixed some of the mother tincture in warm water, before the operation, and afterwards found great relief from rinsing the mouth with it. The dentist observed my movements, and saw, no doubt, that relief was obtained; though no homœopath himself, he has since constantly used it in his practice, and on his coming to draw another of my teeth last week, he assured me that his patients find very great relief from its use, and are always anxious to know what it is, where it comes from, and where it is to be procured.

I found, by my own experience on the occasion of losing my last tooth, that *Arnica* checks hemorrhage, lulls pain, and promotes the healing of the gum. I have now advised my friend the dentist to try *Calendula* as well, as I thought it likely, in cases where the gums are unhealthy, that it would answer better than *Arnica*. No doubt, *Arnica* taken internally at the same time, would also be of service, but my experience of its benefits has been principally, and that of my friend the dentist entirely, as a topical application. If no one else will advise non-medical homœopaths to reap this benefit in dental surgery, let me, at least, do so; let me invite such dentists as think with us, to give us the benefit of their advice and experience on this point; let me further advise *all* dentists to try *Arnica* and *Calendula*, and I make no doubt those who do so will find their patients increase, owing to the palpable diminution of the subsequent pains of their operations. I regard also the use of our medicines by dentists as a means of making our system known; for when sufferers have once tasted the benefits of the great doctrine of "*similia similibus curantur*," they will naturally be inclined to go a little further, and examine into the merits of a medical system which renders them aid on so trying an occasion—an aid which they have never before had offered to them.

Trusting that these few lines may be suggestive of comfort under pain to some, and that they may be productive of some more authoritative remarks on the subject from one or more surgeon dentists, I remain, Sir, obediently yours,

A NON-MEDICAL OBSERVER.

HOMŒOPATHIC EXPERIENCE.

To the Editor of the Homœopathic Times.

SIR,—William Carré, aged two years. When brought to me, in 1837, he could neither walk nor speak, was very backward for his age; extremely thin abdomen, swollen; always craving for food; cross, and crying; violent diarrhœa; very restless sleep. I gave him three globules, 30th dilution, of *Calc. carb., one dose* every seven days, for three weeks.

Mrs. F. T — had a lump or tumour near the corner of her right eye. It seemed under the skin, was extremely painful (the nose seemed slightly inflamed), gnawing pain, was very sensitive to the touch; from the eye it moved to the forehead, thence to the nose, where it was when she came to me; it was the size of a small bean, and raised. She complained of a great pain in her legs, sometimes one of her knees swelled, and sometimes her feet. She was a hard-working woman, and of a slight make, with dark eyes and hair, about twenty-five years of age. I gave two globules, 30th dilution, of *Silicea;* the following day, one more globule; in a few days the acute symptoms disappeared, and a dose of one globule every week for three weeks entirely cured her, and she has had no return. This was in the year 1837. Her son John, the same make and complexion as his mother, aged fourteen months, was brought to me in a very feverish state; his face was sometimes red, at other times of a greenish-white; his breath was most offensive, like bad eggs; his food turned acrid on his stomach; was sick after his food; no appetite; much flatulence, alternate constipation and diarrhœa; disturbed sleep. The inside of his thighs was in a state of violent inflammation and running sore, with small but very painful boils round the lower part of his abdomen. The child had been in this state for several weeks before he was brought to me. I gave him one globule, 30th dilution, of *Sulphur;* three days afterwards, one more globule; the fifth day the wounds began to turn blue and heal; the boils discharged and healed likewise; the seventh day from the second dose I gave one globule more. The improvement was so rapid after this third dose, that I thought no more medicine was required; the result proved me right, as the child recovered his spirits, and laughed and jumped about as before he was ill.

Hosted by Google

Mrs. Nouri, aged fifty years, had violent acute pains, which came on and ceased suddenly, in the left side; she was much oppressed at night, and when walking; cough night and morning; no appetite, or taste of food. I gave her one globule, 18th dilution, of *Pulsatilla;* at the end of seven days, one more. This quite cured her.

Caroline T — suffered from cramps at night in her thighs, which prevented sleep, and caused much suffering. Two globules, 30th dilution, of *Rhus tox.*, and the same dose repeated at the end of a week quite cured this painful affection.

James L —, a child who had every appearance of approaching scarlet fever. His face was red and looked swollen, his throat was very sore, and there was great burning all over his skin. I gave him two globules of *Aconite* in the morning, and one globule of *Bell.* at night. The next day all bad symptoms had disappeared.

T. W. C —, six weeks old, was brought to me May, 1837, in convulsions. His body was bent back so as to rest on his head and feet, and perfectly stiff; it was impossible to change his position; his eyes distended and turned upwards; he was greatly agitated, and screamed violently. I gave him two globules of *Chamomilla* without effect; on examining the child more closely, I found that though the body continued rigid, the arms were flexible, and he constantly threw them about, which does not agree with the symptoms of the convulsions produced by *Chamomilla.* I then gave him one globule, 30th dilution, of *Belladonna* the next morning. He was so much better the following evening, that his mother (according to my directions) did not give him the second globule till the morning she brought him to me. When I saw him, I found his convulsions gone and his body flexible; he was sleeping quietly, but with his eyes half open; he looked languid, and as if he had suffered much. One globule more quite restored him, and he had no return of convulsions. He grew up a fine strong boy.

John M —, four months old, 1837, was brought to me, looking extremely ill, crying violently; his face was pale and thin, his forehead burning; he evidently suffered much in his bowels. He had diarrhœa, with green stools, and much mucus mixed with them. I gave him two globules, 13th dilution, of *Cham.;* the following day he ceased crying, and seemed relieved from pain; the diarrhœa was much less, and less green. I gave one globule more at night; the next day he continued improving so rapidly, that no more medicine was required.

Little M. M—, a child of three years old, had a similar attack about the same time, and was cured by three doses of *Chamomilla* 12.

Little Corbet, six months old, very red face, hot and burning skin and head; looked extremely ill, but had no other symptoms of illness. One globule, 12th dilution, of *Belladonna,* during the night, removed all trace of illness.

H. C.

IRIS FLORENTINA.

(From the North-Western Journal of Homœopathy—Chicago, Illinois, U. S.)

THIS remedy, spoken of by Dr. Teste, is but little known in practice. The only notice of it which we have seen is contained in the Real-Lexicon, from which we should judge it worthy of attention. If any of our friends have any information regarding this remedy, they would oblige us by communicating it.

"Iris Florentina" (Iris officinalis; Florentinische Veilwurz; French, Iris de Florence; English, Flag-lily, Flower de Luce) is indigenous in Provence and in Italy, especially in Florence, whence its name; its beauty has secured it a frequent place in our gardens. The root is a few inches long; somewhat rounded and flattened; tuberous, knotty, heavy; about as thick as one's thumb; white without, and within of a whitish-yellow; has a pleasant, violet-like odour, and a slimy, mealy, sharp, and bitter taste.

When fresh, the root has an acrid quality, which is mostly lost by drying, yet even in the dry root there is a resin of a burning taste, which may be extracted by alcohol, and also some traces of a volatile oil. Jahn thought he detected the presence of inuline. Vogel obtained from it a volatile oil; a brownish-yellow or yellowish-green, fatty resin, giving a yellow solution with alcohol, of an extremely bitter, sharp, almost burning taste; astringent extractive gum; starch, and ligneous matter. According to Raspail, in the tuberosities he detected crystals of oxalate of lime. Thouerry thought he also discovered emetine, which, however, he afterwards denied.

It is most powerful when fresh, when it possesses the greatest acridity, by virtue of which it induces redness and even inflammation of the skin. As regards its medicinal qualities, its proper place is between *Calamus* and *Senega.* Large doses induce burning in the stomach, loathing, nausea, vomiting, cutting pains in the bowels, diarrhœa, anxiety and headache. Aumont relates (Nouv. Bibl. Méd., viii. 525) that the dry powder, used as a hair-powder, occasioned, in the case of two young girls, uneasy sleep, headache, constriction of the throat, redness of the neck, disposition to vomit, a kind of sleeplessness, difficult urination, and an incomplete hemiplegia. This root has the most powerful effect upon the mucous membrane of the intestinal and respiratory organs, and seems, at the same time, to act as an alterative. Hoffmann ascribes to it hypnotic and antispasmodic virtues. It is used with the greatest benefit in chronic mucous disorders, chronic catarrh, asthma, dropsy of the chest, etc.

Pereira says, "During teething, infants are sometimes permitted to rub their gums with and bite the rhizome; but the practice is objectionable, since it is not unfrequently attended with irritation of the mouth and disorder *of the stomach and bowels.*"

MY CONVERSION TO HOMŒOPATHY.

By Dr. E. Acworth, of Cheltenham.

(*From the British Journal of Homœopathy.*)

I have been asked for my confession—not of homœopathic faith, but that which operated my conversion to it. At first, I was unwilling to accede to this request, and if I now venture to write of myself, I do so in the hope it will be only in so far as that self is connected with a cause that I would serve, for it strikes me that if I can simply show how the truth of homœopathy was forced upon me, I shall haply furnish a better answer to its assailants than if I were to answer their invectives more directly.

It is now a good many years ago since homœopathy first crossed my path. It was then a much smaller thing to me than now, and did not long arrest my attention.

I let it go its way. Years passed on, and it had grown to something larger; but what will not imagination make things grow to? Had I not seen what Nature can do—especially when the physician himself does nothing but—give her *leave* to do?

Had I not myself received credit for cures in which I had no concern? Had I not had occasion ere now to see the error of my allopathic ways--and now, instead of thwarting Nature, did I not virtuously follow her suggestions, and find how homœopathic cures might be owing to what was left undone? The diet and regimen of the patient did it all. It was all nonsense!

But still the years succeeded one another, and homœopathy had grown with each till it grew at last into something like a bugbear that frightened my moral sense from its propriety. What if there should be something in it, after all? What if its results were not purely *negative?* What if it turned out *positively* superior to the system of treatment I had hitherto employed? How if it should really prove the art of healing *cito, tuto, et jucunde?* I began to think I would investigate the matter. There was enough to challenge examination, if there was not enough to enforce belief. In the first place, there was the *steady* progress it had made—not in a single country, but in many—throughout all Europe—throughout the world. This in itself was a presumption of its truth. Then there was the constant accession to its ranks, not only of patients, but physicians too. Some of these I had a slight acquaintance with. And here lay the point. *Character* is much more transparent than *opinion*—or rather than matters of opinion. It may be hard to find if a thing be true or false, but not if a man believe in it or not. The *man* is seen through much sooner than the *thing*. I knew of homœopathic physicians about whose earnestness I could have no doubt.

That *they* were convinced I felt assured. I had every reason to believe them to be—as honest—as enlightened—as observant as myself—and as little disposed to take things on trust. They had examined the matter. I had not. Were they not likely to know better than myself? Was not *their* belief a presumption of its truth?

There was still another. And that was the abuse which the *Lancet* lavished on it. I began to have most strange misgivings. Surely there *must* be something good in it—something not opposed to truth. Had I not seen the *British Medical Review* attacked with similar coarseness and vulgarity, only because of its elevated tone—because it would raise the character of medicine—and of medical men too—above the *Lancet* level? I would certainly investigate the matter for myself. If I were to think or feel by proxy, orthodox as I then was, there were those of the pestilent heresy itself I would rather have had for my proxy, even then than that "defender of the faith," the *Lancet*. If my thinking, like my washing, must be *done out* for me (as a friend of mine affirms to be the case with the majority even of educated men), yet still it was not at the office of the *Lancet* I should have wished to get mine done. Whatever the *mangling or getting up* might be, I should doubt if either the thinking or the washing would have much to do with the purifying element in which Truth is said to dwell. Doubtless, those who conduct that journal were in possession of faculties far superior to mine, or how could they so intuitively see not only into what was true or false, but into the dishonesty of those who saw not with them? But still the use of my own poor brains was better for me than the usufruct of theirs. I would certainly look into homœopathy myself. There was nothing in its *principle* I knew of to object to—nothing to stagger one in the homœopathic law—but—the infinitesimals! Yet even then I could not help saying—surely everything is wonderful, or there is nothing so! Is there anything more marvellous in one fact than another, except in its less frequent presentation to the mind? That a millionth part of a grain of anything should cure, was not in itself a jot more extraordinary than that one grain, or five grains, or ten grains, should! It was simply hitherto opposed to my experience. No! not *opposed*—I should rather say—it came not within the *range* of my experience. It certainly was not a jot more

Hosted by Google

extraordinary than that men whom I believe to be honest and observant—men without any motive to deceive—men who had put the matter to the proof, and challenged the proof or disproof of what they stated—should unite to maintain it would, if it would not. It was a question only to be decided by experiment. Was it not an experiment I ought to make?

But perhaps I might not have reasoned quite in this way, if it had not been I was already a believer in that which had made me resolve, henceforth, to be careful of ridiculing even the ridiculous. I mean—in the truth of mesmerism. Of this I had no doubt. I had passed through different phases of opinion before arriving at a conviction of its truth, but now it had firm possession of my mind. And, doubtless, this had made me all the readier to admit the possibility of homœopathy being true. What, if it were so? What, if the same process had to be gone through with regard to *it* as in regard to mesmerism—laughed at—explained away—inquired into—believed in?

At last I could not put the subject from my mind so that it should not infect my quiet. Like another, in a matter of greater moment, I deferred it to "a more convenient season," but, like that other, in the meanwhile trembled. I began to *fear* it might be true. And if it were true there was cause for fear. Did not I know what its belief would cost me? Had I not publicly defended mesmerism, and had I not had to pay for that defence? If there was the same to do for homœopathy! And if with the same results! And then the thought flashed across me—You are a coward!—you dare not face the light! And then I whispered to myself—How base! You are caring nothing for the interests of Truth—you are caring only for your own! And then, too, I recollected the obligation I was under to do the best I could for suffering humanity, and I knew that the *best* involved *comparison*, and I felt that if I said I had done my best, there was something that might tell me it was false! I would not have hone this from anybody else. I would not bear it from myself. Whatever it might cost, I would set my mind at rest. Moreover, at this time came before me such well-authenticated cures by homœopathy as made it a duty there was no escape from, to test its therapeutic power.

I put myself into the hands of a physician near me, who had been an apostle of homœopathy for years, and whose apostleship was placed above suspicion: for the benefits it conferred were on others, not himself. It was "the blessing of him that was ready to perish," but not the fees of the rich, "that came upon him." Homœopathy, like virtue, was to him its own reward. This gentleman kindly procured me books and medicines. I read, resolving what I read to *prove*.

At this time, amongst other patients of mine was a lady of about sixty years of age, of very infirm health, and subject to laryngeal and bronchial attacks of so severe a kind as to demand most active treatment. In the intervals between these, she suffered besides from various symptoms of indigestion, and still more fearfully from violent neuralgia, flying from one part of the body to another, but settling most frequently in the index-finger of one hand, and showing, as it would seem, its gouty origin by a considerable node it left behind it there This neuralgia returned with all the more violence after any depletory measures that might be used to subdue the bronchitic attacks. In other words, the treatment of one complaint was incompatible with the treatment of the other. I had therefore in the last bronchitic attacks, for which at the time I speak of I was attending her, avoided, as far as possible, depletion, and trusted mainly to the use of *Tartar emetic*. But *Tartar emetic* after a while (after the acuter symptoms were relieved) became, in senses more than one, *intolerable*. The patient was still suffering from incessant cough—from difficult and hurried breathing—and from constant wheezing in the chest, which was attended, but unrelieved, by expectoration. Though of a mild disposition and phlegmatic temperament, she was agitated and restless in the extreme, and declared that, if I did not soon relieve her, she must die It struck me here was a case for homœopathy, and, as she would not have other advice, that I would try it. I went home and got some *Pulsatilla*, in the selection of which remedy there was haply more of chance than of my own discrimination. The first dose of it I administered myself, sitting by the patient's side the while. In twenty minutes' time she felt so much relieved that she wished to know what medicine I had given her—for, to use her own words, *she felt herself in heaven!* She seemed disposed to sleep, and so I left her, promising to return in the course of two or three hours. On my return I found she had had some sleep, which she had hardly had for several nights—the pulse was much less quick—the cough less frequent—the wheezing not so marked—the breathing easier. Altogether, the patient was much better, and in forty-eight hours I might say that she was well.

The case struck me. It was the first I had ever treated, or *seen* treated, homœopathically. But might it not, after all, be a *coincidence*—what looked so very like the *cause* of amendment? Ought one to generalize from a single fact? But my wonder did not stop here. Day after day, I looked for the neuralgia that followed convalescence from these attacks, but the neuralgia *did not* return. But more than this, the dyspepsia too had left her. I could not make it out any better than the patient. But what was my surprise to find, on referring to the action of *Pulsatilla*, that whilst merely treatment of one complaint was thought of, I had actually treated the others without knowing it. The medicine was applicable not only to a single set of symptoms, but to many. And here it was that the great superiority of homœopathic treatment forced itself upon my attention. I could not stop here. I could not, *and feel myself an honest man*.

The next case I saw was one of pneumonia—one of the very gravest kind—that was treated with *Phosphorus* and *Belladonna*, and that, to me, with the most remarkable results. The

Hosted by Google

Belladonna was given on account of the delirium, and it was marvellous how quickly it controlled symptoms that *Phosphorus* alone could not control. I recollect well when the first dose was given, at five o'clock in the afternoon, that the pulse was more than 130—at twelve o'clock the following day it had fallen to 78. All the other symptoms showed, equally, improvement.

This case, too, made a deep impression on me. Moreover, at this time, in my dyspeptic person, I was feeling the benefit of homœopathic treatment. But all this did not satisfy me, I resolved to see what hospitals could show me, and so repaired to town; and although they had no acute cases there, yet what I saw was sufficient to convince me, with what I had already seen, that the new therapeutics were better than the old. My mind was made up. I was advised to go abroad and study homœopathy at Paris and Vienna. Before many days had passed away, the resignation of my medical appointment was in the hands of our Hospital Board—my comfortable establishment was broken up—leave was taken of friends and patients—and I had fairly started for the Continent. Of what I saw in France and Germany during my some months' residence abroad, I must speak, if at all, in another place. Enough that the object I had in view was gained, and felt to be worth any sacrifice that had been made. Yet this was more than a pecuniary one. I had counted the costs of my change of faith, and knew them to consist in something else than money. I returned to England to share in the abuse so lavishly poured on the homœopathic body—to be classed amongst a set of impostors, because I could not impose upon myself—to be banned and outlawed by "honourable men," amongst whom *I* might have been received as one, if only I had paid the price—dishonesty! Yes! if I had only been dishonest, if I had only stifled my convictions, if I had made myself a living lie, I might have qualified myself for the society of *gentlemen*, who could meet me *then* in consultation, "without derogating from their own high honour, or the honour of the profession" to which they belonged. Thank God, I was ineligible. This honour was declined. It was better to lie under the charge of imposition, for "why should honour outlive honesty? Let it go all." Let me be a charlatan—quack—anything except a candidate for such a fellowship as this. Let them bring any charge against me but that of being worthy of admission to their meetings. It was something not to deserve *this*. Imposture was a charge much easier to bear. The grounds on which it rested were so new and strange. Instead of riding with Falsehood in a carriage, to be trying to walk hand in hand with Truth—to keep one's conscience, though no nicer than it should be, not exactly in the same pocket with one's fees! to pay and willingly, with loss of income, for gain of greater therapeutic skill! Were not these strange grounds for it to rest on? But when were ever grounds too strange to build an accusation on, when the object was not to judge, but to condemn? How has it ever been in this respect? How in the days of Him whose whole life was doing good? For, not to seem guilty of profane comparison, was not *He*—the great healer of disease—who prescribed not after the manner of the scribes—denounced as nothing better than an Arch-Impostor? Were not the cures which he effected—not being wrought *secundem artem*, or according to the formulas of Pharisaic medicine—ascribed to the Author of Evil, not of Good? When this is remembered, it is perhaps a little difficult not to feel almost unduly elevated by the obloquy one meets with for "proving all things, and holding fast to that which is good"—for acting up to what one believes is morally as well as medically right. And it is well to feel this elevation, within bounds. Those who are standing on the vantage-ground of truth, can afford to be magnanimously forbearing to their opponents. It is not by bandying taunts and accusations—it is not by exchanging terms of scurrility—it is not by crimination and recrimination—that the cause of homœopathy is to be fought and won. Let its disciples recognise their dignified position. We have all the advantage of truth upon our side. Let our assailants have that which vituperation gives. Who would put himself on a level with the *Lancet*? It may call those who practise homœopathy impostors, but who feels libelled by its coarse and clumsy calumny, or who would lower himself by calling *it* names? Let our language be such as may show our opponents we know what is due to ourselves as well as them. If we must reply to the resolutions of Societies that refuse to meet us in consultation, let it be in the calm and self-respectful tone of the counter-resolutions of the Homœopathic Association. A quiet, dignified, gentlemanlike bearing will only show our consciousness of strength: for where there is consciousness of strength, there is repose. For me, I confess that as far as I can see, there is much less to fear from others than ourselves. I laugh at the idea of halls and colleges coercing opinion in the present day—coercing opinion on matters, too, of medicine—of medicine, that never yet has had a fixed belief—that is, *or ought to be*, a thing of progress—and that only in the present year of grace has framed its Athanasian creed, to place beyond the pale of mercy those who might think of saving life in ways its conventional orthodoxy lays not down! I laugh at the idea of halls and colleges prescribing to their alumni *how* they are to prescribe—at the idea of their making a clinical Procrustes of the practice that will not adjust itself to theirs! All this is only too ridiculous. They may say to medical inquiry, Stop! to the onward course of science, Thou shalt go no farther! but the tide of truth still is rolling on and sweeping past the chairs of our Esculapian Canutes,* rising and rising even now above their feet, although it may haply never reach their heads. The earth turns round,—*e pur si muove*—although the anti-Galileos of the day—the

* If it be not libelling Canute so to call them, for centuries ago he *unsaid in solemn jest* what in the present day *they say in solemn earnest.*

Hosted by Google

Inquisition of à Senatus Medicus—will have it, it is standing still. The smallest part of a grain of *Hellebore will* cure, although not learned Professors of their folly. They may refuse examination to homœopathic students, as they have hitherto refused it to homœopathic practice, but *their own* examination is going on the while. They may make their diplomas a license for untruth, as well as for any other breach of the Commandments, but they will not make the world believe (the world that will very soon come to understand that taking such degrees is not "*taking honours*") that these will qualify for *practice* of Physic, whatever they may do for the *profession*. Let them make what arbitrary laws they please—there is one they cannot overrule, and that is public and intelligent opinion. This it is that legislates even to our legislators, and that now-a-days rules and regulates their councils. And this will teach teachers, too, their duty to the taught—that it is not to stunt and dwarf their mental growth by forbidding them any other kind of aliment than beliefs prepared and potted for their use—to arrest the development of their intellectual manhood by crushing it, as the Chinese lady does her foot, in the vice made for it by traditional opinion—to make them figure like stuffed birds in a museum—or, instead of living, breathing men, mere fossil specimens of this or that formation. All this it will correct in the course of time. It will make them impose, not Confessions of Faith, but conditions necessary to a faith worth having; and pronouncing in favour of homœopathy itself, it will make that a matter soon of *interest* to Professors, that is not yet a matter of inquiry. To that public and intelligent opinion we may leave them. They have so discovered their lamentable weakness by the injury they would do us, but have done themselves, that though they have justified, they have hardly rendered necessary more than a passive attitude on our part. "Our strength is to sit still;" aye! and study Hahnemann. Let us only be true to ourselves and our high calling, and we may leave halls and colleges to do their worst. "In quiet and confidence shall be your strength." For me, I have such faith in the omnipotence of Truth, and in the self-correction of the evils we most fear, that I can only say to my Alma Mater what poor Lear says to his unnatural daughter:—

"Mend when thou canst; be better at thy leisure:
I can be patient."

"PROFESSOR SIMPSON AND HOMŒOPATHY.

"To the Editor of the Dundee Courier.

"SIR,—A short time ago there appeared in your columns a report of a speech delivered by Professor Simpson at a meeting of the Medico-Chirurgical Society of Edinburgh, condemnatory of the practice of homœopathy, upon which, with your permission, I would take this opportunity of making a few remarks. Although the medical press is certainly the most fitting place to discuss this subject, yet, when the newspaper press generally opens its pages to one view of a subject, it seems but reasonable that the other side should be heard likewise. The public never can be really benefited by imposition or error, and it is only by free and full discussion that the one can be detected, and the other exposed.

"I distinctly affirm, and shall in the sequel prove, that the Professor's speech is, in the whole scope of its reasoning, unphilosophical, abounding in erroneous statements, and, therefore, damaging to the sacred cause of truth and humanity.

"After making a comparison between Mormonism and Homœopathy, which on this occasion I shall pass over, the Professor raises his 'standard of common sense,' by which to judge of Hahnemann and his followers. He says, 'if we judge the *opinions* of Hahnemann and his followers by this standard, we shall find them sadly, very sadly awanting.' As one of Hahnemann's followers, I fear no amount of investigation or criticism in regard to my opinions, *much less* in regard to the *system of medicine* which I practise, or the *law of cure* which I advocate. But strange to say, the Professor has not, in the whole course of his speech, been able to bring forward one single opinion peculiar to Hahnemann or his followers. This I state emphatically. His vaunted judgment of our opinions then turns out, on examination, to be a piece of mere braggadocio.

"Being determined, however, to damage in some way a cause which he could not controvert, he has been compelled to have recourse to the most shallow and mean manœuvring, in the highest degree discreditable to any one having the slightest pretensions to science or public teaching. The shift fallen upon consists in a borrowed quotation of an old threadbare calculation about billionths and decillionths, which has not the slighest bearing on the point at issue. *Homœopathy is a system of medicine which teaches that, to cure a disease, we must administer a medicine which is known to be capable of producing on the healthy body symptoms which have a strong resemblance to those of the disease.* This, and this alone, is the subject he ought to have taken up and discussed. I appeal to the 'common sense' of the public, if he has attempted to do so. But further, while among these billionths, the Professor says, 'medical jurists and lawyers know of no poison, however strong and powerful, the billionth or decillionth of which would in the least degree affect a man or kill a fly.' Now allow me to put the question,—did Hahnemann, or do any of his followers, hold any opinion opposed to this? If so, where is the evidence? There is none; for we all admit the fact that such minute doses of drugs have no perceptible effect on the healthy body. And yet the Professor's sentence is stated in such a way as to insinuate that we actually deny it. In regard to small doses, what we maintain is this—that doses of medicine, much smaller than those which are generally given by the old-school practitioners, are effectual in curing disease, when given in accordance with the homœopathic law. At what degree of attenuation a medicinal substance ceases to exert

Hosted by Google

any curative power over disease, when properly administered, I don't pretend to say; neither can the Professor. But this I declare, that I have hundreds of times effected cures by the use of medicine, in doses infinitely smaller than those recommended by the old school. Amongst those patients cured, were not a few who had been for years under ordinary treatment, swallowing large and disgusting doses of potent drugs, besides submitting to some of the other appliances of the heroic system, such as issues, blisterings, burnings, bleedings, etc., without deriving any lasting benefit. From these stubborn facts in my own experience, together with a vast number of similar authenticated facts in the experience of others, I am compelled, in spite of all preconceived notions and theoretical reasonings, to believe in the truth of homœopathy, and the efficacy of small doses.

"To every one commencing the study of homœopathy, the efficacy of small doses is an improbable, if not a doubtful-like fact. This was the case with myself. And it is not to be wondered at, when we look back on the notions which, as students, we imbibed from the teachers of the old school. I can therefore fully sympathise with those medical men who at first sight doubt or even feel inclined to laugh at the efficacy of these doses. But as men of science, and holding positions of the highest responsibility, I cannot sympathise with them, when they allow any preconceived notions, or self-interest, to prevent their studying homœopathy, with the evidences in its favour, with zeal and earnestness, and from putting it to the test of experience with all fairness and impartiality. Who of our opponents has done this? Has the Professor so studied, and thus tested homœopathy? Let him speak for himself. He says—'Some eight or ten years ago, an old schoolmate of his, having begun business as a homœopathic druggist in Liverpool, kindly sent him a present of a small box of homœopathic medicines; and a very beautiful painted box it was. During the time it was in his possession, he put it *only to one use*, viz., he gave it as an *occasional plaything* to his eldest son, who was then a child.' Such is the confession of this standard-bearer of 'common sense,' occupying the position of a man of science, and holding office as a Professor in our University! This comprises *his* study of homœopathy, and putting it to the test of experience. This is his ground of authority in passing judgment against us. Conduct like this, in my opinion, deserves the most severe castigation; but I refrain. The experience of the little child may, on some future day, put to shame that of the father.

"As Professor Henderson was the individual referred to as having used the mixed globules contained in the box, it will not be out of place here to allow the Professor to say a word for himself:—

"'*My* first experiments on homœopathy were made by medicines from different sources, in addition to Dr. Simpson's box.

"'The respected secretary of the Society favoured me with a box, in connection with which there was, as became his character, no trick, but all that was fair and honest. Dr. Russell supplied me with many other medicines. Headland of London did so too. The chemist in this city, at a later period, did the same. And some I prepared with my own hands. The results were published, and drew from Dr. Forbes of London the admission, that had the cases been treated according to the rules of the ordinary school, he would have regarded the results as "very satisfactory." Among them were "some wonderful effects and cures," which I have always regarded as evidences of the power of *homœopathic* remedies; but that they were due to "Dr. Simpson's own former homœopathic box," in which the trick was, I do not believe that I could have ever averred, because I was not in the habit of noting, in each case, from what source the medicines I employed were taken, for I suspected no trick. Since Dr. Simpson made his trick public, I have suspected, reasonably enough, that some of the failures which I could not formerly account for but on the ground of my own want of skill, must have been due to the dishonest box.'

"Professor Simpson next says in his speech that 'they (homœopathists) tell us that the mere division of their drugs invests them with tremendous powers.' Now this is another example of his erroneous statements, for neither Hahnemann nor his followers ever believed or ever asserted such to be the case. What we affirm and prove in regard to the preparation of our medicines is this—that the latent medicinal properties of drugs become greatly developed when subjected to a careful and systematic process of trituration; and further, that some drugs, which in their crude state have no medicinal effect at all, become powerful curative agents after undergoing this process. Every one possessing any knowledge of the subject at all knows this. The Professor himself surely cannot have altogether forgotten a number of familiar proofs of the same fact in allopathic pharmacy. Is it not an established fact, that a man may take upwards of two thousand grains of pure mercury without experiencing any medicinal effect from it, while a single grain of the same metal, after being thoroughly triturated with any inert substance, is capable of producing a very marked medicinal effect? It matters not what kind of explanation he may give of this. The fact remains, that a substance, which in its crude, natural condition can exercise no medicinal action on the system, becomes, by a carefully-conducted process of trituration, a most powerful curative agent. This cannot be controverted.

"The Professor's speech contains a fair specimen of the best kind of argument brought against homœopathy by its opponents. The intelligent public have already, to some extent, been able to appreciate its true value, and have no doubt set it down at its real worth. That it is at the bar of 'common sense' valued at a very high rate by the non-professional public, I do not believe. That many of his own party think this a prodigy of talent—a very masterpiece of argument—of which the Professor has dexterously delivered himself, I do not doubt. That not a few of the higher stamp in the same

Hosted by Google

party despise it *in toto* I know. Had it contained one single argument against homœopathy, that might have redeemed its character; but it does not. Such a signal failure to make out a single point against us, is a strong evidence of the hopeless position of our opponents, and bears strong testimony to the fact that ours is impregnable. Had I nothing better to offer in behalf of the cause which I have espoused, I should feel ashamed, and be compelled to give it up.

"Should the Professor ever again think of appearing before the public as an opponent of homœopathy, surely it is not too much to require of him, first to condescend to learn something about the subject, so as to be able to treat it in a reasonable and philosophic manner. In the present speech he has (humbling enough to himself) succeeded in raising a laugh against us; but it has been short-lived: and the time is not far distant when his own weapons will be turned against himself. Homœopathy is on the increase and must eventually triumph. The diseases of man have found in it a true method of relief; and man's benevolent Benefactor will watch over it, and preserve it for the good of his suffering creatures.

"I am, your obedient servant,
"S. C."

TOWN COUNCIL OF EDINBURGH AND HOMŒOPATHY.

(*From the Scottish Press.*)

THE petition of graduates of the University and others, complaining of an irregularity introduced by the Medical Faculty in granting degrees of medicine, which, at a previous meeting of Council, had been remitted to the College Committee, was brought up by the reading of that committee's report. They (committee), without offering any opinion on the subject involved in the memorial, directed the same to be transmitted to the Principal of the University for the information of the Senatus Academicus.

Councillor Ridpath did not think it would be proper to pass over this subject in the way which he observed it was now proposed to do. The Council, as patrons of the University, ought to take up the subject in earnest.

Bailie Fyfe could not agree with Mr. Ridpath, and expressed a hope that the matter would never again come before them. The committee thought the course which they had taken was the most judicious one in the whole circumstances; and it was, be believed, substantially in accordance with the wishes of the parties who got up the memorial. They fully hoped that no more complaints of this nature would come before the Council, and, therefore, they considered the best plan was simply to send the petition to the Senatus for their information.

Mr. Ridpath was satisfied with this explanation.

The Lord Provost said he had talked to some of the professors on the subject, and he believed it would not have been possible to have got even a small number to reject any student on account of his homœopathic tendencies. He believed that that which caused the complaint had been done somewhat inadvertently, and he was satisfied that every student, whatever his notions regarding homœopathy might be, would henceforth find no barrier to his obtaining degrees.

[Our readers will perceive that the Town Council of Edinburgh has effectually given a slap in the face, and a pretty sharp one too, to the anti-homœopathic triumvirate of Edinburgh. Messrs. Syme, Simpson, and Christison have something new to ruminate on, and we wish them good digestion.—ED.]

THE
HOMŒOPATHIC TIMES.

SATURDAY, FEBRUARY 7TH, 1852.

"ART is long, and life short"—is the first axiom of Hippocrates. All who have read human life truly, its beginning, middle, and end, its aims and desires so great, its accomplishments so few and comparatively valueless, know this life is too short to be long about its forms and ceremonies, much too short to waste it in fruitless aims and vain quarrels.

If all who are right-minded acknowledge the truth of this statement, those, above all, are bound to recognise and adopt it who are engaged in the working out a practical Reform, which is for the real benefit of mankind.

La Fleur, the servant of Yorick, was riding on a post-horse, which shied at an ass, and would not pass. La Fleur was thrown, and left in the road, jack-boots and all.

"What's the matter, La Fleur," said his master to him from his chaise, "with this post-horse of thine?" "Monsieur," said the poor man, "c'est un cheval le plus opiniâtre du monde." "Nay, if he is a conceited beast, he must go his own way," said the philosophic Yorick.

Some men are as conceited as post-horses, and the best plan is to let them have their own way.

But we grow wise by experience, and having tried them and found out of what stuff they are, we trust them no more.

This is a sort of parable:—those who

Hosted by Google

know what we mean will require no explanation; those who know it not, will read our riddle in full time.

We wish to see an uniform action of all the good men and true, medical and non-medical, who profess to have received our doctrine, for the promotion of our beneficent Reform. Had it not been for its wonderful vitality, the wretched dissensions and paltry self-seekings which have so lamentably distinguished some would have choked it. But homœopathy will out-live them; and it is to be hoped that our next generation will be wiser than the present.

It is our earnest aim to be the exponents of the homœopathic public—to express their wishes and requirements, their hopes and expectations. We profess to belong to no party, and to be under no partisan influence.

"Art is long," and those who have had the most experience of the medical art are ready to acknowledge how little they know in comparison of the boundless field of investigation before them: "life is short"—when men seem to be at the beginning of something like knowledge, they are removed to another sphere, and their place, *here*, knows them no longer.

It may be—who can tell?—that HIPPOCRATES and HAHNEMANN have compared notes, and that with more enlightened vision and powers, far greater than they knew in their mortal state, the Coän and the Saxon have talked of their several works for humanity.

We are oppressed, at times, with the responsibility of the task that is laid on us. We cannot say with the poet—

"The labour that delights us, physicks pain"—

for we delight not in this work. It is a labour of love in one sense, for we get nothing by it, and have no comfort in it excepting the reflection that we have tried to do our duty.

We sigh for sympathy, and we receive it not; we ask for co-operation, and it is not vouchsafed to us; we demand what is our due, and it is not conceded to us: and we subscribe to the saying of the WISE MAN, "All is vanity and vexation of spirit"—and yet not so altogether; for the seed we scatter will grow, and the harvest will at some time or other be reaped.

Review.

The Medical Circular, and General Medical Advertiser.

SUCH a journal as this was a *desideratum*. It will be an epitome of the other medical journals, and will give in brief space an abstract of their contents—the cream without the buttermilk—the matter without the verbiage—the kernel without the husks. This is the professed aim of the new journalist; we wish him success, and we augur from the passage we shall quote that we homœopaths are to have fairer play at his hands than we have heretofore received.

It is to be published once a fortnight, and the price is threepence. This *multum in parvo*,—the best kind of Medical Directory—will be as useful to us medical heretics, as the unbelievers call us, as to the most orthodox as they call themselves.

That a new medical journal, of such abundant promise, should devote such space to the homœopaths, is significant of the fact that homœopathy is not faint, nor sick, nor weary, nor dead, notwithstanding its doom has been so often pronounced.

"THE 'MEDICAL DIRECTORY' AND THE HOMŒOPATHS.

"Desirous of acting in strict accordance with the wishes of the profession with respect to the propriety of inserting the names of homœopathic practitioners in the 'Medical Directory,' the Editors of that work issued a circular to every member of the profession, with a request that each gentleman would return his opinion upon the subject. The replies have been collated, and we now subjoin a portion of them, in order that our readers may see the variety of opinions that have been expressed.

"It will be observed that the counsels and suggestions are of the most dissimilar character; that some gentlemen have protested against the insertion of the names of homœopaths upon any conditions, and have even threatened to withdraw their support if their views should not be adopted. Others have recommended their admission, but for different reasons. Some of the latter have required that homœopaths should be included in a separate list; others that they should be comprised in the ordinary list, but marked by some distinctive title; while again there are some who have strenuously contended against the possible unfairness of their exclusion, and, like

Hosted by Google

those gentlemen entertaining extreme opinions on the other side, have menaced the Editors with a cessation of their subscription in the event of such injustice being perpetrated. Whilst in the discharge of a difficult and responsible duty it was incumbent on the Editors to reject from their consideration all threats of this nature, it behoved them at the same time to elicit, if it were possible, from amid the mass of discrepancy, some principle upon which the arrangement of the Directory might be altered with advantage. On a close examination of the returns the disagreement was so great and so various, that it presented an insurmountable difficulty to the realization of the Editors' wishes. They resolved, therefore, to abide by their established rule of inserting in the Directory the name of EVERY *duly-qualified medical practitioner* irrespective of his peculiar opinions, or of the line of practice he may pursue. Had they acted differently on this occasion, they would most undoubtedly have injured the character of the work as the only authentic record of ALL the legally qualified medical practitioners in the kingdom.

"This, it is expected, will be the decision of every man who calmly reflects upon the nature of the work, which is merely a register framed upon the authority of official and legal documents, and free from all subjects of a controversial character. An opposite course to that adopted would injure the Directory as a book of reference, and pervert it to become the organ of partisan or dominant opinions. The end of such an imprudent proceeding it would not be very difficult to foresee.

"Had the Editors of the Directory, moreover, declined to insert the name of any duly qualified homœopath among the list of legal practitioners, the excluded individual might have been able to prove that, by such omission, his professional character had been exposed to contempt, and his reputation injured; and in such case the publisher of the Directory would have been liable to a prosecution for damages by an action at law—a proceeding by no means pleasant to contemplate.

"For these reasons, then, the Editors of the 'Medical Directory' deemed it most judicious to insert in that work the names of homœopathic practitioners in their due course.

"OPINIONS OF THE PROFESSION WITH RESPECT TO THE PUBLICATION OF THE NAMES OF HOMŒOPATHS IN THE 'MEDICAL DIRECTORY.'

"D., J. L. W.—Brighton. Yes; that they may be known and shunned as renegades by their medical brethren: to shame them is impossible.

"C. J.—Putney. No; I decidedly think that there ought not to be a list of homœopathic, hydropathic, or other kind of quacks in a Medical Directory.

"O., E. L.—Brighton. No; however useful such a list might be, there cannot be a doubt of the impropriety of putting it here. I think that the names should be left out altogether; that opinion on the subject would be quite unanimous.

"L., G.—Brighton. No; I think homœopathic practitioners ought not to be classed among respectable medical men.

"G., S. J.—Russell-square. No; decidedly not, as the retention of such a list will tend to lower the respectability of the Directory in the estimation of all honourable practitioners.

"B., G.—Cavendish-square. No; I think they should be passed over in the silent contempt they deserve.

"M., J.—Lloyd-square. Yes; with a long letter in its favour.

"F., H. W.—Manchester-square. Yes; if duly qualified.

"T., J.—Kent-road. Yes; let them be known.

"A., H.—Hackney. Yes; if their titles are verified and given correctly.

"G., S. H.—Yes; if specified as such.

"T., W.—Harrow road. No list of homœopathic '*quacks and humbugs*.' I will not have my copy if you do, mind that!!!

"L., H.—Keppel-street. No.

"F., A.—May Fair. Yes; to distinguish.

"C., W. J.—Kensal Town. Yes; those that are *medically* qualified, in order that we may know the black sheep of our flock.

"D., J.—Pershore. No; unless in a supplemental list.

W. J.—Liverpool. Omit my name at your peril. I beg to say that I am a qualified practitioner.

"C., C.—Dorchester. No; from its necessary incompleteness.

"B., H.—Liverpool. No; if published at all, their names should be in a separate list; but I would prefer their being omitted.

"M., S.—Brenchley. No; simply omit them. Silent contempt and rope enough are the remedies.

"D., E.—South Cave. No; unless published to warn us of all such empirics.

"R., H. H.—Brixton. No; erase them, whenever discovered, from the lists of the medical practitioners.

"G., F.—Huddersfield. Yes; but think they ought to be published apart from the others.

"F., E. E.—Teignmouth. Yes; these men should be known to the whole professional world; in a separate list, if possible.

"C., S. S.—Bridport. Yes; and state them to be such, that they may be avoided."

Correspondence.

HAHNEMANN HOSPITAL.

To the Editor of the Homœopathic Times.

SIR,—I see with increasing regret the continued correspondence arising from Mr. Smith's letter, published on the 10th of January. A house divided against itself cannot stand. It is especially to be lamented that these feelings of dissension should be prematurely brought before

Hosted by Google

the homœopathic public, and that, too, in a tone not calculated to preserve that brotherly feeling which ought to exist among members united to promote the common Cause which each professes to be dear to him.

Still more, therefore, do I deplore the fact that, in your number of this day, a third member of the Board of Management has entered the lists, not, as I am grieved to confess, in a spirit* likely to heal the wounds already opened; and if I, a fourth member of the Board, attempt to break a lance with him, it shall not be in a combat *à l'outrance*, but with the endeavour to keep the bond of peace. Indeed, as I wrote last week simply to state my impression that Mr. Leaf's circular was a correct transcript of the views of the House Committee, with whom it had originated, so now my object is simply to entreat the subscribers to whom Mr. Gill addresses his remarks to suspend their judgment.

Mr. Gill expresses his intention "to convey such information to the subscribers, as will enable them to arrive at *correct conclusions*" upon the proceedings of the Board of Management, relative to a part of the third object of the Hahnemann Hospital, viz., clinical instruction. He then proceeds to give an account which, in my judgment, is so far otherwise than correct, that I thus entreat the subscribers to suspend their judgment, because they cannot, from such premises, arrive at correct conclusions. I deprecate partial statements of a Board's proceedings and their being publicly criticised by any one of its members. I think it irregular, contrary to etiquette, and at all events likely to create bad feeling.

My intention is to move, at the next Board meeting on Thursday, for the appointment of a sub-committee to prepare a digest of the minutes of committees, to be submitted for the approval of a subsequent Board, for publication and distribution among the subscribers.

It is dangerous, with regard to brevity, to begin any statement, and yet when I ask for an arrest of judgment, I am bound to give the grounds of that desire.

First. Mr. Gill, in his statement, loses sight (I am sure inadvertently) of the fact that much and varied deliberation on this subject had taken place long before the 18th of July,† indeed since February. The 18th of July was only an epoch, marking indeed most strongly the anxiety of the Board of Management to conform to that very bye-law which is quoted by Mr. Gill. The fifteen letters from members of the Medical Council were printed for private circulation among the twenty members of the Board, etc., purposely that their opinions might be well considered, and I, for one, entirely dissent from the conclusion at which Mr. Gill arrives in regard to those opinions, knowing, as I do, the feelings of the committee up to the time when I discontinued my attendance. I firmly believe that they, and every individual member among them, had the most straightforward intention to act upon a broad basis for the good of the Hospital, without the slightest "personal interest" or "hidden mystery."

Secondly. As to discussions consequent upon the printing of the medical opinions until the ultimate decision of the Board, on the 3rd of January, I have carefully perused all the documents and minutes, and had I been present, I should have adopted the same view at which the Board arrived.

Thirdly. The subscribers ought to know, when they are called upon to form correct conclusions, that at a Board meeting to reconsider the whole proceedings, specially summoned by Mr. Gill, and three others who dissented at the Board of the 3rd of January, a very large majority of the members were in attendance, viz, seventeen out of twenty of the Board, besides the President and Treasurer; and that, after a free discussion of the subject, the obnoxious resolutions were confirmed by a majority of thirteen to four (one member having retired early). Surely the subscribers appealed to ought not, even for a week, to suppose that so many of us would have been dishonest enough or foolish enough to "ignore the united opinion of fourteen" medical men, whose advice we had sought, and to act on the opinion of the *one* only.

Lastly. I will say that all this confusion has arisen from the difficulty of obtaining full meetings, whether of the Medical Council or the Board. But I must think that it is not expedient or just that a minority, if they cannot by regular attendance or argument influence the judgment of their friends, should call upon the public body to condemn that judgment, which courtesy should presume to be honestly adopted, if not wisely. I write this paragraph, because at the various Medical Councils, when ten to twelve of the sixteen London members have been present, the opinion then expressed has appeared to the Board to be that advice which they were bound to follow; while the contrary advice has emanated from those councils which were thinly attended by from four to seven members; but I am treading upon ground which I intended to avoid—I wished to mention only such facts as would justify my request for judgment to be deferred, and not to anticipate the course which I have suggested, or to introduce any topic likely to cause fresh discussion.

tending. I can therefore view the proceedings without any personal feeling, as though *my* acts were called in question.

* I mean that such expressions as the following, have an inevitable tendency to wound and to offend: "I say *avowedly*, for it may appear hereafter that the zeal of some was actuated by motives of personal interest" (page 398). "The fact is so; but to comprehend the principle (or want of it?) upon which they acted, would require a deeper initiation into the hidden mysteries of the Board of Management than I am at present at liberty to afford" (p. 399). "I will not hide from the subscribers my convictions that the sooner their Executive Council is purged from the gross taint of personal influence, which now seems to pervade it, the better will it be for the prosperity of the noble Institution which they patronise and support..... An invidious pre-eminence given to one or two members of the profession.... A strong, because *independent and disinterested* opposition at their own Board" (p. 400).

† Until this period I was among the most regular attendants at committees and Board meetings. Subsequently, during the time that the obnoxious proceedings took place (October to January), I had, from pressing engagements, entirely given up attending.

Hosted by Google

I do not think there is much "division in opinion on many material questions."

I still think the question of "mere title" might be and ought to be arranged. Nor would there be difficulty in this course, if a moderate deference to the opinion of others shall actuate all the parties concerned. I am quite certain that there is no such desire among any of the Board as to "select any one more than another upon whom to confer the title of clinical lecturer," or to elevate any one as a head. On the contrary, I *know* that the Board of Management have taken especial care to avoid even the appearance of it on one remarkable occasion, when, notwithstanding their efforts, an accidental prominence was given.

I conclude a much longer letter than I intended to write, by expressing my sincere hope, that even yet our Hospital will not so stultify its separation from the original, as to show itself incapable of being held together by the following out of that liberal profession, and free and independent thought which gave birth to it.

I remain, Sir, your obedient servant,

Epsom, Jan. 31, 1852. SAMUEL HANSON.

To the Editor of the Homœopathic Times.

SIR,—In your editorial remark on Mr. Smith's letter in this day's journal, you wish to know "at what meeting the Board of Management suggested the publication of Mr. Leaf's circular." I would simply bear testimony to the fact that the subject was discussed at one of our meetings (I believe, in the House Committee), and the expediency of such a letter determined. I do not remember that a minute was made or that the actual letter was drawn up; but when I saw it introduced at the end of Mr. Smith's letter on the 10th of January, I made the remark, "This is in exact conformity with the suggestions of our Committee to Mr. Warne, and perfectly conveys my impression of their feeling on the occasion."

I would briefly add, as a subscriber to your journal, that I very much deplore what seems to me a very unprofitable correspondence, already occupying some dozen columns, to the exclusion of subjects much more interesting to your general readers. I remain, Sir,

Your obedient servant,

Epsom, Jan. 24, 1852. SAMUEL HANSON.

[We fully appreciate the motives of this excellent gentleman, but he has mistaken the point. The inquiry was not whether the Board of Management had authorized the two gentlemen named to issue *a* circular, but whether the *especial* circular of one of them was so authorized. With all submission to his better judgment, we think the homœopathic public is entitled to know whatever has any important reference to a homœopathic hospital, for whose maintenance they pay, and it would be discourteous in us to refuse insertion to letters from members of the Board of Management. Our correspondent will do us the justice to acknowledge that we have opened our columns for free discussion on whatever concerns the homœopathic public.—ED.]

To the Editor of the Homœopathic Times.

SIR,—Few of your readers can have perused with attention the correspondence between Mr. Warne and myself, without being reminded (especially by his letter published in this day's *Homœopathic Times*) of the well-known Westminster Hall story, which runs thus: On opening his brief, a barrister found these words—"*no case—abuse the plaintiff;*" and tradition declares that he followed his instructions. In these days of general psychological knowledge, exasperation venting itself in abuse is so perfectly understood to be the offspring of mortification resulting from exposure or defeat, that I may be well content to leave unnoticed the remarks of this character, which abound in Mr. Warne's letter, to which, in other particulars, I am about to reply.

In his first paragraph he declines my invitation (backed by yourself) to afford a *complete* history of the London Homœopathic Medical Institution. Mr. Warne having gratuitously introduced this subject, and given but an *incomplete* sketch of this Institution, I thought I had a right to ask him to fill up the outline, and a reason less calculated to give offence can scarcely be imagined than that I assigned, viz., that "a complete history," embodying certain particulars I mentioned, "could not fail to be of great service to our Board at the present moment."

The five following paragraphs are occupied with a detailed account of the circumstances that led to Mr. Leaf's circular, which gave rise to the correspondence between Mr. Warne and myself. *Post tenebras lux*—such as it is. It would appear that on 20th February last, the House Committee passed a resolution to the following effect: "That a poundage be allowed to the collector of the late London Homœopathic Hospital, and that *a paper* should be drawn up, *signed by Mr. Leaf and Mr. Warne, as* HIS AUTHORITY FOR COLLECTING." It further appears, that this resolution was approved by the Board, on 6th March following.

Now, in the first place, instead of "*a paper*," signed by Mr. Warne, as Honorary Secretary, and by Mr. Leaf, as Treasurer, merely stating for the information of the parties on whom the collector might wait, that he (the collector) was duly authorized to receive their subscriptions—we have *a letter*, admitting (as I have shown in my first letter) of a very different interpretation, signed by Mr. Leaf *only*. Was this carrying out the instructions of the Board? Could such a letter as *that* have been contemplated by us, when we sanctioned the resolution of the House Committee? Does it, or does it not, warrant the assertion in my last letter,—that the Honourable Augustus Moreton, Mr. Gill, and Mr. Phelps were as ignorant as myself of any such suggestion having been made? Does it, or does it not, throw light on the fact, also recorded in my last letter—"that as for myself and two of the members of the Board already cited, we did not see the letter until this year, and the other gentleman saw it for the first time in December."

But, Sir, this is not all, the circular is dated 1st January, 1851—the House Committee did not

Hosted by Google

suggest even "*that a paper should be drawn up*" till the 20th February following (according to Mr. Warne's own showing), and the Board of Management did not sanction that suggestion till the 6th of March. And yet Mr. Warne, in his first letter (*Homœopathic Times*, January 17th, 1852), upbraids me thus: "*How or why it should, after twelve months'* DISTRIBUTION (*for it is dated 1st January*, 1851), give rise *in January*, 1852, *to feelings of dissatisfaction*," etc. We have Mr. Warne then stating, in the *Homœopathic Times* of 17th instant, *that Mr. Leaf's letter was suggested by the Board of Management;* in this day's *Homœopathic Times*, that this suggestion (if such it may be called) was made on 6th March, 1852; and in the *Homœopathic Times* of 17th instant that the letter of Mr. Leaf's was printed and distributed in January, 1851!!

In your journal of this day we have, however, another version, viz.: "That the circular was predated to the period at which the subscriptions to the London Homœopathic Institution were considered due, viz., January, 1851." Be it so. Then is Mr. Warne's assertion (contained in the *Homœopathic Times* of 17th instant) incorrect, viz. that "it was *distributed* in January, 1851;" since it was not even *printed* till the March following. Well may Mr. Warne declare, at the end of his letter, that "no representations of Mr. Smith shall hereafter induce him to reply to them in your journal!"

To continue. In his seventh paragraph, Mr. Warne proceeds to explain, *more suo*, the extraordinary circumstance referred to in the third, fourth, and ninth paragraphs of my last letter. I there state that it follows, from the preceding propositions, that there must be two pamphlets, both having the same title—"Homœopathy Explained, and Objections Answered"—one by Dr. Luther, the other by Mr. Leaf; *or*, that Mr. Warne has ascribed to Mr. Leaf the authorship of a pamphlet which was the production of Dr. Luther.

Now, it is worthy of remark, that Mr. Warne does not either deny Dr. Luther's assertion that *he* is the author of that pamphlet, or attempt to deal with my reasoning on this topic. What, then, does he say? "I have merely to remark that the only two editions of the pamphlet which I have seen have each an introduction bearing the signature of 'A Non-medical Homœopath' as the author." Hence he concluded—so we are left to infer—that Mr. Leaf *must be* the author.

This, it will be admitted, is strange logic. Are there no other lay-homœopaths in the world besides Mr. Leaf? None more likely to be the author of a literary production than Mr. Leaf? It has been said—and the saying cannot be unknown to Mr. Warne—"one fact is worth a thousand arguments;" why, then, did not Mr. Warne make himself master of the *fact—aye or no, is Mr. Leaf the author of that pamphlet?* Had the answer been in the negative, of course the conclusion is obvious. Had it been in the affirmative, it would have been for Dr. Luther to explain how he came to declare himself to be the author.

Mr. Warne, with no small amount of adroitness, manages to introduce into this paragraph, on which I am commenting, two insinuations calculated to enlist the sympathy of his readers—the one, that I introduced this topic of the authorship as a "gratuitous insult:" the other, that there is some doubt as to my "having seen the fact announced in Mr. Warne's handwriting."

As to the first insinuation,—since I am compelled to speak of myself,—I beg to declare my one great object to be *truth*. I believe in my conscience that the progress of homœopathy has been greatly retarded by the course that has been at various times adopted since its introduction into this country; and I am determined, so far as it shall be in my power, to endeavour to check such proceedings for the future, by exhibiting to public view whatever shall be calculated to injure the great Cause.

As to the second insinuation—I have only to assure your readers, that I have in my possession a document written by Mr. Warne in which, in a paragraph referring to various works which should be read by homœopathic inquirers, he adds—"Attention may also be specially directed to the 'Concise View of Homœopathy;' and also to a pamphlet well adapted to popular comprehensions, by our zealous, humane, and liberal treasurer, Mr. Leaf, entitled *Homœopathy Explained, and Objections Answered.*" —Not even a doubt, you will observe, insinuated as to the authorship; but that authorship confidently, and I might add—considering the relative positions of the two—authoritatively ascribed to Mr. Leaf.

Mr. Warne's eighth paragraph contains a very bold assertion, unsupported by a single fact or argument. If I have advanced one statement which is not correct—if I have put forward one argument which is fallacious in reference to Mr. Leaf, it was open to Mr. Warne to disprove the one and refute the other. His silence on this point is eloquent, and if truth be —as Mr. Warne would seem to imply—a libel, not on me, but on his *protégé*, be the blame!

In the ninth paragraph I am told that I may obtain the history of the London Homœopathic Medical Institution from the "individual who has already given me so many hints for my last letter." I presume he refers to the gentleman who so kindly favoured me with the letter I inserted, signed by Drs. Chepmell, Hamilton, and Laurie. The information I solicited at Mr. Warne's hands, it is not in the power of my friend to supply, who rejoices in never having had any connection with that Institution. I am therefore compelled to renew my appeal to Mr. Warne. I will only further remark on this paragraph, that Mr. Warne is wrong in saying "Mr. Smith misquotes me. I did not state '*first lesson.*'" The words "*first lesson*" are not put by me as a quotation at all; this any one who will turn to your journal, page 386, will at once perceive.

In the tenth paragraph, Mr. Warne, in return for a very civil remark, that I could not construe a few words of his last letter (which, by-the-bye, he does not even attempt to interpret), complains of the style of my first letter. As he does not, however, point out the defects, I am

Hosted by Google

unable to profit by his criticism. He then proceeds to insinuate that the composition of my second letter is not my own; and that "the critical, philosophical, and professional acquirements" of others "were put in requisition." No clearer proof could be furnished than this remark affords of Mr. Warne's utter inability to discriminate the peculiarities of style; and this consideration reconciles me, in some measure, to the absence of that criticism of my first letter that he *could have* supplied. He then goes on to say "that it would be interesting to ascertain *where*, and by how many individuals, Mr. Smith's letter of the 17th instant was concocted." Now I have not the slightest objection to gratify Mr. Warne's curiosity on this subject. The letter was written at my own chambers, no human soul being present. Commencing at half-past ten o'clock on Friday, the 16th instant, my labours terminated the following morning at one o'clock, a. m.—the letter was in type the same day. At the suggestion of a very amiable friend, I submitted to the following alteration being made. After the letter of Drs. Chepmell, Hamilton, and Laurie, I had this paragraph:—"In history we must not look for the certainty of mathematical reasoning. The causes to be investigated are moral causes—the task is therefore complex and difficult. The historian must possess a tenacious and ready memory, great powers of induction and generalization, and an unbiassed mind; and in the proportion in which these exist will the probability be that his conclusions are accurate. Without for a moment denying that all these qualifications are possessed by Mr. Warne, I may be permitted to suggest that the letter just quoted can scarcely have been present to his recollection, or he would scarcely have assigned as the cause of the dissolution of so great an institution as that of Hanover Square—'the want of that necessary management which the ill-health of Mrs. Leaf, and the multifarious occupations of Mr. Leaf, on the failure of other assistance, prevented being given to it.' For whether was it more probable that the dissolution of that Institution was due to the secession of three distinguished physicians, or to the indisposition of a lady, however much the circumstance was to be regretted, and to the increased occupations of a man of business, however necessary to the accumulation of money? Besides, Mr. Warne will see that his hypothesis involves a contradiction, inasmuch as it would prove that Mr. Leaf, in the pursuit of wealth, allowed homœopathy to perish, whereas the grand aim of Mr. Warne's letter is to prove that the principal object of Mr. Leaf's life has been the establishment of homœopathy."

At the suggestion of my amiable friend just referred to, I made the following alteration. "Its perusal may suggest to common-sense, reflective minds, whether the decline of the Hanover Square Medical Institution, and its failure as a Hospital, did not depend upon a more vital point than the painful fact of the ill-health of Mrs. Leaf, and the momentous consideration of the multifarious occupations of Mr. Leaf." These words, you will find, immediately precede the letter in question.

I cannot, however, conclude my notice of this part of his letter without remarking that it is somewhat ludicrous that Mr. Warne should turn round and accuse me of shining in borrowed plumes, when one of my charges against him is that he ascribed to Mr. Leaf *a letter* written by himself, and a pamphlet written by Dr. Luther. I must also observe, that in my letter which will be found in the *Homœopathic Times*, January 10, 1852, I state—speaking of Mr. Sandoz and Mr. Phelps—that without their "united aid, not one tithe of the secretary's duty could my friend have done." So that Mr. Warne's shaft as to my "working by deputy" misses its aim, exhibiting only the malignity of the archer: for even *he* will not venture, I am sure, to deny that *at least a tithe of the work was done by my friend.*" And I must say, that I think it somewhat reckless on the part of Mr. Warne, to sneer at "working by deputy," when our Hospital pays £100 per annum to *his deputy*; when Mr. Warne is open to the observations just made by me on the Leaf letter and the Luther pamphlet, when—but I forbear.

Of Mr. Warne's unfinished Latin grammar quotation, I have only to say, that I presume it is given as the result of his own experience; and as such exhibits, it must be admitted, a most unfortunate insight into his personal career.

Thus far I have had occasion to comment on and expose an immense mass of inconsistency and contradiction. There is one remark of Mr. Warne's, however, which stands forth in such strong contrast to the rest, that I shall not be doing justice to that gentleman if I do not reproduce it here. It is a remark, the truth of which no one, who has the pleasure of his acquaintance, can doubt; and one which, I may venture to predict, no Luther will ever arise to contradict—the remark is this: "that the composition and style of his letter are his own."

A more unwarranted assertion cannot well be conceived than that contained in the eleventh paragraph (and it is unsupported by even a tittle of evidence)—viz., "that my own *admissions* are sufficient to warrant his remark that my history needed correcting." Why, in the concluding sentence of my letter to which he refers, I call on you, "as the exponent of public opinion, to pronounce the verdict—whether my statements had been in any, *even the slightest material point* shaken or disposed of by Mr. Warne."

With the twelfth paragraph, which is addressed to yourself, Mr. Editor, I, of course, have nothing to do. And this, I am happy to say, brings me to Mr. Warne's peroration. He here tells us that "his time can be better occupied than with a correspondence so fruitless." *Fruitless* it has not been, most certainly; the other part of the quotation I have no right to dispute. But when he proceeds to warn you emphatically not to allow the correspondence to proceed—"your columns *ought to be*" (the italics are his own) "more agreeably filled," I may be permitted, I trust, to tender you also my advice—it is this:

Hosted by Google

The effect of this correspondence has been to elicit much truth—its effect has been to prevent certain claims passing current, which, if not detected at the present moment, it might have been difficult to distinguish, after a lapse of years, from the true; and I trust it will also prevent any more coin of this character being struck and uttered. The effect of this correspondence has been to show how "*a paper*," sanctioned by the Board to be signed by two officials, to authorize a collector to receive money, may be converted into *a letter*, containing very different matter, signed by *one* of the *two* individuals in a non-official capacity, thus giving altogether a different character to the document—the effect of this correspondence has been—but I must not take up your space by recapitulation.

My advice then to you, Sir, is—to continue the course you have heretofore followed—of throwing open your columns to free discussion. It is by this course that the truth will be educed, that error will be detected, and underhand proceedings be exposed. And when homœopathy shall no longer be encumbered with the aid of its pseudo-allies; *or*, when those adherents to the Cause shall have been taught to regard homœopathy, and not self-interest, as the object to be pursued (and it is not material which course they elect), then will that glorious system of which Hahnemann was the founder——— the introducer into this country, and the *Homœopathic Times* the active promoter and defender—then will that glorious system, untrammelled by those circumstances that now retard its progress, "ride on conquering and to conquer," till every allopath shall bow to its sway; for "magna est veritas et prævalebit."

I am, Sir, your obedient servant,

F. J. SMITH,

Member of the Board of Management of the Hahnemann Hospital.

74, Old Broad Street, Jan. 31, 1852.

P.S. You will observe that the name of the introducer of homœopathy into this country is left blank. Mr. Warne in his letter, published in your journal on January 17th, assigns this honour to Mr. Leaf. Referring to this point the following week, I said—I had always understood this honour to be due to others. Although Mr. Warne addresses himself to other topics contained in my letter, he studiously avoids any allusion to this. Will you be so good as to draw his attention to this point, as it is one of great importance. I shall wait a week or two before I proceed to give, from authentic documents, a narrative of this deeply-interesting subject, in the hope that Mr. Warne will inform your readers *when* Mr. Leaf embraced the doctrines of the illustrious Hahnemann—*where* his conversion took place, and what steps he adopted to forward homœopathy in England!

And allow me to suggest to Mr. Warne the vital importance of chronological accuracy. In your journal of 17th Jan. (p. 372), he states—"In 1836, Mr. Leaf established the first homœopathic dispensary in London;" whereas, by two circulars before me issued by the London Homœopathic Institution, under the sanction of Mr. Leaf, I find the following paragraph: "In the year 1838, the first dispensary founded in London, under the homœopathic system, was opened in Finsbury Circus, as the London Homœopathic Dispensary."

To the Editor of the Homœopathic Times.

SIR,—I trust in fairness you will insert in your next publication the following remarks. I regret exceedingly that your columns should be the channel for sowing discord amongst the friends of homœopathy and for calumniating the Board of Management, at least, the majority of that Board, by Mr. Gill, because that gentleman, who, with all his eloquence and ingenuity, was left in a minority, thinks proper (in my opinion, with very bad taste) to appeal to the subscribers who have the interest of the Hospital at heart. I only wish he had a tithe of the interest for the Hospital the majority have, whose actions the honourable gentleman so strongly condemns, then, with his ability, he would do the Cause good service. I can only say through the same channel to the subscribers, that the majority have no interest but to serve the Hospital and propagate homœopathy honestly, honourably, and independently, to the best of their ability; and I trust the aspersions of any one member will not lessen the confidence of the subscribers in their Board of Management. I remain, Sir,

Your obedient servant,

SAMUEL SUGDEN,

Member of the Board of Management of the Hahnemann Hospital.

Oak Lodge, Southgate, Feb. 2, 1852.

[We think it the duty of a public journalist to open his columns for the discussion of any subject of interest to his readers. The prosperity of any homœopathic hospital is of the greatest interest to the homœopathic public. The whole of this subject of the divisions among the Board of Management and the Medical Staff will, no doubt, be prominently brought forward at the approaching Annual Meeting of the subscribers to the Hahnemann Hospital, when it will be the duty of all interested to be at their post.—ED.]

To the Editor of the Homœopathic Times.

SIR,—In a passage of Mr. Gill's letter anent the Hahnemann Hospital, he says, the Medical Staff is now reduced *one-half*.

It has been said that two others of the remaining six actually signed their resignations, but did not send them in. The signature of one of these to the act of resignation would have been probably followed by another; and a fourth of the Medical Staff is about to leave London, *on dit;*—so that the Executive would have met their constituents with their two clinical lecturers, as the whole of the Medical Staff.

Your readers will opine that the Executive of the Hospital has too much leaned on an individual, and will, at all events, think there must be some meaning in the withdrawal of so many of the medical officers. The wonder, according as I

Hosted by Google

have been able to judge, is not that they have withdrawn, but that any man, who has any self-respect, remains.

Your obedient servant,
A SUBSCRIBER TO THE HAHNEMANN HOSPITAL.

To the Editor of the Homœopathic Times.

SIR,—Thirteen years ago, I was given up by the allopathic doctors for consumption. A goodly number of them had pronounced me incurable. At this period, a benevolent lady sent from Paris an invitation for me to visit her in that city, in order that I might get the advice of the *immortal Hahnemann.* At first, the doctor then attending me sent word that I was too weakly to undertake such a journey; but the lady persisted in asking me to visit Paris, if it were at all practicable. I believe that the doctor was led to oppose my journey more on account of want of faith in homœopathy, than in my state of health, but he yielded, however, to the urgent and reiterated requests of the benignant lady. In a month after, I was sounded and examined by Hahnemann, who smiled as he stroked my head, and said, "I am glad you have come to me in time; I shall cure you." Now mark, Mr. Editor, I had been examined by more than twenty eminent allopathists (Sir James Clark being one of them), all of whom thought me beyond human skill; but the old, bald-headed, *persecuted* Hahnemann, the great medical benefactor of mankind, after an hour's examination of my lungs, said, "*I shall cure you.*" After being under his treatment for eight months, I returned to Scotland, *completely cured.* I may mention that the good old man (for whose good-doing to me and to mankind I have often felt grateful to God) refused to take a single farthing for his advice and medicine, although he knew that the lady who took so much interest in me was in opulent circumstances.

Having a deep interest in homœopathy, and having read the correspondence which has appeared in your valuable journal both for and against the "Odometer," I was led to test a number of the medicines with a very susceptible female (my servant), the results of which were truly astounding. If you consider them worthy of insertion, I shall furnish you with a few of the many experiments made, to show that I have not arrived at conclusions in a hasty manner. I have tested the globules, less or more, for the last two months, and that in the presence of others. I will give you them as I took them down, leaving you to make use of them, should you deem it proper.

Three globules of *Aconitum,* placed in the palm of the hand, produced immediately feverish heat of skin, thirst, disposition to cough, oppression of the forehead, sore throat, pains in the chest, etc. etc.

Sulphur, weakness in the legs, and especially of the knees; pain in the back, feeling of itching all over the body, skin heated, dizziness in the head, etc.

Nux vomica, fluttering at the heart, heaviness of the head, soreness of the scalp, buzzing in the ears, inclination to vomit, stoppage in nose, sneezing, etc.

Tartarus emeticus, cutting pain in right side of the chest, sweats breaking out in rapid succession, etc.

Arnica, ringing in the ears, sore pain in the temples, a dread in raising the brow, a sensation of load on the head, the eyes felt sore and watery.

Arsenicum, disposition to sneeze, sickness, frequent belchings, shooting pains in the breast and breast-bone, ears felt sore, etc.

Calcarea carbon., tightness and cutting pains in the abdomen, burning in forehead, pain in the loins, etc.

Mercurius, chilliness all over the body, swelling of nose, palpitation of the heart, attended with a burning sensation, great tenderness in stomach, pain in liver, etc.

I shall be glad to answer any questions that may be put to me privately or through your journal. One thing, you and your readers may rely with the utmost confidence on the statement I have now made. The female is quite healthy, but when anything ails her, homœopathic medicines relieve her immediately. I may state that about three months ago she was several times biologised, and has been several times *clairvoyante.*

Hoping that I have not worn out your stock of patience, I am, Sir,

A LOVER OF HAHNEMANN.

[The writer of this interesting letter has authenticated its contents, by sending us his name and address.

We recommend him to go on with his experiments with the Materia Medica, as he has the advantage of so sensitive a subject by whose agency to test the medicines. We shall be glad to know the manner of his conducting his experiments.

The medicines should be so arranged in distinct packages, and those packages be so mixed together, that neither the experimenter nor his sensitive subject should know the name of the medicine, till all the effects be ascertained. The packages containing the medicines should be numbered, and the names of the medicines corresponding to these numbers should be written and enclosed within sealed envelopes, on the outside of which the corresponding numbers should be written. Neither the operator nor the sensitive subject to know what the medicines are. He can, in this manner, see if the same effects are again and again produced by the same medicines.

The brief notice our correspondent has given us of Hahnemann cannot fail to interest all who read it. His singleness of mind, his benevolence, his powers of diagnosis, and his practical skill, are all brought out by a few touches.—ED.]

HOMŒOPATHY AT SUNDERLAND.

Some time in the last month of the last year, the Medical Society of Sunderland, there being fifteen members present, met for the purpose of denouncing homœopathy, and after an animated discussion they agreed to memorialise the College of Surgeons, and the Apothecaries' Company with a prayer to withhold their diploma or license from all candidates who were known to have any tendency to homœopathy.

These proceedings of the fifteen members of the Medical Society of Sunderland, called forth some champions of homœopathy, who have enlightened the good folk of that *ilk* with their views, in the *Sunderland News*. We transfer their remarks to our columns, as it is important that the public should have the facts of the case put before them in every variety of shape; and our readers will not soon weary of these satisfactory *iterations*.

"FACTS FOR THE SUNDERLAND MEDICAL SOCIETY.

"To the Editor of the Sunderland News.

"Sir,—Your *News* of last week contains a report of a meeting held by a few gentlemen calling themselves the Sunderland Medical Society. Now, being an admirer of homœopathy, which they seek to repudiate, and knowing you to be a friend of truth, you will perhaps allow me to lay before your readers a few facts in contradiction of an unfounded statement uttered on that occasion. I find the report interspersed with several common-place vulgar terms, altogether unbecoming gentlemen possessing the education, and holding the position in society which the speakers hold. These I shall pass over in silence, and merely allude to an observation made by Dr. Brown at that meeting. He observed that 'homœopathy was on the decline.' Now, believing this statement to have been sincerely made, I come to the conclusion that the Doctor is ignorant of the following facts connected with what materially concerns his own profession, and which I hope will be of some use to him in guiding his future statements. In the first place, let him remember that the principle of homœopathy has not been discovered above sixty years, and yet, in spite of every organized opposition, the multitude of its converts still increase; and begin to be troublesome even to the members of the Sunderland Medical Society. Twenty-two of the crowned heads of Europe employ homœopathists as their body physicians. There are sixty distinguished professors in the universities of Europe who advocate homœopathy. There are eight homœopathic physicians possessing the title of councillors of state or councillors of medicine, conferred by reason of their acquirements in general science and medicine. There are forty possessing the title of court physicians. There are twenty-five professorships of homœopathy in the universities and medical schools of Europe. No one is admitted to the practice of medicine in Austria until he has been examined by the constituted authorities, and found qualified to practise homœopathy. Candidates for medicine must go through the same ordeal in Darmstadt at the examinations authorized by the State. The Austrian Government have appointed twelve physicians to compile a homœopathic Pharmacopœia for the use of the Austrian States. In fact, in Russia, Austria, Prussia, France, Spain, Italy, Brunswick, Saxony, Denmark, and even in India and Africa, homœopathy is sapping the foundations of the unscientific and barbarous structure of allopathy.

"But if the success of homœopathy has been great in the Old World, it has been greater still in the New, for in North and South America converts to the system can be numbered by thousands. For example, in 1842, there were about 300 homœopathic practitioners in the United States; now there are between two and three thousand. These added to above that number in Europe will exceed five thousand, most of whom are converts from the absurdities of allopathy. There are about fifty homœopathic publications issued in Europe and America. The *British Homœopathic Journal*, published in London, and the *Quarterly Homœopathic Journal*, published in Boston, United States, are fully equal, in point of ability, to any medical journal in existence. In Europe and America there are nearly fifty associations, composed principally of persons unconnected with the medical profession, who have been led by benevolent motives, seeing the uncertainty, inhumanity, and folly of the old practice, to connect themselves together in order to disseminate the truths of homœopathy. There are about thirty hospitals in Europe in which homœopathy is practised. Two of them are in London—the Hahnemann Hospital, Bloomsbury-square, and London Homœopathic Hospital, Golden-square; they are both in a prosperous condition, and what is known of their statistics far exceeds any institution of the kind where the old system is in practice. Private and public dispensaries are numerous even in this country,

Hosted by Google

and their success is beyond all doubt extraordinary. There are two dispensaries in Sunderland, one in Fawcett-street and another in Lambton-street; and could the parties connected with them be prevailed upon to publish their success, living testimony could be produced before our very eyes in favour of homœopathy from individuals who had been cured in a few weeks of diseases subjected to allopathic treatment for years.

"In conclusion, Mr. Editor, let Dr. Brown and his colleagues reflect upon the above facts; and let them consider that *nearly five thousand practitioners from their own ranks* have gone over to the practice of homœopathy, in spite of the odium and persecution heaped upon them by their brethren left behind. These five thousand practitioners must have several millions who patronise them, or they could never exist as such a single month; and however some members of the Sunderland Medical Society may rant about homœopathists being 'renegades and quacks,' 'deluded or designing advocates of an absurd system of charlatanism,' 'a great delusion,' etc., yet the public, knowing the above facts, will not believe that so many thousand men of scientific acquirements and acknowledged ability, holding such high station in society, are knaves, or that so many millions of inhabitants, of the most intelligent countries of the world, could be imposed upon in a matter where their own health and experience would immediately undeceive them.

"I am, Sir, yours,

"COMMON SENSE."

"QUACKS, HOMŒOPATHISTS, AND ALLOPATHISTS.

"To the Editor of the Sunderland News.

"SIR,—In the report of the special general meeting of the Sunderland Medical Society, inserted in the *News* of last week, there was not a single allusion made by any one of the speakers to the set of ignorant quacks whose really mischievous proceedings were exposed in my letter to you, inserted in the *News* of the 20th inst., although the special purpose for which they met was to memorialise the Royal College of Surgeons 'to sever the existing association of the quack with the regular practitioner.' It is very easy to utter denunciations and to call hard names, but the merely stigmatizing a body of men whose system of practice differs from the system of that portion whose ire is excited by the success of the innovators, does not prove that the opprobrious epithets of quack and charlatan are deserved, although it may have the effect of exciting suspicion as to the boasted infallibility of the system whose votaries are so earnest in calling for protection from the progressive inroads of the new. This suspicion is most fully corroborated by the speeches of the members of the Medical Society who composed the meeting. Homœopathy, the system repudiated and attempted to be put down, was said to differ from other quackeries, inasmuch as it was propounded by men who had studied at the colleges and had obtained their diplomas; and as the diploma is held in esteem by the self-styled 'legitimate and high-minded practitioner' 'as some indication at least of scientific attainments, a similar diploma, obtained under similar circumstances, must indicate similar attainments on the part of the 'designing advocates of an absurd system of charlatanism.' It is admitted, then, that homœopathy is propounded and practised by gentlemen of equal scientific requirements, and, so long as they practised by the strict formula of respectable antiquity, equally 'high-minded' as their opponents. Now, as Morison's Pills, and brandy and salt quackeries, and 'whatever has not truth on its side, soon die a natural death,' it is perfectly evident that the motive for seeking protection from it is the fear that its increasing vitality, in place of its long-expected and constantly-prophesied dissolution, may, after all, be an indication of its being founded on truth. I do not say that they seek protection from it, knowing it to be true, but that they fear it is so; for as none of the speakers say a word about having studied or tested it, I conclude they are all quite ignorant of its principles, and not that they make 'false statements,'—a practice ascribed by them to the homœopathists.

"It may be considered presumption in me, who am not a 'qualified practitioner,' defending homœopathy from the unjust allegations of professional opponents; but, after all, it is the public that will have to decide as to its merits. The attempt to taboo it by 'branding its name' is meant to bring it into contempt and ridicule with the public; and the extraordinary nature of its principles are well calculated to have this effect, as truth always has when first seen and opposed to our preconceived notion of things founded—not on experiments and induction—but on the fallacious impressions of our senses. For instance, the doctrine of small doses, which the homœopathist views as an instance of wise and benevolent design, and uses as a blessing of eminent importance, with joyful thankfulness that it has been made known to humanity, his opponents, on the contrary, as if bent only on putting down the system that gives them so much annoyance, strive, by industrious attempts at wit, to turn into derision, instead of, as sensible men, 'proud of their scientific knowledge,' looking at the fact now made known, and the step by step process that led the truth gradually to dawn on the mind of Hahnemann, and reasoning with that true humility which increases in the same ratio as knowledge increases; that as it is probable they do not know all the properties belonging to matter; and the axioms applicable to physical may not be true of vital forces, and that as the effects of trituration on the intensity of a medicine cannot be predicated till it be tried, the only way to prove the truth or falsehood of the doctrine is to submit it to a fair experiment.

"I do not make any attempt to explain the seeming absurdities of homœopathy—it is sufficient for me to witness the manifestations of gratitude of those to whom it has been a blessing to see the victim of a lingering disease willing

Hosted by Google

to undergo anything for the health he has been so long a stranger to,—yet afraid, from painful experience, of the torturing and expensive ordeals he has already gone through—at last resort to homœopathy, and find to his joy and astonishment that the patient and careful examination he has undergone results in a treatment unattended with pain and suffering,—is so inexpensive as to be unfelt, even with his diminished resources, and finally brings back to him surely and gradually his long-wished for, but almost despaired of, health and strength.

"It is hardly surprising to hear the 'high-minded practitioners,' whilst magnanimously refraining from personalities, characterise the doctrines and statements of homœopathic practitioners (now in this country—more so in America and on the Continent—a numerous, also by the showing of their opponents a scientific and, until they were degraded by homœopathy, a 'high-minded' class) as false, when the statistics, the results of their practice speak so strongly in its favour. Still less strange is it when, in addition, it is considered, that many of the patients who resort to homœopathy have already undergone the murderous practice to which the allopaths subject them—that conviction of the truth and beneficence of the system forces itself on the mind, and that homœopathy progresses.

W.

"HOMŒOPATHY NO FALLACY.

"To the Editor of the Sunderland News.

"SIR,—The Sunderland Medical Society have seen fit to meet and condemn homœopathy as 'fallacious in doctrine, and mischievous in its operations upon the public.' That it is neither the one nor the other will be our easy task to show to every mind open to conviction; and as homœopathy challenges no other tribunal than that of actual experiment in curing the sick, it is neither fair nor safe summarily to dispose of its claims upon the assumption of its unworthiness, when we can take the advocate for homœopathy at his word, and bring the searching test of investigation to bear upon him and his cause.

"Homœopathy has now attained the growth of half a century. In these fifty years how many bubbles and shams have been blown to the winds; yet it lives on, and shows no sign of decay. The little company that gathered round its illustrious founder has grown into a formidable band. Not fewer than five thousand practitioners rally round the laws of Hahnemann as their guide in practice, and thousands of grateful patients sing pæans to the name of him who propounded what the Sunderland memorial calls 'an absurd and fallacious charlatanism.'

"The system of homœopathy, then, has been long enough in practical operation to exemplify the truth or falsehood of the principle on which it rests. Statistical reports *duly verified*, are now to be had from many of the chief cities of Europe and America, embracing a sufficient number of cases to enable any one who examines them to arrive at a definite judgment upon the comparative results in allopathic and homœopathic practice—and this is the tribunal, of all others, to which the matter must be brought—for of what value to suffering humanity are medical theories and hypotheses? Is not the vital question to physician and patient this—the cure?

"Of these statistical reports the most important, perhaps, are those that refer to the treatment of cholera. The high mortality everywhere attending epidemic cholera is well known and painfully remembered by us all. Yet even in cholera, the number of those who died under homœopathic treatment was not one-fifth the number who died under the old system.

"Not less successful has homœopathy been in the treatment of acute inflammation. The following tables will show the rates of mortality under the two systems—the allopathic returns being chiefly those of the Edinburgh Infirmary, a small portion from French authorities, while the homœopathic are those of Dr. Fleischmann, of the hospital of the Sisters of Charity, Vienna:—

	In every 100 *cases.*
Mortality of cholera treated allopathically..	63
Mortality of cholera treated homœopathically	11

	No. of Cases.		*Deaths.*
Mortality in cases of pneumonia treated allopathically ..... or 1 in every 4½.	909	..	212
Mortality in cases of pneumonia treated homœopathically.. . or 1 in every 15.	229	..	19
Mortality in cases of pleurisy treated allopathically ..... or 1 in every 8.	111	..	14
Mortality in cases of pleurisy treated homœopathically.... or little more than 1 in every 100.	224	..	3
Mortality in cases of peritonitis treated allopathically ..... or rather more than 1 in every 4.	21	..	6
Mortality of cases of peritonitis treated homœopathically.... or rather less than 1 in every 25.	105	..	3

"In addition to these statements, a narrative of deep and recent interest, in which homœopathy was tested almost side by side with the old practice, remains to be cited:—

"During the early part of 1847, the accounts from Ireland of the daily extending ravages of pestilence first took that frightful form which causes that year to become memorable in the records of human calamity. In the *Times* of 26th of March, it was stated that in three localities widely distant from each other—Armagh, Mayo, and Cork—the progress of the disease was such that hundreds of the sufferers were totally without any medical assistance; that the workhouses were crowded; and that the attendants and medical men were dying daily. In the workhouse at Ballinrobe the building was one charnel-house, the unfortunate paupers being nearly all victims of fever—the dying and the dead huddled together. The master, the clerk, the matron, and the physician

Hosted by Google

had all fallen victims in their constant attendance on the sick and diseased inmates. In many places the doctors seemed to be more particularly marked out as the victims of the malady, and consequently the great want among the mass of sufferers was that of medical attendance.

"'Immediately on the appearance of these accounts, the English Homœopathic Association despatched one of their number to the aid of these wretched people. They selected Mr. Joseph Kidd, an Irishman, and a member of the London College of Surgeons, and fixed on the town of Bantry, as being one of the most severely visited, as the scene of his labours. The disadvantage of his position will at once be seen, from the deplorable condition of those who were to be the objects of his care. They were destitute of food, nurses, and attendance, while, on the other hand, the patients of the infirmary, fever-hospital, and workhouse in Bantry, who were treated allopathically, were, of course, provided with these necessaries. Notwithstanding, the results were as follows:—

"'*Comparative results of the allopathic and homœopathic treatment of fever and dysentery, at Bantry, in April, May, and June*, 1847.—Under allopathic treatment: fever, 254 cases, 35 deaths, or 14 per cent; dysentery, 250 cases, 90 deaths, or 36 per cent. Under homœopathic treatment: fever, 111 cases, 2 deaths, or 2 per cent.; dysentery, 81 cases, 11 deaths, or 14 per cent.'

"These returns show that in the instances recorded homœopathy has been able to save four times the number of persons that allopathy has, in diseases of the most acute and malignant kind.

"With regard to the success of homœopathy in chronic cases, we have the testimony of Dr. Forbes, editor of the *British and Foreign Medical Review*, that, in the treatment of chronic cases which have come under his notice, 'there has been a proportion of success with which the best-informed physicians would have been fully satisfied if it had occurred in their own practice;' and so completely has this been observed by other practitioners, that it is perfectly common to hear the results of homœopathy attributed, since they cannot be denied, to 'diet,' 'time,' 'imagination,' abstinence from medicine,' or to a 'salutary effort of nature.'

"With these facts and figures before us, we believe that homœopathy is neither 'a useless nor mischievous system of practice,' and although those who differ from us deny our success, we shall, as the best means of refuting their objections, go on and endeavour to multiply our cures.

"We do not expect soon to convert the profession to our faith. There are many hindrances in the way. Thus has it ever been with new truths. Galileo, in his day, complained that the philosophers would not look through his telescope, and, therefore, doubted the existence of his moons and stars; and so long as our medical men refuse to look through our telescope, they will assuredly not see the wonders of our firmament. As the world went round, despite of the men who thrust Galileo into the dungeon of the Inquisition, so, if it be true, will homœopathy advance, colleges and medical societies gainsaying. 'It must soon be utter night with a lie, or glorious sunshine with a truth.'

"I am, Sir,

"Yours truly,

"R. S. Tate."

"THE SUNDERLAND MEDICAL SOCIETY'S ANTI-HOMŒOPATHIC CRUSADE.

"*To the Editor of the Sunderland News.*

"Sir,—In your paper of December 27th is a long report of the proceedings of the Sunderland Medical Society.

"It is quite clear that the Sunderland Medical Society feel that homœopathy has taken so strong a hold on the public mind as to have caused a considerable hesitancy in their proceedings.

"Thus, although they pass a resolution, that 'the *public* profession of homœopathy shall be held to disqualify from being admitted or remaining a member of the Sunderland Medical Society,' they have not courage to add the resolution (by-the-bye, its grammar is shocking) to the regulations of the Society.

"Mr. Johnson proposed a resolution, and expressed that he wanted some protection for himself and for his medical brethren.

"How can a man of Mr. Johnson's talent and genius want protection? Surely the best protection a medical man can want is that arising from curing his patients quickly, surely, and kindlily *(cito, certe, et jucunde)*.

"Mr. Orton seemed very indignant with the College of Surgeons, because they would not brand the names of the members of the college that practised homœopathy as 'renegades and as quacks.' Why does not Mr. Orton himself do this? It would be an act of courage and of virtue, because then any such branded members could bring an action for libel (as did Dr. Ozanne in Guernsey, and that successfully), and, in so doing, would give Mr. Orton an opportunity of proving before a legally-constituted tribunal that such a brand is just.

"Mr. Parker was very vehement. He talked of the College of Surgeons 'robbing them of the titles they had wrought hard for.' He, like Mr. Orton, wants protection, 'by some means or other, against what was a great delusion.' Surely the best protection against delusion is common sense, acting upon well-ascertained facts; and it cannot be doubted that a gentleman of such reputation as is Mr. Parker has that common sense which, as Juvenal severely remarks, is—

"'Rara avis in terris, nigro simillima cygno.'
"A rare bird on the earth, very like to a black swan.

"Sincerely yours,

"A Sunderland Man."

"*To the Sunderland Medical Society.*

"Gentlemen,—The meeting of your Society,

Hosted by Google

ostensibly convened to memorialise the College of Surgeons against homœopathy, has evidently (from the publicity given to the proceedings) been intended as a manifesto to the public, and which I feel I cannot pass by unnoticed, from the sense of gratitude I entertain for the benefits I have experienced under this new and enlightened system.

"In conning over the remarks of the various speakers, I was struck with the claims laid to scientific and other attainments of the 'Protesters,' whilst in vain I looked for any manifestation of it in the sayings and doings of your body; whilst one thing unfortunately, abuse, prevailed instead of argument, and there was instead of the 'feast of reason and the flow of soul' nothing but 'torrents of abuse.'

"Not one single argument to disprove homœopathy was even suggested, nor did it appear that any one member of your Society had ever tested the practice of it, and found it wanting; consequently, I am compelled to take it for granted that not one of these gentlemen know anything of the subject but what they learn from the rivald stuff and nonsense of those writers in the *Lancet* and *Medical Times*, who, like themselves, in a case like this, where really much trouble and scientific application is required (and consequently there would be an unwilling task to fulfil) prove the truth of the old adage 'where ignorance is bliss, 'twere folly to be wise.' For the benefit of the public, however, I will inform them that at the present time there are upwards of two thousand regularly educated medical practitioners (quacks as you in your charity would call them) practising homœopathy, and amongst them many men of high standing, and of acknowledged ability and integrity; and that there is only one instance on record where a medical man, after having adopted the homœopathic system of medicine, has returned to the allopathic practice of bleeding, blistering, salivating, purging, etc. etc. I will go further, and assert that there is hardly an instance of an allopathic practitioner, who has fairly tried by practice the homœopathic system, even though in nearly all such cases he has entered on his experiments with the hope and intention of exposing and disproving the system, that has not himself become a convert.

"But there is a large class in every community, which resolutely sets itself against innovations, and denounces every change as a curse, and every novelty as an imposture. For instance, the most determined opponents of church reform are the bench of bishops and the clergy. The strongest resistance to every measure of law reform comes from the members of the legal profession; and it is proverbial that every important discovery in medical science has been received with distrust, if not positive hostility, by the professed conservators of the public health.

"Amidst such powerful obstacles has the truth in all ages had to work its way; so that society now finds itself dependent for its comforts, and almost for its existence, upon inventions and discoveries which at first excited almost universal ridicule. Truths newly discovered and carried into practical operation constitute the very essence of our present civilization. But whilst we condemn the hasty and inconsiderate rejection of every novelty, we must equally avoid the opposite extreme of presuming that every novelty is a truth. Our duty is to investigate freely and fairly every new idea which presents itself to our minds, never doubting that whatever is true either in science or morals cannot be in the end injurious to mankind.

"Homœopathy has this decided recommendation, that the quantum of physic which it dispenses is almost imperceptible; and if it can be proved by practical results that its infinitesimal doses can effect cures with as much rapidity and certainty as the large pill and dose system, without the prejudicial effects of the latter, then I do not hesitate to predict its popularity. But the medical profession denounce it as 'quackery and humbug' (presuming, of course, that the public give them credit for being themselves wholly free from such an imputation), and charitably offer its practitioners the alternative of being regarded as knaves or fools; for if homœopathy is quackery and humbug, as you assert, then those medical men who have been all their lives practising the healing art, and from year to year continue administering doses of nothing (as you allege), and yet are so blind (and unfortunately their patients too!) as to fancy that they have the same curative effects as the large doses which they formerly administered, must be fools indeed; and if they don't themselves believe that the medicines administered by them in minute doses have any effect either for good or for bad, then they must be worse than fools —they must be knaves.

"But, gentlemen of the Sunderland Medical Society, you will excuse me for reminding you that homœopathy claims the favour of the public as a practical science, and therefore its efficiency can be tested only by experience; and medical men have so often been compelled to adopt ideas which they formerly laughed at, that I cannot accept their dictum as conclusive against any theory, however novel and startling it may be.

"It was obviously your design to put down the new heresy without taking the trouble to convince the public, or even yourselves, of its falsity by scientific inquiry or actual experiment, but with what effect the daily adhesion of both medical and non-medical men to the 'heresy' sufficiently shows. There are now two regularly qualified medical practitioners pursuing the homœopathic system in this town, and another about to establish himself among us, besides two dispensaries; and their patients are counted by thousands.

"I am, Gentlemen,
"Your obedient servant,
"SCRUTATOR."

HOMŒOPATHY IN CALCUTTA.

(*From the Calcutta Citizen, Nov.* 21 & 24, 1851.)

As Dr. Tonnerre's project renders the subject of homœopathy one of interest at the present time to the Calcutta public, we, though without

Hosted by Google

the slightest pretension to be considered as scientific journalists, revert to it, and proceed to lay before our readers the information which we have drawn from one of the theses kindly sent us, the production of Dr. Geddes McKenzie Scott, a brother of one of our fellow-townsmen.

Samuel Hahnemann, a physician born in Saxony in 1755, was, as most of our readers are already aware, the founder of the homœopathic school. Without apparently any very defined object he subjected himself when in sound health to an experimental course of *Peruvian Bark*, wishing to observe the *modus operandi* of the drug. He was shortly attacked with the symptoms of intermittent fever. "The similarity of the effect to the disease which this substance cures was," says Dr Scott, "to Hahnemann what the falling apple was to Newton: *it suggested a law*, which an accumulation of facts only could establish, but which with the ardour of a true philosopher he proceeded to investigate." The result was the establishment of what may be announced as, *par excellence*, THE PRINCIPLE of homœopathy—*similia similibus curantur*—which may be paraphrased *like cures like*. This maxim, the great, we may say the only *essential* tenet of the followers of Hahnemann, is empirical, and independent of any theory. But the homœopathists, like all other sects, *have* their theory, which we proceed to explain.

The vital power is held to be a distinct principle pervading the frame of living creatures. This energy, the homœopathists maintain, has a dynamical action peculiar to itself; and they are distinctly opposed to those physiologists who would reduce all the functions and operations of the animal economy to chemical or mechanical processes. We need not stop to discuss whether this declared "opposition" be not unphilosophical. Our own opinion is that the researches of science will in the end discover that all the classes of phenomena, which we now are accustomed to regard as regulated by separate and independent laws, which we term those of gravitation, of light, of heat, of electricity, and of vital energy, are but modifications of one universal law. All, therefore, that we take the declaration of the homœopathists really to amount to is, that they consider it more practically useful to prosecute their investigations into the dynamics of vital energy, than to endeavour to reconcile them with the laws which regulate chemical and mechanical processes. The vitality then which pervades each animal, the homœopathists regard as being *one* and indivisible. All disease is a contest between the morbific power and the great ruling power of life. Malady thus cannot, according to their ideas, be local. The effects of the disease may be more distinctly perceptible in one organ of the frame than another, but the kingdom of life is attacked although the invading force may have advanced no further than the outposts. In support of this view, it is remarked that a general undefinable uneasiness ushers in almost every complaint; that a fever, a cold, an inflammation of any class have all their premonitory symptoms—symptoms premonitory of disease generally, but not always pointing to the particular organs which prove ultimately the seat of the severest suffering. So far their doctrine is not peculiar to the homœopathists. Many distinguished physicians of other schools have maintained the theory of the constitutional origin of local disease. The separation between the homœopathist and allopathist is observable only when they come to treat of the phenomena which accompany an attack of the morbific power upon the vital energy. Those symptoms which are ordinarily ascribed to the *disease*, are held by the homœopathists to be due to the *reaction* of the vital power called into play to resist it. As this principle is the keystone of the homœopathic philosophy, it is better to use Dr. Scott's own words in describing it.

"When," says he, "a morbific power is presented to the constitution, the vital energies are called into play to resist it; hence arise the symptoms of the disease; which are not the effect simply of the morbific power, but of the strife subsisting between it and the vital energy —the reaction to which the hostile invasion has given rise. Any substance applied to dead matter produces a different effect from that which it does when applied to living, it is fair to suppose that the *difference* is owing to the *vitality;* and the tendency of vitality being to preserve itself, it is reasonable to suppose that the *peculiar effect* is owing to the *reaction* of the vital energy. Now when two substances produce a similar effect, it is because each excites the reacting power of the vital energy *in the same direction*. Hence the principle of homœopathy. A certain morbific power stimulates the vital energy, and the contest produces a certain effect. Now all that is wanting to cure this effect (which we here consider the whole disease) is, that the vital energy should react sufficiently to overcome the morbific power, when one of the conflicting powers being subdued, the strife, and therefore the disease, would be at an end. The medicinal agent, whose effect corresponds to that of the disease, stirs up the resistance in the same direction, that is, still against the morbific power, without increasing the opposing force (because the power of the medicine, though *similar*, is not *the same* as that of the morbid power), and therefore it is that the vital energy becomes victorious."

Dr. Scott very wisely disclaims for the homœopathic system, as brought into vogue by Hahnemann, the character of originality. Though first insisted upon by that physician as fundamental, the principle on which it is based has, he observes, been in many instances recognised by those who, in their zeal for legitimate practice, would denounce the Hahnemannites as quacks. He gives a long list of cases in which the cure of disease is recorded, from the use of drugs which, administered to a healthy patient, would produce symptoms similar to those of the disease: and this list, lengthy as it is, is but, he informs us, a selection from the array set forth in the Organon of Hahnemann, the Bible of the homœopathists, published in 1810.

In practice the homœopathists stand forth avowedly as empirics. Of the number of patho-

Hosted by Google

logists, they remark, each individual has his own hypothesis, and all their theories are not only different but contradictory. The homœopathists complain that the rules of practice which physiology suggests are meagre and uncertain: while, therefore, they "fully accord to the students of morbid anatomy the merit which is their due, particularly improvement in diagnosis, they consider that, as a practical guide, it is of no great service. They regard the curing of disease as the great end of medicine, and therefore direct every effort to the discovery of means to effect it."

The experimental part of the new system is therefore confined to the observation of the influence of medicinal substances on the human frame: the peculiarity of the method pursued by them being, that the experiments are not tried upon the sick, *but upon persons in sound health.* When the operation of a drug is to be ascertained, a healthy subject is chosen, who undergoes a course of discipline intended to avert every source of error. "He avoids stimulating food, depressing or exciting passions, debilitating pleasures, undue exertion, and exercises a constant and very minute watch over his own sensations, noticing the most trivial change. The same process is repeated by several, and when the results agree, they are naturally ascribed to the medicine. The medicine is administered perfectly pure, *i. e.*, in combination with no other."

When by such an experiment artificial symptoms have been produced in the voluntary patient similar to those presented by some natural disorder, the drug which has induced the feigned disease is deemed the specific for the real disease to which it bears a resemblance.

As a *sub*-principle the homœopathists have adopted that of infinitesimal doses; but Dr. Scott is careful to guard against the supposition that the system of minute doses forms an integral part of the homœopathic system. He insists only upon the *superiority* of the mode of exhibiting medicine in very small quantities, not its *absolute necessity.* In fact, he acknowledges that "he thinks it very possible that cases may occur in which larger doses than infinitesimal, though still small in comparison with those ordinarily administered, may be preferable." To give the infinitesimal a fair chance, its professors require that all disturbing causes should be avoided; the patient must be submitted to a strict regimen, even his passions must be held in control, and in the very atmosphere which he breathes counter-agents must be dreaded and guarded against. Now as those in poor circumstances and engaged in business cannot yield themselves up wholly into the hands of the doctor, in numerous instances the nice operation of the infinitesimal dose must be disturbed. In such cases Dr. Scott does not object to treatment in some degree more vigorous than that which he would recommend under circumstances more favourable to the operation of the influence of just the faint "suspicion of medicine" which the homœopathist delights to insinuate.

It may amuse our readers if we conclude our notice by quoting Dr. Scott's description of the method by which the homœopathist fills his fairy medicine chest. It runs as follows:

"If soluble, one grain of the medicine is placed in the third part of 100 grains of *Sugar of Milk* in a porcelain capsule, not varnished. These are mixed with a spatula of bone or horn: the mixture is then pounded during six minutes: the mass is then scraped from the bottom of the capsule, and from the pestle, to render it more homogeneous, and the pounding continued for six minutes; it is again scraped during four minutes, after which is added another third part of 100 grains of *Sugar of Milk;* this is agitated with the spatula and bruised with the same pestle six minutes: it is again bruised during six and scraped during four minutes, when the remaining third part of the *Sugar of Milk* is added, mixing with the spatula, pounding for six minutes, scraping for four, pounding again for six, and then carefully detaching. The powder thus obtained is preserved in a corked phial, and marked $\overline{100}$.

"To obtain the second attenuation, one grain of this is made to undergo a similar process, and the result is marked $\overline{10,000}$."

"The same operation is repeated for each attenuation, so that six times six minutes are occupied in pounding, and six times four in scraping, making one hour for each attenuation."

This minute formality might at first sight appear absurd—but no magical effect is attributed to the repetition and alternation of pounding and scraping, and the performance of each attenuation in exactly one hour. The object of establishing an uniform mode of manipulation is only to ensure certainty and accuracy in the quantity of medicine which each drop or globule of the homœopathist's apotheca contains: an object which those who believe in the efficacy of doses almost inconceivably small must consider of vast importance.

[Our readers will be much interested in seeing that homœopathy is thus discussed in the periodical literature of India. We are always thankful to those who send us any information bearing on this subject. Dr. Tonnerre, of Calcutta, has opened a Homœopathic Hospital in that city. We subjoin the prospectus.—Ed.]

PROSPECTUS OF A HOMŒOPATHIC HOSPITAL.

Native Homœopathic Hospital and Free Dispensary, under the patronage of the Honourable Sir John Hunter Littler, G.C.B., Deputy-Governor of Bengal and President of the Council of India.

The rapid progress of homœopathy in Calcutta, and its great success amongst the natives, have induced me to make the present appeal to the public in favour of a Native Homœopathic Hospital and Dispensary.

This Institution will be established for the purpose of enabling the poorer classes to avail themselves of the homœopathic method of treatment in those extensively-distributed and fatal diseases, cholera, fever, dysentery, and diar-

Hosted by Google

rhœa, which form by far the largest items in the causes of mortality in the climate.

In undertaking the responsibility of conducting the medical department of the Institution, I feel called upon to observe that I do not come before the public as one who is merely about to subject the comparative merits of the homœopathic and the old system to his own judgment, but as a man who, seeing every year hundreds of natives die for want of medical aid, now comes forward to offer them the benefit of a simple system, more in harmony with their habits than the old system of medicine.

My convictions are already fully formed, being based on many years of searching inquiry into the most successful method of treating disease; and after having practised simultaneously the allopathic and homœopathic systems for eleven years, my experience and conscience have constrained me to admit and adopt the homœopathic practice, as being the most successful system of medical treatment, the only system possessing a fixed and unerring law for its practice.

C. Fabre Tonnerre, M.D.

Regulations.

The Hospital will be under the patronage of His Honour Sir John Hunter Littler, G.C.B., President of the Council of India and Deputy-Governor of Bengal.

2. The Committee of Management will consist of four members, elected for this purpose, and the medical attendant.

3. A responsible treasurer will be appointed to take charge of the funds.

4. The Oriental Bank has been selected for that purpose.

5. A Quarterly Report will be published, showing the treatment of the patients, and the management of the funds.

6. The Institution will be divided into two departments; an Hospital for the treatment of acute diseases, and a Dispensary for chronic cases.

7. Poor patients with acute diseases will be admitted free at any hour, but to prevent abuse of the charity, the medical officer will reserve to himself the privilege, if he should think it necessary, of requiring from the patient a certificate from some native gentleman, or from some person of known character and respectability, to show that the applicant is a proper object for gratuitous relief.

8. Cases of cholera are exceptions to the rule and will be admitted without delay, and under every circumstance.

9. Out-door patients affected with chronic diseases will be attended to every morning.

10. The distinctions of castes will be strictly attended to.

11. The Institution will be supported by voluntary subscriptions, or donations paid in advance.

12. The services of the medical officer will be gratuitous.

We publish the prospectus, drawn up by Dr. Tonnerre, of a "*Native Homœopathic Hospital and Free Dispensary* (to be established, we presume) *under the patronage of the Honourable Sir John Hunter Littler, G.C.B., Deputy-Governor of Bengal and President of the Council of India.*"

We suppose that the object of Dr. Tonnerre, though he nowhere in his prospectus directly states so, is to invite subscriptions to carry out his project, and such we shall be happy to receive and forward to him.

On the comparative merits of the allopathic and homœopathic systems we are unable to offer an opinion; but we know that the latter, the more recent of the two, has votaries among scientific and well-educated medical men, and this is sufficient to make us desire that an opportunity should be given of testing its excellence by a fair experiment. We have been very cautious of pooh-poohing anything, merely because it is novel, and presents startling combinations of cause and effect which would appear at first sight at variance with those presented by the phenomena which ordinarily have fallen under our observation, since mesmerism, which we once laughed at in the self-sufficiency of ignorance, has become established as a fact. Those who pronounce off-hand—"Oh, you will never make me believe that which is quite *unnatural*"—should reflect that this absurd expression involves upon the part of the speaker an impudent assumption that he has navigated every sea and explored every bay, creek, and strait of that ocean, upon the shores of which Sir Isaac Newton expressed himself to be but a gatherer of shells. "Unnatural," as used by men of sense and reflection, conveys no further idea than not *apparently* to be accounted for as a result of those causes which we see ordinarily brought into operation. We say not *apparently;* for on farther investigation, that which seems at first sight startling is often found, on more close examination, to be merely the operation under new combinations of circumstances of causes with whose effects we are daily conversant. The rising of the balloon from the earth seems at the first glance to be a violation of the laws of gravitation; when further examined the phenomenon is found to be an illustration of the immutability of those laws. That only can be properly styled unnatural which is *contradictory* to experience, and before we can venture to assert with a *rational* confidence that an occurrence reported to us as having taken place under certain circumstances is *in this sense* unnatural, we should be careful to ascertain that those circumstances are *precisely* similar to those in which we have observed the same means described to have been used produce a different end. Will any sensible man then venture to predicate of a particular course of medical treatment, described by a man of fair reputation for honesty and intelligence to have been successful, that it is unnatural and therefore absurd? Assuredly not; when our greatest physiologists confess how little they are acquainted with the principle which binds together in strength and beauty tissues which, when it has fled, melt in a few hours into a rotting mass of foul corruption.

Hosted by Google

There are, however, in the medical as in every other profession enthusiasts who are carried away by the fancied infallibility of some nostrum, or rule of treatment; and while we deprecate a summary judgment without trial being passed against any system which proffers respectable witnesses to speak in its favour, we are not inclined to pin our faith to any man's sleeve.

All we ask for Dr. Tonnerre and homœopathy is a fair trial, and we are selfish enough to adopt the maxim "*fiat experimentum in corpore vili.*" The Doctor is anxious to practise upon the natives, and the natives are willing to take this pills. Physic away, good Bolus, say we. If your system be one of kill, it is not *we* you will send to the Stygian shades: if on the other hand it show itself one of cure, you may have the honour of dosing the *Citizen.*

PROFESSOR MACDONALD AND HOMŒOPATHY.

To the Editor of the Medical Times and Gazette.

SIR,—In your autocratic position in the editorial chair of the now incorporated *Medical Times and Gazette*, you have issued your first bulletin, disclosing your future relation to the periodic medical press, in which capacity I wish you that success which the long list of contributions, including many names eminent both in science and practice, fully guarantees.

You also state your proposed relations with the homœopaths, on which I beg you will afford me a small space in your widely-extended journal, in order to examine the dogmas you have laid down, against which I demur for the following reasons:—

I. Because you restrict the term "Regular Practitioner" in a sense not hitherto received by the profession or the public, to the exclusion of those who treat disease homœopathically. Hitherto all who have acquired legal title to practise medicine after a prescribed course of study, by several years' attendance at the medical classes, with sufficient practical instruction in the laboratory, dissecting-room, hospital, and dispensaries, and after the age of twenty-one shall have passed an examination by the authorized boards, showing a competent acquaintance with the prescribed subjects of study, received the diploma, and were admitted as regular practitioners, in contradistinction to those persons who may engage in the treatment of disease without such qualification and previous study. This is still the conventional meaning of the term in society, and any such restriction as you propose is not only ungenerous but unfair, and an uncalled-for innovation.

II. Because, like all who possess the previous knowledge of their profession and the legal qualification, those who prefer adopting the homœopathic principle in the treatment of disease—the homœopaths, as you term them—claim the same free enjoyment of their professional privileges as those who deprecate the principle and denounce the practice of homœopathy; and they therefore resist the attempt at present so actively pursued by many of their professional brethren, and fomented by the Medical Press, by the Medical Societies, and even some of the corporate bodies, who have not hesitated to apply epithets, not only inapplicable but unfair, and to attempt to exclude without legal power to do so. We ask no new fellowship,—we only claim the continued possession of our rights and privileges.

III. Because you blame the homœopaths as having originated the system of abuse and invective which you admit the others were not slow to follow. This is a point to be settled by a reference to dates; but whoever initiated the practice, I entirely concur with those who discard it as neither argument nor evidence, though often substituted for both; and I trust that the future career of your journal will not be bloated with the virulent personality which is glaringly exhibited in some of your contemporaries.

IV. Because, in all questions of mere professional principle and theory, the fair and free discussion should be conducted with courtesy and decorum; and, therefore, the subject which at present is the topic of such general interest should be treated with that calmness which its importance demands. I propose the following modification of your grounds against any congeniality in the professional discussion or practice:—

1. Professing the same object, "the cure of disease," both seek the success of their system according to their conscientious convictions, although they may not use the same drugs in the same quantities, or prepared in the same manner.

2 and 3. Each follows his own course, without necessarily condemning the practice of others as erroneous, or rousing their indignation or contempt.

4. Let any medical man who can only view homœopathy as a fallacy and deception, avoid it, and the homœopath also, if he pleases; but he is certainly neither entitled to stigmatize him, when duly qualified, "as a foolish dupe, nor a cunning and dishonest pretender."

The 5th ground is so utterly beneath consideration, that it is surprising you should have penned it.

On the subject of consultation, it is scarcely worth while noticing it, were it not for the injudicious prominence which has been given to it in certain quarters. As the first step in treatment is to ascertain the seat and nature of the disease, more especially in obscure and difficult cases, there does not seem any good reason why difference of theory should prevent the consultation as to the facts of the case. All medical men use the same modes of examination, and the phenomena of health or disease are exhibited alike to all, whatever the theory of treating it may be. And, as every one has an inherent right to refuse meeting in consultation, there surely was no necessity for the formal decree which some of the colleges have issued, but which the council of the Royal College of Surgeons have declined as not being expedient, without in the least giving any approval of either party.

Hosted by Google

Diagnosis must be the same, whatever course of medicine is adopted; and surely it was a careless oversight, when you concluded your article with the following sentence:—Between such methods of diagnosis there is no real correspondence; and to pretend that any enlightenment could follow a conference between the practitioners of two such opposite systems, is merely to attempt to impose on the public.

Before concluding allow me to refer to the attempt to prevent students, after passing their examination, from obtaining their diploma on the pretext of their future intentions. Such a course is not only unjust to the students, but also to the public at large, whose only safeguard is the guarantee that a sufficient course of study of all the branches of knowledge required for the successful treatment of disease has been gone through, and that they have obtained their diploma as the documents of having passed their required test. To refuse this, is to lay open to any unqualified pretender, who may appear in the field of medicine or surgery, many of their many departments to the manifest danger and disadvantage of the public at large. Trusting to your impartiality, I beg you will allow this letter to appear as soon as the crowded state of your columns will permit.

I am, etc.,

W. MACDONALD, M.D. and P. St Andrew's.

[The Editor of the *Medical Times and Gazette* publishes this letter with his remarks. We substitute for his a few of our own. This excellent Editor, a scholar, a well-read man, one, like Ulysses, versed in many tongues, and with the ways of many people, knows very well that he is a partisan. He is an Editor, and so he attacks homœopathy.

In a leader he taunts Professor Henderson, as if by *his* taunts that illustrious man would resign his professorial chair!

Let the bigoted upholders of the Hippocratic or Galenic systems do their worst. Professor Henderson will stand his ground. The mimic thunders of the *Lancet*, and the classical elegancies of the *Medical Times* have no weight with him.

This Editor of the *Medical Times and Gazette* is fond of harping on the broken fortunes of the medical men who take up homœopathy as a resource. We remind him of the proverb—"Those who dwell in glass houses should not cast stones"—and of the Scotch proverb, we forget the *Doric*—"Fools should not use sharp sticks."

Let him meditate on these two proverbs, and be wise. We like him very much; but we know quite as much of him as he can know of Professor Macdonald.

We are favoured with a little comparative rest from the assaults of the weekly medical press: but our progress is not the less. The establishment of a homœopathic hospital in Calcutta is likely to call the attention of many medical men in India to our mode of practice.—ED.]

THE

HOMŒOPATHIC TIMES.

SATURDAY, FEBRUARY 14TH, 1852.

THRONES topple; dynasties are changed; men are born, live, have children, and—die. But while all human interests, kingdoms, and races undergo change, Truth remaineth. The mists of earth may obscure, but cannot hide it for ever; the fires of hell may encompass, but cannot consume it. The insensate prejudices of men may bar its progress for a time, but cannot put it in a perpetual prison.

SOCRATES was never more glorious than when he drank the hemlock—for conscience' sake. That divine man knew he was a martyr for truth, or what he believed to be truth. In this age of Tubal-Cainism, of mechanical inventions, when the ideal is sacrificed always to the practical, what hinders the progress of a true and out-and-out Medical Reform? It is that the higher faculties of men, as well as their grosser, are invited to take a part in it, and for the most part those higher faculties are eliminated.

"Let us eat and drink to-day, for to-morrow we die," say the selfish and the sensous, and the sensualist.

"Let us heap riches for the mere pleasure in the acquisition," say the AURICOMES of this world.

"Let us get the praise of men," say those ambitious of the world's applause.

"Let us get power," say those who are fond of rule—and even pismires are not insensible to this so-called pleasure.

But the truth-lover breathes a higher and serener air. He looks down from a lofty eminence on those who are floundering blindly in the mists and errors of low-lying Egypt.

Such a truth-lover was Hahnemann, whose name has been so vilified, and so wantonly *taken in vain.*

His at least was a clear spirit; he was the earthen channel that conveyed an immortal truth to mankind. He under-

Hosted by Google

stood his mission. He proclaimed the truth he was commissioned to utter—he died—and his body is embalmed by the tenderness of his consort, who withholds his revised writings from his disciples and the world.

Such fantastic tricks are played in this world!

We are not insensible to the gross abuses that are now being practised in relation to homœopathy, and its advancement. We are not ignorant that many are disposed to bow down before a *brazen calf*—in disrespect or disregard of Hahnemann. But let them try as they will, they cannot convert a *calf* into a MAN, and much less a calf of their own making.

It is with sincere grief, and not without some bitterness of spirit, that we see broad and well-laid schemes for the advancement of our great Reform sacrificed to the aims of the selfish, the vain, and the ridiculous.

But there is evermore a rebound, and truth is indestructible; and though we now utter oracular sentences, we shall, at some time or other, feel ourselves authorized to speak out plainly.

But we, meanwhile, press on all those who have sincerely received our doctrine and believed in our practice, to qualify themselves to give "a reason for the faith that is in them." This is no child's play,—no acting charade,—but a serious and solemn reality.

We care nothing for the ribaldry of our opponents, for their ostentatious ignorance and their fatuous malignity; but we feel that those who do battle for this Cause honestly, should in return receive a more hearty support from those who profess to be of the like faith.

Correspondence.

A SCREED ON ASSES.

To the Editor of the Homœopathic Times.

SIR,—The family of Ass is an old and distinguished one; we know that a brace of them were in the Ark, at the very least 4000 years ago.

An Ass may be more assish than an ass. He may have almost all his head behind his ears,—not a particularly good type of head.

An Ass of this ancient family may do very queer things; he may neglect contumeliously those who have advanced his worldly interests, and he may at the same time say, with a Sir Charles Grandison air and tone, "I value good will for its own sake, and as much if I get a shilling by it, as if I get a thousand pounds."

An Ass is also a very patient animal. He will bear kicks and rubs. He will roar in a vain imitation of a lion, but he will stomach huge affronts. He will daintily sniff at a *leaf*, but will greedily munch an *artichoke*.

He will let a *cur* yelp at him, and won't kick at him.

In short, such an Ass is a very strange animal—a psychological curiosity. This creature has a large self-regarding region.

Let me not be mistaken: I am illustrating the biped variety, not the four-footed original.

I have spoken of one specimen; let me give you another, and preface it by an apologue.

Once on a time, in a tropical colony, an Ass (biped) figured in the militia; and after a time got the command of a company. He had a favourite black servant, Pompey. So Pompey drove him one day to parade. The captain had the command; he was in full costume, and, within six degrees of the Equator, was in all the hot glory of *scarlet*—such is the Assish wisdom of the Horse-Guards, even in respect to British regiments in the tropics. The noble captain performed to his own entire satisfaction, as does a well-graced surgeon in an "operating theatre." He got home, bathed in perspiration, of course; got cool—and said to Pompey, "How did I give the word of command?" "Grandly, sir; you did it like a lion."—"Where did you ever see or hear a lion, Pompey?" "Oh, sir, you hab one here—and he go so," and Pompey imitated to the life the bray of a donkey.

Now, Sir, there is such a (biped) Ass to the fore at present, who does not see that his white Pompeys, when they give him leonine attributes, really ascribe to him those that are asinine. He is paraded as a head and director, in French and German periodicals, over a *corps*, which really regards him as an Ass.

With Ass-like solemnity—for the Ass is a solemn animal in his gait, his feeding, his regard, his amours—he propounds monstrous follies. As he is a King Ass, little Asses look on his wisdom as something oracular. He has discovered—in the secrecies of Ass-land—that the lower the vitality, the more necessary it is that humanity should be stinted of aliment. He has made other notable discoveries in science, butall of the same stamp—all intensely asinine.

Bray loudly, King Ass—and bray in various tones as loudly as ye can, ye little Asses!

Oh! that Landseer would take you all off for the amusement of ourselves and of our posterity!

Yet in their different ways very grand is each of these Asses I have sketched for your edification.

I have plenty more to do for you, if you like; but you must let me know, for I am only a modest

OBSERVER OF THE ASS-KIND.

[We shall be glad of more sketches from this wit. We do not recognise the characters; others may. But don't be too truculent, friend. —ED.]

HAHNEMANN HOSPITAL.

To the Editor of the Homœopathic Times.

SIR,—Allow me a small space in the next number of your valuable journal in which to notice the letter of your amiable correspondent Mr. Samuel Hanson, who, in entering the lists with me as the champion of the present Board of Management of the Hahnemann Hospital, disavows a combat *à l'outrance*, and proposes to break a lance in amity. Faithfully and like a true knight does he keep his word; all who glance at his reply to my letter must acquit him of having wielded any but a pointless weapon. But I am convinced that Mr. Hanson ought not to be an antagonist of mine in any sense, either hostile or amicable; and that, upon his own showing. He entreats the subscribers to suspend their judgment, because they cannot, from such premises as my letter contained, arrive at just conclusions; and he therefore proposes the appointment of a select committee to prepare a digest of all the minutes relating to the subject of clinical lectures and a medical school, for publication and circulation among the subscribers. I can only say that if this committee have access to all the documents and evidence necessary for it to arrive at the truth, and thereupon does its duty, the sole object of my letter will have been accomplished,* and publicity and information afforded to the subscribers on those points upon which they will be called upon to legislate at the next meeting. We are not at issue here therefore; both desire openness, fair play, and a clear understanding of the question.

Mr. Hanson next puts forward four grounds for his entreaty. First, that I have inadvertently lost sight of the fact, that much deliberation on the subject took place at the Board previous to the 18th of July. I certainly did not know it for a fact, though I might have presumed it. But of what value is it as a fact? If the opinion of the Medical Council, by which alone the Board ought to have been guided, was not formally demanded *until* the 18th of July, all discussions prior to the knowledge of that opinion were but so much time wasted; I therefore commenced my statement at the date when the question began to assume something like a definite and legitimate form. Now it appears, from Mr. Hanson's own statement, that though prior to that date he was a regular attendant at the meetings of the Board of Management, yet subsequently, "during the time that the obnoxious proceedings took place (October to January), he had, from pressing engagements, entirely given up attending." This gentleman is certainly quite right to call for a committee of inquiry, for he can have but slight idea of the subject; scarcely enough, I fancy, to entitle his modest judgment of my statement—viz. that it "is far otherwise than correct"—to much weight. Had he but exercised the same caution which he beseeches of the subscribers, and suspended his own judgment until he was better informed, I am sure that he would have entered the lists to break a lance in the same cause, and not against me. True, he entirely dissents from the conclusions I arrive at on the opinion of the Medical Council; but then has he read them aright? I can only judge of this by analogy. Let us see if Mr. Hanson always reads aright. His second ground for entreating a suspension of judgment is, that "as to discussions consequent upon the opinion of the Medical Council (at which he was not present), until the ultimate decision of the Board, on the 3rd January, I *carefully* perused all the documents and minutes, and had I been present, I should have adopted the same views at which the Board arrived." Now in this *careful* perusal he must have found that, at the meetings of the Medical Council, held on the 15th and 22nd of December, the question of title was warmly debated, and the opinions of twelve of the Medical Council strongly expressed on the subject, and placed in the hands of the Board, for their decision on that very point. Yet Mr. Hanson, as late as Thursday last, avowed his ignorance of the question of title; and I had myself to explain that it was the essence of the question, to the great surprise of the honourable chairman of the meeting at which it was first discussed, who very forcibly expressed his wonder that any one could suppose that the question of "mere title" was not the very *causa belli*, and if that were arranged all would go on well, so much for *careful perusals*. This misunderstanding of the real question explains Mr. Hanson's third ground of entreaty viz., that at a special meeting called by myself and others to reconsider the very subject, we were outvoted by thirteen to four; and therefore the subscribers must believe the thirteen right and the four wrong. Now, Sir, at that meeting I clearly enunciated the principle that the creation of a title would estrange the medical men, and hamper our future school, thereby materially injuring our influence and sphere of usefulness; but I was not listened to or even answered. Every member who spoke in reply blinked the question; and, in spite of repeated remonstrances on my part, the time of the meeting was occupied with matter that was *not in question*, viz. whether we should have clinical lectures or not—a point we are all agreed on. It is therefore on the very ground that the majority are so blind or so wilful that they cannot or will not see the true bearing of their acts that I considered it my duty to appeal to the subscribers, and most happy am I that I did so, since it has been the means of getting a committee of inquiry on the subject, a result I should have fought for in vain at the meetings of the Board.

Mr. Hanson's last ground is that "it is not expedient or *just* that a minority, if they cannot by regular attendance or argument influence the judgment of their friends, should call upon the public body to condemn that judgment which courtesy would presume to be *honestly* adopted, *if not wisely*." I am sure, Sir, my friend must have forgotten our true position when he wrote that paragraph, and if he is the candid upright man I take him to be, he must wish it re-

* The suppression of any documents or evidence relating to the subject would nullify the report of this committee, and my charge against the Board remain unanswered.

Hosted by Google

called. Can he have recollected that we are a body appointed to regulate the affairs of a charity supported by other people's money—that we have no business with courtesy in matters connected with the welfare of the trust confided to us—and that to act therein *not wisely*, is to act *dishonestly*? since it is our duty, before we *honestly* adopt any measure, to see that it is a *wise one*. Had I, Sir, from feelings of courtesy winked at proceedings which I was sure would militate against the welfare of the Hospital, I should have spared myself much trouble, but at the expense of my honesty. I pointed out to the Board, at the meeting called to consider these appointments, the error they were about to fall into. I was not listened to. I then called another special meeting, to reconsider the subject; here, though listened to, I was not answered—the "honest but not wise" resolution was carried. It then became a duty to myself to resign my seat at the Board, or appeal to the subscribers, as I really wished well to the Hospital, and dreaded that, if a few more of these "honest but not wise" resolutions were come to, the Institution would before long be shut up. I thought it best to stimulate inquiry, and it seems my letter has had the desired effect. As to the etiquette or courtesy of writing it, I cannot but think that in the management of a public charity the interests of that charity should be alone considered. The subscribers must therefore judge of the *justness* of my appeal, and as to the Board of Management, I can only say, that the upright and well-meaning among them can take no offence at it. Allow me to conclude, Sir, with a few lines which fully exemplify the position I have attempted to establish, and which I hope it will be my aim always to hold in all matters, whether public or private:—

"With mean complaisance ne'er betray your trust,
Nor be so civil as to prove unjust.
Fear not the anger of the wise to raise,
Those best can bear reproof who merit praise."

I am, Sir, your most obedient servant,

WILLIAM GILL.

To the Editor of the Homœopathic Times.

SIR,—In your journal of this day (page 412), immediately preceding a letter from myself, is one from Mr. Hanson *in re* the Leaf circular.

This gentleman candidly admits that he relies entirely on his memory for his impression, and that that impression is—that the Leaf letter "is in exact conformity with the suggestions of our committee to Mr. Warne."

Now, nothing is more probable than that, after a lapse of eleven months and four days, with the very best intentions (and no one who has the pleasure of Mr. Hanson's acquaintance could doubt the purity of his intentions), an impression should be wrong—nothing, comparatively speaking, more improbable than that a minute of a committee made at the time a resolution was passed, *should be incorrect*.

In your editorial note on Mr. Hanson's letter, you say "he has mistaken the point;" and I beg to add, that his impression and the minute are at total variance, as will be seen by my letter to which I have just referred.

Having made this observation, I must decline to correspond with any more of Mr. Warne's friends on this subject. I reserve myself exclusively for Mr. Warne himself.

I am, Sir, your obedient servant,

F. J. SMITH.

74, Old Broad Street, Feb. 7, 1852.

To the Editor of the Homœopathic Times.

SIR,—One of the great principles, I believe, of the Hahnemann Hospital was to have perfect equality among the medical men.

The appointment of clinical lecturers and professors, as such, with that title, was to give those so elected what Milton calls a "bad eminence."

I do not, however, mean to disparage the hero of the Paradise Lost, by comparing with him those so elected at the Hahnemann Hospital. That *hero* had an indisputable pre-eminence in Pandemonium.

There are now six medical officers of that Institution—one of them, it is reported, has taken upon himself to authorize some medical visitors to take and treat the cases of the out-patients in the Hospital.

He is, therefore, the *dux* of the school, as they say in Scotland.

It is difficult to say whether the impertinence or the presumption of this proceeding is the greatest; and as they submit to his dictation, the other five men are, clearly his *subordinates*. He is their chief—they are bound by his dietetics, his diagnosis, his doctrine, and his practice.

Out of the six remaining medical officers of the Hahnemann Hospital three are foreigners. Would it not be as well to change its name, and call it the "Hôtel des Etrangers?" London and its neighbourhood even now supply six other foreign practitioners to make up the original number of the medical staff.

This is a nut for the Board of Management to crack: but Englishmen find this sort of thing hard of digestion; and the Board of Management will probably discover that the General Annual Meeting will think so too, as well as does

A SUBSCRIBER TO THE HAHNEMANN HOSPITAL.

To the Editor of the Homœopathic Times

SIR,—Your correspondent Mr. Hanson, in your number of the 7th inst., concludes his reply to Mr. Gill's letter of the week before by saying, that he is quite certain "that there is no desire among any of the Board to select any one more than another upon whom to confer the title of clinical lecturer, or to elevate any one as a head."

It appears to me that Mr. Gill charges the Board with having done the very thing which Mr. Hanson seems to think they have no desire to do. I certainly read both in the French and German newspapers, lately, a paragraph to the purport that the Hahnemann Hospital was presided over by Dr. Curie, who was Chief Physician and Medical Director of that Institution, which seems to bear Mr. Gill out in what he says.

Hosted by Google

It follows, therefore, either that Mr. Hanson has been deceived and misled as to the desires and intentions of the Board, or that body has on this occasion *acted* contrary to its *intention;* in either case the results are the same, and threaten to be most disastrous to the Hospital; but if it should appear that the Board so acted against the advice of the majority of the Medical Council, it will indeed be a "*mystery*" to the subscribers, of whom, Sir, I am one, and

Your very humble servant,

OBSERVER.

To the Editor of the Homœopathic Times.

SIR,—If the following case (which seems to be chiefly interesting from the fact of the child having been under allopathic treatment, and declared by the medical attendants to be past recovery) is worth insertion in your journal, I beg you will make use of it, and give it a place in your columns.

I am, Sir, your most obedient servant,

WILLIAM WATSON.

7, Bower Place, Maidstone,
February 2, 1852.

Case.—On the morning of the 18th October, 1851, I was called out of my bed to see a child that was thought by the parents to be dying. On my arrival I ascertained that the little sufferer was under allopathic treatment, by two medical men, who also had been sent for as well as myself. One of them arrived whilst I was there, and I took my leave, assuring the parents that, although extremely ill, the child was not dying. I was again called upon by the father of the child, on the 21st of the same month, to know if I would take the case into my hands, as the allopaths had declared they could do nothing more for the child, and concluded by stating that nothing but a miracle could save the patient.

I told the father it was scarcely fair to ask me, at the eleventh hour, to treat the case, especially as the child was now not merely suffering from its disease, but in all likelihood was under the influence of a medicinal affection; that in treating it I should have to encounter both the one and the other, which, of course, would render the case more difficult, and the chances of recovery would be diminished. However, I assured him I would do all I could for the restoration of his child.

On paying my visit this day, I learnt that the child, a little girl of twenty-two months old, was cutting teeth, and had been seized with this attack at the house of an aunt in London, but was at once brought down to the country in a state of insensibilty. It had been about ten days or a fortnight under allopathic treatment, during which time it had been bled with leeches, blistered, had had mustard poultices applied, *Calomel*, every three hours, besides other medicines. No amelioration of the symptoms had taken place during this course of treatment. When I saw the child, it lay on the bed, with the eyes partially open, rolling the head from side to side; moaning and quite insensible to everything; it took nothing; the bowels were in a most disordered state; the motions black, green, slate-coloured, slimy, and especially offensive; passed involuntarily and frequently; extremities cold; countenance very pallid; the odour from the child remarkably sickening and oppressive. The attendants did not think it could survive twenty-four hours.

I put four globules of *Belladonna*, and four of *Chamomilla*, each into two table-spoonfuls of water. One teaspoonful to be taken alternately every hour.

October 22nd. No very apparent alteration, yet no ground lost.

I had the head shaved; the mouth to be moistened with water, or gum-water.

23rd. If anything, rather less rolling of the head, at times a cessation of it.

Sulphur, *Nux*, and *Belladonna*, every alternate two hours.

24th and 25th. The medicines have been continued, and the child is much more quiet. She is evidently better; motions still very bad, but less frequent; offensive odour not diminished.

26th. The moaning and rolling of the head have almost ceased; she begins to open her eyes; evacuations from the bowels rather more healthy. Beef-tea when she will take it. Omit *Sulphur* and *Nux*, and take *Belladonna* and *Chamomilla*, alternately, every three hours.

27th. Better in all respects; takes the beef-tea with much gusto.

28th. Improving; appears in much pain at times in the bowels; stools better; sleeps gently when free from pain.

Belladonna and *Arsenicum*, alternately, every three hours.

29th. Is much better; appears very hungry; to have a mutton chop for dinner.

30th. Improvement very great; appetite voracious; is continually crying out for more meat; to have a chop morning, noon, and evening. To omit all other medicine, and take simply one globule of *Chamomilla*, twice a day.

From this time her recovery was rapid, and in a few days I discontinued my visits to her.

The debility in this case was excessive, and for several weeks she was unable to stand upon her feet. After about a week or ten days she was content with one mutton chop *per diem*, nature appearing to be satisfied.

This was evidently a case of metastasis to the head from the bowels, which were disordered by teething, and the effect of the *Belladonna* in relieving the sympathetic affection of the brain was most remarkable. Her bowels gradually assumed a healthy state, and as her mother, from fatigue and anxiety, about the time of the child's recovery, was taken ill of typhus fever, I had daily opportunities of watching the progress of her recovery. The child is now in excellent health.

HOMŒOPATHIC AND ALLOPATHIC PRACTICE.

By an M.D. of Edinburgh.

In the neighbourhood where we reside, the new school of medicine having taken root nearly twenty years ago, has gradually encroached largely upon the domain of "legitimate medicine." We can enumerate seven or eight amateur homœopaths of either sex, each possessing a Jahr, and a case of globules to match. Some of them are skilful practitioners, and perform very numerous cures; and in *four* towns, not far distant, new homœopathic pharmacies have recently been opened, relying for support, no doubt, upon the well-known commercial principle of "demand and supply." Most probably, but for the exasperating language of a vulgar-minded and pandering medical press, lashing up the placid waters into a yeasty storm, the new system would have quietly supplanted the old, upon its merits; instead of, as now, taking its strongest holds by violence, and supplying Mr. Douglas Jerrold and Sir E. Bulwer Lytton with materials for excellent political and satirical hits* to amuse the novel-reading public, but to the serious detriment of what ought to be a noble profession. Such works as "The Practical Guide," "The Domestic Physician," and others of this class, tend very much in the direction of the old plan of prescribing for the name, and not for the symptoms of the disease, and on this account chiefly we deprecate all such popular books. For it may be taken to be a cogent proof of the abstract excellence of the homœopathic law which guides us in the selection of a remedy, that when much pressed for time, as in hurried dispensary practice, our success is not near so great as when pains are taken to collect all the indications a disease may offer, and these are then collated with the Materia Medica. It is this which renders the application of our renowned therapeutics so laborious, and the lack of this research it is that has caused well-meaning dilettanti Hahnemannists to bring so much discredit upon their system. For even where an able and accomplished physician has, by long study and extensive practice, so far mastered the Materia Medica Pura as to perceive intuitively, and without reference to books, the connection between a malady and its true homœopathic remedy, still the preliminary examination of the case, separating the symptoms into primary, and secondary, and accessory groups, with other minutiæ, requires the exercise of considerable skill and vigilance; and it is precisely here that the ill-educated or hasty practitioner and the amateur will continually be at fault: for the *application* of medicines must ever be based upon anatomy, physiology, and pathology, and without a knowledge, both competent and ready, of these three sciences, the most accurately-acquired pathogenesy of a medicine cannot be brought into serviceable play.

We may very fairly chronicle the fact, as one of the characteristics of the present allopathic school, that a practitioner could hardly be found who would think a case worth drawing up for publication, unless he were enabled to add the details of the necropsy. This first and principal point of interest consists in the relation he can establish between the symptoms during life and the appearances displayed after death. The utility indeed may not be great, but it is generally an interesting comparison, and it affords scope for considerable science and ability. His second point is to classify the pathological lesion, and if he can exhibit a good specimen of "Bright's disease," that may be preserved in alcohol, or a coloured drawing of "Simpson's honeycomb cells in the brain," he is conscious to himself that he has committed a laudable action. But should the diagnosis made during life, with science the most consummate, fail, and the dissecting-knife display an anomalous or commingled mass of diseased tissues, the scientific triumph is hardly less complete. It is held up as a *lusus morbosus*, and men gather round to see and touch and admire; and the enthusiastic young student ascends to his solitary chamber, profoundly im-

* Vide *Punch* passim, and *Blackwood's Magazine* for June last.

Hosted by Google

pressed with the conviction that he has just learned a lesson of the highest practical importance. Alas! medical literature, the discussions of medical societies, and the teaching, too, in our hospitals and cliniques very sadly confirm all and much more that is here alleged against the pathological school. But let us shift the scene. The homœopath, on the contrary, delights in bringing forward instances of *cure*, not boastfully, as regards a new science, nor to advertise his private *savoir faire*, but because the *cures* contain the real point of interest and value to him. In fact, the Manuals daily used by the homœopathist abound with *useful* indications drawn from this science,—*ab usu in morbis*, as it is termed; such likewise are the "Repertories," or collections of cures, of Ruoff and of Dr. E. F. Rückert, to which no parallel whatever exists in allopathic literature; works whose very title,* it may be aptly said, turns aside from us—the true disciples of Hahnemann—the biting sarcasm of Addison:—"If, in the third place, we look into the profession of physick, we shall find a most formidable body of men. The sight of them is enough to make a man serious, for we may lay it down as a maxim, that when a nation abounds in physicians it grows thin of people. This body of men in our own country may be described like the British army in Cæsar's time: some of them slay in chariots, and some on foot. If the infantry do less execution than the charioteers, it is because they cannot be carried so soon into all quarters of the town, and dispatch so much business in so short a time."—*Spectator*, No. 21.

The following case is adduced to show, by ranging them in parallel columns, with what precision and confidence the homœopath, guided by the symptoms alone, follows his law of cure.

Obstinate Dyspepsia. Remedies, Sulphur and Nux Vomica.

Mr. J. T—, a farmer, æt. 67, was brought to me the 13th January, 1851. He came to please his friend, and not with the slightest expectation of deriving benefit from my "quackeries." His antecedents were these: in early life he had inflammation of the eyes, and wore a shade for several years, but eventually got the better of it. At a later period, a surfeit invaded the back, with considerable irritation and discharge. Last summer the complaint of the eyes returned, and was removed partly by caustic. He has had a weak stomach for many years, but last July he became much worse, and tried allopathic treatment in vain, for months. Nothing but essence of hemlock seemed to give even temporary relief, and the medical attedant had warned him that he laboured probably under incipient cancer of the pylorus; of late he has had recourse to spirits five or six times a day, to quell his sufferings, and to allay the distressing flatulence, hiccough, and vomiting that are fast wearing him out. For the last six or seven months every kind of food is sooner or later ejected from the stomach, and he is, in consequence, grown very thin and weak.

Symptoms present Jan. 13th.	*Symptoms of Sulphur.*
Constant uneasiness at epigastrium.	720, 28, 29. Constrictive pains of the stomach; tearing at the epigastrium.
Aggravated by food.	628. Weight at the stomach, soon after eating.
Which is at last vomited.	697. Food vomited the same afternoon.
Flatulent eructation.	651, 2, 3. Eructations.
Resembling hiccough.	650. Hiccough morning, evening, and even in bed.
Water-brash.	660. Et sequent. Pyrosis.
All the pains subside on lying down at night.	
Itching, red eruption on the back.	1675. Eruption causing a burning itching.
Eyelids inflamed at edges, and cilia scanty.	263. Inflammation of the eyelids without notable swelling.
Milky cloud on each cornea.	
Is greatly reduced in size.	
Is become impatient.	44 Irritable humour, disposed to find fault with everything.

He was accordingly ordered *Sulph.*, two globules, of the 30th dilution, in three doses; one night and morning.

Jan. 17th. The pain at the epigastrium, or at the sides, has hardly been felt since. The eructation and hiccough are decidedly less; has not felt sick, or been obliged to provoke vomiting, which he generally did every afternoon; eyelids are less red.

Symptoms produced by Nux Vomica.

334. After a meal, a watery fluid is gulped up.

340. Frequent hiccough, without any apparent cause.

378. Aching pain in the region of the

* Outlines of Successful Homœopathic Cures, collected, etc., by Dr. E. F. Rückert.

Hosted by Google

stomach directly after a meal, as if he had eaten too much.

379. Pressure in the pit of the stomach, with distension after a meal.

970. An itching burning is felt in the eruptions.

1264. Is very much disposed to quarrel and feel vexed.

Prescription.—Nux Vomica, three globules, of the 12th dilution, in water, in six doses; one night and morning.

Jan. 24th. No sickness since; less suffering at epigastrium; the wind still, but no pain; rising of water almost gone; appetite much improved.

Prescription.—Sulph., two globules, of the 30th dilution, in three doses; one night and morning.

Feb. 6th. The medicine searched him a good deal about the stomach; no vomiting since, and less rising of water; no hiccough the last week; has had considerable itching about the body.

Prescription.—Nux Vomica, two globules, of the 30th dilution, in three doses; one night and morning. Pause five days, and repeat *Sulph.*, two globules, of the 30th dilution, as above.

March 6th. No more sickness; the eyes have suffered from a humour, but are better for the last ten days; some hiccough at night; has had much itching about the body, and some red rash, now gone off; the cloud in the centre of the cornea is thinner, especially on the left eye.

Prescription.—Sulph., three globules, of the 30th dilution, in solution, in six doses; one each morning.

May 28th. He has continued quite well ever since, and is getting very stout again.

What better commentary upon such a case can be made than is contained in § II. of the "Organon." "The perfection of a cure is rapid, gentle, and permanent restoration of the health, or removal and annihilation of the disease in its whole extent, in the shortest, safest, and most harmless way, on easily comprehensible principles." Though indeed some may perhaps view as a more clenching conclusion, the crowds of substantial relations and friends who, fee in hand, continue to besiege the door of the fortunate practitioner, whose surprising skill to their rural capacities seems little less than a species of omnipotence.

And now, Mr. Editor, having delivered ourselves safely, as we trust, of this medical narrative, lest any of the amateur fraternity should think themselves rudely elbowed or unhandsomely spoken of, permit us to call off the attention of your readers for a moment to an instance of professional surgery—not unparalleled, for it occurs every day; not unjustifiable, for the principles upon which this practice is founded are daily taught in the best schools of our metropolis, but a piece of surgery notwithstanding, that may best be designated by the title of a certain pamphlet in Cromwell's day, well known as "Killing no Murder." It is reprinted here from the London *Times* for November 26th, 1851, and struck us as an instance of surgical treatment so glaringly illustrative of the tenets of the orthodox school, that at the time we laid it by for future reference and comment.

"THE LATE COLLISION ON THE LONDON AND NORTH-WESTERN RAILWAY.

"Weedon, Tuesday evening, Nov. 25,

"This afternoon, at one o'clock, the coroner's inquest on the body of Mr. James Currie, aged 52, one of the unfortunate passengers killed by the collision which took place on the London and North-Western Railway, at Weedon, on the afternoon of Saturday last, was opened before Mr. H. B. Hicks, coroner for Northamptonshire, at the Globe Hotel, Weedon.

"Mr. William Swan.—I am a surgeon, residing at Weedon, and was summoned about half-past four on Saturday afternoon to the Weedon station. I saw deceased, and found him lying on the floor of the station-house. There appeared to be *a great deal of blood* about the head. On a superficial examination, I found a large cut above the right ear, about three or four inches in length. He was in a comatose state, his pulse was *slow and feeble*, and he had very bad or stertorous breathing. He appeared in a very bad state. He was brought immediately here, and the symptoms continuing, I thought it advisable that bleeding should be resorted to, to prevent congestion. I was assisted by Dr. Campbell, and further examination took place. We applied leeches, a blister to the nape of the neck, and administered opening medicine. I continued with him till eleven o'clock on Saturday night. On the following day *we persisted in our mode of treatment—reduction*. He was insensible, with the exception of a lucid interval for a short time on Sunday. We continued our attendance, but he never rallied, and died yesterday afternoon about half-past six. I have this day made a post-mortem examination. There was extravasation over the external part of the brain, a deep-seated fracture of the skull was found from the right orbit of the eye to the left, quite sufficient to cause death. That was the cause of death. All other parts of the body were perfectly healthy.

Mr. Richard Gamble examined.—I am assistant-surgeon of the 4th Regiment, stationed at present in Weedon. I was called to the scene of accident by Lieutenant-Colonel Gold's servant. Deceased was labouring under severe cerebral symptoms. I continued my attendance till six o'clock yesterday evening, at which hour

Hosted by Google

he expired. Made the post-mortem examination with Dr. Swan, and agreed with him as to the appearance and the cause of death."

All the medical gentlemen called in, three in number, agreed as to the proper course to be pursued, and as to the indications *secundum artem*, viz., reduction or depletion; therefore we are bound to accept their view of the treatment as one in all respects most sound and correct. It does, however, remind one irresistibly of Mr. Pettigrew's late interesting paper on "the history of the barber-surgeons, traced down from the earliest periods both here and abroad," and read last month, before the British Archæological Association. It shows, too, that very inconsiderable progress has since been made, in this direction at least.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

"Once upon a time," says Mr. Pettigrew, "that is, during the 10th, 11th, and 12th centuries, the clergy and Jews were the top men of the medical profession, and barbers, who were then of much greater consequence than now, were employed by them to assist in the baths, shave, apply ointments, and such like occupations. From the year 1131 down to 1163, the thunders of the successive Popes were launched at the heads of the practising ecclesiastics, and in the latter year they were prohibited from performing any operation involving bloodshed. The clergy for a long time afterwards practised physic, but had to give up surgery and leave it to their assistants. These worthies seem to have been particularly addicted to bleeding, and the painted pole and basin which occasionally may still be seen looming over the pavement of a country town, and marking the place where balm of Columbia or Macassar oil is retailed, were actually part of their stock of surgical instruments."

But to return for a moment to the sad case of the unfortunate nurseryman, upon whom the inquest was held. We insist that had homœopathic remedies been resorted to in his case instead of repeated blood-letting, life would in all probability have been prolonged for many hours; with a much greater amount of consciousness, or, as it was termed in the evidence, "of lucid interval." Recovery under such a frightful amount of injury as the post-mortem examination disclosed was apparently out of the question. But looking only to the symptoms present, and to the probable character of the injury—wound, with very violent contusion—we cannot, as physiologist, as pathologist, or as experienced practitioner, discover upon what principle a further loss of blood (for a good deal had already flowed from the wound in the scalp) was likely to prove beneficial to the dying man.

THE
HOMŒOPATHIC TIMES.

SATURDAY, FEBRUARY 21ST, 1852.

EVEN an unjust cause, sometimes, gains by opposition; a just cause always gains by the resistance made to it. An eloquent statesman of France has lately declared that we live in times when even the intellect of man may be degraded, and ruined; when civilization may be thrown back into the mediæval type, of which some are enamoured. But we do not think so: nor do we believe that the thirty millions of the Anglo-Saxon race who inhabit these islands and the United States can be so easily disposed of.

The truths of homœopathy are becoming stamped on the Anglo-Saxon mind; and that bodes well for the progress of our Medical Reform. Our readers will find an interesting paper from Ohio in our present number, which shows the progress made by homœopathy among our transatlantic brethren.

A gentleman of the name of Routh has lately published what the Americans would call a *smart* pamphlet, entitled the "Fallacies of Homœopathy;" he uses gentlemanly language. We have been promised an analysis of his pamphlet by a skilful critic.

There is a book called the "Fallacies of the Faculty," which we think says more against Dr. Routh's method of practice than his book on the "Fallacies of Homœopathy" says against us.

He has shot his Parthian dart; it has been shot twice; once before a Medical Society, and now in type. It has fallen on the ground—"*sit tibi terra levis.*"

When Dr. Routh is a homœopathist, and he is young enough to become one, he will smile hereafter at his youthful enthusiasm in a direction contrary to the convictions of his riper manhood.

Hannibal vanquished the Romans, and was virtually subdued amid his own powers in Capua.

We require keen resistance at this pre-

Hosted by Google

sent time, for we are in Capua. But we must not think we should pause in our work, because the assaults of our adversaries are less frequent.

The Editor of the *Medical Times and Gazette* speaks of the word homœopathy as an inanity; and we, therefore, presume he is altogether ignorant that the word "*homœopathic*" occurs several times in the New Testament, and that he may find it in Greek Lexicons and in Greek authors.

Thucydides remarked that those who know not the value of words seldom know the value of things. There is a precious meaning in the word "*homœopathic*," even though the Editor of the *Medical Times* has not discovered it; it speaks of the sympathy between the healer and the healed—between the healing remedy and the suffering organism. The greatest man that ever had his spirit shut up in flesh, needs not to quarrel with a word of such excellent significance, nor with the title of homœopathist that has been so worthily maintained by so many worthy persons.

There is much in the recent aspect of our affairs that requires grave counsel, serious resolves, and a determined course of action.

To have right counsel there should be a reliable council, and those who elect that body should abide by its decisions; and that council, to enforce its decrees, should be single-minded, and free from all prejudice.

We have no such œcumenical council —the more the pity. We have this and that Association, this and that Society; but there is no unity of purpose, no definite line of action.

In the most ancient and most loyal of the English colonies in the Antilles there is a prescriptive rule for the militia. Those who have shoes and stockings stand in the front rank; those who have shoes but not stockings, stand behind them; and the rear is made up of those that have neither shoes nor stockings. Many heroes do not understand this necessary distinction; and so there is confusion in their ranks.

It is certain that we require some regular plan for conducting our future campaigns.

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—In fulfilling the task I have undertaken, of giving to the world a brief narrative, from authentic documents, of the introduction of homœopathy into England, I called to-day on a medical man, from whom I hoped to obtain some information. What I required it was not in his power to afford; but he indulged me with the recital of the circumstances that led him, in the year 1837, to embrace homœopathy.

The incidents are in themselves so striking, and the charm of his style was so fascinating, that I could not help regretting it was not compatible with my numerous avocations to carry down my *narrative* to the period in question.

After leaving this gentleman, it occurred to me that what had so gratified me could scarcely fail to entertain others; nor could I believe that this case, that I had thus accidentally met with was the only one associated with facts of great interest: on the contrary, I felt that it was far more reasonable to imagine that each case has its peculiar and striking incidents. And if this be so, then does it follow that you will add no inconsiderable charm to your journal by presenting your readers with an occasional biographical sketch—once a month for instance—of some homœopathic practitioner. And a far more important end will be gained even than this by such a series of sketches, for the *Homœopathic Times* will thus become a Record Office, and this Biographia Homœopathica will furnish most important materials for the future historian.

I am, Sir, your obedient servant,
74 Old Broad Street, F. J. SMITH.
Feb. 16, 1852.

[We think the proposed history of homœopathy, with the biographies, or sketches of biography, proposed by our correspondent would be of exceeding interest to the homœopathic public, and we feel sensible of Mr. Frederick Smith's zeal for the good Cause, in devoting so much of his valuable time to this historical research. Dr. Quin, Mr. Uwins, R.A., and Mr. Headland (the first and for a long time the only homœopathic chemist in Great Britain) would be able to throw much light on the introduction of homœopathy into these kingdoms, and on its first struggles. The history of its first decennial æra in England will be intensely interesting.—ED.]

To the Editor of the Homœopathic Times.

SIR,—Will you allow me to suggest to your contributors, as well as yourself, the propriety of all letters concerning the present misunderstanding at the Hahnemann Hospital having the writers' signatures appended. The Hahnemann Hospital question is one in which all sincere homœopaths, and particularly subscribers to the Hospital, must feel an intense interest, and therefore no one interested ought to be afraid to come forward openly. I protest against the mode of denouncing principles of action, as well as individuals, behind the hedge: my antagonists will bear me out in this, I believe. I should have addressed you long ago upon the subject of the Hahnemann Hospital, had not feelings of delicacy restrained me. My position is now altered, at which I cannot but feel more than happy, as my retirement from hospital

Hosted by Google

service has freed me from much wear and tear and an atmosphere of strife, the offspring of an unwise policy, which nine-tenths of mankind, initiated into all the secret machinery, would construe into something very like undue artifice or finesse, to which no one of either "honour or gentlemanly feeling" will tamely submit. The recent disruption at the Hahnemann Hospital, which I and others in council failed to avert, will be proven to have resulted, I hesitate not to say, not because "wishes have not been attended to," but from what I have hinted, anü which it may be my duty shortly to unravel and place before the subscribers in an intelligible form. But I will forbear while an issue is now pending an investigation, that will no doubt prove satisfactory so far. I should not now have penned one syllable, had I not felt it due to myself to give a *public* denial to an inuendo in a note addressed to me by one of the physicians of the Hahnemann Hospital, to the effect that it is possible I am the contributor of what he considers an offensive letter, under the signature of "A Subscriber to the Hahnemann Hospital." That physician has denounced the proposal of the recent arrangements as lustily as any man, but has felt, from his peculiar position as a lecturer, that he could not take an active part to avert mischief; honestly do I pity him. My answer to that physician's suspicion has been, as it is now to the public, that I am thankful to say I can more agreeably and profitably employ all my time than writing letters under a feigned signature. You must well know, Mr. Editor, that I have not contributed a single communication upon the Hahnemann Hospital question, nor shall I without attaching my name. Truth and integrity of purpose have nothing to fear. Surely, one who took such an interest in the establishment of the Hahnemann Hospital—nay, as I shall hereafter prove, from conquering feelings and prejudices, to an extent that scarcely another man could, for the sole object of effecting union, and which was the means of congregating that grand demonstration at the London Tavern, on the 10th April, 1850,—which brought about the foundation of the Hospital—could not have any motive in kicking the same now sportively like a football. No! my affections for the Cause of Hahnemann are too deeply planted for me to indulge in such a game. Unhappily for my own peace, I have allowed my energies to be associated with those whom colleagues and others advised me to shun, and whom experience has now taught me I ought to have avoided; and if for my independence, I have received mere mud than thanks in furtherance of a *principle*, I am not in the least disconcerted. In this country no great institution can, in my opinion, flourish as it ought, which has for its object such an excellent and world-wide-spreading Medical Reform, unless based upon and governed by principles similar to those I and others have advocated, and to which I still cling The supineness of some and misgovernment by others, do not in the least militate against those *principles*.

The results of the Hahnemann Hospital experiment are to me and others ample and satisfactory, in some degree, for the sacrifices sustained. Some of your contributors have caught the spirit in which the constitution of the Hahnemann Hospital was conceived and framed, quite in accordance with the original proposition of the "Hahnemann Comemmoration dinner," which had, among other objects as set forth in a circular now before me, "the reconciliation of the differences which have split the homœopathic body into divers sections." That such a result would have been soon effected there cannot be a shadow of a doubt, had the *spirit* in which I addressed myself to those who *reluctantly* yielded to my views been acted on by them. For a *time* and a *purpose only*, as it would now appear, have they seemingly been honest and true.

There is a time to be up and doing, as well as to have done, so I will conclude for the present by taking a slight liberty with the poet's couplet, which well-nigh seems to express the truth—equally applicable to homœopaths and allopaths.

"'Tis *gow'd* makes *some* to fight the fiercer;
Without it *doctoring* wad be scareer."

Yours faithfully, D. WILSON.

[We fully exonerate Mr. Wilson. He has sent no communication on the late topic of the Hahnemann Hospital previous to this. We regret that some notes have inadvertantly been allowed to appear, which should not have been admitted without the signatures of the writers—ED.]

To the Editor of the Homœopathic Times.

SIR,—Perhaps you may consider the following extracts from the last November issue of that excellent "Quarterly Magazine of Medicine and the Auxiliary Sciences," *The North American Homœopathic Journal*, of sufficient interest to secure a place in your widely-read periodical. Your American cotemporary, which has just closed its first year, has in each of its quarterly parts, as was to be expected from the celebrity of the names who undertook to conduct it, viz., *the* distinguished homœopathic Patriarch Dr. Constantine Hering, of Philadelphia, and his gifted coadjutors, Drs. Marcy and Metcalf, of New York, fully sustained the scientific reputation of our American colleagues.

The cases which tend to show the deleterious influence of tobacco, in whatever seductive form it may steal an ascendency over its victims, will, no doubt, be read with interest, and may afford a valuable hint to patients suffering from chronic diseases, who too often, to their own detriment, retard their cure by a persistence in acquired habits. On no subject does the general non-medical public require more minute and convincing information than the opposing influence of certain habits of life. Medical men, too, are continually required to explain their grounds of objection to certain foods and beverages, which they know to be medicinal in their action,—objections which would be more forcibly illustrated by a few examples, such as that here afforded, than by all the arguments we

Hosted by Google

could advance. Abundance of instances can be given, I am sure, in the use or rather abuse of coffee and tea, as well as spices, pickles, peppers, and many more, *supposed* to be innocuous dietetic commodities, which it would be well to publish for the benefit and instruction of all interested.

Yours, etc.,
D. WILSON.

"*Tobacco.*—[The following long article by Mr. Shipman, from the *Boston Medical and Surgical Journal*, will furnish the homœopathic physician with some admirable indications for this too much neglected drug.]

"In the year 1837, my attention was called to two cases of disease in the same family. The symptoms and phenomena attending them were so similar, that it struck me at once that they had a common origin. The first was that of a young gentleman D. W., a student at law, of a nervo-sanguine temperament. He had been a martyr to dyspepsia for two or three years. He had spent a year in the Western States, and had attended the law lectures at Cincinnati. While at the West he had acute ophthalmia, which was treated by active depletion with little benefit, as his eyes, when I first saw him, were highly injected; cornea vascular and semi-opaque, and the lids granular. He applied to me for the treatment of his eyes, but what most afflicted him constitutionally was low spirits, want of resolution, and general hypochondriasis. His stomach would receive food with a good relish, but the moment he had finished his meal a train of nervous symptoms came on, which harassed him for two hours, until the stomach was empty. Acidity, cardialgia, gastrodynia, palpitation of the heart, giddiness, vertigo, and fulness of the head, with the most profound gloom; keenly alive to every feeling, he was in constant fear of death, yet tempted to commit suicide, to escape from a life more intolerable than death itself. These symptoms harassed him for months, with varying degrees of intensity, when a new symptom arose which terrified him more than all the rest. His sleep had been broken by the most horrid imagery, in the shape of frightful dreams, for more than a year; but now, when the first hour of sleep came over him, he was suddenly awoke by a shock in the epigastrium, which started him in great alarm from his sleep. These shocks and startings were repeated several times in the course of the night, and as often as he fell into a slumber. They were at first confined to the epigastrium, but after a few weeks, the sensation was transmitted to the head, which he described as more unendurable than when confined to the epigastrium. It was followed by a sensation as if a rush of blood took place to the head, and a firm conviction in his mind that he should die with apoplexy. This impression preyed upon his mind incessantly.

I was often summoned in great haste, and found him agitated, with cold sweats, palpitation, and terrible apprehensions of immediate death. A little soothing encouragement, a dose of *Morphine* and *Carbonate of Ammonia*, would dispel his fears and quiet his agitation, and enable him to rest the remainder of the night with tolerable composure. This state of things lasted several months, during which time he was not in a condition to pursue any kind of business, and finding that medicines only gave him temporary relief, I suggested to him that tobacco might have some agency in his complaints (as he used it freely, by smoking, chewing, and snuffing), and advised him to abandon the habit. In this I was successful, so far as chewing and snuffing were concerned; but he was so much attached to his cigar, that it was a long time before he could be induced to leave that. I will here add, that from the time he left off the habit of chewing and snuffing, his health in some measure improved, particularly the shocks and epigastric sinking. He now became satisfied that this partial abandonment of the habit had been productive of good, and renounced the habit entirely; and the nocturnal shocks and epigastric sinking, with the whole train of nervous affections vanished as if by magic. His digestive powers gradually improved; the chronic inflammation of his eyes yielded readily to appropriate treatment; the gloom and despondency which had oppressed him as an incubus cleared away; the nervous palpitations and rushings of blood to the head subsided, and he was able to prosecute his studies with energy, was admitted to the practice of the law, and is now an able and talented member of the bar, in the possession of good health, spirits, and prosperity. The foregoing history I copy from my notes taken at the time. There were many other symptoms which are common in dyspeptic cases, and many of those described are found in every-day practice in nervous, dyspeptic, and hysterical habits. The sudden and complete cure of all the symptoms, on leaving off the use of tobacco, was too obvious to escape the observation either of patient or physician.

I will now briefly allude to the case of a sister of the gentleman whose case I have been describing, although not occurring in the order of my notes. She was married, and the mother of two children; her age, 39; dyspeptic for the last ten years; of a nervo-sanguine temperament; her youngest child ten years of age. Suffered since her last accouchement from leucorrhœa, partial prolapsus uteri, and hypochondriasis. Has smoked and snuffed tobacco for the last fifteen years; eight years ago began to have shocks at the epigastrium, with a sinking sensation at the pit of the stomach, cardialgia, acid eructations, a sense of rushing of blood to the head, palpitations, sleeplessness, and startings when first falling into slumber. These kept increasing upon her, when there came on tenderness of the spine along its whole length, but more especially in the cervical and lumbar regions, rigidity of the limbs, costiveness, derangement of the catamenia, etc. She had been under treatment for a long time, with little or no benefit. To soothe her feelings, she had taken more freely of snuff, and had smoked more often, as she fancied that it gave her temporary relief. Seeing the good effect from

Hosted by Google

abandoning the use of tobacco in her brother, she made the same experiment in part herself, and with the same marked relief from many of the symptoms. The shocks at the epigastrium left her, sleep became quiet, her mind more cheerful, and the epigastric sinking, cardialgia, acidity, and eructations were greatly relieved. The spine, however, required cupping and counter-irritation, and with the use of anodynes and tonics she recovered a comfortable state of health. This patient has frequently ventured upon a moderate use of tobacco since, but after using it awhile, she experiences, though in a slight degree, her old feelings, and then quickly abandons it. She is perfectly satisfied of its pernicious influence upon her constitution, and therefore is in little danger of carrying its use again to excess.

S. E—, æt. 40, was in possession of good health until 1838, when he began to emaciate and grow pallid; his food did not digest well; with acidity, heartburn, gastralgia, palpitation of the heart, sinking at the pit of the stomach, and a host of nervous symptoms; gloom, hypochondria, and apprehensions of sudden death. But what most amazed him, and which filled his cup of misery full, were shocks at the epigastrium, which attacked him when first falling asleep every night. These followed him two years, and increased to such a degree that his sleep was a succession of starts, which nearly wore him out. At the end of two years they came upon him during the day. He described them as like shocks of electricity, and confined to the epigastrium. He was incapacitated from business of any kind, was weak, irresolute, and desponding; had consulted many physicians, and taken a great variety of medicines, with only temporary relief. On his giving me a history of his case, I was struck with its similarity to that of D. W., and inquired if he was not in the habit of using tobacco. He stated that he was, and had sometimes imagined that it might have some agency in producing some of his bad feelings, but had never had any physician advise him to leave it off, and, in reality, was too much a slave to its use to lightly make the sacrifice. Upon my assuring him that the symptoms and disease depended upon the habit, and that nothing but a complete and total abstinence from it would restore him, I extorted a promise that he would lay it aside a month at least. As he was costive, I prescribed the compound syrup of *Rhubarb*, and directed him to call again in a month. At the end of that time I was agreeably surprised to witness the improvement in the appearance of my patient. His countenance, which had previously exhibited a sallow, pallid aspect, was now ruddy with health and strength; he had gained fifteen pounds of flesh in the time, and his strength had increased daily from the time I last saw him. But what to him was more than all the rest, the annoying shocks, with the general nervous agitation attending, had entirely left him from the third day of his abstinence from tobacco. The dyspeptic affection, the palpitation, the gloom and depression of spirits, the apprehensions of death, had vanished as if by enchantment. He had resumed his business (that of a farmer); he could now sleep quietly through the night, and get up in the morning refreshed and buoyant in spirits, and is so convinced that tobacco was the root of all his previous complaints, that it requires no advice to induce him to forever refrain from its use. This man has now the most perfect health, and has taken no medicine since the first month.

C. P—, æt. 43; nervo-bilious temperament; farmer; temperate; has been a tobacco-chewer for twenty years; has been dyspeptic the same period more or less, attended with nervous palpitation and acidity, hypochondriasis and epigastric sinking. First began to have shocks at the epigastrium in 1839, in the night, on first getting asleep, which started him up in great agitation and alarm; was frequently obliged to get up and sit, for fear of the shocks. On his consulting me, I advised him to discontinue the use of tobacco, and prescribed no medicine. He left it off, and the shocks immediately subsided. He did not resume the use of tobacco again for eighteen months, and was healthy during the time. Being of an irresolute disposition, he resumed its use again, and in two months the shocks began with great severity. They were now felt in the chest and region of the heart, at first always in the night, but after awhile in the daytime, with a rushing of blood to the head, which would momentarily deprive him of consciousness. The shocks now took place in the head. This so terrified him that he earnestly besought me to prescribe something for him, and agreed to abide by my advice. My opinion was that no medicine would be of the least service without a complete abandonment of tobacco. This he solemnly pronounced he would do. I prescribed the compound syrup of *Rhubarb*, with the ammoniated tincture of *Valerian*. The shocks at once left him, his sleep became quiet, his dyspeptic symptoms disappeared, his mind became calm, spirits elastic, and he was capable of working his farm. Two or three times since he has cautiously ventured on the use of tobacco, but, after a certain length of time, his old feelings begin to appear; so that it is reduced to a demonstration that tobacco was the sole cause of his former troubles. This man has increased fifteen pounds in flesh, and his colour, from being sallow and pale, is of a ruddy hue.

S. C—, æt. 63, farmer; robust and healthy, until four years ago, when he began to complain of epigastric sinking, sleeplessness, palpitation, irritability, and nervous tremors. Shocks at the epigastrium came on at the first hour of slumber, which were repeated several times in the course of the night, and often in the morning before breakfast. Has been a tobacco-chewer thirty years, and a portion of the time to great excess. On his consulting me, I suggested that tobacco was the agent in all the trouble which he experienced. He said he had often suspected it, but had never had fortitude and resolution to forego its use, but agreed to make trial. The shocks immediately left him, together with all the train of nervous affections;

Hosted by Google

his sleep became calm, his strength and flesh returned, his spirits improved, and he has gained twenty pounds of flesh in three months. He has not resumed the use of tobacco. This man was temperate in all things except tobacco, neither using tea nor coffee. He was sensible for years that something was wrong, but could not believe that an article in such universal use as tobacco, and one which he had used for a long series of years, could possibly cause his troubles. This, I am persuaded, is the case with hundreds who are similarly situated.

S. J—, æt. 54; nervous temperament; farmer by occupation; has been in the habit of using tobacco for ten years. It frequently has salivated him. He spits much, is emaciated, nervous and hypochondriacal. The shocks commenced about two years ago, in his bowels. They came on in the night, when first getting into a drowse; at length they came on in the daytime, with epigastric sinking, costiveness, and dyspepsia. I put him on the use of the compound syrup of *Rhubarb* and ammoniated tincture of *Valerian*, and, at the same time, he left off the use of tobacco. The shocks immediately left him, and he improved gradually, so that at the present time he is in comfortable health.

A. C—, æt. 27; is of a sanguine temperament, and robust habit; a farmer by occupation. Hs chewed tobacco for four years to excess; was taken, in the summer of 1841, suddenly with sinking at pit of stomach, and faintness, which obliged him to lie down in the field. Shocks at the epigastrium came on about the same time. These were first at night, on getting asleep, but after awhile in the daytime; at these times he would suddenly break out into a profuse perspiration. His digestion was tolerably good, and his health otherwise little impaired. He says that, previous to these symptoms, he had used large quantities of tobacco, but never imagined that it could hurt him. I advised him to immediately discontinue its use, which he did, and the shocks and faintings left him at once, and have never returned. This man took no medicine.

Rev. Mr. H—, æt. 30; of a nervo-sanguine temperament; addicted to the use of tobacco fifteen years. For many years he was troubled with epigastric sinking, and lately with shocks in the same region. He is in tolerable health in other respects, and, but for the annoyance which they occasion him when first getting asleep, would not think of asking medical advice. I recommended him to quit his tobacco, which he did, and a perfect cure was the result.

J. S., æt. 40; of a nervo-bilious temperament; followed the sea many years; commenced smoking for spitting up his food; soon commenced chewing, and carried it to excess, often using a pound a week. Five years ago, began to feel a sinking sensation at the pit of the stomach; then starting from his early slumbers, with a shock through the epigastrium, and sometimes chest; a rising sensation like an aura to his head, oppression at the chest great, and sudden difficulty of breathing, palpitation, choking, sudden faintings, unquiet sleep, frightful dreams, dyspepsia, and hypochondriasis. From being strong, robust, and resolute, he became weak, nervous, and timid. In this condition he applied to me for advice. It was with great difficulty that I could persuade him to quit his tobacco, and when he attempted it, was often a backslider. But soon he perceived the good effects, and was at length induced to lay it entirely aside, and with it went all his former bad symptoms. I have since ascertained that he was somewhat addicted to the use of ardent spirits, which may have contributed in a measure to some of the complaints.

From the same number we have much pleasure in laying before our readers the following interesting information, as regards homœopathy in America.

Medical Schools and Medical Societies.—The course which has been pursued within the past few years by medical societies, and still more recently by medical colleges, in relation to homœopathy and its advocates, will excite no surprise in the minds of those who are familiar with the progress of events in the medical world during the present century. The medical reform which was commenced hy Hahnemann fifty years ago, bears a striking resemblance in many respects to the course of every reform in matters vital to humanity with which the world has ever been blessed. When the great Protestant reformer commenced his career, the religious opinions and practice of nearly the whole civilized world were held in absolute subjection to the Romish Church. Martin Luther then stood forth single-handed, and with impassioned eloquence boldly exposed what he considered to be the errors of the prevailing church; he was first met by sneers and ridicule, then by fierce denunciations, and finally by all the oppressions which could be inflicted by legislative enactments. But the sentiments he then uttered gradually extended throughout the civilized world, until many of all nations and people have adopted them as true.

Hahnemann, with equal genius, equal benevolence, and superior acquired knowledge, has accomplished in medicine a revolution as great as that which Luther effected in religion. Like the latter, he has encountered successively, ridicule, sarcasm, sneers, denunciations, calumnies, and a variety of legal oppressions; but his doctrines, like those of the religious reformer, have already extended throughout the civilized world, and now reign triumphantly among the intellectual and thinking portion of mankind.

In view of these facts, is it strange that medical societies and medical colleges are so much alarmed, and with impotent anger, and silly assumptions of talent and knowledge, pass revengeful and illegal bye-laws for the purpose of depriving homœopaths of their just rights, and of dictating to them what they shall believe and what they shall not believe? The gentlemen of the old school have evidently become desperate, if we may judge from the bitter anger, the falsehoods and misrepresentations, and

Hosted by Google

the petty oppressions in which they are constantly indulging towards the advocates of our school.

With respect to the inquisitorial and proscribing policy which is at present being pursued by a number of allopathic colleges in Europe, we can afford to treat it with the contempt which it merits. We have in this country two excellent medical institutions of our own, where students can get as thorough a knowledge of medicine, surgery, etc., as at any other college in America; and the first symptom of any oppression on the part of colleges in this country similar to that lately attempted in Europe, would be the signal to start a score of others in operation, which would prove formidable rivals in the business of affording instruction to the medical mind of "*Young America*." Our people are not to be put off with the cast-off opinions of the last two thousand years. Young America demands Young Physic, and she *will* be supplied, though allopathic dragons were as plenty as "the tiles on the housetops of Worms."

The "Homœopathic Medical College of Pennsylvania" and the "Western College of Homœopathic Medicine" at Cleveland both afford facilities for instruction in all the branches pertaining to our art, which are equal to those of any allopathic institution. Why then should the believer in *similia* any longer seek an allopathic college? Why need he longer subject himself to the insults and blackguardism of disappointed Hippocratic professors, when he can listen to their absurd dogmas and learn their pernicious tendencies at an equally respectable homœopathic college?

We trust, hereafter, that every disciple of Hahnemann will exercise his entire influence in favour of a homœopathic institution, instead of lending aid to the vindictive and corrupt schools of our opponents.—E. E. M.

Homœopathy at the West.—The accounts we receive of the progress of homœopathy in the *Great West* are almost beyond belief. There seems to be a magic in it which converts whole townships at a stroke; scarce a town through the whole Ohio and Mississippi valleys but has its one or more homœopathic practitioners, with the attendant crowd of intelligent and zealous lay partisans. A monthly journal for lay readers is published at Buffalo; one has just been established in St. Louis, Mo.; one has been for some time issued in Cincinnati, Ohio, and so rapidly and thoroughly has the Queen City been converted to homœopathy, that we perceive that another is just commenced by Drs. Pulte and Gatchell. This multiplication of journals *for the laity* is a striking sign of the novel times upon which we are fallen, of the attention which homœopathy is exciting among the people, and of the passing away of old things, and that all are becoming new. A monthly journal is published in New Hampshire; one has been some six years in operation in New York, where we hear of the probability of the speedy appearance of another, and there is some talk of the establishment of a similar one in Philadelphia. We should be glad to see a weekly journal established in New York—the times will easily bear it.

Our allopathic friends throughout the country have been unwontedly silent for some time past; perhaps they are awaiting the result of the struggle across the water—perhaps they are becoming wiser and yielding to the tempest which they cannot restrain—in any event we wish them health and a rapid conversion to the blessed and only true *art of healing*.

Homœopathic Convention in Ohio.—A convention of homœopathic physicians met at Columbus on the 23rd ult., and seems to have been respectably attended, as it was obliged to adjourn from smaller quarters to the Methodist church. We have not seen a full report of its proceedings, but learn that it resulted in the organization of an "*Ohio College of Homœopathic Physicians*," which adjourned to meet next year at Dayton. We rejoice much in the evidences of the steady and rapid progress of homœopathy in this country, which is afforded by the frequency of these conventions. They are exceedingly serviceable not only by making the members of the profession personally known to each other, but also by giving the lie to that oft-repeated allopathic story that "homœopathy is going down." We should like to see a convention and state organization in every member of the Union. There is no state which does not number practitioners enough to make such a course practicable, and even necessary. Massachusetts, New York, Michigan, Illinois, and Ohio have set the example; who will be next to follow?

Professional Liberality in the Middle of the Nineteenth Century.— Hahnemann published an article upon this subject at the "*commencement* of the nineteenth century," which is so pertinent to some of the physicians of the present day, that we shall quote a few remarks, with the hope that certain individuals of the profession may profit by them, and in future restrain their aberrations from right and truth.

"I do not here refer," says he, "to that low, envious, trading spirit, for which the pressure of want is often the cause that can be best pleaded in excuse; I wish to say a few words about the professional jealousy of medical men among themselves, which is the prevalent custom in Germany, a *bellum omnium contra omnes*, which has had a most injurious influence on the prosperity of one of the noblest arts, and the one which stands most in need of improvement—medicine. For no sooner has a colleague made a suggestion that must be for the general good, put forward a perhaps useful proposition, discovered something profitable, than instantly the professional jealousy of his colleagues (with very few exceptions) falls foul of him, in order to bury in oblivion, or, if possible, to destroy the novelty by spoken or written depreciations, insinuations, sophistries, or even injurious aspersions, and all because—*it did not originate with themselves*.

Let the small men of the profession (for none

Hosted by Google

but the *insignificant* and *morally base* ever descend to jealousy, false insinuations, and personal abuse), let all such ponder upon these remarks of our great master, and endeavour in future to profit by them. Combat principles freely, and meet all novel ideas fairly and honestly; but for the sake of our noble science, let no one entertain the vile sentiments so forcibly denounced by Hahnemann, or give countenance to any one who disgraces his calling by circulating falsehoods and calumny against his brethren who differ from him in opinion. But, above all, how detestable is the hypocrite who clothes himself in the garb of *piety*—who profanely *exhorts* and *prays* publicly in order to secure business, but whose heart is steeped in envy, malice, and rancour against his neighbours. Eschew especially the contaminating influence of these sacrilegious wretches, and spurn them beneath your feet as foul and slimy reptiles, whose breath is poison, and whose touch is pollution.

We regret to say there are some physicians to whom these remarks will apply with full force—men who have been publicly branded as falsifiers and slanderers—who *know* that they have been guilty of injuring their neighbour, and yet, with characteristic meanness and knavery, decline to retract their falsehoods. Such are perhaps more worthy of pity than of blame, but every right-minded man will find their society irksome, and will leave them to seek a congenial atmosphere among fellows of their own stamp.

E. E. M.

HOMŒOPATHY IN OHIO.

To the Editor of the Homœopathic Times.

Respected Sir,—Pardon this unlooked-for intrusion, and permit us to introduce ourselves to your favourable notice as the newly organized association of the "Ohio College of Homœopathic Physicians."

Wishing to solicit a friendly correspondence with the "Homœopathic Medical Association" of London, and being wholly unacquainted with their address, we have been induced to take this measure. Any attention of a friendly character shall be considered by us of the West as invaluable, and it shall be hailed as a new and strong incentive to perseverance in the *noble* work of Hahnemannian medical reform. With earnestness and sincerity, we ask all possible favours which are coexistent with the rules of the "Association," and do ourselves most unhesitatingly promise the same—honorary membership if desired.

Accompanying this communication please find duplicates of the original constitution, bye-laws, and list of members, formed during the late convention and organization of our infant Society; accept one yourself, the other we offer to the London Association. It will doubtless be gratifying to the friends of homœopathic reform to know that the system in the West is attended with most signal success, and is spreading with astonishing rapidity; and it is our firm belief that the time will soon arrive when there shall be an entire revolution in medical science, providing the friends of "Homœopathy" will faithfully employ the necessary means of which they are possessed. May we therefore, request you to lay this communication before the honourable "Association," or the officers of the same, that we may be favoured with their attention at the earliest period practicable?

Should it be a matter of any consideration to you, please forward to us a prospectus of your very valuable journal, and we will use all honourable endeavours to extend its already wide circulation among the friends of the great Cause. Ere we conclude, permit us to assure you of our appreciation of and highest esteem for your zealous and indefatigable exertions, in diffusing light on the principles of the immortal Hahnemann, and may you long live to give the world those labours of benevolence and philanthropy.

With profound respect,

The Ohio College of Homœopathic Physicians,

G. St. Clair Hussey, M.D,

Cor. Secretary.

Portsmouth, Ohio, U.S.

January 16, 1852.

[We have received with this letter a copy of the proceedings of the Homœopathic Convention of Ohio, to which we will take an early opportunity of referring. We cannot fail to be well pleased with the fact that our labours are valued in the "Far-West." We wish our brethren there all success; and we shall be glad to reciprocate with them all and every kind of good fellowship.—Ed.]

CASES.

GASTRIC FEVER.

January 8th, 1852. M. A. W—, æt. 3, was quite well up to yesterday evening, when she became restless, and complained of headache. This morning she has vomited everything she has taken; food remains in the stomach for about half an hour, and then returns, with much retching and straining, in the same state as when taken. She is very thirsty; complains of no pain anywhere; pulse a little hurried; tongue coated with a very thin, white fur; bowels rather costive.

℞ Ipecac. 6, gl. viij.
Aquæ, ℥j. M.

A teaspoonful every three hours.

In the evening she was very ill; pulse 125; still vomiting everything she takes, with jelly-like mucus at intervals; skin very dry; has been very restless through the day, and very thirsty. Bowels not moved; eats a little biscuit and gruel.

℞ T. Aconit. 3, ♏ ij.
Aquæ, ℥j. M.

A teaspoonful every three hours through the night.

To be put into a warm bath.

9th. Passed a restless night; to-day pulse 132; tongue more thickly coated with white fur; the vomiting continues, though it has only occurred once during the last two hours. Complains of no pain; no appetite at all.

Hosted by Google

The *Aconite* and *Ipecac.* to be continued, alternately, every two hours. A gruel injection, with Ol. Ric., ʒij.

In the evening she was better; the emetic had brought scarcely anything away; she had no relief since; has complained once or twice of pain in the abdomen, but she bears pressure on it well. Loss of appetite continues; she is very thirsty, and continually drinks cold water; the sickness has stopped since the middle of the day.

To go on in the same way through the night.

10th. Slept well till five a. m., when she became restless and uneasy, and vomited at seven o'clock, complaining of much pain in the stomach. At present she is composed and cheerful, and altogether much improved; pulse 120; tongue loaded with white fur; skin not so hot; thirst not so great; feels no pain, and asks for a little food. Continue.

In the evening she was much better; pulse 100; tongue cleaner. Two globules of *Bryonia* 6, to-night.

11th. Much better; pulse 96; tongue continues to clean; had a good night; no return of sickness; has had an evacuation, which was of a very light colour.

℞ Mercurius 30, gl. viij.
Aquæ, ʒj.

A teaspoonful twice a day.

12th. Nearly well; pulse 90; tongue much cleaner. Allowed beef-tea Continue *Merc.*

The next day the bowels were relieved, the evacuation being of a natural colour. Cured.

NEURALGIA OF LOWER JAW.

December 22nd, 1851. Mrs. W— for two weeks has suffered much from a kind of trismus, which affects her chiefly from night till three p. m. next day. During this time she can only open the jaw to the extent of half an inch, and cannot chew at all. She feels an aching, gnawing pain in the articulation of the right side, which is worse when she attempts to eat or to talk. During the remainder of the day she is able to open her mouth sufficiently to enable her to chew, though even then movement of the jaw is accompanied with a snapping noise, and is very painful. There is no swelling of the face; a little tenderness to pressure exists over the articulation of the right side.

℞ Rhus 12, gl. viij.
Aquæ, ʒiij. M.

A tablespoonful twice a day.

30th. Has been very much better since she took the medicine, and considers herself well.

PLEURISY.

September 11th, 1851. Miss L—, æt. 4, a very delicate, scrofulous girl, after feeling unwell for several days, was to-day seized with a fit of shivering, followed by much heat; very sharp pain in the right side, between the seventh and eighth ribs, hurting her very much when she coughs and breathes; short, barking cough; inability to lie on the right side; skin very dry and hot. Respirations 48, pulse 120.

℞ T. Aconit. 3, ♏ iv.
Aquæ, ʒiv. M.

Two tablespoonfuls every four hours.

12th. Better; does not feel nearly so much pain in the right side; dullness on percussion along the lower part of the right side of the chest; resp. 44, almost inaudible on right side; puerile on left; is able to lie a little on the right side; pulse 120; cough hard, and not so frequent.

℞ T. Bryon. 3, ♏ ij.
Aquæ, ʒiv. M.

Two tablespoonfuls every four hours.

In the evening she had a very sharp return of pain in the side, with increase of fever and cough.

Omit *Bryonia*, and resume *Aconite.*

13th. Decidedly better; resp. 34, pulse 116; cough more easy; countenance more cheerful. Continue *Aconite.*

In the evening I found that she had been able to get out of bed; has slept well. Continue *Aconite.*

14th. Much better; dullness on percussion decreasing. Resp. 28, pulse 108.

℞ Bryonia 12, gl. viij.
Aquæ, ʒiij. M.

A tablespoonful twice a day.

15th. Nearly well, and as strong as before her illness.

In this case it is observable how quickly the pain returned, on the premature substitution of *Bryonia* in the place of *Aconite.* Had this delicate young girl been treated allopathically, how protracted would her convalescence have been!

DYSPEPSIA.

November 17th, 1851. S. H—, æt. 18, a scrofulous, leuco-phlegmatic girl, has felt for six months a gnawing pain in the stomach, which got better two months ago, but has lately returned in an aggravated form. Her present symptoms are, a gnawing pain in the stomach, worse after eating; it comes on immediately after eating, lasts for an hour or so, abates, but soon returns again; drinking makes the pain worse; suffers every day from water-brash, chiefly in the afternoon; feels tenderness over the stomach, Tongue red at the edges, white in the centre; has a foul taste in the mouth, which is worse in the morning; the legs are stiff, and soon get tired; the arms are heavy, and holding them up increases the pain in the stomach; craving appetite; very thirsty in the morning; bowels regular; menses regular.

℞ Nux 6, gl. ij.

Every morning in water.

19th. Worse in all respects; the lassitude of the lower limbs much increased. Allow the medicine to continue its action.

21st. Very much better in all respects; stomach scarcely aches at all; tongue becoming natural; feels more able to endure fatigue. Still allow the medicine to act. She got quite well after this without further medicine.

PERITONITIS.

September 26th, 1851. J. F—, æt. 40, a hard-working, steady man, obliged, from the nature of his business, to take his meals at irregular hours; for a month at least has been ill, complaining constantly of pain in the stomach,

Hosted by Google

and vomiting his food, mixed with blood. About ten days ago he came to me, complaining of aching pain all over the abdomen, with much flatulence, and loss of appetite. He soon got better of this, and did not leave off his work. I was hastily summoned to him to-day, and found him complaining of intense pain in the belly, which seized him suddenly at five a. m.; he now lies on his back with his belly drawn up; pulse 110, very weak; face very pale, and pinched-in expression; abdomen very sensitive to pressure; mouth and teeth very dry; and evidently he is most dangerously ill.

℞ Aconit. 3, ♏ viij.
Aquæ, ʒiij. M.

A tablespoonful every two hours.

In the evening he was not any better. Alternate *Mercurius* with the *Aconite*.

27th. Somewhat easier; the pain is still very acute, particularly on pressure; expression of the face much changed for the worse; mouth very dry; teeth becoming coated with sordes; belly tense and swollen; bowels not moved; pulse 120, very small. Continue *Mercurius*.

About three p. m. a state of collapse came on; the belly swelled more; and cold perspiration broke out over the skin. He died at seven a. m., on the 28th, sensible to the last, having been ill about forty-eight hours.

I could not obtain a post-mortem examination, but have no doubt that he died from rupture of the stomach, consequent on chronic inflammation of a small portion of that organ.

HOMŒOPATHIC EXPERIENCE.

To the Editor of the Homœopathic Times.

SIR,—S. D. G—, a young woman, had been some time subject to the following symptoms—she came to me in 1837:—Weight and splitting pain in the head; itching, and falling off of the hair; giddiness, as if tipsy; brain feels as if shaking; heat in the face, though the face is pale and yellow; sore throat; no appetite, with bad taste in the mouth; nausea, flatulence, and colic; cough, with white expectoration; oppression, with throbbing of the heart; pain in sacrum and arm; night perspirations. Two globules of *Nux*, 30th dilution, given at seven days' distance, cured her in a few weeks.

Miss S— had suffered for years from attacks of violent headache, which were accompanied by much feverish feeling at the time of suffering. She was well otherwise, and could not describe any particular symptom of the headache. When questioned, she said the pain was dreadful, and she had felt at different times all the symptoms I had mentioned in my questions. I gave her two globules of *Aconite*, 12th dilution, and the following day two globules of *Ignatia*, 12th dilution, which cured the headaches, and she has continued free from them.

Miss L— had for many months been subject to violent headaches, for which she had consulted her medical man, and had taken many drugs without receiving any relief. Her only symptoms were headaches, with sensation of fulness in the head; face red, and burning in head and face; the headaches lasted a day, and came on very often. Two globules of *Aconite*, 12th dilution; the following day, two globules of *Nux*, 12th dilution, and another globule the following day quite removed them.

Mrs. Lowe, aged thirty, 1837, complained of giddiness; nausea, with stupifying headache, with great thirst, and burning pain; eyes watery; face red, yellow, and burning; great burning in the nose; pain in the jaw; bad taste in the mouth; thirst, with disgust to drink; no appetite; food quite tasteless; flatulence; pain in the sides and pit of stomach; costiveness; pain in the nape of the neck; the shoulders and back are burning in bed; skin very sensitive, cannot bear the touch; pain in the limbs; only dozing sleep with startings. I gave her two globules of *Belladonna*, 12th dilution, and one globule next day. This in a few weeks quite removed all ailments. The reason I gave no more medicine was that amendment followed the taking of the medicine so decidedly, and the countenance regained its healthy look, that I felt sure no more would be required.

The same person came to me a few months after; she had continued perfectly free from her old symptoms, but complained of a pain in the right side of her abdomen, from which she had suffered for upwards of a year, since the birth of her last child. On questioning her, I found out that there was an unnatural pressure there during her pregnancy. My idea was that it was caused by the position of the child, which had injured some internal part. I gave, therefore, two globules of *Arnica*, 12th dilution. In a week she came and reported that the pain was entirely removed; she has felt no return of it.

When the scarlet fever was very much about, Betsy L—, a young married woman, came to me with her face very red and burning, and complained of sore throat. I gave her two globules of *Belladonna*, 12th dilution; the next day she was well.

Judith Corbet, a young woman, who had felt ill for one or two days, came to me at the same time; her symptoms were sore throat, no appetite, tongue white, face red and burning, bad taste in the mouth, no taste of food, warm and cold shiverings. I gave her two globules of *Belladonna*, 12th dilution; one the next morning; two more the following evening. She returned to me quite well.

These two cases, taken in time, no doubt escaped the scarlet fever. I had several other similar cases of children during the epidemic.

Joseph Pinwell, an infant of a month old, October 22nd, was and had been for some days in extreme pain, crying, and restless; he was hot, and had burning skin. The mother showed me the child's leg; from the outside of the middle of the thigh to the middle of the calf of the left leg was a red, inflamed space, here and there covered by a blistery eruption. I gave the babe one globule of *Aconite*, 12th dilution. The following day they brought the child; he had had a good night, the inflammation was gone, but the blisters remained. I gave one globule of *Ant. crud.*, 9th dilution; in a few days he was quite well, and continued so.

Betsy O—, aged five years, came to me

Hosted by Google

with her face covered with large flat pimples, moist and crusty. I gave her one globule of *Mercury*, 12th dilution. The following week she came to me; her face was much better, but far from well. On examination I found the same eruption on the back of the head and other parts. I gave three doses of *Petroleum*, consisting of one globule, 30th dilution, to be taken every seven days. She came October 2nd, 1837, and was quite cured November 4th. The child lived at a distance too great to allow her to walk it easily, so that I gave three doses of *Petrol.* instead of the one I would have given, could I have seen her easily. I have no doubt that less medicine would have cured her.

H. C.

THE MEDICAL OFFICERS' REPORT OF THE EXETER HOMŒOPATHIC DISPENSARY FOR THE YEAR 1851.

	Remaining Jan. 1, 1851.	Admitted in 1851.
Cured and much benefited	36	219
No change	5	20
Dead	—	5
Results unknown	—	33
Remaining under treatment ..	—	66

In presenting to the subscribers the above table of cases treated at the Dispensary during the past year, the Medical Officers beg to offer the following explanation of the results:—

In comparing the number of cases "cured and much benefited" with those admitted under treatment, it must be particularly borne in mind that the great majority of patients were suffering from long-standing chronic diseases, for which they had been under much previous treatment at the allopathic public institutions or elsewhere, and that they had only resorted to the Homœopathic Dispensary *after they had tried all other means in vain;* viewing the table above in this light, the results cannot but be considered in the highest degree satisfactory, and manifest in the most striking manner the efficacy of the treatment. The five deaths occurred among patients admitted in the last stage of pulmonary consumption, and young children in a dying state when first seen. In the thirty-three cases where the results were unknown, the patients, after attending once or for a week or two, did not appear again, and, as they are generally most anxious to avail themselves of every opportunity of presenting them at the Dispensary, it is but reasonable to suppose that they ceased their attendance because they no longer felt that they required medical aid.

In consequence of the demand for subscribers' recommendations greatly exceeding the number issued, the committee, in January last, authorized the Dispenser to dispose of them to the poor at 2*s.* 6*d.* each, and to a very large extent have they availed themselves of this boon—thus proving the estimation in which this Institution is held by those for whose benefit it was established. The Medical Officers have also arranged to attend at the Dispensary four days in the week.

Dr. Guinness, on Mondays and Fridays, at ten o'clock.

Mr. Boughton Kingdon, on Tuesdays and Saturdays, at the same hour.

It is earnestly requested that the subscribers and friends of the Dispensary will strenuously exert themselves in behalf of this truly useful Institution, in order that the benefits may be extended still more amongst the suffering poor; numbers of whom are most anxious to avail themselves of its aid, but, unable to procure the recommendations, are debarred from its advantages.

Arthur Guinness, M.D.
Boughton Kingdon.

Exeter, January 21, 1852.

Miscellaneous.

Remarkable Recovery.—We find the following in *Le Siècle*:—"A religious custom has just prevented a person from being buried alive, and, singular to relate, this is the second time the same thing has happened to the same person. About ten years ago, Eulalie B—, then aged three years, daughter of honourable tradespeople in the Rue Montmorency, was attacked with typhus fever. After a fortnight's sickness she appeared to expire, and her parents, as a relief to their sorrow, left the house, leaving two of the girl's aunts to superintend the funeral. As the family belonged to the reformed religion, it was resolved, in compliance with the usual custom, to wash the body before placing it in the shroud. Whilst the water was warming, one of the aunts proposed that it should be made quite hot, and that part of the foot of the deceased should be placed in it. This was done, and the two females, to their surprise, fancied that they heard a slight sigh. They thereupon began to employ friction on different parts of the body, and succeeded in restoring the child to life. The girl continued to enjoy good health until recently, when she was attacked with brain fever, and, after suffering for some time, appeared to die. A physician declared her dead, and signed a certificate for the interment. One of the aunts watched the body in company with a nurse. The aunt having stated in the course of conversation the singular circumstance that had previously occurred, the nurse recommended that the proof of hot water should be again tried. The leg of the girl was accordingly plunged into hot water. This produced a similar result, and the girl recovered."

SUBTLE AGENTS AS ILLUSTRATIVE OF MEDICINAL ACTION.

Read by H. P. Gatchell, M.D.,

Before the Ohio College of Homœopathic Physicians.

The study of nature ever leads to the recognition of subtle agents, and the further investigation is carried the more deep is the conviction that only subtle fluids act, while the grosser combinations of matter are but acted upon; and that the more subtle the more active. Light, caloric, and electricity are universally diffused, and universally active tenants of the most opaque bodies; while Baron Reichenbach has recently demonstrated the existence of a new element, *odyle*, especially interesting in connection with organized bodies and the semi-organized crystal.

Nor are agents weak in proportion to their subtleness, as one accustomed to consider only massive bodies and mechanical forces might suppose; since the force of crystallization, capable of rending mighty masses of rock, and that of gravitation, which controls the stellar orbs, both belong to this class, and light itself, infinitely attenuated as it is, would prove destructive to the most durable bodies, if its influence were exerted upon them without intermission. And it certainly indicates a great lack of sound philosophy, a gross deficiency in perception of analogies, a very rude idea of power, that physicians of the antiquarian school should have medicinal influence so inseparably allied in their minds with massive doses.

When not a vital operation can be traced to its ultimate cause; when the prime agent of chemical affinities is as hidden as the human spirit itself; when gravitation, which controls the sun as perfectly as a mote, has never been searched out, it is superficial and unreflecting to deny to medicines the possible possession of interior powers, in virtue of which they operate, to modify the manifestation of the vital powers—powers which we can recognise through no chemical or mechanical means. Scrutinize the most active medicine with the microscope, weigh it in the most delicate balance, reduce it to its chemical elements, the medicinal force still eludes the search, still escapes detection. Nor can we predict in advance of physiological experiment the medical properties of any substance, whatever familiarity we may have with its other qualities. Hence we find Liebig alluding to experiments upon chemical relations of the constituents of the body, in the following terms:—"By pursuing this method, useful remedies or modes of treatment might by accident be discovered; but a rational physiology cannot be founded on mere re-actions, and the living body cannot be viewed as a chemical laboratory." And again:—"A diseased condition cannot be made to disappear by the chemical action of a remedy."

Beautifully illustrative of subtle forces, intimately associated with vital processes, and most subversive of the views of the antiquarian school—hence, for the most part, unceremoniously rejected by them—are the recent discoveries of Baron Reichenbach. His investigations prosecuted according to the most rigid methods of the physical sciences, by an experienced philosopher, are placed on too firm a basis to be disturbed by doubts or sneers; but like other recent treasures of novel character, snatched from the not unwilling hand of nature, the impress of time is needed to sanctify them, and to lend them the force of authority.

Not to attempt any detailed survey of the rich field which the Baron has wrought, it is sufficient for our present purpose to state that *odyle* is a universally-diffused, most subtle and most mobile element. It is radiated abundantly from the human hand, from crystals and from magnets, and is the medium of the operations grouped under the name of animal magnetism. Testing its qualities upon highly sensitive nervous systems, the Baron found that odyle plays an important part in the action of inorganic substances on the human system, in the sympathetic and other influences of one person upon another, and in the physiological changes occurring in each individual organism.

Through this medium an uneducated girl was able to arrange an immense va-

Hosted by Google

riety of substances according to their electric states, by her feelings alone. In the language of the Baron:—"It is surpassing and in the highest degree worthy of notice that a human being, a girl perfectly ignorant of such things, is capable of classifying with certainty and accuracy, according to one of their innermost, profoundest, and most obscure peculiarities, their electro-chemical character, all the substances of this world, without seeing them, and by mere sensation.

Certainly it is surprising, viewed from the stand-point of half a century ago—it is incredible, if we regard the universe as made up merely of forms, weights, and magnitudes. But in the light of numerous modern developments, in the light of the philosophy of subtle forces, in the light of spiritual existence, it is no more incredible than that man thinks and feels, and it is only surprising because new. It is, however, matter for rejoicing that one like Baron Reichenbach, of deservedly wide reputation for knowledge, judgment, and rigid induction, has had the philosophy to pursue these researches, the clear-sightedness to perceive, and the courage to announce their results. The world will, with such aid, be prepared in time to recognise the true doctrine of medicinal action.

Thus the odylic force could not only be transmitted, like electricity, along a wire from the hands of the Baron to the persons of his subjects, but it could be communicated to both solids and liquids, so as to be retained for a time, and from them exert its peculiar influence on the subject. Thus an odylised glass of water can be selected by a sensitive from any number of glasses not thus charged; and whatever other relations to the system any substance might have, the odylic would be found superadded after the application of the operator's hands to the substance,

But experiments have been made more intimately associated with, and more fully illustrative of medicinal action, than those of Baron Reichenbach. In these experiments, medicines have been found to exert their specific influence by means of a current of electricity passed through the medicines to the person of the patient. In this way *Ipecacuanha* will be found to produce emesis, *Colocynth* catharsis, and so of all drugs and all possible influences. Now, since electricity is uniform in its nature, and retains its specific character after passing through the drug, the superadded medicinal influence can only arise from a new force combined with it in its passage; but this is not communicated in virtue of any transmission of the substance of the drug, since this remains undiminished. It must therefore be that the medicinal influence proper to each drug resides in a subtle, intangible force, inhabiting among the atoms of the drug.

A more convenient experiment, expressive of the same principle, may be made without the agency of electricity. Let a sensitive person hold a drug in his hand carefully enveloped in paper, and he will find its medicinal influence still exerted upon him, and this, though no odour is able to pass through the folds of the envelope. *Opium*, *Lobelia*, *Capsicum*, *Aloes* will narcotise, vomit, irritate, and purge; nor is the inodorous *Tartar Emetic* less active than the odorous *Opium*. In this experiment we have the medicinal force not transmitted along a current of electricity, but directly radiating its influence from the drug to the nerves, proving that medicines are always giving off such an influence, and that it is only necessary to its perception that a sensitive system should be placed in a proper relation.

But the purely dynamic character of the medicinal influence can be demonstrated by a more decisive experiment. Let a carefully-closed glass phial be substituted for the porous paper, and upon a sensitive subject the result is equally satisfactory, and more conclusive; since in this case it is quite impossible that any of the substance of the drug can have passed through the enclosing material. This experiment demonstrates that the medicinal influence, like the luminous, electric, and odylic, can pass through solid bodies. If any one objects that he does not know how such influence can pass through such a body, one might with propriety inquire if he knows how light, electricity, and odyle pass. The question of fact must always precede the question of cause or method; and it is proper always to settle first the reality of a phenomenon, and then to inquire into its relations. No philosopher will deny a result because he does not understand the mode. Minds undisciplined in philosophical pursuits betray this weakness, and even those who have acquired considerable reputation in science, through the exercise of a vigorous memory, with perhaps fine powers of perception, often vie in this with the rude and ignorant; but such lack powers of reflection, however much they may be distinguished for those of perception.

Does any one inquire how numerous are such sensitives as would become proper subjects of these experiments? I reply that Baron Reichenbach estimates them at one-third of the population of cities. And

Hosted by Google

the most delicate of his experiments require a degree of sensitiveness as great as those which I now propose; but among sensitives, perhaps not one-quarter are proper subjects of these most delicate ones. It should be borne in mind that susceptibility exists in every degree, from that which in Reichenbach's experiments could respond to the influence of sulphur through forty feet of wire, to the hardy barbarian, who is scarcely sensible of ordinary changes of temperature. For myself, so numerous and varied have been the experiments of this kind (which I first saw attempted by Dr. Buchanan) in which I have participated, that I consider the relations which I have stated to be as well demonstrated as those of electricity itself. That they should be doubted, is no more strange than that when the secretary of the Royal Philosophical Society read before that learned body a letter from Franklin, detailing his then recent discoveries in electricity, the dignified assembly greeted the reading with a roar of laughter. The progress of events since that time renders laughter less prudent; and it is now pretty well ascertained that folly is more prompt with a sneer than wisdom.

The step is but short from experiments with drugs to those with attenuated medicines; I therefore endeavoured to make my experience in the one contribute to the producing of valuable fruit in the other. I have tested the influence of attenuated medicines by such experiments as left the question of their efficiency at rest. I have repeated these experiments on various sensitive persons, and taken such precautions as were necessary to exclude error. Among the most interesting was a series which I tried upon Dr. E—— T——, then a student of medicine. I knew this gentleman to be intelligent in medicine, as well as possessed of a highly impressible constitution; he promised therefore to be an excellent subject.

Accordingly, having mixed a few drops of medicated alcohol with half a glass of water, I gave him the water thus medicated, in teaspoonful doses, repeated it often enough to maintain the medicinal action, and leaving him to state the effects, with but few and those not leading questions. In my first experiment he gave a correct outline of the recorded pathogenesis of the medicine tested, remarking, after some twenty minutes, that he perceived a metallic taste and a styptic effect on the tongue, and concluding with expressing the opinion that the substance used was copper. It was *Cuprum*, fourth dilution.

In the second experiment he gave, as before, a correct outline, complaining especially of pains in the stomach and internal burning heat. He noticed also a corrosive effect in the mouth, and concluded with the opinion that it was arsenic. It was *Arsenicum*, fourth dilution.

In the third experiment he was again successful as to the symptomatology, but said nothing about the taste. On being questioned as to this, he described the taste as being peculiar, but faint and insipid. A remarkable feature of this experiment was, that while it was in progress he observed that his eyes were singularly affected, and turning to a fellow-student who had accompanied him, he remarked that his sensations were like those which the professor of surgery had that day described in connection with the disease on which he had lectured. The disease was fungus hæmatodes, and the medicine was *Carbo animalis*, sixth dilution. It is unnecessary to urge upon any homœopathist the striking accuracy of this result or the delicacy of the experiment. Had but one such an instance of accuracy occurred, we might set it down as accidental. A series of consecutive accurate results does not occur by accident; it indicates law, and all minds that have passed beyond the immature stage of childhood should be prepared to appreciate it. Numerous experiments, prosecuted with a variety of articles of different degrees of attenuation, from simple tinctures to the twenty-fifth dilution, demonstrate the influence of attenuations upon the sensitive.

This constitutional sensitiveness is analogous to the occasional sensitiveness developed by disease. Indeed the constitutional sensitiveness can hardly be considered as a normal state, and is generally found connected with some form of debility. It is an old maxim, that irritability is proportioned to debility.

But the circumstance which affords the most singular evidence of the most wonderfully subtle character of the medicinal influence occurred accidentally in the course of my experiments. While Dr. T. was holding the glass containing the medicated water, grasped by the thumb and fingers of each hand, with the tips of the fingers in contact, he accidentally separated them, he perceived at once a sharp thrill and a distinct medicinal effect. On restoring the contact of the fingers, the vividness of the influence ceased, on separating them it was renewed; and thus, as often as he produced or interrupted the contact, was

Hosted by Google

the influence suspended or renewed. The possibility of all this is naturally suggested by that experiment of Reichenbach, in which it appears that the right and left sides are in opposite odylic states, and that a current perceptible to the sensitive subject can be produced by joining the hands.

It appears from the above-stated experiment that the odylic like the electric current is capable of conveying the medicinal influence.

When the fingers of Dr. T. were in contact the odylic current passed directly from hand to hand; when they were separated it passed through the glass, bearing along with it the influence of that peculiar property which substances have of operating upon the physiological forces, and which, like the interior principle of odours, is but imperfectly understood.

I found but little difference in Dr. T.'s impressibility to diluted medicine, whether it was brought in contact with the tongue and stomach, or its influence was propagated by the odylic current.

I have not entered into much detail in regard to these experiments, because they are of that simple character which any one can at any time try for himself. To those who may attempt them, I would recommend to try, at first, those requiring the least degree of impressibility—such as holding the more active drugs in the hand. They should bear in mind too, that the result will be striking in proportion to the sensitiveness of the subject. They would do well to remember also, that the number of persons capable of conducting philosophical experiments, especially of the more delicate kind, with success is but small; otherwise philosophy would not advance with tardy steps. It is rare enough to meet with those who can appreciate such experiments when made; much more those who can make them.

Experiments of this kind are especially interesting to the homœopathist, as, independently of their general philosophical character and the rich illustrations which they afford of the finer susceptibilities of the human constitution, they afford a ready means of obtaining an outline of the pathogenesis of any drug. I am aware that we can never dispense with those protracted provings, which afford us a knowledge of the more thorough effects of medicines upon the health; but it is sometimes convenient to make, with reference to a particular case, a partial proving, when time is not afforded for a more full one. It should also be remembered that the more searching effects can be obtained upon the sensitive as well as upon the unimpressible, and that too in a time short in proportion to the sensitiveness of the subject. I propose publishing, under the head of suggestive provings, some results which I have obtained from native drugs. I do this both for the value of the pathogenetic outline thus obtained, and for the sake of calling attention to the native materia, in order that the accuracy of this class of experiments may be tested by comparison, and that others may be induced, by repeating them, to afford additional demonstrations of the subtleness of medicinal forces.

Reviews.

Chemical Record, and Journal of Pharmacy.

In the 30th number of this serial (February 7, 1852) there is an editorial article on the "Dénouement of Homœopathic Fraud."

The statement of this Editor is to the effect that homœopathy has destroyed itself within the last four months; he asserts that a *circumstance* has "*struck a death-blow* at the *foundations* of homœopathy, and *enlightened* the public on the matter of the absurd pretensions of the Hahnemannic empirics."

We say nothing of this extraordinary jumble of words, but proceed to the important circumstance of the not very enlightened Editor of the *Chemical Record.*

"Some time in the autumn of last year, a gentleman named Rutter succeeded in combining after some fashion, not very clearly made known to the public, and probably not well understood by himself, an instrument made of brass rods, silk, sealing-wax, and we do not know what else. Let us not be accused of unscientific vagueness in our description; we cannot understand the machine, and never met with one who could; moreover, as the instrument is now proclaimed by its inventor a failure, there is very little inducement for us to go deeper into the theory of its mechanism at this time."

The only truth in this statement is, that Mr. Rutter's name is Rutter, and we have to inform this editorial scoffer at homœopathy that Mr. Rutter began his experiments some months before the autumn of last year; that the instrument is very simple, and its mechanism is of such a kind that even the restored king of *Lagos* could make it out; and that its inventor has *not proclaimed it a failure*, but that his

Hosted by Google

faith in the reality of his experiments and in the value of his "machine" continues unabated.

"The machine, when made, was ushered into the world with all solemnity by the homœopaths, as a contrivance specially adapted for reducing the mystery of homœopathy to the level of the meanest understandings. Henceforth there would be no doubters; for science herself had come forward to proclaim the truth of homœopathy."

In answer to this paragraph we reply, that only very few, comparatively, of the homœopathists did believe that the "magnetoscope" would prove serviceable to homœopathy; that *not one* pretended that it was a contrivance for reducing the mystery of homœopathy to the level of the meanest understanding; that some few did hope, and some few hope still, that by this or some other instrument, contrived by this or some other inventor, science will show that the medicinal essence of medical substances does affect the human organism, independently of bulk and weight. Three homœopathic journals, at the onset, had articles in favour of the magnetoscope. In one of them Mr. Rutter and his experiments have been prematurely consigned to oblivion; in another there has been, since Dr. Madden's withdrawal of his favourable deductions from his experiments, strict silence; but in the third, the *Homœopathic Times*, the whole question of the odylic phenomena, and of Mr. Rutter's experiments, has been kept open.

"It will be necessary here for us to say, *in limine*, that, after all, the instrument was said merely to prove the power of small doses; leaving the proposition of *similia similibus* to stand exactly as it stood before."

This is not true; if the instrument can be proved to be trustworthy, it is as capable of proving the truth of the law, as "the power of small doses." In fact, one of Dr. Madden's original propositions was that he could by the magnetoscope prove the truth of the homœopathic law.

"A decillionth part of *Nux Vomica*, for instance, caused the index of the machine to move to the right; an equal quantity of *Belladonna*, to the left." Not true—see Mr. Rutter's pamphlet on "Magnetoid Currents."

We leave the editorial impertinence about Lord Belfast to his lordship to answer, if he will condescend to do so; but the Editor's account of the "explosion of the plot"—of the "kind friend of the inventor"—of "the deceiver publishing his deceit"—is altogether fictitious. The inventor still believes in his invention—the discoverer in his discoveries—the truth-seeker in what he believes to be the truths he has found.

Dr. Madden, who first made known Mr. Rutter's invention and its supposed applicability as a test of the homœopathic law, and of the homœopathic dose, and who himself made many experiments with the instrument, afterwards believed and believes that the delicate "machine" was not affected by the medicines, but was moved partly by the will of the operator, unconsciously exercised, and partly by muscular motion. Believing himself mistaken in his first views, he acknowledged what he believed to be error, and was as prompt in accounting for it as he was in enunciating what he thought to be truth, in the first instance.

"The real circumstances of the affair have been carefully suppressed by the homœopathic gentry, to the best of their ability. They have oozed forth, nevertheless; and one of the results of the publicity has been seen in the refusal of the first-class London publishers to have any further connection with the homœopathic imposture."

So far from there having been any concealment on the part of the homœopathists, the whole matter has been freely discussed, *pro* and *con*, in our columns; and the Editors of the *British Journal of Homœopathy* have declared, though the inventor has not done so, that the magnetoscope is a "failure." We are not aware that the first-class London publishers have refused to have "any further connection with the homœopathic imposture;" and if it should be the fact that others should follow the example of Messrs. Highley, it would be more from fear of the gall of the *Lancet* than from the "oozing out," that the magnetoscope had failed to prove the homœopathic law and dose.

In conclusion, we have to state that for every individual homœopath that has believed in the magnetoscope, we will engage to produce at least five allopaths who have so believed: so that, *mutatis mutandis*, belief in this instrument on the part of a few allopaths might be construed into an argument of the folly, fraud, and imposture of allopathy, if the mode of arguing adopted by the Editor of the *Chemical Record* were held to be legitimate. We wish him good digestion.

Ex pede Herculem: our readers may judge from this analysis of a review by one chemist, what is the real worth of the objections of other chemists.

Homœopathy in 1851. Edited by J. RUTHERFURD RUSSELL, M.D. Published by James Hogg, 4, Nicolson Street, Edinburgh; and R. Groombridge and Sons, 5, Paternoster Row, London.

THIS book, with an engraved likeness of Hahnemann, and an engraving of his monument at Leipsic, and containing the greater number of the articles, of a controversial character, in defence of homœopathy, which have appeared for some time back up to the close of last year, is published for half a crown.

It is expressly meant for the public, for the non-medical reader.

There is first the capital letter of Professor Henderson to Dr. Forbes; then follow some excellent remarks by the late Dr. Andrew Combe, who was one of the Physicians-in-Ordinary, in Scotland, to the Queen, and was for a while physician to King Leopold, by whom he was held in the highest esteem.

Then there is a paper of Dr. Rutherfurd Russell, wherein is shown that the "young physic" of Dr. Forbes, followed to its legitimate conclusion, would land the medical inquirer amid the certitudes of homœopathy, instead of the mere expectances of the expectant school.

We have next a caustic article on Medical "Toogoodism." We think the word a very happy invention, for it strikes off and brands—as "canny shepherds brand their seely sheep"—the class of dogmatic opponents, of whatever rank or calling, and of whatever age of the world, to any new truth or proposed reform, because they *will* prefer, whether from prejudice or from interest, the Canongate to Carlton Terrace — any venerable prejudice to any truth newly made known.

Then follow two papers on Colleges; and next the New Test Act—an admirable essay; and then his reasons for embracing homœopathy, by Dr. Ransford, the one-while pet of the Royal College of Physicians of Edinburgh, graced by that august and venerable body with a present of plate and a most laudatory inscription thereon, but soon after fiercely denounced, because, having arrived at mature life, and in the full vigour of his understanding, and in the exercise of his private judgment on matters of opinion,—a right that every Briton enjoys, from the Queen at her dining-table to the scullion in her kitchen at Windsor, —he adopted homœopathy.

Then we have fulminations against homœopathy, succeeded by homœopathy and allopathy.

There is an excellent analysis of the Brighton protest against homœopathy; and then comes the withering blight of the petals of the rose of Putney, in the shape of a letter from the Reverend Rector of Wickwar to Dr. Rose Cormack.

> "Pure Putney! it is sad to think
> A ruthless parson's pen and ink
> Should do such mischief, and disclose
> The canker in thy boastful Rose.
> For now of all its glory shorn,
> It can no more thy heath adorn;
> Decay is in its beauty found;
> Its petals lie upon the ground:
> And wags their sides with laughter crack,
> While Everest tickles Cormack's back."

Then we have the East versus the West. In the long run we back the West—Yankee-land against Hindoo-land.

There is a capital trial of the Triumvirate of Edinburgh—Professors Syme, Christison, and Simpson.

Then there is Dr. Russell's eloquent address at the Second Congress of Homœopathic Practitioners.

Then comes a lively description of a trip to Leipsic; the Hahnemann jubilee, and the inauguration of Hahnemann's monument in that famous city.

The proceedings are next given of the Town Council of Edinburgh in reference to homœopathy.

The second edition of this book should be called for in a month. It affords in one volume a vast deal of matter, collected with great pains and much discrimination. The year 1850 was the year of the foundation of Homœopathic Hospitals; the year 1851 of a concerted persecution of the homœopathists—and this volume is the record of much of that persecution. Our readers will find in it much to interest them, and not a little calculated to rouse their energies, and awaken their sympathies in behalf of homœopathy.

THE

HOMŒOPATHIC TIMES.

SATURDAY, FEBRUARY 28TH, 1852.

WE have lately received the most gratifying accounts of the progress of homœopathy in various regions of the earth—in the East and West especially.

The fact of the establishment of a Homœopathic Hospital in Calcutta is very important; and not only some of the European medical men, but the native doctors, who are so well acquainted with

Hosted by Google

their indigenous remedies, will be, as a matter of course, induced to make inquiry into our medical Reform.

In the Brazils and British Guiana, in Dutch Guiana, and other parts of the continent of South America, homœopathy has been introduced; and in several of the West India islands it is being practised.

Wherever public charities are established for the treatment of the poor on the homœopathic principle, and with the homœopathic practice, every individual favourable to homœopathy should, according to his or her means, assist in the work, and be ready to say to poor sufferers,—

"Auxilio tutos dimittam, opibusquo juvabo."

The homœopathic literature should also be frankly and generously supported; and among the writers in that field, the journalists should be assisted with information and materials. But in this, as in other departments, the proprietary as well as the editorial "We" have often to ask—

"Nos aliquid Rutulos contra juvisse nefandum est?"

The period is fast approaching for the celebration of the Annual Meetings of homœopathists, in connection with the public homœopathic charities. In addition to the three existing hospitals, we believe it is hoped that preparation will be made for the inauguration of one in Edinburgh. We conceive it to be very important that there should be one in that city and another in Dublin; because each of these cities is the seat of a renowned medical school; and in each of them, but especially in Edinburgh, there has been a notable persecution, set a-foot by medical allopathists, of homœopathy and homœopathists.

The allopathic journals abound with offensive and irrational abuse of our method of practice—offensive from the language made use of, and irrational, because there is a positive refusal to receive any amount of evidence in support of the Hahnemannic practice, to which there is opposed the most obstinate dogmatism.

In some cases, *speculum-mechanicians*, who have no great knowledge of general medicine; in others, reviewers, past or present, who have never had much practice; in others, chemists, who also have never had any considerable experience in the treatment of disease; in others, druggists—have been our assailants. We must add, that among those who have authoritatively pronounced against homœopathy are to be found men of fame and experience; but these have never made any *bonâ fide* trial of homœopathy.

Notwithstanding, our medical Reform is making great progress; and it is important that our public should be furnished with details of the rise and establishment and progress of homœopathy in these realms.

We are glad to find that a sketch, at least, is about to be given of its introduction into England.

That we give no hospital and dispensary reports, week after week, is not our fault; for we have repeatedly asked for them.

We are mortal, and liable to error—but we defy the gainsayers to deny us the character of endeavouring, to the best of our ability, with such means as have been at our disposal, to popularise homœopathy, and bring it home to the public as an established fact.

Our chief support, heretofore, in a difficult and sometimes irksome, in a toilsome and sometimes painful labour—not always a labour of love, except that we have always loved the cause of Hahnemann, which is the cause of humanity—has been the conviction of our honesty of purpose, of the unselfishness of our aims, and of our entire integrity throughout.

Correspondence.

ALLOPATHIC PRACTICES, PROVING HOMŒOPATHIC PRINCIPLES.

To the Editor of the Homœopathic Times.

SIR,—The following fact has just come to my notice, which tends, in a striking degree, to confirm the doctrine of Hahnemann as propounded in his "Organon," axioms 244, 246, 279, and 280,] with their accessory notes, wherein he shows the propriety of small doses, when *homœopathically* administered, and the

Hosted by Google

injurious effects of giving large doses of medicine, when homœopathic to the disease.

In treating the agues among European soldiers living in marshy countries, allopaths have discontinued the administration of *Quinine*, on account of the very unpleasant symptoms, headache, vertigo, etc., which it always leaves behind, after the patient is recovered; and they have now commenced to administer the *Bark* in powder, instead of the *Quinine*, imagining, as they *sagely* fancy, that the different other ingredients which the *Bark* contains besides the *Quinine* will counteract these injurious results, not considering that it is their wilful ignorance of the homœopathic principle explained by Hahnemann, and above referred to, which causes these unpleasant consequences, namely, giving doses of a homœopathic remedy—as *Quinine* most certainly is in ague—in too large and too often repeated doses, whereby the *vital principle* is provoked and stimulated to an undue action, instead of merely assisting it to throw off the morbific influence, which excites and continues the ague, in a gentle and quiet manner, by administering two or three small doses of the remedy. But neglecting this, through their stupidity in not investigating the action of *China* on the healthy system, they establish in the patient the pathogenetic symptoms of the drug, and consequently cannot account for these—to them—mysterious results.

Since they have discontinued the *Quinine*, these purely pathogenetic symptoms, headache, vertigo, etc., have considerably disappeared, which can only be attributed to the fact of administering the remedy, *i.e.* the *Quinine* contained in the *Bark*, in small doses, and consequently more in consistency with its homœopathic properties.

If any fact be calculated to induce allopathists to investigate the unstable, unphilosophic, and untherapeutic mode of their practice, one would naturally conclude that such facts as these ought to make them reflect, and hesitate to continue their wilful condemnation of a system of therapeutics of which they are altogether ignorant.

I am, Sir, your obedient servant,
HUGH HASTINGS, M.D.

Cheltenham, Feb. 9, 1852.

To the Editor of the Homœopathic Times.

SIR,—If, instead of being a homœopathist, I was still in the ranks of allopathy, I should certainly now be forced—better late than never—to examine into and explore the arcana of a system which has drawn forth such volumes of unsparing abuse from allopathic journalists and speakers.

I would reason thus: there must surely be something in this new creed, else why be at such pains to write and talk it down? since if it were the absurdity they strive to represent, it must fade away before the searching light of truth—

> "And like the baseless fabric of a vision,
> Leave not a rack behind."

I think it was O'Connell used to say "he was the best-abused man in Europe." In like manner, we may affirm that homœopathy is the best-abused system, if not in Europe, at least in England, and we, its disciples, come in for a plentiful share of ugly names. It is fortunate that hard words break no bones, else would every one of our bodies be comminuted. Indeed, so trifling is the danger compared with the loudness of the threats, that the garrison, "few, but undismayed," can look even with amusement at the incongruous train of battering artillery pointed against our fortress, which—a moral Ehrenbreitstein—frowns defiance.

"Full of sound and fury," and pre-eminently first, is that great gun, the *Lancet*, whose discharge produces infinite smoke and noise, but none of whose shot, to my perception, "has made a breach in the battlement;" indeed, being formed of a base metal, full of flaws, it is likely soon to burst from an overcharge. I have already observed those who serve it are frightened by its recoil. Next is seen that polished brass piece, the *Medical Times*, less formidable in appearance, yet "willing enough to wound;" but its balls reach our ramparts so nearly spent, as to do little mischief. Then the *Monthly Journal*,, a heavy mortar from which Professor Simpson recently launched a coarse shell, crammed with futile assertions, which burst harmlessly in mid-air. The *Pharmaceutical Journal* follows in the wake, loaded with a more silicated detonating powder, and endeavouring to press unwilling chemistry into the service against us.

What shall we say of the speeches enunciated at sundry provincial meetings by members full of wine and wrath, and of the smaller fry of medical periodicals? Methinks they may be compared to flying artillery, more for show than use. So desperate indeed are allopathic efforts to extinguish us, that they have condescended to enlist the buffooneries of *Punch*, whose wit utterly forsakes him when he attemptsto be jocose at the expense ,of homœopathy.

It is really admirable to observe the marvellous unanimity on *this subject* of a profession united *in nothing else*. Homœopathy is condemned as a pestilent heresy by men who, being wholly ignorant of its principles and practice, must, forsooth, be competent judges. Let them but test it in an honest spirit, and full sure I am, many who came to scoff will remain to practise in our ranks. But they may depend upon this, that neither the "*incredulus odi*" of the sleek self-satisfied practitioner, who is perfectly content with things as they are, and vouchsafes us only a sneer, nor the one-sided assertions of speakers, who ingeniously, perhaps, but not ingenuously, parade long rows of infinitesimal calculations, throwing dust into the eyes of the hearers, but totally suppressing the admirable principle on which our medicines, be the doses large, small, or even infinitesimal, are administered, can long prevent the public from recognising the superior value and safety of homœopathi

Hosted by Google

therapeutics, and finally adopting them in preference to the thousand and one theories of the old system, that wondrous piece of patchwork, over which solemn Professors seek to throw the venerable cloak of antiquity, and thus to conceal all defects and incongruities.

Let Doctor Simpson ride his own special hobby as often as he pleases, we do not object. When he has studied homœopathy (as Dr. Russell sensibly observes), we shall be glad to have his opinion of it, but not till then.

We know Mr. Syme to be an able surgeon, and if we were so unfortunate as to require an operation, would place ourselves in his hands with all confidence; but we are not aware what qualification he possesses for pronouncing a damnatory judgment on homœopathy. "*Ne chirurgus ultra scalpellum.*"

Let the *Lancet* rave on. We really feel for it, knowing that self-preservation is the first law of nature. If reckless assertions, coarse invectives, and frantic denunciations were passports to success, *it* must succeed.

To the public we would say, surely it is better to cure patients by minute doses, which do no injury at the time of taking, and leave no sting, than to subject them to massive and severe doses of, in many cases, deleterious substances, which, if life be preserved, often entail grievous sufferings and embitter their after years.

To our medical opponents we repeat, give us, or rather our system, a fair trial, and then condemn if you can; but let not monstrous statements, unsupported by a single fact, be paraded against us as proven truths. By our acts, by our success in encountering disease, we are willing to be estimated, not by the prudent swervings of our chariot-wheels from the deep and dangerous ruts which mark and mar the road of "Old Physic."

I am, Sir, your obedient servant.

February 5, 1852. C. C. T.

To the Editor of the Homœopathic Times.

SIR,—I am much surprised that, as the avowed organ and champion of homœopathy, you have not noticed, and that at some length, a matter very seriously affecting the whole body of homœopathic practitioners. I now beg to call your attention to the subject, viz., the draft of the new bill relating to the profession, which is likely to be introduced into parliament the present session. One of the clauses in that bill, as reported in the *Lancet* a week or two back, provides for the expulsion of medical men "guilty of irregular practice."

The *Lancet* is pretty quiet upon homœopathy just now, and no doubt with the object of quietly smuggling that bill through parliament in its present form.

Now I do not believe that anything will actually be done in the present session, because our profession are divided into so many sects and varieties of opinion, that I verily believe no minister would legislate for them; at the same time, it behoves us to be upon our guard, and take steps to oppose the obnoxious clause.

I have the honour to be, Sir,

Your obedient servant,

A PRACTITIONER.

Manchester, Feb. 9, 1852.

[We believe that the Association for the Protection of Homœopathic Students and Practitioners has undertaken to watch the bill our correspondent alludes to; and no doubt steps will be taken to vindicate homœopathy, and to put homœopathic practitioners in their right position.—ED.]

CASES BY GEO. STRONG, M.D.

RAPID RECOVERY FROM A FALL.

January 2nd, 1852. Alfred G—, a fine young man, of five-and-twenty, a gardener, was tying a rope around the stem of a pine about to be felled, having previously cut away the principal roots, swayed by the wind, the tree was falling with him, and he instinctively dropped to the ground. He fell upon the sward, from a height of not less than twenty-one feet, the lower part of the *sacrum* receiving the blow, while the trunk of the tree fell beside him, without inflicting any farther injury. It seems he lay unnoticed for a considerable time, being quite unable to move; this was about noon. When I saw him in his bed, whither he had been moved with much suffering, an hour after the accident, he was unable to pass any water; he seemed in pain, and completely prostrated and faint; he could not move or turn in bed without the greatest agony in the loins, *sacrum*, and *ossa pubis*. No fracture could be detected; pulse feeble and slow. *Tincture of Arnica*, twenty drops, of the 3rd dilation, in eight ounces of water—a teaspoonful to be taken every four hours; a compress moistened with the same to be applied to the *sacrum*, and renewed every two hours.

3rd. Soon after the second dose of the *Arnica* had been taken, he slept for three hours. He slept again the first part of the night, but awoke about four a.m., in great pain, particularly in the abdomen, which was tender to the touch; the loins and *sacrum* seem considerably easier; a troublesome, dry, and violent cough has come on. Five doses taken. Apprehending an aggravation, the medicine was discontinued until the evening.

4th. Two doses of *Arnica* taken; had a bad night from the incessant cough; abdomen very tender, but he has been able to stand, and to pass water; excellent appetite.

On the 5th he was up and walking about the garden.

8th. He came up to my consulting-room, complaining of the same constant cough. As he was of a very irritable temper, I decided upon *Nux Vomica* 12, every six hours, until the pain should abate.

10th. The first dose, he said, cured the cough completely; but he has been troubled the last twenty-four hours with a painful, ineffectual desire to urinate; sometimes a little

Hosted by Google

urine flowed *guttatim*. He seemed to be much distressed, and asked to have an instrument passed; however, this new symptom being clearly an aggravation from the *Nux Vomica*, of which he had incautiously taken six doses, he was ordered a few papers of unmedicated *Sugar of Milk*.

The next day he reported himself quite well, and able to urinate freely. He can dig, but cannot wheel a barrow yet, or weed, without some uneasiness in the back.

NEURALGIA CURED BY BELLADONNA.

February 24th, 1851. M.s. J. D—, about thirty years of age, the wife of a builder, thinks she is *enceinte;* is a delicate-looking person, and subject to headache, with giddiness. She has been affected with neuralgic pains for the last four or five years, they were but slight at first. For the last four days she has suffered from a rheumatic pain of the entire right side of the head; it is a continual aching, with occasionally an acute shooting; it seems to follow the course of the infra-orbital nerve towards the ear; it does not affect the nose; the face flushes. She is worse by night, and thirsty; the pimple on her cheek is owing to some local application; she fancies that a bright light brings on the paroxysms. *Belladonna*, four globules, of the 6th dilution, in an ounce of water; a teaspoonful every three hours.

26th. Had some relief the same evening, and slept about midnight; the pain has been more endurable ever since; no more flushes of heat; the pain has now shifted towards the ear, and resembles a dull earache; is still thirsty. *Belladonna*, three globules, of the 30th dilution, dissolved in water; a sixth part every eighth hour.

March 3rd. For the last three days she has felt quite well, even at night; there was an increase of pain at first, and particularly of the giddiness. Yesterday, a thick red rash covered the face, with but little itching; it is now gone. The cure has proved a permanent one.

PRESTON HOMŒOPATHIC DISPENSARY.

CASE I.

CONTINUED FEVER, ENTERITIS, BRONCHITIS.

September 16th. H. B—, æt. 20, seen to-day for the first time. Reported a week ill, and to have commenced with an attack of shivering. Her father, to whom she had frequent access, is only now convalescent from fever. Present state: head rather hot, with pains in the forehead, aggravated by the sitting posture; tongue dry, red, glazed; abdomen rather tense; thirst; pulse 90; bowels regular; sleep disturbed; raved last night.

Bell. 3.

17th. Passed a better night, without raving. Scarcely any headache to-day; complains chiefly of pains across her loins and in her feet. No motion from the bowels since; urine high coloured; abdomen less tense.

Bry. B.

18th. Her head feels confused. Tongue dry and red; constipation.

Nux Vom. 3.

19th. Bowels moved twice; feels easier since; less thirsty; abdomen more soft; pulse 90.

Continue *Nux Vom.*

20th. Slept about three hours last night. Head still confused; pupils dilated; she is averse to light. Some tenderness of abdomen on pressure; tongue white at the edges; red and fissured at the centre and tips; craves cold water.

Bell. 3; *Nux Vom.* 3, alternately.

21st. Increased debility; tongue more foul and cracked; had bilious vomiting in the night; bowels moved three times; abdomen more swelled; winces much under pressure. Slept for three hours. Pulse 108.

Bell. 3; *Bry.* B, alternately.

22nd. Diarrhœa has set in; had six watery motions since last report; tongue same; abdomen same; aversion to noise; respiration quickened; moaning; little sleep since; pulse small, 108, with tendency to rise.

Acon. i.; *Arsen* 3. Warm stupes to abdomen.

23rd. No material change; says she has pains all over her.

Arsen. 3; *Bry.* 3.

On account of her extreme debility at this stage, I was forced to order her a little wine.

24th. Nearly the same. Had about ten fluid stools since last visit; some broken sleep.

Continue.

25th. Is still purged, but not so frequently; has mucous vomiting and thirst; pulse 108.

Arsen. 3; *Rhus Tox.* 3, alternately.

27th. Rather better; slept more last night; less purging; abdomen less tense.

Continue.

October 1st. The stomach is now free from disturbance, and the motions are less frequent and more consistent. Her tongue is rather more clear, but still very sore and fissured. Omit wine and substitute beef-tea.

China i.

6th. The diarrhœa having nearly ceased, I had hoped my patient was over the worst, but a distressing attack of acute bronchitis now came on, with bloody sputa and severe lancinations through the chest. Respiration laboured; countenance expressive of extreme anxiety; debility excessive; pulse 120; sleep nearly lost. This was met by *Bry.* B, and *Phosph.* B, with *Hyosey* i., for the racking night-cough, the others being given alternately throughout the day. The more acute symptoms were removed in about a week, and my report of October 18th shows the chest to be free from sonorous râle; loose cough, with copious white sputa; general improvement; much less thirst; tongue moist, and its fissures healing; motions natural; pulse 108.

China A; *Phosph.* B.

24th. Is not so well, in consequence of

Hosted by Google

having taken indigestible food, tongue white; nausea; bowels relaxed.

Puls. B.

27th. Is going on well; tongue quite clean; appetite much improved; cough relieved.

China A.

31st. Convalescent.

In this severe case, which I would term one of gastric fever, supervening after exposure to typhus contagion, I am of opinion that stimuli could not have been dispensed with, and that our remedies, admirable though they be, must have been over-tasked without these adjuvants. This is, I am aware, a disputed point with homœopathists; but, after all, it must be left to the judgment and experience of each practitioner when to give and when to safely withhold.

2. CATARRHAL OPHTHALMIA.

E. A—, æt. 6. Conjunctiva of both eyes injected; eyelids much swollen, and wholly closed; purple swelling under the eyes.

Bell. B; *Merc. c.* i., alternately.

Very much improved, after three days' treatment; opens the eyes fully, and can bear the light; the œdema of the lids is quite gone. For slight remaining redness of conjunctiva,

Sulph. 6. at night.

3. HOOPING-COUGH.

October 4th. H. G—, æt. 3, ill about a fortnight; a full, flabby child. Head extremely hot; face flushed; considerable dyspnœa; tongue foul; appetite impaired; sleep disturbed; the cough occurs in violent paroxysms.

Bell. 3; *Dros.* 3, alternately.

20th. Is very much bettur, both as to the cough and his general state of health.

Continue *Dros.* 3.

This case went on improving, and soon ceased to require medicine.

4. CHRONIC CEPHALALGIA.

A. L—, æt. 42, complexion dark; habit bilious. Had been subject to intermittent headache, chiefly frontal, for many years. The pain usually occurs in the morning, and ceases or is mitigated in the afternoon. It comes on particularly when she is hurried, with a weight over her eyes, and dimness of sight.

Arsen. 3, morning. *Sulph.* 6, night.

By a short course of these medicines she was soon relieved, if not cured.

5. GASTRIC DERANGEMENT, PILES.

October 20th. C. H—, æt. 22, states that she has been ill fifteen months; complains of aching across her forehead, and increased heat of head; tongue dry in the morning; thirst at night; gums swollen; sometimes bleeding; appetite impaired; water-brash; soreness of the epigastrium; bowels much constipated; bleeding piles; urine thick, dark, sometimes milky; cough, with white sputa; cold sweats about the head; low spirits; debility; faintness; pain across the loins; sleeps badly; pulse 120.

Nux Vom. 3, twice a day.

25th. Considerably improved. Head relieved; appetite better. Her bowels have acted every day since.

Nux Vom. 3; *Sulph.* 6.

November 15th. Is looking well. She states that she is remarkably improved in every respect, and has not enjoyed such good health for a long time.

Omit medicine.

6. GASTRALGIA.

October 22nd. A. B—, æt. 25, states that she has been ill for two years. Complains of pain in both temples, with heaviness over her eyes, and dimness of sight. Foul tongue every morning; bitter taste; nausea; soreness at the epigastrium; worse after food; eructations of wind; dry cough, aggravating the gastric pain; leucorrhœa; pains across the loins and in the legs; the right leg swells in the afternoon; has much thirst, and liking for sour drinks. When warm in bed, a red itching rash breaks out on her skin.

Lycopod. 6, morning. *Puls.* B, night.

29th. Headache and gastric symptoms; very much relieved; is still subject to the rash.

Puls. B., morning. *Hepar s.*, night.

November 5th. Says she is quite comfortable now, although before she commenced homœopathic treatment, she could not remain at rest for five minutes at a time, on account of the severity of the gastric pains. The eruption is disappearing. Her appetite being rather impaired, I gave *Nux Vom.* 3, a dose daily, and *Hepar s.* at bedtime.

12th. Came to-day to announce her cure; her appetite being much improved. and the eruption having quite disappeared. She stated that she found the medicine of more value than any she had ever taken.

7. EPILEPSY.

November 15th. J. N—, æt. 60. Has been subject to fits for the last twenty-five years, which occur frequently, and prevent him from following his trade as a weaver. The attacks begin with faintness, followed by insensibility, and stertorous breathing; he bites his tongue, and awakes with cries; memory impaired; has shooting pains in the occiput of a stunning character, and sometimes in the forehead; constipation and urinary difficulty.

Lachesis 6.

22nd He exhibits a remarkable improvement. Has had no fit since. The noise complained of in his head is removed; his memory and hearing are more clear; sleeps much better; appetite improved; bowels regular.

December 3rd. Reported going on well. Is able to work, and considers himself twenty years younger.

8. APHTHOUS DIARRHŒA.

November 18th. Mary J—, æt. 15 months, was brought to me to-day in a wretched, almost hopeless state. Her mother says she has been ill for fourteen days with purging, vomiting, and excessive thirst; her stools are white; her tongue is covered with aphthæ, and her gums swollen.

Hosted by Google

Merc. c. 2; *Nux Vom.* 3, four times a day, alternately.

22nd. Very much improved; has no vomiting now; the aphthous spots are healing. She takes food better, and has rested well for the last two nights.

Merc. v. 3; *Nux Vom.* 6.

26th. A further improvement; the purging has nearly ceased. The cure was completed by a few doses of *Merc. v.* and *Sulphur.*

9. GASTRIC FEVER.

December 10th. Alice I—, æt. 6, ill three weeks. Head hot; countenance livid; tongue very foul, brown at the centre and edges, red at the tip; stools dark, slimy, offensive; urine thick and milky; much thirst; pulse 140; dry cough; starts in her sleep.

Arsen. 3, a dose three times a day.

15th. Is looking infinitely better. Her tongue is cleaning; she has less thirst; motions much less offensive and frequent.

Continue medicine.

17th. The amendment proceeds; her colour is very much improved.

Continue *Arsen.*

22nd. Nearly well; indeed the amendment was so great, that there was no occasion for bringing her again to the Dispensary.

10. SORE THROAT.

December 17th. J. G—, æt. 24. Chronic inflammation of the tonsils and pharynx, which he says he has had since his twelfth year. At present has a severe aggravation after taking cold, with some feverish symptoms.

Bell. 3; *Merc. c.* 3, alternately.

22nd. His throat is well. States that he found relief after the second dose.

11. DREGS OF SCARLATINA.

November 10th. Robert F—, æt. 2½. Had scarlatina three months since, and has been ailing from that time. He has a very large head; bloated cheeks, and enlarged abdomen. His face becomes very red and hot sometimes; he picks his nose; has much thirst, and is drowsy by day; has purging, six or seven motions daily, green and yellow; urine milky, becoming thick on cooling. He vomits frequently after coughing.

Bell. 3; *Cina* i., alternately.

15th. Improved; less purging and thirst; did not vomit since; much less cough.

Continue.

29th. Convalescent; has a most ravenous appetite. To take a dose of *Calc. c.* 6, and *Sulph.* 6, occasionally.

12. PNEUMONIA.

December 10th. John C—, æt. 40, had been subject to a cough for the three last winters; is now confined to bed by an accession of cold. Found him suffering from congestive headache, which was relieved by epistaxis coming on. Is hot and thirsty, with foul tongue; pulse 96; considerable dyspnœa; has an herpetic eruption on the upper lip.

There is a general dullness over the chest, and the breath-sound is obscure or altogether inaudible over the inferior two-thirds of both lungs.

Acon. i.; *Bry.* B, alternately.

11th. Passed a tolerably good night, and is much more easy to-day. Experienced relief very soon after taking the medicine. The headache is mitigated; pulse 96. Has a sharp stitch in the left mammary region on endeavouring to take a full inspiration; also pain under the left scapula. The lower lobes of both lungs are particulariy dull; sputa viscid, rust-coloured.

Continue medicine.

12th. Marked improvement to-day; oppression much relieved; pulse 72; tongue becoming cleaner; headache removed; had a comfortable night; cannot well lie on the right side. The lower lobe of the left lung exhibits most dullness, and a distinct crepitus is heard there about the centre of the seventh rib; sputa still rust-coloured.

Continue as before.

13th. Continues to improve. He can lie on either side to-day; his breathing is much more free; sputa tenacious, with only a trace of blood.

Continue.

14th. The chest is free from pain to-day; sputa less viscid, with a slight trace of blood. There is still dullness in the lower lobes of both lungs, but the respiratory murmur is extending, and much more audible.

Bry. B, and *Phosph.* B, alternately.

15th. A further improvement. Sputa free from blood to-day; tongue nearly clean; pulse 68; still some cough.

Continue *Bry* and *Phosph.*

17th. Convalescent.

CHELSEA HOMŒOPATHIC DISPENSARY.

ON New Year's day a Dispensary, bearing the above title, was established at the Commercial Hall, King's Road, Chelsea. Days of attendance, Mondays and Thursdays, at ten, a.m. Each patient is admitted on the recommendation of an annual subscriber of one guinea, or on the payment of half-a-crown a month. The Medical Officers of the Institution are Dr. Neville Wood and Mr. Daniel Smith, M.R.C.S.E.

Miscellaneous.

A UNIVERSAL GENIUS.—We announced lately the death of Johnson Jex, the learned blacksmith of Letheringsett. He was the son of William Jex, a blacksmith, and was born at Billingford, in this county, in or about the year 1778. In his boyhood he was sent to a day school, but he has often been heard to say, that although he was *sent* off to school for years, he never *went* three months in his life. He frequently walked to Foulshum instead, to look in at the shop-window of Mr.

Hosted by Google

Mayes, a watchmaker, who resided there. He did not learn to read or write at school, but taught himself afterwards. His mechanical talent manifested itself at a very early age. With regard to Jex's first experiment in clock-work, the following anecdote is related. When about twelve or thirteen years of age, a watch-maker went to his mother's house to clean her clock; Jex watched him while he took it in pieces, cleaned the works, and put them toge-ther again. No sooner had he left than the boy determined to try whether he could not do the same. He at once went to work, and com-pleted his task with all the skill and exactitude of an experienced hand. From that time he began to turn his attention to watch and clock-making, and eventually attained great excel-lence in the art. When about thirteen years old he became acquainted with Mr. Mayes, of whom mention has already been made. Mr. Mayes's attention was first attracted towards Jex by frequently observing him look in at the window. He at length asked him what he wanted. Jex replied, he "wished to see *that thing*," pointing to a newly-invented instru-ment for either clock or watch-making. Mr. Mayes showed it to him, but did not allow him to touch it. Jex declared he "could make one like it," and he accordingly did so in about a month. Mr. Mayes was delighted with the talent and ingenuity displayed by the boy, and from that time took great pleasure in showing him anything connected with his business. At his death he left Jex a legacy of £50, as a proof of the high esteem he entertained for him.

In early life Jex was by no means robust in health, and he afterwards declared his belief that working at the bout-hammer, at the black-smith's anvil, had been the means of strengthen-ing his constitution and saving his life. Some particulars of Jex's early history are given in Young's *General View of the Agriculture of the County of Norfolk*. We subjoin the following extract, written about the year 1802. "Under the head implements, I must not conclude with-out mentioning a person of most extraordinary mechanical talents. Mr. Jex, a young black-smith at Billingford, at sixteen years of age, having heard that there was such a machine as a way-measurer, he reflected by what machinery the result could be produced, and set to work to contrive one; the whole was his own inven-tion. It was done, as might be expected, in a roundabout way, a motion too accelerated, corrected by additional wheels, but throughout the complicity such accurate calculations were the basis of his work, that when finished and tried it was perfectly correct without alteration. His inventive talents are unquestionable. He has made a machine for cutting watch-pinions, a depthening tool, a machine for cutting and finishing watch-wheel teeth of his own inven-tion, a clock-barrel and fusee engine made without ever seeing anything of the kind. He made a clock, the teeth of the wheels cut with a hack saw, and the balance with a half-round file. He has made an electric machine, and a powerful horseshoe magnet. Upon being shown by Mr. Munnings a common barrow-drill, the delivery by a notched cylinder, he in-vented and wrought an absolutely new delivery; a brass cylinder, with holes, having moveable plugs governed by springs which clear the holes or cups, throwing out the seed of any size with great accuracy; and not liking the application of the springs on the outside of the cylinder, reversed the whole; and in a second now making, has placed them most ingeniously within it."

Shortly after Young's notice of him was written, Jex removed to Letheringsett, near Holt, where he worked as a common black-smith till within the last thirty years. Since that time he has employed workmen in the practical part of his business, but he continued till his decease to live in the house adjoining the blacksmith's shop. The first watch ever constructed by Jex was made after he had settled at Letheringsett, for his friend the Rev. T. Munnings, of Gorget, near Dereham. *Every part of this watch, including the silver face, and every tool employed in its construction, were of Jex's own making.* One of the greatest efforts of Jex's inventive powers was the con-struction of a gold chronometer, with what is technically termed a "*detached escapement*" and compensating balance, which was made long before he ever saw or heard of the "*detached escapement*" — the principle of which has since been so successfully applied by Arnold and Earnshaw. Jex turned the jewels himself, made the cases, the chain, the mainspring, and indeed every part of the watch, except the dial. The very instruments with which he executed this wonderful piece of mechanism were of his own workmanship. It is only by watchmakers themselves that this triumph of skill can be adequately appreciated. *They* know that no single man is ever employed to make a complete chronometer, but that different parts of the mechanism are intrusted to different hands, and that many are employed upon a single watch. This watch is now in the possession of Mr. Blakely, of Norwich.

Such was Jex's thirst for information, and such was his resolution to clear away every obstacle which impeded his progress, that, wishing to read some French works on Horo-logy, he mastered, *unassisted*, the French language, when about sixty years of age! He then read the books in question, but found that they contained nothing which was new to him, he having become thoroughly acquainted with the subject by previous study of English authors.

Another of Jex's inventions was a lathe of extraordinary power and ingenuity, which re-mained in his possession until his death. By means of this lathe, he was enabled to cut the teeth of wheels mathematically correct into any number, even or odd, up to 2,000, by means of a dividing plate. He also constructed a lathe on a minute scale for turning diamonds, which is very complicated in its structure. He in-vented an air-tight furnace door for his own greenhouse, so constructed that the fire would keep lighted from Saturday night till Monday

Hosted by Google

morning, thus obviating the necessity of attending to it on Sunday. About ten years ago he invented a method of opening greenhouse windows to any required width, and so fastened that the wind had no power over them. Jex was also an iron and brass-founder, a glass-blower, a maker of mathematical instruments, barometers, thermometers, gun-barrels, air-guns, etc. He understood electricity, galvanism, electro-magnetism, etc., and had a thorough knowledge of chemistry as far as the metals are concerned. Amongst other sciences, Jex understood astronomy, and could calculate the time by the fixed stars. In taking astronomical observations, he was accustomed to make use of his own doorposts and a chimney opposite. He made telescopes and *metallic reflectors*, which are universally acknowledged to be extremely difficult of construction.

He was naturally a timid man, and excessively afraid of contagion; yet he lived in a state of filth which was almost sufficient of itself to generate disease. He never allowed a woman to enter his house for the sake of cleaning it, and his rooms consequently contained the accumulated dust of years. His disposition was shy and retiring; but whenever he met with any one whose tastes were similar to his own, he would converse for hours with the greatest delight on any subject connected with the arts and sciences. He was a man of the strictest integrity, and of unimpeachable veracity. He was *entirely* destitute of the love of money, and sought out truth *for its own sake*, and with no view to any personal gain. Such an example is rare indeed in this grasping and selfish age. He was kind in his manner to the poor, and rarely sent a mendicant away without relief. In 1845, Jex had a stroke of paralysis, from the effects of which he never entirely recovered. His intellect gradually lost much of its original power, and, the last year or two especially, a very marked alteration was perceptible. He was again attacked with paralysis in November last, and his death took place on the 5th of January last. His remains are interred in Letheringsett churchyard.—*Norfolk News.*

Death of the Centenarian John Maclean.—The oldest inhabitant of Inverness died on Wednesday. He had reached the seldom-equalled age of 105 years. Of the many local changes that have occurred in that time he was a living chronicle. A vigilant observer in his youth, and preserving a retentive memory, which the frailties of advanced age but slightly impaired, he was able to recount many out-of-the-way anecdotes, gathered both from tradition and personal remembrance. He recollected, it is said, the introduction here of most of what are now considered indispensable requisites in every town. In his youth there was only a weekly post from the south, by means of foot runners over the hills; and when the weather happened to be coarse, or the runner took "a glass too much," the letters were often several days behind. Afterwards the post was brought thrice a week, by way of Aberdeen. He remembered when the first postchaise was brought here, which continued for a long time to be the only four-wheeled carriage in the district; and about ten years afterwards (1770) the first cargo of coals was brought to the town, one cargo in the year being sufficient for a long time. The people were at first much surprised to find the "black stones" burn better than the good country peats. At that time there was no bank in the town; the houses were mostly thatched; there was plenty of fish and game, and no lack of smuggled tea and brandy, and cheap wine, so that the "merchants and writers" were well off, and their apprentices found them out at night wherever they were, and saw them safe home, though there were no lamps in the streets. The king's birthday was kept with great splendour; "the town's carpet" was carried out to the cross, and there the provost and bailies assembled and drank the claret wine, while the bonfire blazed. He used to speak with great gusto also of the doings when the judges came round; how a cartload of peats was burned in the tolbooth to put away the "bad scent," and then after the criminals were tried and condemned—which were nearly synonymous in those days—the judges, magistrates, and gentry walked up the river to the island in the Ness, crossed in the boat, took salmon out of the cruives, boiled and ate them on the green, with everything else in the style of a grand dinner, and with punch made in a hogshead—nothing less than a hogshead. The provost in those days was Mr. Hossack; he was called the "kicked provost," because he was kicked down a stair by General Hawlay and his officers after the battle of Culloden, in consequence of his remonstrating with them on their cruelty to the poor Highlanders. Latterly it afforded him his chief delight to open out on these reminiscences. His declining years were cheered by the charitable assistance of many families in the neighbourhood. His situation and history having been brought under the notice of her Majesty, when a visitor at Ardverikie in 1847, a donation of £10 was immediately forwarded to him, enclosed in a letter, which the late Mr. Anson, Keeper of the Privy Purse, addressed to "John Maclean, Esq." It found its appropriate destination, however, and the old man was full proud of the royal courtesy. His remains were interred on Saturday, and a great number of our most influential citizens accompanied them to their final resting-place.—*Inverness Advertiser.*

"An error is not the better for being common, nor truth the worse for having lain neglected; and if it were put to the vote anywhere in the world, I doubt, *as things are managed*, whether truth would have the majority, at least while the *authority of men*, and not the *examination of things*, must be its measure.—*Locke.*

CRITICAL ANALYSIS OF A PAMPHLET BY DR. ROUTH,

Entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

By John Ozanne, M.D.

I.

Scarcely three weeks have elapsed since a work bearing the above title issued from the press. The title is an imposing one. It promises no less than an exposure of the fallacy of homœopathic theory and practice, by means of the very facts which homœopaths have been accustomed to look upon as an illustration of the superiority of the new system over old medical systems of every kind. Whether the promise of the title-page be fulfilled in the course of the work or not, it will be a chief part of my task to inquire.

Although I have undertaken to write this analysis with a very short preparation indeed, considering the magnitude of the questions at issue, it is not to be supposed that Dr. Routh entered the field without a full preparation, or a deliberate purpose. This is neither the production of an idle hour, nor the first cast of the author's views. He informs us, in the first page of his introduction, that "he has been induced to publish in a *separate* form his researches on the subject of homœopathy," which means to say that this is the publication in a separate form of a paper or papers read before a medical society in London, some months ago. My readers will, I suppose, recollect having seen some notice of the discussion which then took place, in the columns of the *Homœopathic Times*. If I lay some stress upon this fact, it is simply to show that this essay has already been some time before the profession, and, if thought necessary, revised and improved.

That, in the opinion of the allopathic portion of the medical profession, this work is expected to do "great things," is evident from the first three lines of the introduction, which runs thus: "At the request of several distinguished friends, both in and out of the profession, I have been induced to publish in a separate form my researches on the subject of homœopathy." From this circumstance alone, even were there no other inducement, I cannot but feel it to be incumbent upon us to enter fully into the consideration of this would-be exposure of the system, which we look upon as having achieved a real reform in the practice of medicine. This it is my intention to do. But, in undertaking the task with so brief a preparation, in the midst, moreover, of all the duties which medical practice entails, and being able to spare for the purpose only a portion of the time which otherwise would be allotted to repose, I claim the reader's indulgence for any defects of style or other imperfections he may notice.

If therefore the reader, having perceived the importance of the subject, will bear patiently with me throughout the course of a few papers, I hope it will be in my power to show that none of the promises held out in the title-page of Dr. Routh's work have been fulfilled.

In the course of this critical analysis it will devolve upon me to consider—1. The motive which led to the researches contained in this work, and subsequently to its publication. 2. The plan and line of argument which form its groundwork. 3. The evidence brought forward in support of the various propositions enunciated by the author; and, lastly, his conclusions.

First, then, what was the *motive* for the preparation and publication of this pamphlet? It was urgent indeed. But with the deep sense of this urgency, and with the consciousness that something must be done, I do not intend to find fault. For it must be recollected that the question at issue concerns the health, the lives, and, consequently, the well-being of the community at large. It is one which, though it may become with the thoughtless a subject of a jest in time of health, is but too keenly felt in times of sickness and suffering. The aim of the author is not, however, very clearly expressed. We get at it more by inference than by the literal meaning of the words. This ob-

Hosted by Google

scurity seems to proceed from some mental defect in the author, which results in confusion of terms, and leads him into logical fallacies, without which, if I may here state my full conviction, I believe no such work could be got up.

"This system," says Dr. Routh, "has unfortunately lately made and continues to make such progress in this country, and the metropolis in particular, and is extending its influence even amongst the most learned, and those whose high position in society gives them no little moral power over the opinions of the multitude, that our profession is, I think, bound to make it the subject of inquiry and investigation. Colleges of physicians and medical societies may and justly do condemn it, but their influence is confined to the moral power of the executive over their own members or fellows. The individual members of society at large have no part in this condemnation, and however they may look up with respect to the declaration of learned persons as embodying opinions of some weight, in this inquiring age something more is needed than a mere declaration." (pp. 1, 2).

It is obvious that in the author's mind *inquiry* and *investigation* with reference to homœopathy are equivalent to its *condemnation*, perhaps even synonymous. This twofold notion of investigation and condemnation, as one single process, seems to be the fixed point around which all his other notions gravitate. Perhaps the reader may think this observation of mine unfounded. Let him, however, read the book throughout, and he will feel convinced that it is not so, although possibly it may be prematurely stated in this place.

The admission in the above quotation that *this system has made and is still making progress in this country*, a progress which is styled unfortunate, supplies us with the *motive* which led Dr. Routh to make these researches. A little further on the twofold notion that homœopathy is to be *investigated and condemned*, gives the answer to my first question. The consideration of the plan of the work, and of the arguments forming its groundwork, will show how the author expects to stop the progress of homœopathy, which he so sincerely laments.

Although it would be my aim, in a critical analysis of this kind, to deal only with logical fallacies, were the essay got up as it ought to be, I am compelled, however uncongenial it may be to my feelings, to notice a *mode of argument* which I had thought all controversialists had agreed to banish from their writings, as foreign to their purpose, and only calculated to introduce into them an *animus* which might alike mislead either party, and carry him beyond the bounds of legitimate discussion or inquiry. I am sorry to say that Dr. Routh introduces into his essay elements which *ought not* to be found there, and which, should a new edition of his work see the light, he will, I doubt not, feel it right to expunge: his ardent zeal for a falling cause, which it is evident cannot come out scathless from a searching inquiry, has misled him. I notice this in no spirit of indignation, or anger; for it is not the part of one who unfurls the banner of reform in an important matter to lose his temper, or use hard words. Now it so happens that a great part of Dr. Routh's essay, and by no means the smallest portion of his argumentation, consists in *imputations of dishonesty* in one form or another. Selection and falsification are the chief arguments against homœopathy. I had always thought that imputations upon the *honesty* or *veracity* of individuals were not admissible in controversy, unless the clearest *proofs* could be at the same time adduced in support of such imputations; Dr. Routh gives us none. My readers may inquire how it is, seeing that the various institutions, upon the statistics of which he casts such imputations, are and have always been open to the inspection of medical men,—how it is that no one has as yet adduced a single fact in support of them? I, in my turn, ask also — how is this? I am no judge of, nor do I wish to discover, the motives of men. Dr. Routh is the last man that I should suspect of using deliberately a system of argumentation which is banished from all well-regulated controversy. Therefore, I offer this in explanation of his conduct; he was, as I have said above, misled by his ardent zeal for a falling cause, and, unconsciously perhaps, through inexperience, he has transgressed the limits of legitimate discussion.

I will therefore give Dr. Routh full credit for his really being convinced that he is successful in his endeavour, as expressed by him in the following words—"one thing I have endeavoured to do; it is to treat the subject as fairly and as honestly as I can" (p. 1).

Having thus protested against one of the principal features of the work under review, I will now proceed to consider the plan of the work, and the line of argument carried out in it.

Here I claim the fullest liberty of entering into a careful analysis of the arguments adduced. In the performance of

Hosted by Google

this portion of my task I mean entirely to abstain from all considerations of motives, or of anything personal to the author or irrelevant to the subject.

The plan of the work is simply this: after the introduction, we have a chapter upon the theory of homœopathy, and upon the presumed absurdity of the small doses, in which are scattered here and there some assertions which have already been disposed of elsewhere, and which teach us nothing that we did not know before. Next comes a chapter on the circumstances which ought to influence our estimation, by means of statistics, of the value of medical treatment; which is, I may safely say, the best part of the work. In the next chapter, the propriety of taking as our basis in this estimation the general mortality of hospitals is very justly questioned; then follows a review of homœopathie statistics, under the different heads of *Pneumonia*, *Pleuritis*, *Peritonitis*, *Encephalitis*, and *Meningitis*; *Dysentery*, and *Fever*; and lastly, of *Cholera*. In an appendix are given eight pages of statistical tables, which seem to have been industriously and carefully prepared: these tables are arranged so as to exhibit, side by side, the allopathic and the homœopathic results, with the word "alleged" affixed to the latter.

Of the plan of the work I have nothing to say but that it is good, and well worked out. I may, moreover, declare that the author displays considerable ingenuity and skill in the arrangement of his materials: indeed, there are tables of figures in close succession, so managed as to conceal several errors of reasoning and omissions, which it will be a part of my office to point out. At present I will say no more of the materials brought forward in the work as evidence against homœopathy, in a future number of this journal I shall devote sufficient space to the examination of this evidence; I therefore proceed to inquire into the line of argumentation adopted by the author.

It will not be difficult for me to show that the whole work is essentially vitiated by faulty reasoning. Nearly all the author's conclusions are more or less tainted with error, either flowing from premises destitute of proof, or being irrelevant to the question at issue.

(*To be continued.*)

HOMŒOPATHY.

Anniversary Meeting of the Hahnemann Academy of Medicine of New York.—Inaugura Address of the President, Dr. Curtis.

THE anniversary meeting of the Hahnemann Academy of Medicine was held last evening at the Stuyvesant Institute. The address of the President elect, Dr. Curtis, was delivered in his absence, in consequence of indisposition, by the corresponding secretary, Dr. J. W. Metcalf. We give in the following abstract all the material portions of the President's remarks.

The address began with a sketch of the progress of homœopathy, especially in this country, contrasting the present condition of the school with a period little more than twenty years ago, when the late Dr. H. B. Gram was its only representative in this city. Dr. Curtis paid a well-deserved tribute to the memory of that estimable man and learned physician. Allusion was then briefly made to the contributions of Hahnemann to the Materia Medica, and the truly scientific form given to medicine by the recognition of his well-known law, solving relations between disease and medicine that constituted a perverser problem than the riddle of the Sphinx. The main subject of inquiry, the operation of substances recognised by the chemist as forming part of the body, and how far the law *similia similibus curantur* was modified by their agency, was then taken up. On this point the address proceeded.

To determine the relations of medicines to food—the cardinal point of attention—let us examine the various elementary substances in nature, in order to ascertain their relations to the animal economy. We observe, at the very outset, one fundamental difference existing among them, in virtue of which they are divisible into two classes. The first of these embraces those bodies which are either essential to or enter into the composition of the animal frame. The second consists of a class which are foreign to the organism, and the presence of which, even in comparatively minute quantities, disturbs the equilibrium of the functions and induces disease. The former of these, then, comprises constituent or alimentary bodies which, in proper combination, are homogeneous to the animal tissues; the latter are incapable, under all existing circumstances, of healthful assimilation, and hence, in regard to these tissues, are intrlnsically heterogeneous or poisonous. To the constituents belong, as the chemist demonstrates, carbon, hydrogen, nitrogen, oxygen, sulphur, phosphorus, chlorine, fluorine, magnesium, calcium, sodium, potassium, iron, silicium, etc. The non-constituent or foreign class embraces arsenic, gold, silver, platina, tin, zinc, mercury, antimony, nickel, bismuth, and many others.

A little reflection will now satisfy us that the above difference is fraught with important consequences to the pathologist and physician. To prosecute the thought, let us take iron and arsenic as examples. Iron is an indispensable element to blood and muscle, and is found in

Hosted by Google

smaller quantities in other living matters; *some* iron, then, is normal or healthy, but neither the solids nor fluids, when sound, contain the least appreciable particle of arsenic. More recent chemical research has indeed occasionally pointed out the existence in the animal tissues of lead, copper, and other substances, not always recognised as constituent bodies; but nearer examination justifies the conclusion that several such are casual or extraneous rather than constant, while the total absence of all physical proof of the presence of many other elements found in nature, stamps the above as a legitimate distinction. To return, iron, then, is one of the animal elements, and, as such, subject to excess and deficiency; but is this the case with arsenic? The answer is no—the least portion of it in a healthy living organ is hostile. In this view, therefore, iron is dietetic, an orderly and constant supply of it being necessary to the economy; arsenic, on the other hand, is potentiai, dynamic, or alterative, its use being not for nourishment, but for exerting a modifying power over the morbid vital processes, until such time as, these being corrected, it may be eliminated from the organism. The function of arsenic in medicine, and of the class to which it belongs, may be aptly compared to that denominated *catalytic* in the language of chemistry, as will be readily understood by the scientific student. The conversion of starch, by boiling it with diluted sulphuric acid, into several kindred bodies, among which are gum and grape sugar, furnishes one of the most interesting examples of this phenomenon. In this result the acid undergoes no change, its simple presence being adequate to ensure the transformation of starch into sugar. The decomposition of oxygenated water by the contact of platinum or silver, is a still purer catalytic result. The effects of the acid and silver under these circumstances, taking place without combination or loss of the agents, illustrate what is termed dynamic action.

The criticism just rendered on iron is, of course, equally applicable to every nutriment; and again, the relations of arsenic hold uniformly good of all dynamic or catalytic elements. I have already remarked that these nutritive substances, in due proportions, compose the animal fabric; when they fall beneath this normal or regular standard, this deficiency just as certainly entails disorder as their excess. The one state, in fact, is starvation; the other repletion. Without lime, for example, the secretion of milk fails; the bones and teeth become soft, or are arrested in their development; without soda no bile can be formed; without phosphorus and magnesia, the nervous tissues lose their energy, and the impaired condition of the brain is evinced by loss of memory, frightful headaches, and impending paralysis Ghastly paleness, prostration, faintings, and coldness attend the lack of carbon; deprived of sulphur, the hair would rapidly cease to grow, and the absence of iron is marked by lividity, disordered digestion, passive dropsy, and other symptoms of an anæmic or chlorotic character.

The food we receive daily furnishes the natural source of these elementary substances, and serves during health to repair the waste of these matters through the skin, kidneys, and other excretories, consequent upon the voluntary and vegetative functions of the economy. Hence the equilibrium is preserved. Inordinate use of particular organs induces a disproportionate consumption of their substance, and hence of the elements from which this substance is formed. Excesses in watching, thought, and muscular effort, for example, by overtaxing the brain and muscular fibre, render these tissues rapidly effete, and therefore cause an exaggerated demand for their peculiar *pabulum*, as phosphorus and iron. It is very easy, thus, to perceive how a highly artificial and voluntary life, so distinctive of man, breaks the vegetative balance and produces impoverishment of nutrition. On the other side, inefficiency of the excretory organs, bad medication, and vicious feeding lead equally, sooner or later, to a surplus of one or more vital constituents.

These remarks suffice briefly to illustrate the subject, and prepare us for the next step in the investigation, which is evidently to determine their practical bearing on the elaboration of the Materia Medica, and consequently their influence in the treatment of the sick. If the views I have taken be correct, it is plainly erroneous to suppose that the cure of a malady always requires positive treatment—that is to say, *something* to be administered in the way of medicine. Cases are presumable, nay demonstrable, in which the main duty devolving on the rational physician should be the exclusion of some specific organic element, ascertained to preponderate already in the organism.

The only method known to the vitalist of determining the action on the human body of various substances, is watching and noting the changes which ensue on administering them to the healthy subject. Such was the course pursued by the modern master, and such are the results submitted to the world in his "Pure Materia Medica." Among the substances there *tried* and displayed, we find many of the nutriment class, viz., ammonia, lime, magnesia, soda, phosphorus, silex, carbon, potash, sulphur, iron, etc. It is in place, however, to observe here, that he contemplated only a purely positive pathogenesis, the nature of his experiments having been such as to ensure a class of symptoms dependent on an excess of the substance under trial. Hahnemann's records of dietetic agents are indeed particularly remarkable for symptom-groups of an apparently antagonistic character. These are classified by him as primary and secondary effects; the first, according to his opinion, being the product of the remedy; the other, the reaction of the constitution. These secondary groups may represent, then, a comparative, but by no means an absolute or abnormal, deficiency of vital elements. I have already, however, said sufficient to show that positive pathogenesis can never exhibit the indications for the employment of special nutritive elements. To assert the contrary would in act be to maintain that surplus and lack of thes

Hosted by Google

elements are betrayed by precisely the same phenomena.

Such an assumption is contrary to reason and experience. We derive hence the important practical conclusion, that it behoves us to enter upon a new order of drug-provings which shall embrace the negative pathogenesis of all the alimentary substances. These trials will reveal the individual changes of the organism under the privation of particular elements, and thus pave the way to a system of accurate special dietetics. Studied in this light, the positive symptoms of dietetic bodies would in all cases point out not their homœopathicity, but their identity or isopathic quality in diseases they resemble. This position is of the gravest import, and, if not erroneously founded, shows that positive results of organic elements, now exhibited in our Materia Medica, are to be regarded as contra-indications of their use in disease. I should avoid iron, for example, when its positive symptoms indicated its excess in my constitution, or I should choose silex, because the symptoms of its negative trials corresponding with my own, declared an impoverishment of that particular constituent.

Thus, abstinence from acids is found proper in softening of the bones, and I have known inveterate catarrhs permanently ameliorated by the abandonment of common salt (chloride of sodium). Yet, apart from the distinctions I have just drawn, phosphoric acid would seem homœopathic to bone-softening, and no remedies in our service appear more appropriate in pulmonary catarrhs than the different forms of soda.

The prosecution of negative or positive trials would obviously present far greater difficulties than have been encountered in drug-provings hitherto. Each experiment of this kind must be grounded upon the systematic exclusion from the diet of the article on trial. It might in all probability be impossible totally to eliminate it; perhaps a reaction of it to the *minimum* would be sufficient, especially as these researches would require to be tested and perfected by the co-operation of the physiological chemist. Lime-provings would admit, for instance, of the use of potatoes, peas, and occasionally, perhaps, of oatmeal and wheat; it is much more abundant, however, in rye and barley, whence preparations from these would weaken the result; again, animal, muscle, milk, cheese, and shell-fish abound in lime, and therefore would be totally incompatible. The nutritious grains generally contain a great deal of silex, and hence unbolted meal would spoil the pathogenesis of this substance. In the composition of rye, we find about twenty-one times as much oxide of iron as in potatoes; the trials of iron would consequently make the former inadmissible; the yolk of eggs are so rich in iron, that their continued use as diet might elicit the symptoms of a surplus of this metal.

It is not my purpose, however, to extend here the details of this subject, but only to expose its principles, extent, and connection with chemical and dynamic medicine. There yet remains to be considered one important feature of the action on the constitution of assimilatable substances. I mean their behaviour in states of combination. The effects of vegetable and mineral acids generally present great varieties, and are very different from what, judging from their analysis, we might have been led to conjecture. Carbon, hydrogen, nitrogen, and oxygen, so congenial to human want in the form of egg-white and cheese, combine either all or in part, in different poisons, from the paralysing strychnine to the still deadlier prussic acid.

Oxalic and nitric acids, and the wide range of vegetable alkaloids, are examples of this truth. Of these articles, the homœopathic Materia Medica embraces a large number; the symptoms of many of them are minute and extensive, and we prescribe them daily with greater or less success.

Such results appear at first sight to controvert the views I have offered, and to demonstrate no essential distinction to exist between the laws of pure food-elements and medicinal bodies. This doubt will cease to embarrass us if we consider that worn-out tissues, which obviously consist of alimentary elements, could never be extruded from the system were not certain combinations of these elements possible, inharmonic to and incompatible with the healthy structures; in other words, if carbon, hydrogen, nitrogen, and oxygen, were under all circumstances, capable of appropriation, it is plain enough that the economy would never part with them at all. Hence it is evident that the presence of excretory matter in the constitution must necessarily awaken reactions or morbid manifestations, and in so far simulate the general results observed from the presence of strictly foreign elements.

This elucidation of the apparent discrepancy alluded to above, if not sufficiently full for future purposes, seems nevertheless satisfactory, and gives a clue for unravelling this intricate and interesting matter. Minute quantities of nitric, oxalic, and I believe prussic, acid are digestible—that is to say, capable of being resolved into their constituent elements, and thence of appropriation according to the normal laws of the economy; in larger quantities, however, the vital powers proving insufficient to rend or decompose them, they retain their proper organic combinations unbroken, and hence act as dynamic or chemical integers. This view is strengthened by the fact that in certain morbid states, cyanogen and nitric and oxalic acids pass the kidneys, thus proving the cognate vital relations of these and similar bodies to lithic acid and urea, which are the limits of the vital disintegrating power. The laws of vegetable remedies appear identically the same, and we find that heat, moisture, and exposure so far break up their constitutions as to prevent them from exciting a unitary action. Many poisonous plants are rendered edible by culinary processes. This explanation will perhaps serve also to show why we are not unfrequently disappointed in the operation of composite constituent remedies, their dynamic effect being lost if they undergo assimilation.

Hosted by Google

Before concluding what I have to present on this topic, I wish to be distinctly understood as not proposing to supplant vital or dynamic by chemical medicine. My object has been to show the boundaries of each, and their mutual relations. Chemical medicine is inadequate to meet functional changes. On the other side, dynamic remedies will never, *per se*, feed the starved organs, nor render superfluous the banishment of some constituent prone to accumulate. It seems highly probable that our results in chronic diseases are often transient; because the reviving activity of affected organs is overwhelmed by reiterated material causes.

Hahnemann's psora doctrine is, in fact, only the rudimental philosophy of subjective disease. His views herein are indeed differently received by his followers—by some dogmatically embraced, by others, totally rejected; happily they in no case practically affect the great body of homœopathy or dynamic medicine proper, but they outshadow the significance of substance, as well as function or form in disease, and show that his far-reaching mind detected the necessity of a scientific method applied to the former. Dynamic and elemental medicine are really inseparable; they are related as passion to subject; the first concerns effects, the second causes; the grammar of the one is homœopathy, of the other chemistry. I shall have accomplished enough for the present, in behalf of this theme, if I succeed in arousing the attention of the school to its reality, and to the importance of exhaustive or negative trials of food-elements. That such trials must prove of great clinical value, and conduce especially to our success in the treatment of chronic diseases, appears beyond a doubt. An examination of the nature of crises belongs here, and is clearly interwoven with the above considerations, but it would be technical, and hence out of place in an address of a partly popular character.

After submitting this subject to the Academy, the address pointed out the grand practical aims of the profession as deserving of all honour. To accomplish these, the duties demanded at the bedside at the hands of the physician, are indeed the crowning triumph of the practitioner of medicine. They are the crucial trial of his learning, sagacity, and skill. Beyond the study or the lecture-room, medical speculations have no solid abiding-place. They savour of the lamp and of solitude; they pall upon the uninitiated, and perchance recoil at the contact of realities as from men in armour. It is the practising physician who bears the merit and demerit of medical systems. He it is who does battle with the ruthless legions of disease. Of him the patient requires not precedent, not authority, not hypothesis, but action and success. His current life is a constant repetition of this ordeal. To do his work, therefore, and do it well, deserves an honoured membership in his art. None comprehend so well as he the actual condition and the actual needs of his profession; none understand, like him, the dignity of a diagnostic, and the value of a cure. His hope in in the redemption of his art from the dusky recesses of conjecture and concealment, and its restoration to certainty and precision. His faith composes the possibility of these great objects. To ignore them as the ends, however distant, of medical research, is to abandon its goal, and degrade its practice to the level of instinct, or the chaos of accident.

The patient study of the phenomena exhibited by the organism in sickness and in health, and of its modifications from other causes, is the only means we possess of advancing in this pursuit. Such contemplation must lead to the evolution of principles which reveal the *nexus* of Nature's operations, and which, once obtained, give us mastery over their order, and thus enable man to realize the imprescriptible lordship of his destiny.

To give this, in its fulness, the chemist directs the flashing battery, or toils over the careful tube, the philosopher dives into the hidden sympathies of the magnet, anatomists call the microscope to aid, and psychologists introvert their thought and gaze on soul. Each intent upon his work, sees not, growing slowly beneath his hands, the towering pile which the sun of some auspicious morning shall suddenly irradiate to glorious symmetry.

For the present, then, let us address ourselves to the useful, nay, indispensable tasks, prophetic of this completeness; tasks which, though not triumphal, are manly, and even noble, and entitle us to a welcome brotherhood in that scattered band, who shall, one day, hold festive re-union, and whom Art shall emancipate in her wide-spread sabbath.—*New York Tribune*, Jan. 15, 1852.

THE
HOMŒOPATHIC TIMES.

SATURDAY, MARCH 6TH, 1852.

We are very glad to acknowledge that many of our friends, non-medical as well as professional, are showing a fresh and lively interest in this periodical.

In our present number will be found a very interesting account of the London College of Physicians in 1618, when the "British Solomon" was on the throne—

"Tempora mutantur nos et mutamur in illis."

Vast have been the changes in the Pharmacopœia since that time; and manifold have been the changes in medical theories and in medical practice. There has been, unquestionably, a greatly improved hygienic system, and this, apart altogether from allopathic practice, has prolonged the mean

Hosted by Google

of life, when the physical existence is maintained under favourable circumstances.

Our readers will be glad to learn that the proprietors have just concluded important negotiations, which will enable them, at no distant time, to enlarge the journal, and to carry out the original design—not pecuniary gain, but the popular spread of homœopathy, and defence of its persecuted disciples. Success in every way has, at an earlier date than could have been expected, crowned their efforts. The *Homœopathic Times* will therefore soon be made, through powerful allies, with scholarly and independent editorship, totally unbiassed and unconnected with PARTY influence, the vehicle of communicating whatever may be of interest, abroad as well as at home, in the literature as well as the practice of homœopathy.

To enable the Editor to accomplish this fully, there should be the cordial support of the medical officers of hospitals and dispensaries, with weekly statements and reports of cases, and it is not doubted he will meet with every assistance and co-operation that may be desired at the hands of our American and foreign colleagues; and it is to be hoped that those of our own country will afford vigorous help.

There are already one quarterly, one monthly, two fortnightly, and one weekly, homœopathic journals. This fact speaks for itself; it shows how large our public is, and what interest they take in the progress of homœopathy.

While our shortcomings and our failures of whatever kind are freely acknowledged, full allowance should be made, and the wonder is, not that the *Homœopathic Times* has done no better, but that it has done so well, when the means and materials are considered that have been put at the disposal of its conductors.

As this is a kind of re-announcement of aims and intentions, of hopes and expectations, for the future, it is proper to thank most cordially the numerous subscribers, and not numerous contributors, who have heretofore supported this periodical. which has been always conducted with thorough independence, and shall be conducted so to the end of the chapter.

For whatever has been wrong, or deficient, or superfluous, it is right to apologize; over the past there is no control, the future is not ours, but of the present every one should make the best use in his power.

We suggest to our readers, to those, if there be any, unfriendly as well as those friendly to us, the wisdom and propriety of this passage from the Swan of Avon:—

"*Ham.* Let them be well used; for they are the abstract and brief chronicle of the (Homœopathic) times.

"*Pol.* I will use them according to their deserts.

"*Ham.* Odd's bodikin, man, much better: use every man after his desert, and who shall escape whipping? Use them after your own honour and dignity; the less they deserve, the more merit is in your bounty."

But, after all, we are conscious of deserving well, with certain limitations, of all who love the Cause of Hahnemann, which, as we have remarked, is the cause of humanity.

Correspondence.

YE COLLEDG OF PHYSITIANS. LONDON.—1618.

To the Editor of the Homœopathic Times.

SIR,—I have for some months past taken in your interesting periodical, and have earnestly studied the "principle" and "theory" of that marvellous system, homœopathy. I have tested the great efficacy of her "practice" in some of our dear children, as well as in my own case; have avowed myself her convert, and have endeavoured, in my humble sphere, to promote her cause among my relatives and friends; and having convinced my husband of the reasonableness of her claims, he was persuaded the other day to become a patient of that accomplished physician Dr. Quin, her firm, faithful champion, who planted her fair standard on British ground. Long may it wave by the side of its ancient royal sister; and may they together brave, for more than "a thousand years, the battle and the breeze."

But having taken up your paper of Jan. 31, I read to my husband some "Resolutions of the Provincial Medical and Surgical Association.—Report on Irregular Practice."

"*Irregular practice!*" How startling! It was true we had tried it, and found it succeed to admiration, being free from many evils of Regular practice, and at the same time possessing a power over disease, both acute and chronic,

Hosted by Google

truly astonishing. But then, being "*irregular*," ought we to continue it?

I must here tell you a little of what I have had to struggle through, before I attained to that confident state in which your Number 131 found me. For I have had to overcome the three grand difficulties alluded to in Mr. Sampson's charming essay, "Truths and their Reception:" first, the prejudices of an early education among highly esteemed medical men of the old school; secondly, the force of habit, that "second nature;" and thirdly, self-esteem and interest; for I was a *very* successful allopathic practitioner, rarely having occasion for any other, although we have had a rather numerous household. But now, having to deal with such delicate tissues, and refined, almost ethereal, medicines, with whose specific virtues I am not yet fully acquainted, my knowledge is quite insufficient for many cases; and my choice and, as I considered them, excellent prescriptions are dead letters; and my nice, French-polished medicine chest—once such a pleasure and treasure—is of little use, except to keep the tinctures of *Arnica* and *Rhus* in, the poor *Calomel* being thrown away; but all this would have been less than no sorrow, but rather gladness, had it not been for Number 131.

And what was to be done? One thing remained, which might finally decide us: once more to review both sides of the question. This, however, was not needful then, so far as regarded homœopathy, as I had lately been again reading many parts of Mr. Sampson's other lucid, masterly work, besides some of Hahnemann's most celebrated treatises; this simplified my task, and I began to reinvestigate allopathy.

With numberless books on this topic, from "the never-dying Hippocrates" to the present day, by talented and acknowledged authors, containing every variety, even to direct opposition, of opinion, both as to its theory and practice, it might have appeared, at the first blush of the matter, very easy to find one which would in every respect answer the purpose; but I could not be thus easily satisfied. Finding that Hahnemann's new and, as it seemed to me, very exquisite and valuable doctrine was "stigmatized" as a modern "delusion," I began to think is it not possible that innovations and "imposture" and "delusion" may be rife among the other party? This was a striking idea; and a sudden thought occurred to me—I will not take any modern guides on this subject; for however valuable is the accumulation of facts and cases, yet is there a danger that, while truths have been flashing out, errors have been creeping in; therefore, let me go back to the good old "Times," and endeavour to find that era when allopathy, that is to say, Regular practice, was in the zenith of its excellence and glory. But how was it possible to discover that very nick of time? I could not refer to those antique systems, each of which, to use Pliny's expressive words, was "a system of conjectures;" nor even to the twilight of Roger Bacon, when the darkness and dross of alchemy seem to have been inextricably mingled with the bright light and pure gold of research and experiment; and yet I must go beyond an Abernethy or a Darwin. And I could not, as it proved, have decided better than I did, when I fixed on the days of the "learned monarch," James the First,—a period I was evidently most fortunate in selecting, as the following considerations will prove:

It was then that any unhealthy, feverish excitement of the glorious Reformation had subsided, leaving the calmness and dignity of truth behind; and the illustrious reign of Elizabeth had intervened, giving opportunity for the development of rare talents in many philosophers, both literary and scientific; and it was before the wild tumult of the revolutionary perturbation of Cromwell and his adherents had begun its troublous ferment; just when an enchanting Shakespeare, an intrepid Raleigh, an unrivalled Bacon, an inductive Harvey, a metaphysical Donne, and an erudite Selden were contemporaries. Yes, that was the precise epoch to which I might unhesitatingly refer, for the soundest views in each "*regularly-educated medical practitioner.*"

Having but few books at home on the subject, my husband not being in the profession, I availed myself of a very extensive library in the neighbourhood, to which I have free access; and looking over a variety of works, I made a suggestive discovery. Perhaps, Sir, *you* well know, although I did not, that in James the First's time "The Colledg of Physitians," in London, published one of their most famous dispensatories, "Pharmacopœia Londin." (of which they have lately put forth a new and, I should suppose, a somewhat modified edition, but I have in vain endeavoured to find it in the library before alluded to), which had for its authors a number of the most distinguished men of the day. Among them were:

Henry Atkins, Doctor of Physick, the King's Physitian in Ordinary, and President of the Colledge of Physitians.

Theodore de Mayerne, Doctor of Physick, and Chiefe Physitian to both their Majesties.

John Craig, Will. Paddy, Gent., the King's Physitians in Ordinary; Thomas Trear, Thomas Moundeford, Mark Ridley, Edward Lister, Richard Palmer—seven of the eight chosen.

John Craig, the younger, Chiefe Physitian to Prince Charles.

Matthew Gwinn, the King's Physitian to the Tower.

William Harvey, the King's Sworn Physitian.

Leonard Poe, the King's Physitian to his Household.

John Raven, the Queen's Sworn Physitian. With others whom it might be tedious to enumerate.

Here was truly a "chosen" set of names; and now, if I could but find this celebrated compilation, what comfort and satisfaction I might expect. And I *did* find it; not the copy "compiled in the Latin tongue," with which I might have been a good deal perplexed, as I am not a first-rate classic, but "A Physicall Directory, or A Translation of the London Dispensatory, made by the Colledge of Physitians in

Hosted by Google

London; being that book by which all apothecaries are strictly commanded to make all their physick.

Persius. "Disce, sed ira cadat naso, rugosaque sana."
Cicero. "Non nobis solum nati sumus sed etiam patriâ."

And this work was not only written and sanctioned by them, but there was "A Brief of his Majesty's Royal Proclamation, commanding all and singular apothecaries of this realm to follow this Pharmacopœia lately compiled by the Colledg of Physitians of London, under pain of our high displeasure; willing and commanding also hereby all majors, sheriffs, justices of peace, constables, etc., to be aiding and assisting; given at our Palace of White Hall, 26th of April, in the sixteenth year of our raign of England, France, and Ireland, and of Scotland 51, 1618."

How intensely gratifying was this! I opened the volume, turned over its pages, and what a constellation of the most brilliant sparklings of science and of "gallant experimental" wisdom did it contain!

I found also in this copy, what had before been considered as more unattainable than even the philosopher's stone, "a royal road to learning;" for on the cover was stamped in gold letters, "Gift of G. III."

There was an address from "The Colledge to the Candid Reader, commencing in a highly benevolent strain: "Physick, which gives thee health, wisheth good health to thee, and that it may the better provide for thy health, it hath built up this new apothecaries' shop;" and it was indeed a well-stored one. First came the "Simples: roots, barks, woods and their chips or rasplngs, herbs and their leaves, flowers, fruits, buds, seeds or grains, gums, tears, liquors and rosins, juyces, things bred of plants, living creatures, parts of living creatures, things belonging to the sea, mettals, minerals, and stones;" then followed the "compounds; compound waters, physical wines, physical vinegers, decoctions, syrups, compound syrups, syrups made with honey, rob, lohochs, preserves, conserves, species or pouders, electuaries, pills, troches, oyls, compound oyls, oyntments, plaisters, cerecloaths, chymical oyls, chymical preparations, the way of making extracts, the way of making salts of any kind of vegetables;" and to conclude, "preparations of certain medicines very necessary for apothecaries."

Some of these were carefully arranged in classes:—"The five cordial flowers, the five emollient herbs, the four greater hot seeds, the four lesser hot seeds, the four greater cold seeds, the four lesser cold seeds, the five greater roots, the two roots, the five lesser roots, the five capillary herbs, the four pluretical waters, common pot flowers, three stomach oyls, four hot ointments, four cold ointments, four ointments fit for chyrurgiens; precious fragments of saphire, granate, emerald, jacynth, sardine, ruby, pearls, amethist."

Among the very many recipes were, as you, Sir, may easily suppose, admirable remedies. These were, "Aqua mirabilis" and "aqua cœlestis;" "aqua protheriacalis" and "aqua cordialis frigida," "Saxoniæ," "syrup of roses solutive with hellebore montanus," and "syrup of roses solutive without hellebore," "a majesterial syrup of scabious compound," and "a majesterial syrup against melancholly," "syrup oxysaxccharum symplex Nicholaus," "sea-sand," "froath or foam of the sea," "species electuarii diatrag," "acanthe frigidi," "species electuarii diacal," "aminthes compositæ Fernelius," "cat's head," crab's eyes," "frog's liver," "oyl of swallows," "oyl of scorpions," "oyl of foxes," "unguentum diapompholigos nihili," "eclegma of squils," "emplastrum metroproptoticon," "agsick trochiocated," "troches of vipers," "lohoch sanum et expertum," and "mundificationum ex apio."

But even now you will scarcely realize the extreme value of this Pharmacopœia, unless I add a few details, which may be most acceptable to some of your readers, if their resolutions have been shaken by the "Resolutions of the Provincial Association; and to commence, let us glance at some extracts from their Materia Medica Pura:

"The head of a cole-black cat being burnt to ashes in a new pot, and some of the ashes blowen into the eye every day, helps such as have a skin growing over their sight; if there happen an inflammation, moisten an oak-leaf in water and lay over the eye. Mizaldus saith he hath (by this one only medicine) cured such as have been blind a whole year.

"Toadstone, being applied to the place, helps the bitings of venemous beasts, and quickly draws all the poyson to it. It is known to be a true one by this; hold it neer to any toad, and she will make proffer to take it away from you, if it be right, else not.

"Gold is temperate in quality; it wonderfully strengthens the heart and vital spirits; which one perceiving very wittily inserted these verses,—

> "For gold is cordial; and that's the reason
> Your raking misers live so long a season,

However, this is certain, in cordials it resists melancholly, faintings, swounings, feavers, and all such like infirmities incident either to the vital or animal spirit."

It is very interesting, Sir, in searching these archives, to catch here and there glimpses of what we, perhaps in our vanity, consider as the discoveries of later days. Is not the following one strictly hydropathic?

"Sea-sand, a man that hath the dropsy being set up in it, it draws out all the water."

And again, are not these forebodings of Mr. Rutter's wondrous magnetoscope, or at least of the mysterious results of the labours of Galvani, Volta, and Gauss?

"Raw silk heats and dries, cheers the heart, drives away sadnesse, comforts all the spirits, both natural, vital, and animal." What an importance does this give to the suggestion you have perhaps lately heard, of the probability of the cultivation of the mulberry tree, and of the silkworm, in our own land, so as to make silk a staple article of our commerce.

"*The common Preparation of Filings of Steel* Take of filings of steel, cleansed by a load-stone, washing them in clean water, and drying them; then sprinkle them well with sharp wine vineger, stirring them well; dry them in the shaddow, often putting fresh vineger to them, so let it stand thirty daies, afterwards heat it into very fine powder, and keep it for your use.

"In such steel as is prepared by the fire with brimstone, you must note that unless after the burning it retain a smatch of the tast of vitriol, it is good for nothing."

You may be pleased to know, that the Colledg spoke very strongly of the effects of *Bryonia alba;* which, although "ill to be tampered with by the 'unskilful,' is yet held to be wholesome physick."

So true is it, that

"In the perfect circle of creation, not an 'atom could be spared,'
From earth's magnetic zone to the bind-weed round a hawthorn."

But the testimonies to homœopathy, and even to the infinitesimal dose, are very striking.

"The lungues of a fox, well dried (but not burned), is an admirable strengthener to the lungues: see the lohoch of fox lungues. The liver of a duck * * strengthens the liver exceedingly.

"The flesh of vipers being eaten * * resist poyson exceedingly, neither is there any better remedy under the sun for their bitings, than the head of the viper that bit you, bruised and applied to the place, and the flesh eaten; neither any comparable to the stingings of bees and wasps, etc., than the same which stung you, bruised and applied to the place.

"Swallows, the ashes of them being burnt and eaten, helps sore throats, being applied to them.

"The bone that is found in the heart of a stag is as soveraign a cordial, and as great a strengthner to the heart as any is, being beaten into powder.

"Jacinth strengthens the heart, being only worn in a ring. Cordamus saith, 'it increases riches and wisdom.' Amethist quickens the wit, and is profitable in huntings and fightings.

"Elks claws or hoofs are a soveraign remedy for epilepsy, though it be but worn in a ring; but, saith Mizaldus, it must be the hoof of the right foot behind."

Can we not most evidently perceive in some of these hints a decided, though feeble, yearning of the medical heart of those days, after the grand, though simple truth in therapeutics, enunciated by our "immortal Hahnemann"—*similia similibus curantur.*

I have little space for the "compounds;" but I scarcely like to omit all further allusion to them; they are very numerous. I may select two or three; it is too early in our English season for the composition of "oyntment of swallows," as it requires "sixteen swallows, whol and alive," and "May butter," besides the three other "simples," to commence with; and perhaps "oyls of scorpions" would be scarcely suitable for our English clime, as it would take "of scorpions, by number, thirty;" but "oyl of foxes" does sem more patriotic, so I venture to give that.

"*Oyl of Fozes, Mesne.*—Take a fat fox of a middle age, wearied with hunting, and new killed; the skin and bowels being taken away, and the bones broken, cut into many parts, boyl him in white wine and *conduit* water" (what weight would this give to the arguments in favour of 'the high-pressure systems being adopted by the commissioners of our metropolitan water-works'), "of each six pound, till almost half be consumed, scumming it dilligently; then mix with it four pound of old sweet oyl, common salt three pound, the flowers of sage, time, of each a pound; let it boyle till almost all the water be consumed, then ad water (wherein a handful of dill and time have been boyled) eight pound; boyl it again over a gentle fire, to the consumption of the water, then press out the oyl, and if any watery substance remain amongst it, separate it with a funnel, and keep the oyl for your use.

"It is exceeding good in pains of the joints, gouts, and pains in the back."—*Translator.*

We may presume that the "Manica Hippocrates, his sleeve, and strainer made of woolen cloath, sewed together in the form of a sugar-loaf," is the one intended.

This might be sufficient to induce many of your readers to commence a personal acquaintance with our sage apothecary; but as many of your country friends may not be as conveniently situated as I am for this privilege, I cannot refrain from a slight further trespass on your indulgence, while I give a surpassing remedy, already referred to by our author.

"*Lohoch of Fox Lungues.*" I should premise that "lohoch" is an Arabic word, called in Greek, ἐκλέγμα, in Latin, linctus, and that "it is in respect of body, something thicker than a syrup, and not so thick as an electuary.

"The use it was invented for was against the roughness of the windpipe, diseases, and inflammations of the lungs, difficulty of breathing, colds, coughs, etc.

"Its manner of reception is with a liquoris stick, bruised at end, to take up some and retain it in the mouth till it melt of its own accord.

"*The Preparation of Fox Lungues.*—Take of fox lungues, being fresh, the asperia arteria being taken away, wash them diligently with white wine wherein hysop and scabious have been boyled, dry it gently in an oven, but burn it not, then lay it up, wrapped in wormwood, horehound, or hysop, *dried.*"

"*Lohoch of Fox Lungues. Mesne.*—Take of fox lungues prepared, juyce of liquorish, maidenhair, annis seed, sweet fennel, seeds of each an ounce, sugar clarified with coltsfoot, water fifteen ounces, the things being beaten which may be beaten, and brought into very fine pouder; let them be made into a lohoch with the sugar.

"A. Mesne appoints sixteen ounces of honey, and no sugar nor uncertain quantity of coltsfoot water; and reason itself will tell you honey is most cleansing."—*Translator.*

"A. It cleanseth and uniteth ulcers in the

Hosted by Google

lungues and breast, and is a present remedy in phtisicks.—*Translator.*

"Note.—*Phytick* is an ulceration of the lungues, and the very same disease usually called a consumptio of the lungues."

If this recipe could only be generally adopted, what an entirely new character would our English fox-chase assume; one might have felt that it was a pursuit scarcely worthy of so much of the time and money of our noblemen and gentlemen, merely for the destruction of what appeared to be an insignificant and useless animal, far different from the noble stag, or even the timid hare. But now how important do our foxes become, carrying, as they do, the remedy for some of the direst diseases in our country. We might then expect soon to have a very valuable new treatise, "on the rearing and management of the fox, with a special chapter on the treatment for the full expansion and healthy action of its lungs." How inferior in real worth, are "les foies gras de Strasbourg." And then the reward for that signal act of heroism, being "in at the death," will no longer be "the brush," but "the lungues;" and the careful mother's earnest desire for her young collegian, during the winter vacation, will not be "my dearest boy, be sure you put on your respirator," but, "Edward, dear, take care to bring home the lungs;" and we may fancy we almost hear her gentle but anxious voice, while directing her still-room maid to take away the "asperia arteria," and to use the wash of wine, and all the precautions necessary for the "compound."

As to oyls of "minerals and stones," I had better pass them by, as the sensible translator observes,—"Having perused these oyls following, I would willingly have left them quite out, I mean the manner allotted by the Colledg to make them, because I fear they and truth are *separatists.*"

This might appear somewhat severe upon the Colledg, but as the expression is ambiguous, may we not believe that the oyls are what are intended?

There was one receipt which might be extremely useful.

"Mathiolus, his great antidote against poyson and pestilence;" and it is truly *great*, and we may imagine exceedingly and peculiarly beneficial and potent, as it consists of about a hundred and twenty "simples," besides several "compounds," which are composed of nearly a hundred and fifty ingredients; but as several of these are only repetitions of others, we may state them perhaps at the moderate number altogether of one hundred and seventy-seven.

"The title shows you the scope of the author in compiling it; I believe it is excellent for those uses. I want time to examine what alterations the Colledg hath made in it, or whether any or none."—*Translator.*

These extracts from the recipes may suffice, although a large number might prove very interesting—

"Cum multis aliis, quæ nunc perscribere longum est,"

and indeed, some of them are of too cannibal a nature to insert here, as they might greatly shock the delicate nerves of many of your fair subscribers, who are not accustomed to such studies, and are far more in accordance with the manners and customs of the darkest ages of New Zealand and the Sandwich Islands, than for the enlightened, peaceful times of our benign, beneficent, beloved sovereign Queen Victoria, and her philosophical, philanthropic, princely consort, Albert.

In conclusion, Sir, I cannot do better than transcribe a few passages from an address of "The Translator to the Reader," being singularly suitable for our *own* "*Times.*"

"Courteous reader,—It is a proverb not more vulgar than true, that he that looks on in a game may see as much into it as he that playes. It cannot but be confessed, that this nation hath been playing a sad game a long time. The prize which we now play for, is THE LIBERTY OF THE SUBJECT. This is the part which some think is so sluggishly acted; but I am of opinion will speedily be ended with a joyful plaudite upon the English stage. So far as I can see by the help of my *optick nerves (whether it be intromittendo species or extramittendo radios, it matters not much) the liberty of our common-wealth (if I may call it so without a solecisme) is most infringed by three sorts of men, [b] priests, physitians, lawyers yet I accuse not all of those faculties, trades, or (if I may be so bold without offence); monopolies, for that were a bad trade that had never an honest man in it. *The one deceives men in matters belonging to their souls, the other in matters belonging to their bodies, the third in matters belonging to their estates.* Amongst these, physitians walk in the clouds, their waies being not so discernable to a vulgar view, as the waies of the other two are; and that's the reason men are led by a company of proud, insulting, domineering doctors, whose wits were born above five hundred years before themselves. Would it not pity a man to see whole estates wasted in physick, both body and purse consumed upon outlandish rubbish? Is it handsome and well-beseeming to see a doctor ride in state, in plush, with a footcloath, and not a grain of wit but what was in print before he was born? But some self-seekers (of whom I expect to be traduced for the translation of this book) will be objecting against me for quoting the vertues of the recepts, of which I meet with one in the epistle of the Colledg to the reader, viz., it tends to the destruction of the common-wealth, because thereby ignorant fellows will be induced to the practice of physick, and, therefore they say they wrote it only to the nurslings of Apollo. But I, if Apollo had served the *nine Muses* so as they serve the apothecaries, viz., hid all his art from them, they would have no more wit than *nine geese.* 2. All the nation are already physitians. If you ayl any thing, every one you meet, whether man or woman, will prescribe you a medicine for it. Now, whether this book thus

"* Indeed the discerning of these things belongs to the internal not the external sences."

"b. Romish."

Hosted by Google

translated will make them more ignorant or more knowing, any one that hath but a grain of understanding may easily judg. 3. All the ancient physitians wrote in their own mother tongues, and native language. Mesne, Avicenna, Averrois, Rhazis, Serapio, etc, in Arabick. Galen, Hippocrates, etc., in Greek. Paracelsus, in High-Dutch. Did these do their countries good or harm, think ye? What reason can be given why England should be deprived of the benefit of other nations? Worthy countrymen, the Colledg doth in effect say, that you are the greatest fools under the sun; are you not much engaged to them, think you? I am confident there be those in this nation, that have wit enough to know that the *Papists* and the *Colledg of Physitians* will not suffer *divinity* and *physick* to be printed in our mother tongue, both upon one and the same grounds, and both colour it over with the same excuses.

"For my own part I am now in the prime of my age, therefore not affected with the lightness and vanity of youth, nor the dotage of old age. I am not at any private interest in doing this work, but purely the good of my country. I never received (that I know of) the least prejudice by any of the Colledg which might procure desire of revenge in a melancholly breast. I cannot boast as the Colledg did, that no errours are committed by the printer or my self. If it be childish, 't is the liker to my coppy. I hope the ingenious will favorably pass by my failings. Charity usually dwelleth in generous breasts; if this be kindly accepted, it shall be an engagement to me further to open this famous (though too much abused) art of physic to you, and withal alwaies to remaine your servant."

But the quick, hurried beat of the alarum warned me that the "early closing hour" was at hand; the clock struck four. I committed the fascinating volume to the care of one of the attentive, polite librarians, returned home, and sat down *a devoted homœpathist.*

Believe me to remain, Sir,
Your obedient subscriber,
UNA MADRE.

London, February 17, 1852.

P.S. If any of the knights-errant of the *Lancet*, should be so ungallant as to doubt the accuracy, the verbal *literal* accuracy of these quotations, let him make a pilgrimage to that palace of delights, the British Museum, and consult for himself, our sagacious apothecary and gentleman.—Press mark, $\frac{G.\ a.\ 1}{442}$

P.P.S. Do you not think that several of the medical men of the present day must be lineal descendants of some of the physicians in James's time? They have the same surnames, and so many of their drugs are of the same nature as theirs, and I could suspect their spirit is very similar; for after the translator has given a recipe, in which one of the ingredients is "white sugar one pound two ounces and two drachms," remarking, "this is notable—they should have added, two grains and a half and half a quarter," he adds, "I hope they (the Colledg) do not hold arbitrary government—they make such arbitrary receipts."

MODE OF KEEPING HOMŒOPATHIC MEDICINES.

To the Editor of the Homœopathic Times.

SIR,—It is my fate to be continually coming in contact with persons who have been under homœopathic treatment, and who tell me that they have found no benefit from it; others, again, admit that they have received benefit, but that they do not like the strict system of dietetics which is sometimes required, and therefore relinquish it. However, when I submit these parties to examination, particularly the first class, I find that it is they who are to blame, and not the system in question. Some there are who will not abstain from using camphorated dentifrices, others from strong scents, and other objectionable agents, but the most in fault, and I believe the greatest transgressors, are those who leave their medicine exposed, either to the full glare of sunlight or to the weaker but still powerful diffused daylight.

In order to give some of your readers an idea of the powerful influence exerted by light, I shall enter rather fully into particulars.

If we enter an ordinary chemist's shop, and examine the liquids in the bottles, we shall find loss of original colour, depositions of powders, muddiness of the tinctures, and in some of the delicate yet powerful compounds total decomposition; we find the bottles containing powders completely incrusted in front, but not at the back; and in every part of the shop we shall find strong evidences of the power of light. Now if such be the case with medicine in a concentrated state, what will happen when it is reduced to an infinitesimal quantity diffused through a clear liquid? The only wonder to me is, how we succeed so often.

But many will say, we can put it into a dark bottle, and then we shall be safe; but it unfortunately happens that dark-coloured bottles are generally blue, and are therefore useless. In order, therefore, to adopt a remedy, we must have a knowledge of the power we have to deal with.

An ordinary sunbeam is composed of three distinct principles—light, chemical power or actinism, and calorific or heating power. White glass allows the three to permeate it thoroughly; blue glass obstructs the illuminating power to a great extent, but offers no obstruction to the actinic rays. Yellow glass, on the contrary, admits an immense quantity of light, but is a perfect barrier to the chemical power. In proof of this we may expose the most sensitive photographic paper under a yellow glass to the bright glare of the sun for hours, without the least change. A more instructive proof is the following:—Place two pictures, one under a yellow glass, the other under a deep blue one, and take an impression from each by any photographic process; the one under the deep blue glass, although nearly invisible to sight, is perfectly represented, while the other will not have made the slightest impression.

From this it is perfectly evident, that if we wish to preserve our medicines unchanged, we must use bottles stained of a light yellow (that

Hosted by Google

with oxide of silver is the best). The slight additional expense will certainly be no obstacle to the introduction of the stained glass for medicine-chest bottles, and for using as a regular recipient of the medicines when under treatment. Bottles are now made and graduated for persons to dissolve their powders in, most of them fitted with stoppers, though it would be an improvement to have a hole entering the bottle through the stopper, at right angles, to prevent the ingress of dust.

When we reflect on the character of our medicines, and the cases of life and death in which they are often used, we cannot be too careful how we preserve them.

Commending this to the especial notice of the homœopathic chemists, I remain, Sir, your obedient servant,

HELIOS.

To the Editor of the Homœopathic Times.

SIR,—We live in an unbelieving age, in which too many men refuse to believe everything that they cannot exactly comprehend, and that they have not themselves seen; while with strange perverseness, rejoicing in their blissful ignorance, they refuse to test new discoveries, or to make the slightest effort to satisfy themselves as to their truth or falsehood. I trust I am a little in advance of some of these *philosophers*, and that I am ready to receive new discoveries upon good evidence, and to put them to the test, where I can, to satisfy any lingering doubts I may entertain on the matter.

On reading Dr. Gregory's translation of Reichenbach's work, I was perfectly satisfied with the evidence there produced in proof of the existence of odyle, as made manifest to numerous witnesses in luminous emanations from the poles of magnets, etc. etc. I lately had an opportunity, which I eagerly embraced, of experimenting in person upon the existence of this odylic light.

A young man has been travelling through the west of England, lecturing on electricity and magnetism. He formed, by means of a powerful galvanic battery, a horseshoe magnet, capable of supporting nearly three hundred weight. I got him to bring this down into my wine-cellar, from which I had carefully excluded all light, and to my great satisfaction I found that, out of a party of nearly twenty persons, ladies, gentlemen, and servants, more than one-half, including myself, saw a bright flash of light whenever the armature of the magnet was removed. Two of us, of whom I was one, saw a succession of luminous flashes from the poles of the magnet after the armature was removed.

One lady, by her own account, saw a luminous horizontal appearance, following probably the line of the armature when fixed on the magnet. There could be no mistake or fancy in the matter, as several voices frequently at the same instant called out when the light was seen, and were able to distinguish it at once from the sparks produced by disconnecting the wires of the battery. The lecturer saw nothing, and was much astonished that we did; he was perfectly satisfied of the fact, and hoped to make further experiments on the subject. We found that we could see nothing until the eye had got accustomed to the darkness, and shaken off the images impressed upon it on coming out of a lighted room. We had been engaged all the evening watching experiments at the lecture, and staring at dissolving views and chromatropes, which was a bad preparation of the eye for the inspection of the odylic light. I feel satisfied, for my own part, that on another occasion, when the eye had been less tried, I should see more of the luminous emanations from the magnet than I did on the night in question.

I send you this communication as one instance to show that it is much better to test a new discovery, than to deny its truth upon the grounds of our previous knowledge or ignorance.

I have also tested the truth of Reichenbach's statement with reference to the benefit to be derived by invalids, especially persons liable to any kind of hysterical or other fits, from their sleeping with their heads to the north. Reichenbach states that many persons suffer great inconvenience from restless and sleepless sensations, when lying with the head in any other direction, such symptoms being most unpleasantly developed when the head is placed to the east or west. According to Reichenbach's theory, these strange results arise from the odylic currents of the earth. Be this as it may, I have tried the effect of sleeping with the head to the north in a few cases, and in two of these with very marked results. In one case, a little boy, of between three and four years, has been changed from a very restless to a very sound sleeper; in the other, a servant-maid in my house, who is liable to hysterical and fainting fits, has from a very bad sleeper been suddenly, much to her own astonishment, transformed into a very sound one. Where persons sleep badly, I should strongly recommend them to put their heads to the north and try the result, even though they do not receive Reichenbach's theory on the subject. To adopt the scripture language, let us "prove all things, and hold fast that which is good."

Faithfully yours,

A NON-MEDICAL OBSERVER.

ROYAL INSTITUTION.

PROFESSOR BRANDE delivered a very interesting lecture at this Institution on Saturday, the 28th Feb., on the refining of sugar. Having given a brief chemical history of the staple sent to this country to be refined, he proceeded to explain, very fully and clearly, the method by which the raw material is converted into the beautiful crystalline products in general use in this country. This consists in dissolving this staple in boiling water: to this solution is added lime-water and blood, which enable the refiner to get rid of many of the impurities invariably associated with raw sugar. The liquor is then passed through filter bags on to a bed of animal charcoal, which deprives the solution of most of the remaining impurities. Here Mr. Brande

Hosted by Google

spoke in high terms of some improvement in the construction of filter bags, the invention of Dr. Price. The liquor so prepared is then boiled in a vacuum-pan,—the invention of Howard. Heat is destructive to sugar, and the vacuum-pan, enabling the refiner to evaporate at 140° of Fahrenheit (instead of 212° required in the open vessels formerly employed), is now generally used throughout England. The liquor having been thus boiled, is let down into a vessel called "the heater," where it is stirred about for a few minutes, at a slightly elevated temperature, for the purpose of increasing the grain. The mass is then placed in moulds, with the apex downwards, in which is an aperture which is closed with a peg; after remaining in these moulds for twenty-four hours, the peg is removed, and that part of the mass that has not crystallized runs through the hole. A small quantity of the sugar is now taken off the whole of the base of the mass, and mixed with water. The water percolates, washing the crystals in its passage. A material called magma (that is, water saturated with white sugar) is now employed. This material also percolates, washing every crystal in its downward course, and depositing the white sugar, of which it was composed, in the interstices it has made. The mass, after this operation, is left for a few hours, then taken out of the mould, covered with paper, placed in a stove heated to 120° Fahrenheit, and kept there for two days, after which it is fit for the market. The syrup which drains, as we have seen, from the potted mass is submitted to a subsequent treatment, and made into an inferior kind of refined sugar.

The learned professor passed a high eulogium upon certain rotary or centrifugal machines lately invented, for separating the syrup just alluded to from the crystalline mass; and also on a machine invented by M. Van Goethen, of Lembecq, for drying loaves; the latter, however, on account of its great mass and the velocity required, he feared might be attended with danger, which had been the case, in fact, as we understood him to say, in one or two instances.

The lecturer, in conclusion, adverted to certain chemical agents that had been suggested as being superior to blood and lime for defecation—alumina was one; but the drawbacks, he said, to its use were such that he did not expect it would ever be generally employed. There were also other chemical agents, but none of them claimed any particular attention, excepting that known by the name of Dr. Scoffern's process. It was now, he observed, two years since he brought this subject before his audience, on a Friday evening in January. He then stated that it was, chemically speaking, a very beautiful method of refining; that the agent employed—acetate of lead—although a poison, admitted of being extracted with the greatest ease by means of sulphurous acid; and that the test required by the inventor to be used to determine whether the whole of the lead employed had been extracted, was so easily and cheaply prepared, and might be applied with such facility, that no trace of lead could be left in the sugar so manufactured, except through the most unpardonable carelessness. "I expressed," he continued, "the hope that so efficacious and beautiful a system of refining would obtain public favour, and I am now happy to find that there are at least two refineries employing this process on a large scale in this country. But whatever the effect of this process," he concluded, "applied to the refining operation, may prove in a commercial point of view, it is to the sugar-growing countries that I look to see its maximum advantage realized."

The lectures at this Institution are of a far more popular character than they were formerly. Any one possessing ordinary intelligence, and having had the advantage of such an education as is usually given to ladies and gentlemen (and of which science forms but a subordinate part), can now fully enter into and appreciate the topics discussed. And delivered as these lectures are, by some of the most distinguished men of the day—such as Faraday, Brande, Playfair, and Mantell—we cannot too strongly urge on our readers the advantage to be derived by attending this theatre of useful knowledge.

For ourselves we shall make a point of publishing from time to time, some such brief sketch as the foregoing, whenever the lectures shall appear to us to possess more than ordinary interest or instruction.

THE MEDICAL REPORT OF THE BARNSTAPLE HOMŒOPATHIC DISPENSARY.

A GENERAL meeting of the subscribers to this Institution was held on Friday, the 20th instant, the Rev. J. H. Gosset, chairman; John Joce, Esq., M.R.C.S., Medical Officer.

During the past eleven months, 230 patients have been admitted to the benefits of the Dispensary, and with the following results:

Cured	161
Relieved	52
Died	2
Discharged	2
Remaining under treatment..	13
	230

The Medical Officer is desirous of submitting to the subscribers that by far the major part of the patients had been long previously under treatment at the allopathic institutions or elsewhere. The results are therefore in the highest degree satisfactory, and sufficiently attest the success of the homœopathic mode of treatment. The patients who died were both admitted in an advanced stage of consumption.

In the absence of the late treasurer, the Medical Officer has much gratification in announcing that Earl Fortescue has kindly forwarded a second donation of £5 towards the support of the Institution.

CRITICAL ANALYSIS OF A PAMPHLET BY DR. ROUTH,

Entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

By John Ozanne, M.D.

II.

Having concluded my last paper with the assertion that "nearly all the author's conclusions are more or less tainted with error, either flowing from premises destitute of proof, or being irrelevant to the question at issue," it is necessary that I should show cause for such an assertion. This will be done in the course of the present paper.

It is always good in scientific research to consider well the ground upon which we stand before we proceed upon our course. It is necessary, moreover, to mark out the road we intend to follow before we enter into matters of detail, in the intricacies of which we might become so tangled, that to extricate ourselves would be an achievement all but impossible. The traveller journeying in an unknown country, who, on the brow of a hill seeing an immense forest before him, through the mazes of which he would have to thread his way, should neglect to select, in the distant horizon, some mountain peak or other conspicuous object to serve as his guide when engaged in the windings of the labyrinth below him, would be looked upon, not only as devoid of common sense or prudence, but also as deserving of destruction, should such a fate be his. In scientific research the landmarks are neither mountain peaks nor objects already existing in nature. They are mental conceptions, but as such, and although merely acts of the mind, they are as inevitably connected with the very foundations of human intellect, as the irregular surface of the earth is with the purposes for which it was created.

These conceptions are called, in scientific language, *hypotheses*, which mean suppositions, or simply questions. Hypotheses are usually looked upon as mental conceptions in a more advanced state of realization than mere questions; as when, for instance, hypotheses are made to play the part of theories, but it is an error. Allopathic medicine is full of these theories. There would be no evil in this if it were *always recollected* that hypotheses are never more founded than mere *suppositions* ought to be, yet the habit of assuming hypotheses *as probable*, has led to the assumption of many of them as real facts in ordinary medicine. I need no further example than one of the very fundamental points in medicine—namely, the assumption that *bleeding is useful*, nay, *necessary*, in inflammatory diseases of a severe character. This has always been looked upon as a fact which could not be doubted, at least it has been so looked upon by the immense majority of physicians. Yet subsequent experience, the result especially of homœopathic practice, has shown that this fundamental point in the creed of nearly every physician is a mere *hypothesis*. It has been proved that it is *not necessary; neither* has it been shown to be *useful*. Indeed there is pretty strong evidence to the contrary; this evidence being no less than the practice *now* followed in large hospitals at Vienna and Leipsic, under the direction of learned physicians, whom we might style *allopathists*, were it not that the appellation *hygienists* is more appropriate to them.

But what is the use of hypotheses, the reader will ask, if they are capable of leading us into such errors? My answer is, they are never to lose the character of hypotheses, they are never to hold a place in our estimation as worth anything more than mere suppositions, until fully verified by carefully and properly conducted investigations.

I crave forgiveness for this *apparent* digression. That it is not entirely beside the question the reader will perceive, when shortly he will be introduced to the facts of which Dr. Routh's work is made up.

But there is a principal reason why I have thought it necessary to show that hypotheses or questions, if limited to their true office, and never losing their character as suppositions, may be useful as guides to

Hosted by Google

direct us in our researches in difficult or intricate investigations.

Now there is one signal advantage to be derived from their use, both by the reader and by the investigator himself. By the former, for he is thereby enabled to follow the author in the details of his investigations, without fearing to be misled; his guides will tell him at once when the author swerves from the correct course, and when he returns to it. By the latter, for he has before him the means of again and again examining the course upon which he is proceeding, and of ascertaining whether it be wavering, circuitous, or direct.

Again, the fact that an author distinctly states beforehand the questions to be solved, the course he intends to follow in order to attain their solution, is, in itself, to the reader a *guarantee of truth.*

It is not so with the sophist. His method of entering the field is neither bold, nor open, nor frank. He proceeds cautiously to lay down some principle which is to be *the conclusion itself,* but he carefully guards his intention from too clear a view. His course is then circuitous, ambiguous, and doubtful; it is neither open nor tangible, and therefore not easily detected. He quietly assumes inferences from his principle at starting; these are brought out casually without much show, but nevertheless assumed; then his course continues to be equally obscure, until, at the conclusion, we find the assumptions from his principle stated at the outset brought forward *as correctly inferred from his researches,* and from these assumptions, arranged as premises, he draws a conclusion, What? His conclusion is the very fact or principle which was laid down as proved at starting. In this mode of conducting an investigation *into matter of fact,* several logical fallacies may be necessary. For instance, we have necessarily an *assumed* premise, then it is necessary to argue in a *very large circle,* and to encumber the various steps of the progress with as much irrelevant matter as possible, in order to conceal the weak part, namely, the *assumed premises.*

I am sorry to say it, but I cannot avoid doing so, the above is exactly the picture of the essay before me.

In dealing with it, therefore, I mean to be careful to follow the proceeding laid down as a guide in the commencement of this paper. I shall take care to have my landmarks, in order not to become involved with Dr. Routh in inextricable confusion.

I will therefore begin by laying down an hypothesis. Let us suppose, for instance, the object of the author to have been a *bonâ fide* inquiry into the merits of homœopathy. Starting from the superiority the statistics of homœopathic institutions exhibit—he might call it "alleged," if he chose: for this we would allow him the fullest liberty, for the plain reason that an hypothesis is in reality only a supposition —proceeding in this manner, he would perhaps have drawn out a simple argument, in the syllogistic form, for the sake of greater accuracy. This argument would read thus:—

I. Any (or every) medical system which presents results manifestly superior to those produced by the ordinary modes of treatment, is *relatively* of more value as a means of curing disease. Homœopathy presents results superior to those produced by the ordinary system. Therefore, homœopathy is relatively more valuable.

This would have been the first step in his inquiry; the point to be ascertained being the *truth* or *fallacy* of the premise, "*homœopathy presents results superior to those produced by the ordinary system.*" With its truth or fallacy, homœopathy *as a system*—let not this be forgotten; for the author does admit that cures are sometimes obtained in the old system by homœopathic practice (see p. 6, *line* 9 *and following lines*)—must stand or fall, not *absolutely* be it remembered, but *relatively* to the ordinary system.

If this point were ascertained *upon sure and undeniable evidence,* it is obvious to every person endowed with common sense that *homœopathy would no longer be a flourishing system, but a thing of the past.*

But if this inquiry resulted in proclaiming the superiority of homœopathy, *as a system,* over the ordinary practice, the inquiry would not end here. It would lead to a further step, which may be stated in the following form:—

II. Every system which presents results superior to those observed when cases of disease are left to nature *alone,* is to be declared as really possessing the power of curing disease.

Homœopathic results are superior to those observed when cases of disease are left to nature alone. Therefore—

Homœopathy really possesses the power of curing disease.

The point to be investigated here is whether, under homœopathic treatment, patients recover more frequently and more rapidly, than when they are left to nature alone.

The above conclusions are of course denied by allopathists; but I here solemnly declare, that the rejection by allopathists

Hosted by Google

of these conclusions is purely of an *à priori* character, never having been made after a careful inquiry into the two points above stated. As a proof of the correctness of this declaration, I give Dr. Routh's book itself; a book professing to condemn homœopathy, after a full, a fair, and a candid inquiry into its merits. I want no other proof of the truth of the homœopathic tables standing at the end of it, side by side with the allopathic, in the full glow of their superiority. Let this be said, however, with the caution to the reader that, although the correctness of these tables is disputed in the body of the work, although they present the results of homœopathic practice in institutions ever open to any medical man who may choose to visit them, although the proof of their fallacy would have been easy if they had been really false, *no proof whatever is brought forward.* Of course, I do not look upon the suggestion of possibilities, imputing inaccuracy or *dishonesty* to those who have drawn them up, as proofs of their falsification. Were the institutions closed to the inspection of allopathists, the consideration of such possibilities would then be legitimate, and the imputation of trickery, selection, and dishonesty in a measure excusable; but as the case stands, these suggestions are indicative of the weakness of the allopathic cause, whilst the imputations are neither more nor less than unwarrantable *slanders.*

I cannot quit this topic, to pass on to an examination of the author's reasoning, without observing that every homœopathist has gone through the above inquiry for himself, before adopting homœopathy. I cannot say whether every one has reasoned *precisely* as I have stated in the above two forms of argument, but I may aver that the reasoning of each must have been substantially the same. Each has first formed his conclusions regarding the superiority of homœopathy *relatively* to allopathy; this was an easy task. But not so with the next, for the terms of comparison were not to be found, seeing that it is far from easy to show that allopathic results are not in reality *greatly inferior* to those observed when the cases are left to nature. Dr. Routh glances lightly beside this question. It is a rock which would split the author's frail bark, as it has already proved the destruction of the more mighty fabric, which sailed gallantly and boldly in the same waters. I allude to the *British and Foreign Medical Review.* But I may state it as my belief, that no man can practise homœopathy with care and watchfulness, without soon perceiving that his remedies really have the power of *curing disease.* But of this more hereafter. I now proceed to expose the argumentation of the author of "The Fallacy of Homœopathy."

There are two leading arguments in Dr. Routh's attack upon homœopathy; they proceed side by side, and are alternately put forward as the occasion may require, when dealing with individual facts. The first may be stated as follows:—

1. Every medical system which pretends to cure disease by the agency of medicines totally powerless to influence disease, is false as a system of cure.

The homœopathic system does this. Therefore the homœopathic system is false.

It will be observed that the whole of the argument is based, as regards homœopathy, upon the assumption of the premise—*the homœopathic system pretends to cure disease by the agency of medicines totally powerless.* The truth of this assumed premise is denied by homœopathists, yet upon it, *although denied,* the author builds up his whole case.

He starts from a proposition, given in the introductory part in three places, in the body of the work in four, and again in the conclusions. This proposition appears each time clothed in different words.

In the introductory part it is worded as follows:—

1. "The belief, therefore, that anything so small could have any effect on disease, is too ridiculous to require comment." (p. 8).

2. "Thus are we compelled to conclude that the infinitesimal doses, neither by analogy nor upon any theoretical grounds, can have any power upon the human frame." (p. 16).

3. "The infinitesimal dose is, therefore, inert; but even small doses, not infinitesimals, may be so." (p. 17).

Be it remembered that these propositions —I might say *conclusions*—are given in the introductory part, before any of the facts usually brought forward by homœopathists in support of the efficacy of the means employed are even noticed. It is by the light thus afforded by this *à priori* conclusion that the facts themselves are to be examined.

In the second part of the work the author asserts, without producing any proof of his assertion, that "in most cases not influenced by mind, the cure is effected by the dietary rules enforced and not by the mere globule" (p. 36).

At page 55 he gives us the history of a case of extensive double pneumonia with delirium, lividity of countenance, etc., observed by him in Fleischmann's hospital, and says, "yet, without a single poultice,

Hosted by Google

cataplasm, or other treatment than *the inert globule*, rest, emollient drinks, a warm atmosphere, and starvation, she got well."

A few lines above he alludes to "the homœopathic treatment, which an allopath will consider as no treatment at all."

In the conclusions we have—"In the homœopathic cures effected, globulism is absolutely for nothing."

Now upon this proposition, which is the beginning and end of his principal line of argument, he has based a mode of reasoning, which I have above reduced into the syllogistic form for the convenience of the reader. It is not, however, to be supposed that it is an easy task to find out what he means to say until we reach his conclusions. The fact is that, feeling the weakness of his case—knowing that the whole of it depends upon the assumption of the premise, "the homœopathic system pretends to cure disease by the agency of medicines which are totally powerless"—he has preferred to allow a veil of obscurity to hang about it, whilst, arguing in *a very large circle*, the various steps of his progress are almost unnoticed.

His argument, the question to be proved being *whether homœopathic medicines have the power to cure or not*, runs thus:—

1. Homœopathic medicines are totally inert.

2. Cures are brought forward to show that these medicines really possess curative powers.

3. But these medicines, being inert, cannot be the means by which these cures are produced.

4. Therefore the cures must be due to other causes.

5. Moreover, it so happens that age, locality, and other circumstances, may modify the results of disease.

6. Moreover, homœopathists have an interest to deceive.

7. Therefore it is probable that their cases are "selected," "cajoled," and the statistics "falsified."

8. On the other hand, allopathic statistics are accurate, honest, and to be depended upon.

9. But they present results inferior to the homœopathic.

10. Now, considering that allopathic practice is useful and powerful, such an inferiority cannot be real.

11. Because, if real, it would imply that the homœopathic medicines are powerful enough to cure disease.

12. But these medicines are totally powerless.

13. Therefore it is certain that the statistics are false.

14. Now, "after what, I trust, has been an impartial and temperate inquiry," I am compelled to arrive at the conclusion that—"in the homœopathic cures effected, globulism is absolutely for nothing, *and the practitioner who would attribute such cures to globulism, must be considered as either full of simplicity or a friend to quackery.*" (Conclusion, p. 75.)

This, reader, is the author's line of argument, divested of all its incumbrances and of its ornaments; in its bare form it is not likely to catch either friend or foe. That it is neither overdrawn nor incorrectly stated, I leave it to you to judge, book in hand.

I have said, that one of the author's fallacies is the assumption of a premise which is unfounded. In his argument this appears, as already stated, several times in the course of his work.

But I have also said that there is another fallacy; the latter consists in proving what is irrelevant to the question at issue—the *ignoratio elenchi* of logicians.

Some samples of this fallacy are apparent in the fourteen steps enumerated above. But we have it in its most striking form in the conclusions at the end of the book.

There are homœopathic cures, there are statistical tables, this nobody denies. There is, moreover, something which, borrowing Dr. Routh's phraseology, I may call "an unpleasant fact" for the allopathists, which is that these tables exhibit a rate of mortality under allopathic practice *greatly exceeding* that which occurs under homœopathic practice. This fact is so unpleasant to allopathy that it is keenly felt that, unless it be explained away, the progress of homœopathy will not be arrested.

Dr. Routh therefore boldly undertakes to perform the task. By means of various considerations, some of which are very ingenious, arranged, moreover, with tables of figures, he is led to infer that perhaps the cases may have been inaccurately classified; that they may have been selected; that perhaps there may have been some trick. In fact, he gives a host of possibilities, points at "unfortunate coincidences for the homœopaths" as indicative of "cajolery;" but of these presumptions he brings *no proof whatever*. I shall have, when dealing with the details of his book, to enter more freely into the various points; therefore I may dismiss them at present, having brought them forward merely to show how, from such premises, he deduces the second series of his conclusions—that the homœopathic statistics are falsified, and therefore that their comparison with the

Hosted by Google

allopathic is unfair, and not to be depended on. This conclusion is irrelevant to the question at issue; namely, *whether homœopathy has really the power of curing disease in a degree superior to allopathy*. And yet it is so placed, that no one who does not see through the fallacies of the book will rise from its perusal without exclaiming, "Homœopathy is a fallacy!" This last conclusion is not given by the author, neither is it deducible from the four propositions which form his second series of conclusions, but it is so arranged, that the conclusion last named will *by most persons* be drawn from it almost inevitably. Therein lies the sophism.

It may here be noticed again that the chief part—I ought perhaps to say *the whole*—of Dr. Routh's argumentation is based upon the assumption that homœopathic medicines are *totally inert*; the reason for this assumption being the supposed impossibility that a quadrillionth, a sextillionth, or a decillionth of a grain of medicine should possess any power to cure disease. Upon this single assumption his denial of some of the homœopathic results, and his doubts of the accuracy of homœopathic statistics in general are based. If it be really founded, his work will stand; if not, it will inevitably fall, crushed by its own weight.

Dr. Routh professes to have entered into deep and lengthened researches respecting homœopathy. He has written a book which has met with the approbation of the Medical Society of London, upon the faith, of course, of the researches in it being complete. What will the members of that Society think of the work, when they find out that the foundation-stone upon which the whole rested, is after all but a foundation of sand?

Dr. Routh assumes that homœopathy consists in the use of quadrillionths, sextillionths, and decillionths of a grain of medicine only, and upon that assumption he bases all his reasonings. Upon that basis he rests his motives for accusing several German physicians of dishonesty, denies their cases because, forsooth, the cures are produced only by "an inert globule!"

Now, Dr. Routh *knew* that these cures were not produced by globules at all. He *knew* that they were produced by the lowest dilutions of the tinctures. Witness two cases reported by himself (pp. 59, 65), in which the 2nd dilution of the *Tincture of Aconite* was given every three hours, and the 1st dilution of the *Tincture of Belladonna* every two hours. He *ought to have known* that Dr. Fleischmann uses not the centesimal dilutions, but the decimal. For instance, the 1st dilution of *Belladonna* is prepared with ninety drops of *Alcohol* and ten drops of the strong *Tincture of Belladonna*. He *knew* or *ought to have known* these facts; they go against his arguments; they are not stated; therefore his work is not trustworthy.

Should he re-issue his "Fallacies of Homœopathy," I recommend to his notice the following quotation from Professor Henderson's letter to Dr. Forbes, published six years ago, and which, considering the ability and position of the writer, it is singular he should have overlooked. "You have been unfortunate in not having considered attentively the means which Dr. Fleischmann used in the course of his remarkable success in inflammation of the lungs. Had you done so, you might have avoided the blunder which I have now exposed; for you would have discovered that the solution of *Phosphorus*, which formed his principal remedy, contained a notable quantity of that very active substance. If you had consulted Fleischmann's notice of his practice, contained in the *British Journal of Homœopathy*, No. 5, you would have found that his *first* attenuation of *Phosphorus* contains, in every hundred drops, a grain of the drug; in the *second*, nearly one-tenth of a grain; and in the *third*, about one-hundredth. These are the attenuations used by homœopathists in severe cases of pneumonia, as you will perceive from the cases detailed by Fleischmann and myself. Now, if you had considered that the dose of this medicine, when given after the rules of your own school, is only about the fiftieth of a grain, or only double the dose of the first homœopathic attenuation, you could hardly have concluded that the homœopathic treatment of pneumonia is incapable of producing any positive effect. You would have perceived that it is not by the millionth, or the billionth of a grain of *Phosphorus* that the homœopathists claim the credit of curing pneumonia so much more successfully than others. And I may here remark, in reference to acute diseases, that the lower or stronger attenuations of the medicines are those almost universally used, a circumstance which you do not seem to have known, when you made the general remark at p. 229, that 'the primary dilutions or attenuations are used comparatively rarely,' otherwise you would, doubtless, have made an exception in respect to inflammations, and thus have silenced the clamour of those opponents who labour to frighten the public out of its propriety by representations founded alike on malice and ignorance. Whatever may be thought of the higher attenuations and their alleged value, in

Hosted by Google

chronic diseases, there can be no doubt, in the mind of any rational man, as to the lower both actually containing a very sensible quantity of medicine and being capable of producing a sensible effect, even though experience had not abundantly proved that they do." (p. 18).

(To be continued.)

Review.

Medicina Mechanica, or the Theory and Practice of Active and Passive Exercises and Manipulations considered as a Branch of Therapeutics, and as adapted both to the Treatment and Cure of many Forms of Chronic Disease. By JOHN W. F. BLUNDELL, M.D. London: John Churchhill, Princes Street, Soho. 1852.

BOOK-MAKING has become a trade; and to put forth a book is now the usual course of any one who practises or intends to practise a specialty, so that the treatise is elaborated or compiled, not to convey the stores of knowledge and the practical views of the author, but to advertise him. In former times, a treatise on any special branch of medicine was looked upon as the result of deep study and mature experience. The book before us does not certainly belong to this order. Dr. Blundell has at once leapt in *medias res;* after a few months' experience of Ling's Therapeutics he writes oracularly, and claims to be an authority.

Mr. De Betou, to whose practice Dr. Blundell has succeeded, was not a pupil of the Swedish Institution. He acquired the knowledge of Ling's method through his partnership with Mr. Ehrenhoff, who, after having studied Ling's system at the Institution at Stockholm, for two years, came to England to practise, in 1845. It is true that Mr. De Betou had for some years previously made use, in a limited way, of some mechanical movements or other, which have about the same relation to Ling's movements as the processes of Mr. Harrup, of Brighton, or those of Mr. Beveridge, of Edinburgh, and of divers others of that class of gymnosophists. Dr. Blundell is therefore thoroughly mistaken in supposing that Mr. De Betou introduced Ling's system into England; and from whomever he obtained the materials, he has sometimes published as Mr. De Betou's teaching the *ipsissima verba* of Ling himself; and he has also reproduced, without any acknowledgment and without the sanction of the real author, Professor Branting's formulæ.

Dr. Blundell then appears to some advantage in some parts of his book, in the plumage of birds of broader pinion and loftier flight than himself or his preceptor.

Mr. Ehrenhoff was supplied with Branting's formulæ by the Professor himself in strict confidence; and to Mr. Ehrenhoff's surprise, no doubt, they are found in this book—how obtained does not appear.

But as the traveller in the desert comes now and then to an oasis, so the reader of this volume will every now and then find some excellent principles clearly laid down, some sound reasoning on the physiology of the movement-cure, and some true practical views; but such passages are due to Ling and Branting chiefly.

This book is entitled "*Medicina Mechanica,*" but is without mechanics or order; a work on Swedish gymnastics, by an author uninstructed therein. As it is, we cannot but feel that Dr. Blundell, so far from adding any valuable testimony to the excellence of Ling's method, has only proved the efficacy of the application of mechanical agency in an exceedingly superficial and sketchy manner. The inefficient knowledge of Dr. Blundell's teacher, as far as Ling's system goes, may in some measure account for, though it cannot justify, the defects of the book. The two living authorities on the subject, Professor Branting, of Stockholm, and Professor Georgii, of London, should lose no time in giving us a full and satisfactory treatise on Ling's movement-cure. If they, after the experience of a quarter of a century, leave their master's reputation and his claims to the honours of the lawgiver in therapeutic gymnastics to the mercy of compilers, the fault and the injustice to the memory of Ling are theirs.

The profession has a right to be properly and fully instructed in Ling's views and principles, and with respect to his theory and practice, and not to be allowed to remain satisfied, perforce, with crude compilations of comparatively inexperienced persons.

We give an extract from the didactic part, and one of Mr. De Beton's cases.

"Let the reader consider for a moment how much of health depends on a full development of the chest, and how much is performed therefore by a treatment which expands that chest—an operation which is safely carried out by properly-directed muscular exercises. This example is a diseased condition of the body as much as any other, and it is simply by removing, in this case as in others, existing obstructions, that similar diseases can be cured. The little knowledge we have attained of the subtle laws of Nature prevents our giving a clear and succinct account of the physiological re-

Hosted by Google

sults of our movements, at least in the minutiæ of repro luction, absorption, and the like. It is ever our plain duty to follow Nature, and *act* by her indicated examples. Ling, ever mindful of these difficulties, has very ably given us *three* deductions connected with even an ordinary diagnosis. They are as follows, namely:—

"1st. 'If the dynamical (nervous) agent is the predominant, the disease shows itself by more mechanical phenomena;' as we may observe in the various involuntary emotions and passions, displayed in powerful or subdued muscular action, whether internal or external.

"2nd. 'If the mechanical (muscular) agent is the strongest, the phenomena are more chemical;' as in the accelerated course of the circulation, increased nutrition, or in the lengthened chain of the *momenta* of the sanguiferous system.

"3rd. 'If the chemical (sanguineous, etc.) agent is prevalent, we may mark more dynamical symptoms;' as in all those cases where the *vital* forces are disturbed, such as in the various conditions of fever, mental disturbance, excessive sensibility, and the like.

"*Luxation of the Jaw, with Paralysis of the Muscles of the Face, etc.*—Miss H—, aged 39. This lady, of nervous-lymphatic temperament, had been subject to the above distressing attacks for a considerable period, the usual medical treatment in such cases having failed to remove the cause of her malady, or restore the general tone of the system. She experienced at times violent headaches, with nervous derangement, loss of voice, luxation of the lower jaw combined with paralysis of the temporal and zygomatic muscles, and partial congestion of the facial nerve or of a portion of the brain itself.

"*Treatment.*—As her general health was otherwise unimpaired, and the systematic disturbance of a local character, the manipulations were carefully directed towards the region of the mischief, in order to remove the tendency to congestion, increase the activity of the absorbent vessels of the head, and give tone to the muscles and ligaments of the affected part. These began with active movements of the muscles of the neck and head, combined with nerve-pressure chiefly on the trunk and branches of the seventh pair, and percussion over the neck and occipital region; these were followed by active motions to the muscles of the jaw, pressure on the parotid and sublingual glands, and lastly, strong active diverting movements of the muscles of the abdomen and extremities. The result was, that in a very short time she was perfectly restored, nor has she subsequently experienced any return of the former symptoms. This case is one which demands particular attention, as it evidences in the most striking manner the efficacy of a mechanical treatment to parts (suffering under the common effect of local fulness or determination of blood) which are accessible to the practitioner; and it is moreover important, as a period of two years had been given, and with a reasonable knowledge of the case, before the diseased part could regain its former vigour."

THE
HOMŒOPATHIC TIMES.

SATURDAY, MARCH 13TH, 1852.

THE time for action should be always prepared for: as none should undertake a war, so none should undertake a part in a practical reform, like homœopathy, without counting the cost.

The medical men who practise after the manner of this reform, have the most unpleasant duty. Their success is vilipended; their character assailed; their honesty impugned. In the last week's *Lancet* there is a case stated, and called "the fruits of homœopathy;" than which nothing can be more lame and impotent, and a charge against a respectable homœopathic practitioner is made to rest on the tittle-tattle of a nurse.

Man is mortal, the sons and daughters of flesh are mortal, so far as their bodies are concerned: it is the Will of the Maker, and as sin brought disease into the world, so disease has brought death. The homœopathists do not claim the power of preventing death, and yet they are treated as though they had advanced so mad a claim. We demand that the results of our practice on a large scale should be compared with the results of the drugging practice.

Some time ago a case at Norwich excited the virtuous indignation of the virtuous *Lancet*: the practitioner then impugned has made out an exceedingly good case on the medical merits of the question. Will he receive reparation? of course not.

Little do the routine practitioners of allopathy know of the labour of the conscientious homœopathist who does not pursue a routine practice. The homœopathist encounters obloquy, and has to endure far more mental toil and anxiety than the allopathist. Alp on Alp arises as he pursues his course; and the more experience he gains, the more he feels how small is his knowledge in comparison of the vast field of study and observation it is his duty to examine.

Hosted by Google

We fully believe that of all the sciences man has undertaken to investigate and master, homœopathy is the most important and dignified. It embraces the largest interests, for its sphere of operation is the whole circle of humanity. It is a Sovran Science, for it reduces under its domain all accessories to healing; it is autocratic, for it relies on the law of a lawgiver; it is aristocratic, for it eliminates the best and worthiest elements for healing; it is democratic, for it descends into the cellar, ascends to the garret, and affords its beneficent aid to the masses, as well as to the Corinthian pillars of society.

Yet it is this homœopathy that a sciolist Williams sneers at, and a Rose Cormack denounces.

The pity is that the homœopathists themselves are not exactly *brethren*: but it is the lot of humanity. Very glorious were the true men of the Commonwealth, but how few were those true men, when they are weighed in the balance. Be this as it may, our proportion of true men is fully as great as that of the old sect of medicine; and we have a bond of union they never had—the law of healing.

We believe this to be a law of Nature; and if so, it must become an established law, like that of equivalents, or gravitation, or the laws of motion.

"There is no rebellion like that of the belly," said Napoleon: there is no rebellion against a medical tyranny, such as that of prescriptive allopathy, like that which induces people to refuse to be condemned to a bad medical practice, when they can have one that is much better.

There is at present, at all events, a dissettlement of men's opinions, on medicine as well as on other subjects: and we are coming to the "day of reckoning."

The men of Manchester the other day subscribed £27,000 in twenty-five minutes for what they believe to be a just cause. We should like to see the like enthusiasm for our Cause on the part of our adherents.

Correspondence.

COLCHESTER AND HOMŒOPATHY.

To the Editor of the Homœopathic Times.

SIR,—The inhabitants of Colchester and its neighbourhood have for some time past been desirous of obtaining a resident homœopathic practitioner.

The population is about 20,000. Many families have embraced homœopathic principles; several have consulted various London homœopaths, but the necessity of a resident surgeon is daily increasingly felt. Several have purchased the medicines and books, and are doctoring not only themselves, but their neighbours. About twenty heads of houses, most of them with large and increasing families, amongst the middle classes, would rejoice to see a homœopath, of good moral character and professional habits, settle in the town. In midwifery he would find employment from the beginning.

If by inserting this note in your valuable journal you can aid us, or by any other means, you will be doing a great service. Any further information I shall be most happy to supply through you,

And have the honour to remain, Sir,
Your obedient servant,
A. B.

THE BRITISH SOLOMON.

"A Brief of his Maiestie's Royal Proclamation, commanding all Apothecaries of this Realm to follow this Pharmacopœia, lately compiled by the Colledg of Physitians of London.

"Whereas by our especial commandment there hath been of late compiled in the Latin tongue, by the Colledg of Physitians of London, a book entituled Pharmacopœia Londin. is now perfected, and is a work greatly tending to the publick good of our subjects, and we minding that all falsehood, differences, varieties, or uncertainties in making or composing of medicines, and distilling of oyls or waters, hereafter be utterly taken away and abolished; and that in the time to come the manner and form prescribed in the said book should be generally and solely practised by apothecaries, in their compositions of medicines, and distillation of waters for all such things as are therein named and prescribed. We therefore desirous in all things to provide for the common good of our subjects, and intending to settle and establish the general use of the said book in this realm of England, do hereby signifie and declare our royal will and pleasure to be, and hereby straightly require, charge, and command all and singular apothecaries within this our realm of England, or the dominions thereof, that they and every of them, immediately after the said Pharmacop. Londin. shall be printed and published, do not compound, or make any medicine or medicinable receipt, or prescription, or distil any oyl, or waters, or other extractions, that

Hosted by Google

are or shall be in the said Pharmacop. Londin. mentioned and named after the waies or means prescribed or directed, by any other books or Dispensatories whatsoever, but after the only manner and form that hereby is or shall be directed, prescribed, and set down by the said book, and according to the weights and measures that are or shall be therein limited, and not otherwise, etc., upon pain of our high displeasure, and to incur such penalties and punishment as may be inflicted upon offenders herein, for their contempt or neglect of this our Roial commandment. Willing and commanding also hereby all majors, sheriffs, justices of peace, constables, etc., to be aiding, abetting, and assisting. Given at our Palace of White-Hall, 26. of April, in the 16. year of our reign of England, France, and Ireland, and of Scotland 51, 1618."

ALLOPATHY IN THE 17TH CENTURY.

"THE COLLEDGE TO THE CANDID READER.

"Physick, which gives thee health, wisheth good health to thee; and that it may the better provide for thy health, it hath built up this new apothecaries' shop; which it hath not only stored with a rich magazine of wholsom medicines, but hath also taken so much care for thy safety, that they should be compounded faithfully, without deceit; safely, without error. But thon wilt say, What need is there of this? seeing there is scarce a forrein city or university of any fame, but have abundantly performed this, both antient and modern; perhaps it is true. But if so many antients, as Mesne, Myrepsus, Alexandrinus, and others, rested not satisfied in this, but every one of them would have his own Dispensatory—the Romans theirs, the Venetians theirs, the Florentine theirs, the Bergomenses theirs, the Augustan theirs, and others which we pass by in silence, why should not the Londoners have theirs? as their own proper garment; the praise of which consists not in that it is gorgeous, but in that it is their own; not in that it is made of purple or pall, but in that it is * fitted to English bodies. Besides, it happens that we are rather distracted than furnished with such varieties; this plenty hath set us to seek, and that disease we meet withal here ariseth altogether of fulness. The vaster the wood is, and the more paths it hath, the sooner may the passenger lose his way. The more spacious the sea is, the more need of a pilot. And this our apothecaries having been a long time destitute of, are tossed up and down with diverse waves, and suffer a thousand distractions; one, in making up his medicines, running in one path; another in another: one follows Cordus, another Fernelius, a third the Augustane physitians, and a fourth his own fancy; so that a medicine comes to have so many several ideas as there are shops: which mischief, that it may not turn epidemical, to the great hazard both of physitians and sick people, wee intend by this work, like as by an anchor cast, to settle the floating course of compounding medicines, and to restrain it within its proper bounds and channels: whilst we do not only teach one and the same rule and method of compounding, but also impose and command it (from which men ought not to err a hair's bredth, as they say); that so both physitians and apothecaries being guided by one and the same threed, they may unanimously proceed, these in prescribing, those in compounding medicines.

"There is another grievous plague, also, which cals aloud for a Dispensatory, to wit, the deceit and impostures of men who, to get a little gain, sell filthy dregs instead of good drugs; nay, even those which are of most value, treacle, mithridate, and alkermes, are adulterated, so that they are no longer antidotes, but poysons; not a help, but a destruction to the sick: such abominable man-slayers, though they deserve the whip or gallows rather than our censure, yet all may happily be salved, (for English men) by benefit of this book, and poor sick people's health provided for. The happy and salubrious counsel, the glory and praise of which we do not ascribe to ourselves, but (that we may confess the very truth) its original came higher, and its rise was more divine; the beginning came from Jupiter, we mean, from our most soveraign, and (which is more rare) most learned, and (which is more grateful) most vigilant for the publick safety KING JAMES; who, as he hath alwaies studied, and happily settled peace in the Christian orb, unity in the Britton orb, conformity in the Ecclesiastical orb, so he hath vouchsafed to illustrate our Appollinary orb and physical sphear with his light, and to appoint wholsom laws to us, for a physical concord and certain harmony of making medicines; so that as before he had respect to the salvation of souls, so here to the health of bodies; before to the dignity of the subject, here to their life and health: so that it may be truly spoken of him, which the divine prophet spoke of the sun, Nothing is hid from his heat, nothing secluded from his care; and the same motto seems to be engraven by a divine hand upon his breast which is upon his coyn, The safety of the people is the supream law: for when he had granted new liberties, new priviledges to the Apothecaries of London, by his letters patent, he inculcates upon this above all,—that when this Dispensatory comes out to publick view, they should religiously bind themselves to that as to a sacred rule, and should obey the decrees of the Colledg of Physitians; to which Royal mandate it was but equal for us to obey, and at length we brought the matter so about that this London Dispensatory is brought forth to publick view, in a habit neither slovenly nor proud, neither wanting nor redundant; in which, although we reverence the learned and gray hairs of the ancient, and have placed their receipts, as it were, in the front, yet we neither reject nor despise the supplies of modern affusions, but we have left them a place and corner in the

"* Some wise men question that extreamly."

Hosted by Google

reer, that so they may serve as auxiliaries to the model of Physick. Neither have we superstitiously tied ourselves to the steps of the ancients so, as that we bring nothing new of our own, for all here described is not transcribed; we have not furnished our apothecaries' shop altogether with forrain wares, but we have added some new ones, and of our own, which we bring forth into the publick as aproved by frequent use; some we have changed in the ancient forms, both the sence and name of the author being preserved, not moved thereto so much through desire of novelty, as compelled thereto by necessity, especially where such simples as are prescribed cannot easily be had, in the place of which we prescribe others, like unto them in vertue. The like we have done in the composition of pils, which, if they were made into a mass after the ancient manner, with juyces or waters, they would soon be too dry, therefore, we have appointed it to be done with syrups; also, whereas in most authors, some things are totally left to the judgment of the artificer, especially in the quantity of honey and sugar, under these two letters *q. s.*, or words [so much as is sufficient], whence it comes to pass that the same medicine hath neither the same consistence, nor the same vertue, we have for the future * taken away this power from the artificer, and for this cause have taken some of the most skilful apothecaries into counsel with us, by whose help and pains we have agreed upon a certain manner of composition, and have designed a certain quantity and dose, which they may not ad to nor take from. And lastly, seeing in most Dispensatories, both ancient and moderu, the use and vertue of every medicine is described, whence ignorant fellows and mountebanks may arm themselves for the practice of physiek, and so put a sword into a madman's hand for the destruction of the commonwealth, we have added nothing at all of the vertues; for we write this to the learned only, and to the nurslings of Apollo, for the health, not the understanding of the vulgar. We need not give a reason why we dispose of it in this order; we have placed the simple bdfore the compound, the internal before the external, the liquid before the sollid: we have digested them all into several classes, that so they may be brought into use and practice with little search. Thus (courteous reader) thou hast both what we have done, and why we have done it so. It is a work to which all the Colledg have brought their talents, as all the Gods did to Pandora in the play, but under the auspicy of a most worthy president, by who, not only as president, but by whose counsel, help, and indefatigable study, this building was finished, which as it is (friendly reader) we vow it to thine and the publick good, and hope it will be commodious for thee; and if it please thy palat, use it and fare well.

"From the Colledg of London, Decemb., anno 1618.

"* In a hopsack."

HOMŒOPATHIC EXPERIENCE.

To the Editor of the Homœopathic Times.

SIR,—Harriet R— came to me, July 1837. She was ten years of age, very subject to eruptions; her ears were sore, and ran with a watery discharge, and her fingers were covered with a blistery eruption. I gave her two globules of *Sepia*, 30th dilution; the following week she was so much better that I gave no more medicine. She continued to improve, and in a few weeks was quite well.

Rachel G—, about twenty-two years of age, came to me in May, 1838. Giddiness; weight in the head; cannot bear the light; pain in the sides of the head; throbbing in the head; pain in the roots of the hair; noise and pain in the ears; bleeding at the nose; the skin of the face tender when touched; often has pain in all the teeth; tongue burning, and covered with mucus in the morning; dryness in the throat, which sometimes impedes swallowing; bad taste in the mouth; after eating, nausea, and a wish to vomit; food has lost its taste; longing for something nice to eat, without knowing what to choose; bitter eructations; abdomen swelled, hard, and feeling of fulness; deficient evacuations, with pain in the back; small cough, with bitter expectoration; oppression in the chest, with fulness when the head is low in bed; cannot breathe when lying on left side; pain as of ulceration in the chest; throbbing of the heart; pain and stiffness in the back; weight in the arms and shoulders; numbness in the shoulders and hands. She sometimes loses the use of her hand in holding anything; veins of the hand are swelled like cords; weight, with weakness and trembling of the legs; swelling of the feet, and sensation as if they were weak and broken; pain and sore feeling on the top of the thigh, which is painful when touched; pricking of the joints; after sitting a long time, going out in the air relieves her; feels worse *after* walking; on rising in the morning feels well, but her weakness is so great that dressing brings back her ailings; frequent throbbings all over the body; agitation and throng of ideas retard sleep; starting in sleep; partial perspiration at night; inward heat, with cold skin; the whole skin very sensitive; cannot bear to be touched. I gave her one globule of *Pulsatilla*, 18th dilution, one globule a week; she improved rapidly. The second week I asked a medical man (of the old school) to examine her. He told me she had a complaint of the heart. I continued the weekly doses of one globule of *Pulsatilla*, and in a short time she was quite rid of all ailings, and became strong. I did not note the number of doses, but know that the young woman was well many months after this cure. I have not seen her since, as she left the island.

George Lowe, aged twenty, 1836. In blasting stones, he shattered his forefinger; the nail was blown off; the finger had the appearance of a small plum dumpling, at the end of a stiff finger, the whole very much inflamed. I gave two globules of *Arnica*, 6th dilution; the following day the inflammation and acute pain were gone. I gave one more globule; it im-

Hosted by Google

proved so much that I waited three days and then gave two more globules. At the end of seven days he could work again; and at the end of the fortnight the new nail grew, and no more inconvenience was felt. The man told me that a young man who worked with him had had a similar accident six weeks before, and he was still under his doctor's hands and unable to work.

Elizabeth M—, aged thirty, 1837. Sore throat; tongue swelled; palate swollen; bad taste in the mouth; feeling of splitting in the head; worse when stooping; headaches; nausea in the morning. Enuresis, prolapsus uteri. I gave two globules of *Belladonna*, 30th dilution; the next day the throat was better; gave one globule more. At the end of a week, the head, throat, and palate were cured, and the rest so much improved that I did not give more medicine. After a few weeks she had no return of any of her former complaints.

Mary G—, aged eighteen, 1837. Since an infant, she had been afflicted with violent headaches, accompanied with great thirst, and swellings of her legs. I gave *Puls.*, but without any good result; the following week I gave two globules of *Aconite*, 24th dilution. The next day she was better, and less thirsty. I gave one globule more; in a week she was so much better, that no more medicine was required.

H. C.

CASES.

CROUP.

June 29th, 1851. J. B—, æt. 3, an unhealthy, scrofulous child; one member of his family has already died from this disease, and several of the others have suffered severely from it. At half-past twelve a m., to-day, I found him suffering from a cough, which he had had since last night, and which was attended with the rough, peculiar sound indicating commencing croup. As there was no fever present, and the child was lively and breathing easily, I gave him *Drosera* twice a day. In the evening I was again sent for, and was informed that an hour or two ago his breathing had become laboured, and the cough dry and accompanied with a ringing noise; he was now asleep; respiration harsh and very audible; pulse 148; skin hot and dry; a good deal of restlessness present.

℞ Aconit. 6, gl. viij.
Aquæ, ʒiss. M.

A teaspoonful every hour, whilst the child is awake.

30th. Slept well during the night; the heat and restlessness subsiding with each dose of the medicine, of which only two were given. He appears now much better, and is lively and active; respiration loud and harsh, with much resonance on coughing, and great difficulty in bringing anything up; pulse 120; appetite none.

℞ Spongia 12.

A globule every three hours.

In the evening the cough was better, and the child doing very well.

July 1st. Much better; he slept well, and the fever is very much abated; breathing not quite so loud; the harsh, rasping sound of croup is almost gone; cough loose and easy; was a little sick this morning.

A globule of *Hepar* to be alternated with one of *Spongia*, every six hours.

2nd. Nearly well. Continue *Hepar* only.

3rd. Cured. The mother tells me that no case of croup occurring in her family has been so easily got over.

LICHEN URTICATUS (?).

August 18th, 1851. Mrs. S—, æt. 64, in good health, with the exception that a week ago an eruption appeared upon her hands, which quickly spread over several parts of the body. It is a papular eruption, and consists of small nodosities under the skin, of a reddish colour, accompanied with swelling of the hands, and with violent itching and burning, which are worse at night than in the daytime. It is thick upon the back of the hands, upon the arms, the shoulders, the knees, and the feet. The eyelids are affected, being red and swollen, itching violently, and sticking together during the night; there is much lachrymation during the day; the bowels are rather costive; the urine is clear.

℞ T. Sulph., half a drop every morning.
Mercurius 12, a globule every night.

22nd. Very much better; the eruption is dying away, and the itching has nearly disappeared; sleep much better; the hands are not so swollen. Continue.

25th. Quite cured.

LICHEN CIRCUMSCRIPTUS.

August 30th, 1851. S. B—, æt. 11, enjoyed good health until a month ago, when an eruption appeared in the middle of the back, which soon spread so considerably as to invade the neck and shoulders. It comes out in circular patches, which are red, and consist of pimples aggregated together, and slightly raised above the surface of the skin; these patches run together, and, as Erasmus Wilson describes the disease, "produce an irregular tracery of curved and broken lines." A furfuraceous desquamation covers the area of the circles; the red colour is more vivid at night than in the day, and the eruption is attended with violent itching, and bleeds when scratched; small pustules appear here and there; not much affection of the general health; bowels regular; tongue covered with a thin white fur; appetite pretty good.

℞ Sulphur 12.

A globule night and morning.

September 2nd. Better; no new patches have made their appearance, and the old ones are failing, and are not attended with so much itching. Continue.

10th. Almost well. I saw no more of her.

A brother of this girl came to me with exactly the same eruption two or three months ago. It was situated on the chest, and yielded to *Sulphur* just as quickly.

Hosted by Google

ENTERITIS, WITH PERITONEAL INFLAMMATION.

December 1st, 1851. Miss S—, æt. 12, a weakly child, very subject to bronchitic attacks, was ailing a little two days ago, and to-day, after eating indigestible food, was attacked with violent pain in the abdomen, forcing her to writhe about in agony. I saw her at eleven p.m.; the pain was then easier than it had been; the abdomen very sensitive to pressure, particularly low down in the right iliac region—not hard or distended; an obtuse feeling of fulness in that region; pulse 132; she lies quietly on her back, unable to move without severe suffering; tongue white; breath foul; much thirst; skin hot. Has had bran poultices applied, which relieved the pain; the bowels have been confined to-day, though an enema has been given; they have been rather costive for some days past; very little urine passed.

℞ T. Aconit. 3, ♏ j.
T. Bellad. 3, ♏ j.

Alternately every hour.

2nd. In much the same state; pulse 132; a little tympanitis over the abdomen, with much pain on pressure, and constant aching in the right side. She has had no violent fit of pain since last night; no relief from the bowels; face flushed; skin dry; has passed urine twice, which was tolerably clear.

℞ T. Bryonia 3, ♏ j.
T. Merc. 3, ♏ j.

Alternately every three hours.

3rd. Violent purging set in yesterday afternoon, which was continued through the night, and is still continuing; she has passed about thirty stools in fourteen hours; they are dark and offensive, and some of them very copious; those passed last are more slimy, and contain bilious, green matter. She is evidently relieved by the free purging; pulse 113; face flushed; much pain in the right side, particularly on movement or pressure.

℞ T. China, ♏ j.

Every two hours, with *Aconite* in the intermediate hours.

In the evening she has had only one stool since beginning the *China*, but there has been much inclination to evacuate the bowels this evening, with inability to do so; face not so much flushed; pulse 119, not so full as it was this morning; not quite so much pain in the belly, which, however, is still very tender on pressure; countenance placid. She takes arrow-root and milk with appetite; tongue white, with the edges and the tip natural in colour; breath not offensive; no sleep through the day, and very little last night.

Continue the *China* twice in the night; two globules of *Hyoscyamus* 6, to procure sleep.

4th. Slept about six hours last night, with an interval of an hour's wakefulness; bowels moved three times since I last saw her, with much pain; motion green and offensive; has flatulence occasionally, which causes great pain; pulse 103; abdomen not quite so painful; the tenderness is more limited in its extent. To have

℞ Puls. 3, ♏ j, every three hours.

Evening. Since leaving off the *China*, she has been purged four times, the motions being of the same character as those passed in the morning; the flatulence has also been troublesome; is cheerful; cheek rather flushed; pulse 113; enjoyed her food.

Omit *Puls. Cham.* 3, ♏ j, every three hours, and *Hyoscyamus*, if restless.

5th. Has not passed so good a night; the flatulent colic continued till three a.m., in spite of the remedies employed to check it; bowels moved three or four times. At three a.m. the *China* was resumed at intervals of three hours. Soon after the first dose she fell asleep, and slept without waking for three hours; a little painful flatulence then disturbed her, after which she slept for two hours more. At present she has had no motion since a quarter past twelve a.m.; she is troubled with occasional flatulence, which does not cause so much pain; there is no swelling of the abdomen; still much pain on pressure; pulse 104; whitish tongue; good appetite.

Chicken-broth; continue *China*.

Evening. Had a bad day from half-past eleven a.m. till three p.m., passing five motions with much pain and moaning; they were orange-coloured, accompanied with flatulence, and caused smarting at the rectum. Since three o'clock she has been much better—ate her broth with much relish; pulse 104, soft; spirits good; has less pain, can bear to be moved without complaint.

℞ Sulph. 6, gl. ij, alternately with
Hyoscyamus 6, gl. ij.

Twice through the night.

6th. Progresses most favourably; has had no disturbance of the bowels since last evening, when a motion passed soon after I left; slept well; pulse 101; tongue cleaning rapidly; abdomen still tender on pressure, but this symptom is gradually diminishing. To eat a little chicken.

Continue *China* as before through the day, every three hours; *Sulphur*, as before, twice in the night.

7th. Continues to improve; bowels have been moved once to-day—motion rather more solid, and not so much pain in passing it; appetite good; tenderness of right side still diminishing; pulse 90; tongue clean; able to sit up out of bed; spirits very good; countenance natural, without any mark of the debility one generally expects after an acute disease.

℞ China, three times a day.
Sulphur, one dose at night.

The after-progress of this case was admirably illustrative of the fact that acute diseases, when treated homœopathically, leave little weakness behind them, relieving patients from the tedious convalescence so common in allopathic practice, and which appears to be owing more to the remedies employed than to the actual disease. My patient began now to get about; a dose or two of *Calcarea* was required to remove some slight tendency to curvature of the spine, owing to weakness of the dorsal muscles, and in a fortnight from the time I first saw her, she was running about in the garden, with no apparent remains of her disease.

Signed, R. TUTHILL MASSY, M.D.
February 18th, 1852.

Resolved unanimously—"That the warmest thanks of the meeting be given to Dr. Massy, for his kind attention and talented services to the sick poor of this charity, for the past year."

Dr. Massy having acknowledged the vote of thanks:—the President then examined the Treasurer's account.

Resolved unanimously—"That the thanks of the meeting be given to the Treasurer for his attention to the general interests of this Institution, and that he be requested to continue his services."

Statistics derived from long experience in various countries, under an almost infinite variety of conditions, demonstrate the superiority of the new method of curing diseases, which, while simple, rapid, economic, and certain in its character, does not deter the patient from pursuing his usual avocations.

The advantages of the homœopathic system over the allopathic treatment are thus briefly and clearly described by an eminent physician:

1. It raises therapeutics to the rank of a positive science.
2. It renders the art of curing diseases safe, certain, and prompt.
3. It frees the science of disease from *vain conjectures*, and *absurd hypotheses*.
4. Its practice is attended with a less number of fatal cases.
5. It shortens the duration of diseases.
6. It avoids protracted and dangerous convalescences.
7. It extends the curative sphere of medical art.
8. *It avoids all violent, painful, and often injurious remedial means.*
9. It is more economical.
10. And lastly. It cures with greater ease and comfort to the sufferer.

* The diseases are classified more to suit the increasing condition of the Institution than for its present limited number, as may be observed under those classed Fevers and Diseases of Children.

† One, incurable insanity; the other, incurable dyspepsia.

‡ This man was dying when visited by the Medical Officer. The poor fellow traced or ascribed his dropsy of chest, abdomen, and extremities, to a large bleeding which was performed eighteen months before, and his present excessive pains and suffering, to violent cathartic remedies.

Miscellaneous.

A DEAD SEA BATH.—I bathed in the Dead Sea. The ground covered by the water sloped so gradually that I was not only forced to "sneak in," but to walk through the water nearly a quarter of a mile before I could get out of my depth. When at last I was able to attempt a dive, the salt held in solution made my eyes smart so sharply that the pain I thus suffered, joined with the weakness occasioned by the want of food, made me giddy and faint for some moments, but I soon grew better. I knew beforehand the impossibility of sinking in this buoyant water, but I was surprised to find that I could not swim at my accustomed pace—my legs and feet were lifted so high and dry out of the lake that my stroke was baffled, and I found myself kicking against the thin air, instead of the dense fluid upon which I was swimming. The water is perfectly bright and clear—its taste detestable. After finishing my attempts at swimming and diving, I took some time in regaining the shore, and before I began to dress I found that the sun had already evaporated the water which clung to me, and that my skin was thickly incrusted with salts.—*Eothen.*

PHYSICIANS. — The first who deserve the name of physicians started from the Temples of Cos and Cnidos; they began to throw off the veil of mysticism, and to lay the foundation of an art founded upon the experience and observation of nature. Among them the most eminent place belongs to Hippocrates, the son of Heraclides. Next to Hippocrates, some other great men deserve mention, for having added new medicines to those already known, or for having taught a better method of dispensing them, as Dyocles of Carystus, Praxagoras, of Cos, Chry-

Hosted by Google

sippus of Cnidos, Theophrastus of Ererus, Nicander of Calopho, Heras of Cappadocia. From these times dates the separation of medicine from dietetics, surgery, and pharmacy, which was brought about by the school of Alexandria. This division has influenced the preparation of medicines, because only those who cured by internal remedies and prepared medicines were called pharmaceutists; whilst the physicians who cured only by the strict rules of diet were called dietetics; and those who performed manual operations only were called surgeons.—*Annals of Pharmacy and Practical Chemistry.*

HEREDITARY FEATURES.—A peculiar thickness of the under lip has been hereditary in the Imperial House of Hapsburg ever since the marriage, some centuries ago, with the Polish family of Jagellon, whence it came. In our own royal family a certain fulness of the lower and lateral parts of the face is conspicuous in the portraits of the whole series of sovereigns from George I. to Victoria, and has been equally marked in other members of the family. The females of the ducal house of Gordon have long been remarkable for a peculiarly elegant conformation of the neck. The Clackmannanshire Bruces, who are descended from a common stock with the famous Robert Bruce of Scotland, are said to have that strongly-marked form of the cheek-bones and jaws which appears on the coins of that heroic monarch, as it did in his actual face when his bones were disinterred at Dunfermline, about thirty years ago. The prevalent tallness of the inhabitants of Potsdam, many of whom are descended from the gigantic guards of Frederick I.; the Spanish features observable in the people of the county of Galway, in which, some centuries ago, several Spanish settlements were made; and the hereditary beauty of the women of Prague—are well-known facts which have frequently attracted the attention of chronologists. The burgesses of Rome (the most invariable portion of every population) exhibit at the present day precisely the same type of face and form as their ancestors, whose busts may be seen carved in relief on the ancient sarcophagi; and the Jewish physiognomies portrayed upon the sepulchral monuments of Egypt are identical with those which may be observed among modern Jews in the streets of any of our great cities.—*Records of Creation.*

SUBMARINE TELEGRAPH. — On Monday last, by permission of the directors of the submarine telegraph between England and France, a series of interesting experiments were made by Mr. Reid, telegraph engineer, of University Street, London, for the purpose of testing a pair of double-needle instruments and two new batteries which he had constructed. One of these instruments was placed in the Company's office at Dover, and the other in the French office at Calais, with a battery to each. Two of the submarine wires were then connected with the instruments, and put in circuit with the batteries. The length of the submarine cable in the Channel is about twenty-four miles, and about five miles of land telegraph on each side, making in round numbers a circuit of sixty-eight miles. The battery that was to work this distance formed a strong contrast to the present battery now in use, the length being only 4 inches by 1½ deep, and the weight 1lb. 5oz., while the old common battery used on the lines is 36 inches long, 7½ inches wide, 8½ inches deep, and weighs 64lb. Some of the telegraph clerks in the office smiled incredulously when Mr. Reid connected the miniature battery with the instrument, but were surprised to find the signals to and from Dover and Calais quite equal to the signals they were receiving from their former batteries. The next experiment was for the purpose of testing an improvement in the double-needle instrument, and will require the utmost stretch of faith on the part of our readers to believe. It was as follows:—The miniature batteries were removed from the instruments on each side of the Channel, and a piece of zinc, three-fourths of an inch square, and a piece of silver to correspond, were then introduced into the mouth of the operator at the office in Dover, and instructions sent to do the same at Calais. The wires attached to these pieces of metal were then connected with the instruments, and by this simple means, and by the simplest of all batteries, the telegraph clerks sent several messages to and fro from England to France. The next experiment was similar to this, only a larger piece of zinc and a larger piece of silver were introduced into the mouth of the operator. The result was an improvement of the signals. This was on the evening of Monday, March 1. The next day, March 2, the experiments were repeated with the same success. The instruments with the miniature batteries transmitted all the commercial messages, prices of stock, funds, etc, till one o'clock, when they were packed up and sent to London. It was thought that during these operations the miniature battery would become exhausted; on the reverse, it improved, and seemed perfectly to maintain its character. From these experiments we may conclude a new revolution is in progress with telegraphs and batteries.—*Times*, March 4, 1852.

[We have inserted the above notice of the "Submarine Telegraph," as in no department has science made so clearly manifest the operations of an invisible and subtle agency, with whose qualities our knowledge would seem to be in its infancy. The *incredulous smiles* of "some of the telegraph clerks" forcibly bring to our mind similar smiles and the dogged obstinacy of *many* of our allopathic brethren, in reference to the grand truths of homœopathy. We wonder so many can now be found to believe the evidence of their own senses. The late Dr. James Johnson once said in our presence, before a learned medical society, that in medical matters in which he had no *faith*, he would not credit the trustworthiness of his own eyesight. So it now is with the bulk of the profession, and it is only the pressure from without that will open their eyes to a true estimate of their *senses*.—ED.]

CRITICAL ANALYSIS OF A PAMPHLET BY DR. ROUTH,

Entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

By John Ozanne, M.D.

III.

Having given a general outline of Dr. Routh's book, I now proceed to the consideration, in detail, of the three parts into which it is divided.

After a short introduction, to which I have already alluded, the author gives us in Part I. a brief history of the manner in which Hahnemann's discovery of the homœopathic law—or *maxim*, as it is called in the "Organon"—*similia similibus curantur* was made. He also notices the subsequent steps taken by Hahnemann to test this law, and apply it to the cure of disease. This account is taken from the Latin edition of the "Materia Medica Pura," published at Dresden and Leipsic, in 1826, under the joint editorship of Stapf, Gross, and Brunnow. Why Dr. Routh preferred this work as his source of information respecting the mental process which led Hahnemann from the discovery of his principle or law to the complete development of his doctrines, I am at a loss to find out. In such cases most persons would prefer to go to the main source at once, if it were possible so to do. Now Dr. Routh might have availed himself of Dr. Dudgeon's excellent translation of the "Organon of Medicine," which would have told him as much respecting Hahnemann's researches as the book he availed himself of, and much more besides; but his object was apparently much less to give a full account of the labours of our great master, than to sneer at him for what he considers a *great defect* in his mode of conducting his investigations.

"The Editor of the Latin edition of his 'Materia Medica' informs us,' says Dr. Routh, "that, after *very many* experiments (these very many experiments are found to have been made with some forty-five medicines only), and comparing these experiments with those accidentally occurring (*sic*) in the practice of or especially performed by other practitioners at different times, he found this law to be one of *universal* application. These experiments occupied him six years, and it was not till 1796 that he published his famous dissertation in *Hufeland's Journal*, in which he made known his discoveries. If any credit thus is due to Hahnemann for originality, it is for these forty-five or fifty experiments;" and further down we find, "this tendency to *universalize* or to deduce from a *few facts* a doctrine, which it is then assumed universally applies, cannot be too strongly reprehended" (pp. 4, 5).

So here is a distinct accusation! Hahnemann first, and his disciples after him, drew inferences from a few facts, and then applied these inferences to the whole range of medical facts, past, present, and to come! This is a very serious charge indeed; it is, however, consoling to find that, although bringing forward an accusation of the most sweeping character, the author, no doubt, through a kindly deference to our feelings, spares us the trite expression, "too hasty a generalization of facts," so often applied in allopathic medicine to theories and practice of every kind, which for a time engage the attention of physicians, and then sink entombed in merited oblivion.

With reference to this charge I cannot help stating my conviction, that the author has never reflected upon the manner in which *great discoveries* are made in science, and more especially those which bring to light the *fundamental laws* which govern the relations in which the different bodies of creation stand to each other; whether they be planetary masses, or other celestial bodies revolving in immense orbits in admirable harmony, or simply atoms, so small that none of the means placed at our disposal by chemistry or microscopy can enable us to isolate them, or to form a more correct notion of what they may be than our *imagination* can suggest. Such laws are not simply "generalizations of facts," or "deductions from a few facts" applied universally; they are, in truth, the expression of the fundamental relations existing

Hosted by Google

between the various bodies which constitute the whole creation, and as such are deserving of our closest attention.

Let us suppose a law of this kind to exist in medicine. Let us suppose an intimate relation, capable of being expressed by some simple *formula*, to exist between the phenomena of the disease, on the one hand, and the properties of the medicine which cures it with certainty, on the other; would it not be of immense advantage, a matter of vital necessity indeed, to discover that law? What would it signify, with reference to a law of this kind, whether it were deduced from a few facts only, or from many thousands? The number of facts has nothing to do with the law, provided, upon careful investigation, it be found to hold good in all cases of disease. No great discovery of the sort was ever made by statistics.

But what is really of importance is, that such a law should be only looked upon as a *mere hypothesis* until fully verified. Now I declare it, to the honour and glory of Hahnemann, *he has done all this.* He discovered a law, he expressed it in a formula which is sufficient for all practical purposes, he has verified it, and we, after him, likewise. What is there, then, to be "*strongly reprehended*" in Hahnemann, or in his disciples, upon this score?

But I cannot quit this subject without pointing out the manner in which facts are transformed in the author's hands, so as to lead to a conclusion in accordance with his *à priori* views. In the quotation above given, we see first, "*very many experiments* with forty-five medicines only;" this is next transformed into "*forty-five or fifty experiments*," and finally, into "a *few facts.*" This is singular! But it is not the only example of inaccuracy in the book.

In connection with the above comments of Dr. Routh upon Hahnemann's doctrines, he draws particular attention to "two *logical fallacies!*" The first has already been stated.

The second is, that "Hahnemann's experiments were made with *appreciable*, not *infinitesimal* doses. Nor is it logical to conclude that, because a large (or even a small) allopathic dose has mimicked a disease in health (*sic!*), therefore, when that disease occurs, an infinitesimal dose will cure. Assuming the principle to be correct, we can understand that a *similar allopathic dose might cure*, but not an *infinitesimal* dose, and yet these preliminary experiments are spoken of by homœopathists, to justify their doctrine of infinitesimals" (p. 5).

I crave forgiveness of the Editor of the *Homœopathic Times*, for occupying so much of his space in so unprofitable a manner. My excuse for doing so is, that I wish to give an instance of the manner in which allopathists again and again attack homœopathy, without knowing what Hahnemann's doctrines really are. The whole paragraph is *inaccurate.* It is *inaccurate* as to the facts stated. Hahnemann used *appreciable* doses in his experiments; he also used *infinitesimal* (Organon, § cxxviii.) Neither is the inference correct. The doses were diminished, not upon *à priori* reasoning, but in their application in the treatment of disease, in order to avoid unnecessary medicinal effects, aggravations, etc.

Dr. Routh says, "*Idiosyncrasy* is seldom regarded. For example: it is notorious that, in some instances, particular individuals are peculiarly influenced by *Ipecacuanha*, so that a grain, or much less, will, if sprinkled through the air, bring about the most violent symptoms of catarrh; and yet it is not logical to conclude, that in *all* cases an infinitesimal dose of *Ipecacuanha* will cure or greatly meliorate the symptoms of catarrh." This assertion respecting idiosyncrasy is *without* foundation. The extreme care manifested by all homœopathic practitioners, in their inquiries respecting the peculiarities of the constitution of their patients, is sufficient evidence in contradiction of it. The inference that Dr. Routh ascribes to homœopathists is so decidedly against the whole spirit of Hahnemann's doctrines, that I wonder any man, knowing what he is writing about, should prefer such a charge. Let Dr. Routh read the Introduction to Hahnemann's "Organon" (London, 1849), and he will feel convinced that the first requisite in him who wishes to discourse upon homœopathy, is to know something about it. Speaking of the custom among physicians of the old school, of attempting to discover the general *character* of any given case of disease as indicative of the appropriate remedy, he says, in a note (p. 5), "Every physician who treats disease according to such general characters, however he may affect to claim the name of homœopathist, is and ever will remain, in fact, a generalizing allopath; for without the most minute individualization, homœopathy is not conceivable." And yet Dr. Routh says, that because *Ipecacuanha* may produce catarrh, we would give it *in all cases of catarrh!* For one thing, however, I must thank Dr. Routh, namely, for the information that persons possessed of the idiosyncrasy alluded to become affected, when inhaling minute particles of *Ipecacu-*

Hosted by Google

anha, with *catarrh*—I had always thought the principal effect was *spasmodic asthma.*

One word more about idiosyncrasy. So little has it been disregarded by Hahnemann, that he has devoted to the consideration of it one of his longest paragraphs (Organon, § cxvii.) Dr. Henderson has presented the question of idiosyncrasies, in their relation to morbid conditions and susceptibility of the most delicate medicinal influence, in a new and interesting manner, in the following words: "Now, a person in disease has an idiosyncrasy or peculiarity of constitution, for the time, either of the body generally or some part of it, and is sensible to influences which have no action, or no action of the same kind or intensity, on a person in health. * * * * * Homœopathists maintain it to be the result of their experience that diseased parts are sensitive to still more delicate influences, when these are of a kind that have in each case a special and peculiar fitness to act medicinally upon the affected organ, in accordance with the homœopathic law.* * * * There is, then, a special relation between the disease and the medicine which is homœopathic to it, *the part affected coming to possess an idiosyncrasy or peculiarity of constitution for the time, that renders it susceptible of an influence from a quantity of such medicine, which, in a healthy state, would fail to affect it at all.*" (Reply to Dr. Simpson, 1st edition, p. 26.)

The psoric theory next claims our author's attention. He considers its promulgation by Hahnemann as giving "no evidence of increased mental powers and ability, but rather of the reverse" (p. 5). A little lower down, he tells us that Hahnemann discovered "that most diseases were produced by scabies." Although the psoric theory is purely a *pathological* theory, and, as such, has no more to do with a theory of *therapeutics* than any other pathological question, and therefore might be at once dismissed, I am desirous of not evading any difficulty, and therefore will make a few remarks upon it.

In the first place, I may remark that Dr. Routh is again at fault in his statement that "most diseases were," according to Hahnemann, "produced by scabies. This statement is *not accurate.*

Hahnemann believed that *chronic* diseases arose "from a chronic miasm" (Organon, § lxxviii.), which, so long as it remained in the system, was the cause of repeated attacks of illness in various forms. The "chronic miasmatic diseases" were those which arose from the presence in the system of the miasms of *psora, syphilis,* and *sycosis* (the condylomatous disease). But it must be remembered that he distinguished chronic diseases under two heads: first, the "true *chronic* natural diseases;" second, the diseases inappropriately named chronic (§ lxxvii.), which are simply diseases kept up by habits injurious to the constitution, by bad ventilation, by living in unhealthy localities, especially marshy districts, by excessive exertion of body or mind, by medicines taken in too large quantities, etc. etc. Who will not at once perceive that the latter class comprises by far the larger number of chronic complaints?

The transmission of the syphilitic taint from parent to offspring is too well known to require comment. But I cannot allow the sneer at the venerable name of Hahnemann, with reference to psora or sycosis as causes of hereditary chronic disease, to pass unnoticed. Let me therefore ask Dr. Routh, how he, belonging as he does to a school, the members of which generally admit the transmission from parent to offspring of a large number of chronic complaints, can think of deriding Hahnemann on this account? Whether the taint be called *strumous, cancerous,* etc., or simply *psoric,* it matters but little, so long as we admit that something exists establishing a difference between one individual and another, with reference to a tendency inherent in either to become affected with chronic disease.

I request the reader to bear in mind the following admission: "Allopaths, admitting the occasional truth of this doctrine, *similia similibus curantnr,* have given the larger dose. The experiments of Majendie have shown that *Tartar Emetic,* in doses of six to eight grains, will produce, amongst other lesions, *pneumonia,* if not rejected by vomiting. Every day's experience proves the efficacy of large doses of *Tartar Emetic* in curing pneumonia and other affections of the lungs" (p. 6).

(To be continued.)

NARRATIVE OF THE INTRODUCTION OF HOMŒOPATHY INTO ENGLAND.

By F. J. Smith.

If, in speaking of the labouring population of the United Kingdom, I am understood to include in this term men, women, and children—all, in fact, who by their labour, of whatever kind it be, tend to advance the well-being of society, from the Prime Minister downwards,—I shall not, I think, be amenable to the charge of exaggeration, if I assume—

Hosted by Google

First, that 1,500,000 of these labourers are annually prevented by illness, for the space of fifteen days, from the discharge of their ordinary occupations; and

Secondly, if I take the average value of their labour at 2*s.* 6*d.* per diem.

However simple and obvious these assumptions may, at first sight, appear, we shall presently see that they are suggestive of trains of thought almost inexhaustible.

Vulgar as arithmetic is by some persons considered to be, the world cannot be carried on without it; and I must beg your readers of this class to forgive me while I proceed to point out, that it follows from the assumptions just made that 56,250,000 shillings, or £2,812,500 sterling, are thus annually lost to the country! And if to this sum be added the not unreasonable charge of 10*d.* per diem for medicine and attendance, the amount will be £3,750,000!

A consideration such as this can scarcely fail to arrest the attention of the most inconsiderate, and to excite the desire to know something more on a subject so important. I will therefore carry the thought a little further. Disease may be said, generally, to consist of two kinds—acute and chronic. Amongst the former may be enumerated scarlet-fever, smallpox, typhus-fever, cholera, etc.; amongst the latter are disorders arising out of the use (or abuse) of strong medicines.

That the victims of both these classes of disease (but especially the former, and by consequence, also, the latter) may be materially reduced in number, by the general introduction of sanitary measures, no one in the preseut day attempts to deny. But after all that can be done in this direction shall have been accomplished, there will still remain an immense mass of disease to be dealt with.

In passing, then, I would observe that it is the bounden duty of every man to exert himself to bring about sanitary reforms of every kind, till nothing remains to be effected for the amelioration of the condition of his fellow-creatures in this particular.

Meanwhile, however, we have the huge arithmetical fact to deal with—of a loss to this country, by the accident of illness, of £3,750,000 annually,—a fact, one would imagine, of sufficient importance to awaken the attention of statesmen, and of the legislature generally, to the condition of the medical art in this country.

Now, let us imagine, for a moment, attention aroused and directed to this point. What would be discovered? The inquirer would find such lamentations as the following from the most able, zealous, and honourable members of the allopathic profession.

From Dr. Paris he would learn: "The file of every apothecary would furnish a volume of instances where the ingredients of the prescription were fighting together in the dark."

He would hear Dr. James Johnson saying: "I declare it to be my most conscientious opinion that, if there were not a single physician, or surgeon, or apothecary, or man-midwife, or chemist, or druggist, or drug in the world, there would be *less* mortality amongst mankind than there is now."

He would find Dr. Billing exclaiming: "I visited the different schools of medicine, and the students of each hinted, if they did not assert, that the other sects killed their patients."

He would tremble at the awful announcement of Franks: "Thousands are slaughtered in the quiet sick-room."

He would shudder at the melancholy profession of faith uttered by Reid: "More infantile subjects are, perhaps, diurnally destroyed by the mortar and pestle than, in the ancient Bethlehem, fell victims in one day to the Herodian massacre."

And he would at least rejoice that the plague has ceased to visit this country, on learning from Dr. R. R. Madden the utter impotence of allopathy in that disease. In his work entitled "Travels in Turkey, Egypt, Nubia, and Palestine in 1824, 1825, 1826, and 1827," this learned allopathic physician, thus writes: "There was only one thing constant and unequivocal, and that was the ultimate event; almost every patient I treated, or saw treated, in Constantinople, was bled, purged, or vomited to keep down the inflammatory fever, and every patient died exhausted.....In short, we did as all other practitioners did: we continued to bleed, and our patients continued to die." (Vol. i. pp. 260, 261.)*

The testimony of Sir Astley Cooper is very characteristic: "The science of medicine," he says, "was *founded on conjecture*, and improved by *murder*."

Dr. Brown says: he "WASTED more than twenty years in learning, teaching, and diligently scrutinizing every part of medicine." Observe *that twenty years so devoted* he considered himself to have WASTED.

Knighton's mournful soliloquy is: "Medicine seems one of those ill-fated arts whose improvement bears no proportion to its antiquity."

Gregory passionately declares "medical

* These volumes consist of a series of letters addressed to eminent colleagues; and curiously enough the extracts in question are from a letter to Dr. Quin, of London, who was at that time practising as an allopathic physician at Naples.

Hosted by Google

doctrines are little better than stark-staring absurdities."

Abernethy, in his peculiarly graphic language, thus delineates the state of medical affairs: "There has been," says he, "a great increase of medical men of late years, but, upon my life, diseases have increased in proportion."

Baillie unhesitatingly announces that he has no faith *whatever* in medicine.*

Huffland, of Berlin, who has been most appropriately denominated the Nestor of medicine, reviewing his past career at the age of eighty years, gave utterance to the following sad reflections: "My opinion is, that more harm than good is done by physicians (allopathic); and I am convinced that had I left my patients to nature, instead of prescribing drugs for them, more would have been saved."

Few men are better acquainted with the literature of their own profession than is Dr. Forbes, the philanthropic court physician, with the writings of his medical brethren in past times and at the present period; fewer still better able to estimate at its intrinsic value the testimony of each author. It is with no feeling of surprise, therefore, that we find this truly great man thus announcing his own convictions as to the state of his own profession. "Things have arrived at such a pitch," he says, "that they cannot be *worse*. They must mend or end. We believe they will *mend*—we flatter ourselves that there is yet enough of young blood, and energy and wisdom in our ranks to redeem the past, and to achieve that glorious regeneration which has been long announced by infallible signs and portents in these latter days. Old as we are," continued this noble-hearted veteran, "we yet hope to see raised the standard of 'young physic,' though we cannot expect to see it furled afrer the destined victory is won."

Those who remember the appearance of this article, in the *British and Foreign Medical Review* of 1846, will not easily forget the sensation it produced in the allopathic ranks. For the information of such as are not acquainted with the subject, it may be as well to observe, that this Review is the *magnum opus* of allopathy; that every man who writes an article in it, has not only to consider his own sentiments but those of the asssociated profession

* The reader is referred to Mr. Gibbs' able work on the Medical Registration Bill, where he will find most of the foregoing extracts, with many more equally instructive. Mr. Gibbs very properly demurs to the propriety of endowing a profession thus denounced by its most gifted members, with such extraordinary powers and privileges as that bill could have conferred.

This article was, therefore, regarded as a betrayal of the citadel by a distinguished general, if not by the commander-in-chief! an announcement to the enemy that the garrison was perfectly ignorant of the *art* for which it had obtained general credit; that all was chaos and confusion within; and that however impregnable the walls might appear, the fortress would become an easy prey to any well-directed attack, however few the assailants, provided only the attack were conducted upon some *general law*.

One more quotation on this part of our subject, and we have done. And we will select our authority from the ranks of those most distinguished by their thorough acquaintance with that branch of science from which so much is expected on all hands, at the present moment—we allude to chemistry. Foremost in this class, since the decease of that justly esteemed chemical physician, Dr. Prout, is unquestionably Dr. Golding Bird; and this is what he says in 1849: "No one can, for any length of time, be engaged in the active practice of his profession (allopathy), or in the observation of disease, without encountering phenomena sufficiently puzzling to surround him with unforeseen difficulties, and often sufficiently inexplicable to force upon his mind the conclusion that medical science, or at least the share of it falling to his lot, is by no means perfect or *exact*. I believe this will be granted by all whose experience has been extensive enough to produce humility."

It is impossible to read this humble confession of so deservedly popular a physician, without a feeling of regret that he, who could thus express himself, should want the time or the true humility of mind to inquire into the truth of the Hahnemannic system—a system that would reveal to him much that is now "puzzling" and "inexplicable;" furnish him with the means of overcoming many an "unforeseen difficulty;" and enable him from his heart to say, with graceful and unfeigned humility,—what is not "perfect or exact" in my practice is not in my *science*, but in *myself*.

Starkie, in his admirable work entitled "A Practical Treatise of the Law of Evidence," remarks: "Whatever a party *voluntarily* admits to be true, though the admission be contrary to his interest, may reasonably be taken for the truth.* The presumption is, that the party who made the declaration or entry would not have made it, contrary to his own interest, unless it had been true.†" So far as the subject under consideration is concerned, the evidence

* Vol. i, p. 35, 2nd edition, 1833. † Ibid., p. 45.

Hosted by Google

we have adduced is of this class. We have had before us a variety of witnesses, all well qualified to give evidence on the point under consideration, all men distinguished by abilities, acquirements, and professional *status*;—men living by that profession whose condition they have thus disclosed;—men, whose interest it was to exalt, not to denounce their profession;—who could have had no motive, save that of truth, in thus proclaiming its (utter) inefficiency. And we shall not be over-stating the effect of the evidence, if we assert that it amounts to a complete condemnatiou of allopathy. But perhaps it will be more satisfactory to sum up the whole case, in the language of Dr. James Johnson, already quoted. "I declare it to be my most conscientious opinion, that if there were not a single physician (allopathic), or surgeon, or apothecary, or man-midwife, or chemist, or druggist, or drug in the world, there would be LESS mortality amongst mankind than there is *now*."

And is this *all* that has been accomplished in 2000 years? There has been no lack of talent, none of education, none of energy; on the contrary, these in all their associated power have been brought to bear upon the subject. Whence, then, this "lame and impotent conclusion?"

Again, if we compare this state of things with that presented by, comparatively speaking, modern sciences, the contrast becomes remarkably striking. To adduce only two examples: we find geology and electro-magnetism—the former in a few years, the latter in still fewer,—making extraordinary strides, taking rank amongst the great sciences, and recognised as such by philosophers of every country.

The students of allopathy may be numbered by millions; those of geology and electro-magnetism at most by thousands. And if to this consideration we add the element of time, and *assume* each to be founded in *truth*, we have presented to the mind a problem which no amount of ingenuity can solve. What, then, is the inference to be drawn? To my mind, the conclusion is irresistible, and it is this,—that the evidence of the allopathic practitioners, given above, is correct, viz., that allopathy, to use the language of Sir Astley Cooper, was "founded on conjecture," not on truth. On this hypothesis everything falls into order; there is no longer any apparent inconsistency, no apparent caprice in the demeanour of science; the absence of success on the part of allopathy is explained; constructed on "a foundation of conjecture," and shifting perpetually from one conjecture to another, as each was discovered to be untenable, what else but confusion and disaster could be expected? While true to herself, and faithful to her God, science has continued, century after century, to scowl on the proffer of so unholy an alliance!

And is it to be conceived that the beneficent Father of the Universe, who has established (as philosophers have discovered) so many laws for the well-being of his creatures, hath ordained no *law* for the preservation and restoration of their health—the greatest of earthly blessings? All *à priori* reasoning is against such a supposition.

Whether an universal sanitary law has been *discovered*, and is *acted upon*, is another question. But that such a law has been *ordained*, who shall venture to doubt? A time there was, when the law of gravitation was unknown; nevertheless it existed. An universal law of healing, then, may have been *ordained*, and not yet *discovered*. The practical question therefore is—*has* an universal law of healing been discovered, and *is* it acted upon?

(To be continued.)

THE
HOMŒOPATHIC TIMES.

SATURDAY, MARCH 20TH, 1852.

ALL who have faith in the science of homœopathy—for it is a science—and are interested in its progress, are indebted to Dr. OZANNE for his analysis of Dr. ROUTH'S pamphlet, entitled the "Fallacies of Homœopathy."

It is well that such a pamphlet should be shown to be a thing of shreds and sophisms, of deductions from false premises, and tainted with the errors of the old sect. Had the pamphlet not been answered, many would have supposed that homœopathy was nothing else than the "expectant medicine" of those who believe drugging to be noxious, and recommend, in fact, that nothing at all be done, but that Nature should be left to her throes and her perturbations, her disorders and diseases. With such persons the "*vis medicatrix*," the inborn healing power, goes for much; with the allopathic school it goes for much; but homœopathy assists, guides, directs,

Hosted by Google

overrules what is called nature in whatever relates to health and disease.

The aim of Dr. OZANNE is to show, without imputing in the least degree falsity to the man, that the whole of Dr. ROUTH'S reasoning is vicious and false, made up of unreasonable assumptions and deductions. We think the task worthy of Dr. OZANNE, and we have no doubt he will completely overthrow the specious and hollow pretensions of the pretentious and ambitious author, who assumes for himself the prerogative of remitting Hahnemann, his doctrine and his practice, and his thousands of disciples to the tomb of the Capulets.

Another of our valued correspondents is engaged in unfolding the history of the introduction of homœopathy into England. From our knowledge of the historian, we know he will do it in a fair and honourable spirit; and we presume he will be furnished with all necessary materials by all who can contribute authentic facts relating to the introduction of our Reform into these kingdoms.

Another esteemed correspondent—last but not least, in our estimation—is engaged in reproducing from the past the spectral iniquities of allopathy—the grisly shades of a portentous drugging system—the jejune inanities of polypharmacy—the puerilities, absurdities, and fearful outrages of that vaunted system on common sense and on the citadel of mortal life.

We have by our vilipenders been called at different times many hard names; but we have the most numerous testimonies to the fact of our usefulness, and to the weight of our influence.

We hope that a succession of valuable papers from valued contributors will satisfy our public that those who are able are becoming willing to assist us with their contributions.

At all events we have nailed our colours to the mast—we sail in the good ship Integrity—Hahnemann is our captain; we have charts for the oceans already discovered and the realms already mastered, and we have the means of future discoveries almost without end, and our banner is inscribed with the motto—"The greatest attainable amount of health for the greatest number of human beings."

THE HOMŒOPATHIC HOSPITALS OF LONDON.

THE period is fast approaching for the Annual Commemorations of Hahnemann.

It happens this year that the 10th of April, Hahnemann's birthday, falls between Good Friday and Easter; and for that reason the Board of Management of the London Homœopathic Hospital has appointed the 21st of April for their festival.

The authorities of the Hahnemann Hospital have not yet announced their festival-day.

We are not in possession of facts to enable us to say anything of the actual or relative prosperity of these hospitals.

The London Homœopathic Hospital is *officered* on what we have always contended to be a vicious principle; but, so far as we can judge, its business has been well conducted.

The Hahnemann Hospital is *officered* on what we believe to be the right principle; but, as is well known to most who take any interest in homœopathy, circumstances have taken place which have caused the secession of some of its medical officers, and there are at present flagrant differences of opinion among those who constitute its Board of Management, as well as among those who constitute its Medical Council—

> "Ex illo fluere, ac retro sublapsa referri,
> *Res* Danaum, *fractæ vires.*"

It would be for the manifest advantage of the Cause, if the directors of each Hospital would call a public meeting of the subscribers to both of them, and bring about their amalgamation.

Correspondence.

THE NEW MEDICAL REFORM BILL.

To the Editor of the Homœopathic Times.

SIR,—As has been already intimated to your readers, by a practitioner residing in this town, it is proposed to introduce into parliament a bill to secure uniformity in medical education

Hosted by Google

and qualification; by which act a board of examination is provided, which all who intend to practise medicine must pass, whatever grade in the profession they may ultimately desire to occupy.

This proposition suggests three questions:—1st. Is such an act a desideratum? 2ndly. Supposing that it is so, is this the most befitting time to procure it? 3rdly. Is the proposed bill the most desirable that could be obtained for the purpose?

We may, for the sake of argument, acknowledge the first question as decided in the affirmative. But with regard to the suitability of the time or instrument, we must enter a demurrer: the time is not appropriate, because the profession at large is divided on more than one important point. But supposing that homœopathy and its title to credence be the only ground on which a difference of opinion exists, it is assuredly most important that this question should receive that impartial and deliberate investigation which has hitherto been denied it in this country. A licence "*ad practicandum artem medicinæ*," etc., is to be granted to men who, in the course it may be of a very short period after their commencing practice, will, by the mere force of circumstances, be led to investigate a system of therapeutics they have had no previous opportunity of studying, and of which the public have no guarantee of their qualification to practise. Whereas, were this bill delayed only for a few years, homœopathy would then, most undoubtedly, hold a position in medical estimation very different to that in which it at present stands. It will, in short, if its progress be as rapid as it has been during the past ten months, and we see no just cause or impediment why it should not, but rather the contrary, especially if our friend the "*Lancet*" and his more polished cotemporary, the "*Medical Times and Gazette*," will but fan the blaze their ire has served to kindle—it will, we say, under these circumstances, be the grand basis on which medical practice is conducted. The *Materia Medica Pura* will be taught in all our schools, aye, even in *Auld Reekie*, in spite of all the despicable efforts of that medical protectionist triumvirate, Syme, Christison, and Simpson; and, as a natural consequence, will form one of the most important elements in their examination of aspirants to medical honours.

This, of itself, we think, forms a sufficient argument why the present should meet with that determined opposition which, on other grounds, it so thoroughly deserves. But we must hasten to consider the third point, viz. is the proposed bill the most desirable means by which this supposed desideratum can be obtained? To this question we give a most emphatic negative, and that for the following reasons.

The examining board is to be constituted by men equally celebrated for their ignorance and hatred of homœopathy; what, then, will be the result of this? The conduct of the Medical Faculty of Edinburgh towards myself will be merely an example for the new board—invested with far greater power than that of Edinburgh—to imitate. That they will do so has been more than hinted at by the Editor of the "*Lancet*" in last week's number.

But supposing that homœopathists are admitted to examination, and passed, there still remains in the hands of the Medical Council a means of depriving them of their rights, viz. by condemning homœopathy as "irregular practice." A condemnation which it has already received at the hands of the very men who are to form the council board. In fact, the all but unlimited power placed in the hands of the Medical Council makes the bill savour more of the despotic nature of a Parisian decree of the present day than of the deliberations of three hundred educated English practitioners of medicine, aided by the legal counsel of a "member of the junior bar."

We hope and trust therefore that no means will be spared to enlighten those in whose hands the fate of the proposed "Medical Reform Bill" will lie: first, of the premature nature of the measure; and secondly, of its all but certain tendency to ruin the practitioners of homœopathy; a body daily increasing in strength, by the reception into its ranks of men of no mean intellectual power or moral worth among the adherents of the old school.

I remain, Sir,

Yours truly,

ALFRED C. POPE.

Homœopathic Hospital, Manchester,
March 10, 1852.

[We do not see what the homœopathists can do, except by petition to parliament. Homœopathy is too vigorous a plant to be ruined by decrees or hostile enactments. It is rooted in truth, is watered by the dew of experience, is becoming endeared to the public mind, and will flourish. We wish Mr. Pope would again try conclusions with the Medical Faculty of Edinburgh. We have always considered him to have been very ill advised in the matter, and we, from the interest we take in him, recommend him to demand, as a right, to be re-examined on the two subjects in which it was alleged he was deficient. It is what we would do ourselves, if we were in his place. The devil is not so black as he is painted, according to the proverb; and we think the Medical Faculty of Edinburgh should be allowed an opportunity of showing their repentance. Our readers will peruse Mr. Pope's note on the Medical Reform Bill with interest and pleasure.—ED.]

ENCOMIUM ON MERCURY.

To the Editor of the Homœopathic Times.

SIR,—Although we may say, "old times" are "changed," we cannot add, "old manners gone;" in proof of this, you may like to see a few passages from an old work, published in or about 1733, entitled "Encomium Argenti Vivi; a Treatise upon the Use and Properties of Quicksilver, by a Gentleman of Trinity College, Cambridge."

After giving an interesting and detailed ac-

Hosted by Google

count of its natural history, and the method of obtaining it; its properties, chemical history, etc., the author goes on to speak of its "Physical Use," and says. "It is a difficult matter to remove vulgar Errors; they are as strongly rooted as the most inveterate Disease, and Reason and Physic are frequently baffled by both. How high did the cry run formerly against the Use of the Bark, one of the best medicines in the *Materia Medica*. What Fears! What apprehensions of its evil consequences! What strange misconstructions of its Effects, and downright absolute perversion of its Properties! Nothing can be safe from such misconceptions; neither merit in man, nor excellence in Medicine. The wiser and more honest Part of Mankind, by the natural Turn of Thought and Temper, as naturally engage in Defence of both; and there have been very few noble Remedies found, either by Art or Chance, and brought in Practice by the skillful Right-judging part of the Faculty, but have been as generously supported by Reason and Argument at the very Instant that the Torrent of popular Clamour was at the Height against them. The Cause of both is the same; and the Party formed against both the same likewise. The great Physician, of course, falls into a Method of Practice, which the lazy, the little, the unskillful Practitioner can no more imitate than he can understand.

"Where is the Wonder therefore, that such exert all the Malice they are Masters of, and strive to blast what they cannot copy?

"Were Hippocrates and Freind to rise from the dead, they would again, for a while, suffer the same Fate. But the World by Degrees comes generally about, and all this Envy only directs us where to pay our Applause.

"It only remains for such to proceed upon their own strength; as a genius will see further into Nature, in the compass of a few years, than ordinary souls, were they to live a Thousand.

"As some are made Enemies through Envy, others may become so through Interest. I hardly doubt but that some of the trading Tribe are found useful enough this Way; they can serve very well for *Mercuries* to carry and hawk about Scandal; and people in Business are allowed to act from a view of gain, perhaps by some such great Philosophers, the vulgar Error of Quicksilver being a poison might be fortify'd; as who can tell what a Distruction just Apprehensions of its virtues might occasion to Gally-pots; how many Phials might be thrown away, etc. We must therefore try to remove this prejudice, and so clear our Way to a more full and larger account of its Efficacy. * * * * *

"That several of our greatest Practitioners have frequently made use of Mercury in disguise, done eminent service to their Patients with it, and gained much Reputation to themselves, is with me past all Doubt: that many now continue to use it likewise, with as good Success and as much secrecy, I doubt not neither.

"Nay, some are found who speak evil of it in public, but, notwithstanding, give it concealed in private; a strong Argument in its Favour, whatever views may oblige them to act in such a manner. Such little Pieces of Craft will ever be practised by some, especially such as stand in need of them.

"But those who set out upon different principles, who consider Physic not as a Trade but as a Science, a useful and an honourable one, and intend the Good of Mankind by Profession, never act thus in the dark; their Practice is very fair and open, and Friends they are to those who, like themselves, are content with the Reputation of doing Good, and borrow not assistance from Cabals and Parties to steal a name. Such was the late Dr. Freind; and such are several now living, Ornaments of the Faculty, and most useful members of Society.

* * * * *

"Experience is the best Guide, and Facts the strongest recommendation; these Gentlemen *a* have found it useful, and accordingly openly declare what Relief they have found it to give; it is an easy matter to cry out Quack! Empiric! but the World will still think such men as honest, as skillful, who prove their Practice by well-attested Facts. This is the very case with these two Gentlemen; Cabals and Factions are known to subsist among the Faculty; and it may be much safer to kill in the Common Roads of practice, than cure out of it. Rumours are very apt to rise, and Falshoods to fly about, when Physicians shall dare to be greater Friends to the Patient than the Apothecary."

And now let the name of Hahnemann be substituted for that of Dr. Frieind, and the word homœopathy for quicksilver; and then "let us reflect."

These remarkable and well-expressed sentiments were publicly put forth about one hundred and twenty years ago, or rather more; and wonderful advances have been made in numberless paths, both of art and science, since that time; and unwieldy machines have given place to the powerful though tractable steam-engine; and the well-appointed mail-coach, with its noble steeds and enterprising, intrepid driver, lags far behind the fleet, energetic express train; and the echo of our beloved monarch's speech from the throne—instead of journeying for hours over British ground, and voyaging slowly across the Channel, and then being dragged its long, weary way by poor, lean, French horses, yoked to their cumbrous chariot, with harness of rope—flashes into beautiful, unhappy Paris almost like the lightning itself; and the coarse, heavy "drug," whose very name had become a by-word for what is a burden, unsaleable and unwelcome in our markets, has been refined, and nearly, if not quite, etherealized, and is the mighty though invisible inhabitant of the exquisite, glorious "globule;" while the prejudice of the medical heart, in its various forms of "*delusion*," remains the same: unchanged, stereotyped, petrified. What word can be found fully to denote

a Thomas Dover, M.B., and Mr. Belloste, an eminent surgeon abroad.

Hosted by Google

the stolid, fixed, imperturbable, impenetrable dullness and obstinacy of its spirit?

Believe me to be, Sir,

Your obedient servant,

UNA MADRE.

THE HOMŒOPATHISTS AND THE HOMŒOPATHIC TIMES.

To the Editor of the Homœopathic Times.

SIR,—A few sentences in your last *leader* satisfy me that you will not impugn the truth of the following postulate, upon which what little I have to say is grounded, namely, that the homœopaths give a very inadequate support to your excellent periodical. I will now humbly endeavour to investigate the causes of this apparent apathy of some, if not most, of your medical colleagues. It is notorious that you have ever placed yourself in the forefront of the battle for them, because you fight under the same banner, and have uniformly defended their cause alike from the phlebotomy of the *Lancet* and from the petty carpings of those lecturers at Bristol and other places who have wished to flesh their swords upon the venerated name of Hahnemann and his benevolent discoveries. These gentlemen have found it more convenient to deal with theories than facts; for it is comparatively easy to show that our infinitesimal doses *must* produce only infinitesimal effects; in fact, I believe, they give us the credit of dividing "that which has no parts," or "the smallest indivisible part of matter," as well as the more bungling performance of splitting hairs: and yet when we turn to facts and show them (through a microscope, if you please) what these "motes that people the sun's beam" have effected, lo and behold, the venue is changed, they stand over on the other tack, and attempt to throw discredit on the cures produced by them. If they say truth, our patients must indeed have strong imaginations; for if faith can take a man to pieces, dust him, lubricate him, and set up a regular action in his system, as Dent would do for your chronometer, or Joe Manton for your double barrel, why then there is an end of medical jurisprudence, be it homœopathic or allopathic; the matter lies in a nutshell, the age of miracles has returned. Let us macadamise the roads with our crushed globules, and let our allopathic brethren flush the sewers with *Jalap* and *Castor Oil*, and then let us unite in a humble petition to her Majesty to extend the royal touch, as of yore, to suffering humanity, and open a dispensary at Buckingham Palace. But it is with the stubborn things called facts that we wish to deal, and precisely on this point it is that our adversaries would, if we would let them, conquer, Parthian-like, in flight. They cannot deny that we daily perform hundreds of cures, but then, forsooth, it is all done by faith and regimen!! If the former, we may easily believe the feats of Tarquin with the razor and whetstone; if the latter, why then do these regular opponents of ours nauseate their patients, rather than extend the wand of Dr. Sangrado over their banquets, and march them out for fatigue duty, like the captain of hydropathic celebrity at Ramsgat? What an incentive then does our government hold out to crime, since the treadmill and the diet for the refractory is a cure, not a penalty; the univereal panacea—the elixir of life!!

Many causes may be assigned for the imputed professional indifference to the success of the *Homœopathic Times;* one we may trace in the paucity of practitioners; "a nihilo nihil fit" will, I fear, apply to them, until we emulate the example of foreign lands, and surround our sea-girt isle with a pacific army of practitioners, who can at least prescribe a "remedy not worse than the disease." Homœopathy flourishes in Calcutta, and in all the provinces of the western world, from Boston down the entire seaboard to Rio Janeiro. And is England to be again stigmatized in the nineteenth century as an *Ultima Thule* as regards the most important of all sciences—the science of prolonging life and increasing our means of enjoying it? The universe, Sir, and England along with it, sympathises with you; for, while *your* efforts are paralysed by the want of due support, they have a more cruel want—that of the circulation of the resources which have been drawn from our common mother for the good of mankind.

I am satisfied that, if the mass of practitioners who already think with you, would cast off that semblance "of modest and ingenuous worth which blushes at its own praise;" or, in other words, would no longer be influenced by the fear of appearing to wish to advertise *themselves*, while they are apparently supporting *you*, that we should hear through your medium of well-authenticated cases of cure, sufficient to convince the sceptical and confirm the wavering. It is true that many bestow their best wishes upon you, who cannot give you their time; let them, then, submit to become coiners of the latter commodity, remembering the words of the old song, "the best of all ways to lengthen our days, is to steal a few hours from the night;" their contributions would not be less lucid if indebted to the aid of the midnight oil. But is it really essential that the modest gentlemen I have referred to should be "shown up in print?" If they will not avow themselves, let them adopt a *nom de guerre;* let them pull the wires behind the scenes, as in the Marionette theatre; we don't want them to "strut their little hour" on the boards, we want their experiences, and you want them also, and a little of their substantial favours, the sinews of war, besides. I make these observations, because I think there is that in your columns which entitles you to the public support, for one good turn deserves another; and have you not supported, and that nobly, the homœopathic cause at Bristol, at Huddersfield, at Sunderland, at Ross, at Edinburgh, Exeter, and divers other places? Is it not to your advocacy that the metropolitan and provincial homœopathic hospitals are indebted for fully half of their present support, and that at the expenditure of your energies and your time? And though I sincerely trust that a future harvest of fame, power, and emolument awaits you, the crop has not yet invited the sickle. If

Hosted by Google

abandoned by you, what, let me ask, would be our position? The solitary pickets, of whose too great isolation I have been complaining, would be rapidly driven in, and a war of extermination carried into our very camp. Debellation (if I may coin a word) would be the watchword of the foe, and the very men who are now content to see you fight their battles, without joining your ranks as contributors, would be left to oppose the poisoned arrows of the *Lancet* and the more refined sword-play of the classical *Medical Times*.

But, Sir, the cause of truth will triumph, however ill defended; mankind, whether you are well or ill supported, must one day acknowledge the efficacy of our benevolent art. Indifference in its professors may delay, but cannot prevent, our success, and if the remarks which I have made should succeed in arousing one of the goodly band of practitioners who are not ashamed of unfurling our standard to a greater zeal, or inducing one of the thousands who, it is well known, are only too glad to avail themselves (*sub rosâ*) of our preparations, to avow himself a disciple of Hahnemann, I shall not regret having troubled you with them. The Anti-Corn-law League combined and persevered until it got its own way; surely, then, a league to emancipate us from the shackles of professional routine, and its solemn absurdities, where life and health are concerned, deserves as good a fate.

Some, doubtless, may be cured *secundum artem* (if not killed in the operation), but they are the favourable exceptions; the "οι πολλοι" alas! derive about as much benefit as suitors in Chancery, whose judgments are for their posterity, not for themselves; and as the case of Jarndyce *v.* Jarndyce, in "Bleak House," furnished play for the wit of succeeding generations of lawyers, so does the unhappy allopathic patient serve as a target for the pills of unfledged M. D.s, or a laboratory for the compounds of experimentalizing apothecaries.

Your obedient servant,

E. ROBERTS, Cantab.

[We are obliged to our correspondent for the expression of his good opinion: some of our professional brethren have assisted us vigorously, and the homœopathic public has afforded us a liberal share of support. The number of professional homœopathists is not so small as our correspondent supposes.

We hope with the proposed enlargement of our paper to secure a far wider range of circulation, on account of the increase and variety of our materials. We have had a difficult and sometimes an arduous task to perform; but we have done the best in our power, and, after a little while, that *best* of the *past* will issue, we trust and believe, in a much *better* for the future. We shall soon have taken a new starting-point, with a much wider base of operations, to use military terms; and we shall be able at once to carry on a powerful defence, and to advance steadily and surely into the far-spreading domains of medical superstition and medieval barbarism. Our lines of defence are impregnable; for they exist in a law of nature and in experience, they are defended by the batteries of Hahnemann, Constantine Hering, Bœninghausen, and other worthies; our advances are made and championed by conviction, good faith, honesty of purpose, and invincible resolution. We hope to have heavy-armed warriors, skirmishers, and foraging parties. The work of the pioneers has been already done. ED.]

AURORA BOREALIS.

(*From the Liverpool Courier.*)

A RECENT and remarkable display of this very beautiful meteor leads us to dwell a little upon the phenomenon. But let us first present a description of the polar-lights, which were seen in February last, as given in the pages of a contemporary:—"A remarkably brilliant display of the aurora occurred on Thursday night last (19th), illuminating all above the horizon to a degree far exceeding what has been previously witnessed for many years. It appears to have commenced about nine o'clock, p.m., when three distinct arches of pure white transparent light appeared, stretching from east to west across the zenith. These lasted for about ten minutes, during which the most beautiful flashes of red and yellow light issued from, crossed, and occasionally mingled with the white. For more than half an hour afterwards streaks of white and red light radiated in every direction from a point about half a degree north-east of Castor, resembling patches of nebulous light, as seen through a powerful telescope. From ten to eleven o'clock, the light streaming up from the western horizon frequently resembled the reflection thrown to the sky by a large distant conflagration. Columns of light, of various degrees of length and breadth, and tinged with almost every variety of colour, shot up, formed and disappeared with extraordinary rapidity. At midnight, the radiance of the heavens was equal to that of the moon at full. Every portion of the firmament was illumined at the same moment; and the streamers that continued to shoot athwart the expanse appeared to be as palpable as if they consisted of material substance, though the stars in every quarter still shone brightly through. The colours of the several arcs and streamers now began to deepen; lilac, pink, red, deep crimson, blue, purple, yellow, and green were visible at once—now separate, and anon mingled in indescribable beauty and sublimity; and they continued to ascend until all converged at the zenith, where the centre shortly afterwards opened, leaving a brilliant circle of glory. The whole pageant, in about a quarter of an hour from that time, began gradually to vanish; but it was not till the approach of dawn that the silvery streaks of light which had filled the sky had totally disappeared. The impressive silence which prevailed during the time this phenomenon was in activity added grandeur and awe to the spectacle. Not a breath of air seemed stirring, and every distant sound on the river, every clank of chain on board a ship, each rattle of a wheel over the pavement, though far remote, and every footfall

Hosted by Google

for two or three streets off, were distinctly audible. For the last few days the air has been greatly charged with electricity. This accounts for the magnificent display witnessed on the night in question, which would have been visible on the previous night had the clouds been less dense; for, at the Observatory, Mr. Hartnup distinctly saw streamers, similar in appearance to those described, ascending, during a break in the clouds, on Wednesday evening."

Like other natural phenomena, the aurora borealis attracted attention in remotest times, and often must the world's grey fathers have speculated upon its cause. Some contented themselves with describing the appearance; others sought for it an explanation in the science of olden times; but by far the largest mass of observers, those in whom the poetic germ lurked, viewed it as a kind of myth, or received it with superstitious awe. While the rude Indians, therein beheld the spirits of their fathers roaming to the boundless, the more civilized looked upon the meteor as portentous of national calamity, of fire and sword; yet both were wrong, and though wide apart, the bond uniting both is the silver cord of poetry.

"In fancy's eye encount'ring armies glare,
And sanguine ensigns wave unfurl'd in air!
Hence the deep vulgar deem impending fate,
A monarch ruined, or unpeopled state."

Writing, however, at the last moment, when even part of our impression is in type, and with political news swelling our columns, and claiming, through their importance, our first attention, we must leave this region of speculation and descend to stern facts; and wondrous as is the variety in the exhibitions of the polar lights, simple are the truths which science has revealed.

This meteor is not exclusively a *northern* one, we have a southern aurora too; but rarely do we see the *aurora australis* in this latitude. The meteor in both hemispheres is alike. Before it breaks out in those brilliant coruscations, the practised eye can behold a sign, though here less visibly depicted than in the polar regions. We refer to the darkening of the sky in the horizon, nearly in the plane of the magnetic meridian. This indication has been termed the *dark segment*. Though dark and gloomy by the contrast, stars yet shine through it like gems in the midst of a smoky vapour.

Above, and bounding this hazy segment, there now rises a *luminous arc*, clearly defined below, but somewhat indistinctly limited above, and imperceptibly mingling its radiance with the sky. This arc is not always white—this arc is never stationary; it flickers and expands, advancing towards the zenith, and almost invariably is bisected by the magnetic meridian.

Luminous beams now, or at the interval of some hours, shoot from this auroral arc, and tend towards that portion of the sky which is subsequently to display the auroral crown. These beams or streamers are in continual vibration, and often change their form. In proportion to their number, length, and colour—for they are not always white or yellow, but often red, and of other hues—is the beauty of the exhibition. Sometimes these rays mingle with columns of smoky darkness, mobile as those which illuminate the sky. Finally, and as if the climax, these "burning spears" gather in the upper heavens, forming a radiant wreath or *crown*, and then they disappear. The phenomenon is over; perchance some curdled masses remain behind, but they too fade away, and "leave not a rack behind."

At other times the polar lights present an aspect altogether different; they then resemble luminous and many-coloured clouds flitting overhead, vanishing and suddenly reappearing; or they appear as hanging drapery, or a flag floating in the breeze. When such a display occurs, the phenomenon is truly a splendid one; the more if the hues are vivid, varied, deep, and transparent. In the arctic circle such appearances are not unfrequent, and in these lands of desolation an indescribable charm is often added by the physical aspect of the spot; the ground, far as the eye can span, dazzles with the snow, while the sky above glitters with these flickering lights and twinkling stars. There

"No living creature could be seen to stray:
While solitude and perfect silence reign'd."

The aurora borealis is often seen simultaneously over a wide extent of country. Its limits, in fact, cannot be bounded.

The height of the meteor is still a problem in physical science, and doubtless the reason of this is the difficulty of ascertaining that observers in remote places are making their measurements of the *same* auroral arc. Another arises from viewing the display, such as that consisting chiefly of flickering rays, and the other of nebulous patches, at one and the same phenomenon. We believe the latter is in reality much nearer to the earth than the former. The one may be within the range of our atmosphere, but the other is doubtless far above its limits—probably about 180 miles above the surface of our globe. The influence of the polar lights upon the magnetic needle has been duly established, and its connection with electricity or magnetism fairly demonstrated. Displays in the United States and Siberia have produced shaking of the needle in Europe: and during the continuance of the phenomenon the earth's magnetism is diminished. Of its origin we have not yet directly spoken, but we have hinted at magnetism as the cause. It were to extend this article far beyond our assigned limits, to enter into an examination of all the theories; perhaps we may do so on another opportunity. Meanwhile, let our readers wait for the return of the meteor, and fail not to watch its frolics.

Before entering upon the theory of this meteor, let us return for a moment to the recent display, (that is, on the evening of Thursday week,) to point out the extent of its visible appearance on that occasion. It was seen at Edinburgh, Glasgow, Kendal, Preston, Manchester, Chester, Nottingham, Swansea, and London, as may be drawn from the following extracts from our contemporaries:—

From a Glasgow correspondent of the *Scotsman*:—"The aurora borealis burst forth immediately after sunset, and gradually overspread

Hosted by Google

the northern section of the heavens. Between ten and eleven o'clock a luminous band began to stretch around the horizon, and by a quarter past eleven had completely circumscribed it to a height of 20 deg., and at other times betwixt 45 deg. From this belt (forming a base like the arch in the borealis) coruscations of a pale yellow, or pale green and yellow, rippled and darted towards the zenith, round which they irradiated in fine, brilliant pencillings, and sometimes gathered in sheets like lurid clouds. Occasionally it seemed as if a gust of wind swept from the horizon to the zenith, wakening some phosphoric vapour (previously latent) into a livid, uncertain flame; again flowing gently, and producing the phenomenon with nicer decision. The light emitted was of a modified, starlight character. The phenomenon continued for about an hour."

At Edinburgh it was visible between the hours of eight and eleven, p.m. "The streamers were unusually vivid, and darted unceasingly across the whole expanse of the sky, ultimately subsiding into a sort of pale curtain of light, hung, as it were, from the zenith towards the northern and western horizon."

At Kendal it was very brilliant, both on Wednesday and Thursday nights; at one time flashing apparently from every quarter towards the zenith, and at another displaying rich crimson and purple hues.

At Preston it was also seen on both evenings, chiefly in the north and north-west, and occasionally very brilliant, the phenomena remaining visible for a considerable time.

A correspondent of a Bolton paper describes it very much as it was seen in Manchester:—"On Thursday night this phenomenon was splendidly visible in Bolton, shining with something of its arctic brilliancy, and producing, at times, nearly as much light as the full moon. It was observed from nine o'clock till past twelve, p.m., but was visible for some hours longer From eleven to twelve, p.m., bright coruscations of light were seen issuing from the north, some of them in broad striped bands, nearly perpendicular, and others reaching nearly to the zenith. At the same time transverse bands shot forth in an angular direction, both from the north-east and north-west, meeting in radiating points and circles near the line of the ecliptic. While the perpendicular columns of light remained stationary, and shooting forth their coruscations in the same direction as the column from which they emanated, volumes of filmy light came rolling from the north, under these stationary bands, and seemingly at a much less elevation, and spreading with immense velocity towards the south, like very thin transparent clouds, or gleams of phosphorescence. Occasionally coloured streaks were seen, and also masses of reddish smoky-looking substance, not unlike the reflection of a fire, from a light cloudy atmosphere. This was seen most distinctly about half-past eleven, p.m." This observer thinks the phenomena tend to prove "that the aurora borealis or northern lights are the result of magnetic force, and not of electricity, as supposed by Sir Humphrey Davy."

A correspondent of the *Manchester Guardian* describes the display, having seen it so late as three, a.m., on Friday, when, he says, the flashes of silvery light came chiefly from the north and north-west, extending to the zenith, and even sometimes beyond, southwards. "We find," says the *Guardian*, "by the newspapers, that the aurora of Thursday night was even over a greater extent of country; as far north as Glasgow and Edinburgh, and as far south as London. At Glasgow the aurora commenced early in the evening, and continued for some months to flit across the sky, with a radiance that rendered the night almost as clear as if illuminated by the moon, then at her greatest age. It seems to have been attended by a great derangement of electric action through the telegraphic wires, by which it was found almost impossible, till an advanced hour of the morning, to transmit the usual parliamentary intelligence from the south."

At Chester, the aurora was seen for upwards of an hour on Thursday night, commencing a little before eleven o'clock, the coruscations being exceedingly splendid.

A long and detailed communication appears in the *Times*, from M. E. J. Lowe, of Highfield-house Observatory, near Nottingham, who states that the aurora of Thursday night was superior to any display since November 17, 1848, and describes its principal features from seven, p.m., Thursday, (at intervals,) till five, a.m., Friday. We copy his notice of its period of greatest brilliancy:—"11h. 55m. Magnificent curtains, which met and formed a cupola in the centre of a triangle formed by Z, and u Leonis Minoris (about AR 10h. 7m., decl. 29 deg. 8m. 50 sec. N.) The rays sprang up from all directions towards this point, yet did not stop at the cupola, for each ray shot past it at a distance of half a degree, becoming at the same time bent. At times the central point was pure sky surrounded by a milky ring; at others a white circle of about the diameter of the moon, surrounded by a ring of clear sky, but mostly very fantastic in form, resembling wings and wavy lines. Among the more striking features of the aurora were—1st, the many shapes of the central point, and its oscillations at about 12h. 35m.; 2dly, the perfect canopy of light at 11h. 55m.; 3rdly, the large portion of the sky occupied by the phenomena, and its descending as far south as Cor Hydræ; 4thly, the length of time it lasted; and, 5thly, the independence which one beam seemed to have to every other. The readings of the instruments at 11 p.m., (of Thursday), were—barometer, 29·973. (corrected;) thermometer, 29·4 deg.; wet-bulb thermometer, 29 deg.; maximum temperature for the day, 39·3 deg.; force of wind, 0·5; direction, NN.W.; sky cloudless throughout the display, and had been nearly so all day previous to it. There were faint auroral arches on the 15th, 17th, and 18th; violent gales of wind from the N.W. on the 16th, 17th, and 18th; snow on the 18th, with much lightning in the evening in the west."

At Swansea, South Wales, it was seen between eight, p.m., and twelve; exhibiting the most

Hosted by Google

brilliant phenomena witnessed for many years. In endeavouring to solve the question of its origin, we must bear in mind the electro-magnetic influence of the polar lights, the great height of at least one species of the phenomenon —and here, parenthetically, if we are to believe the statements made by some that a noise accompanies the meteor, then must it occasionally occupy a lower altitude; but that sound attends, is far from being established—and the greater fact that the light is *direct*, not reflected.

Many fanciful theories have been propounded; that it was a solar emanation was held by Marian; that it is the impulse of material light disturbing the higher atmosphere was the opinion of St. Pierre—both utterly untenable. Some years ago, Sir John Ross offered another explanation, but not more satisfactory. It had its prototype in that of Monge, who supposed the phenomenon to be clouds illuminated by reflections of solar light from other clouds; Ross fancied it to be the reflection of solar light upon lofty clouds from fields of circumpolar ice and glaciers. Libes conjectured that it arose from decomposition of the atmospheric gases by the agency of electricity—a theory which cannot be established, and against which there are the strongest arguments. Others have supposed it to be a nebular fluid, or gaseous matter, acted upon by the earth's magnetism; and another theory has been broached, that the atmosphere contains metallic particles minutely divided, which, on these occasions, become themselves the subjects of electric and magnetic agencies. To define the height of the meteor would go far, by exclusion, to determine this doubtful point.

The magnetism of the aurora borealis indicates, without a doubt, a close relationship. That the meteor is electrical was conjectured long ago by Halley, and pointed out hy Eberhard and Paul Frisi. This opinion is held by Humboldt, Dalton, Young, Brewster, Kæmtz, Herschel, and many others. By this view, the parallelism of the auroral beams with the magnetic meridian, like staves of a cask running paralled to its axis, also the intensity of the phenomenon near the magnetic poles, and its decrease as we recede towards the magnetic equator, are explained; and the analogy is preserved by the experiments of De la Rive.

The hypothesis of the late Mr. Sturgeon is worthy of consideration, though we do not accede to it. "It originates," says he, "in a sudden change of temperature in the upper regions of the atmosphere, which gives rise to a corresponding disturbance of the electric fluid, causing extensive movements of it amongst the attenuated air and aqueous vapour illuminating them, as it spreads in various directions, according as the different parts are prepared for its reception and diffusion." Referring to those streaks of cirri and cirristrati—the *polar-bands*—which occasionally are seen, he conjectures that they "become luminous conductors, and form streamers of the aurora borealis, displaying different degrees of brilliancy, in correspondence with the nubiferous arrangement and the quantity of electric fluid flowing through it." So far, this theory requires that the polar-lights should occupy a very low position; and it is known to meteorologists that the aqueous vapour mingled with our atmosphere rises to comparatively low altitudes, that its amount is determined by temperature, and that its vesicles are frozen in the region of the cirrus cloud. To meet this objection, Mr. Sturgeon says: "It is possible, however, that on many occasions the electrical disturbances may take place even at higher altitudes, and the light be transmitted through the thinnest bands of these nubiferous arrangements, which would give the appearance of streamers or luminous beams, as decidedly as if they were themselves the conductors or channels of electrical transmission." To this we apprehend the diffusion of the meteor over so large an extent of country offers a disproving argument. The phenomenon has been seen simultaneousiy from the empire of the Czar, westward, to the native forests of America, and from the north of Europe to the equator. We cannot suppose nubiferous vapour spreading over an area so vast. As little can we agree with Mr. Sturgeon, "that similar arrangements of still more attenuated aqueous vapour are frequently found at altitudes where they are far beyond the reach of observation, until illuminated by electric disturbances." We are unwilling, however, to controvert that part of his hypothesis which assigns caloric as the exciting cause. "A sudden depression of temperature, that produces lightning amongst the clouds, would produce an aurora borealis in a higher region of the air; a depression of temperature at the earth's surface invariably succeeds a lightning-storm, and almost as certainly follows an aurora borealis; and very often both of these electrical phenomena appear simultaneously, showing that the disturbance extends to a great height, and the fall of temperature below the freezing-point which succeeds these phenomena, as well as the immense hailstones that attend lightning, infer that the change of temperature commences far above the earth's surface, and that it progresses downwards with various degree of speed."

The *dark segment* below the auroral are, which we have described as the first indication of a grand display of the polar light, is supposed by Argelander to be something real, and not, as Parry and Struwe think, only contrast with the luminosity above. When more luminous arcs than one appear, they are believed to arise by reflection from frozen crystals floating in the air.

PHARMACY BILL.—This bill was read a second time on Wednesday night in the House of Commons, and referred to a Select Committee. It gives great powers to the Pharmaceutical Society, and its wording should be carefully watched.

CRITICAL ANALYSIS OF DR. ROUTH'S "FALLACIES OF HOMŒOPATHY."

By John Ozanne, M.D.

Entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

IV.

Dr. Routh, gives *Arsenious Acid* and *Mercury* as further instances of the occasional truth of the homœopathic law. "But," says he, "numerous instances could be mentioned of the contrary. *Gallic Acid* and *Turpentine* exert a specific influence in cases of hemorrhage. Can these medicines produce hemorrhage?" This would, of course, be a triumphant objection, if it were well founded, for it was precisely by carefully studying "the cases in which the specific remedy for a disease of never-varying character has been revealed to physicians of the ordinary school (not by their own investigation, but *by the empirical practice of the common people*) wherewith they were enabled to effect a direct cure; as, for instance, of the venereal disease with *Mercury;* of the morbid state resulting from contusions with *Arnica;* of marsh ague with *Cinchona Bark;* of recent cases of itch with *Flowers of Sulphur*," etc. It was by taking these cases, and endeavouring, "*for the weal of mankind, to ascertain how these cures, as rare in their occurrence as they are remarkable in their beneficial results, really took place*" (Organon pp. 97—99), that Hahnemann discovered the homœopathic law. Although in the course of these investigations the great Master searched well through the records of medicine for such cases, he found them to be rare indeed; and it is for this reason that his first experiments, instituted for the purpose of accounting for these striking cures by something more satisfactory to his inquiring mind than the mere word *specific*, were not numerous. Dr. Routh has made this the subject of a *sneer*, which, although intended for Hahnemann, applies in truth only to the old system. But this law, discovered in the manner above stated, and subsequently verified by years of careful experimentation, is capable of explaining not only the cures which Hahnemann found recorded in the annals of medicine, but likewise those which have occurred since his time; on one condition however, namely, that the two necessary elements of the problem—the phenomena of the disease on the one hand, and the pathogenetic effects of the drug upon the healthy subject on the other—be first known.

Dr. Routh brings forward two substances as examples of the fallibility of the law. One of them, *Gallic Acid*, although discovered long ago by Scheele, has only been recently found to be useful in *hemorrhage*, particularly in *hæmaturia*. Its effects upon the healthy subject have not yet been ascertained, therefore we cannot at present say whether in it the law will hold good or not. I should say that if its action in arresting hemorrhage be *really specific*, that is, *not dependent upon its chemical action* on the salts of iron in the blood, it will be found some day or another to be capable of producing *hæmaturia*. We are in a different position with regard to *Turpentine*, which has been proved upon the healthy subject. It will therefore be proper to enter into a few developments respecting it, seeing that it is brought forward as a proof of the non-existence of the homœopathic law as a *general law*.

First, then, as regards the cures. We have a very interesting case of the cure of *hæmaturia* by means of a few drops of the *Oil of Turpentine*, recorded by Mr. Vincent (Observations on some Parts of Surgical Practice). We have also Dr. Thomas Smith's good opinion of the virtues of *Turpentine* in *hæmatemesis*, *hæmaturia*, *hæmoptysis*, and *epistaxis*. As regards hæmatemesis, the cessation of the bleeding would be no proof of the *specific* action of *Turpentine;* it might be the result of the direct action of the oil upon the bleeding vessels. But it is different with regard to the other forms of hemorrhage mentioned; to *cure* these the oil must be absorbed. Now I know a person in whom the vapour of *Turpentine* has repeatedly, and at distant periods, produced epistaxis. A sudden death occurred

Hosted by Google

in this island little more than a year ago, through hemorrhage from the lungs, in a man who was taking a teaspoonful of the *Oil of Turpent ne* each evening—a popular remedy for rheumatism. But as it is not fair to bring forward as proofs facts which have not been previously published, I refer the reader to the "Homœopathic Materia Medica," in proof of the power of *Turpentine* to produce *hæmaturia*. I also quote the following words from Mr. Vincent, whose case of *hæmaturia* has already been mentioned. "Few great gifts come to us without alloy, and *Turpentine* is no exception to the rule. In the first place, there are few drugs more repugnant to delicate stomachs. In many it excites vomiting, in others it causes painful strangury, and *the irritation of the urinary organs is sometimes so great that blood is passed with the urine.*" There are other cases on record in which *hæmaturia* was produced by the inhalation of the vapour of *Turpentine*. Dr. Cotton, of the New York Hospital, reports such a case; the subject being a sailor engaged in a vessel freighted with turpentine, who knew no less than twelve men who had suffered in the same way from inhaling *Turpentine*. Dr. Harris, of the New York City Dispensary, met in one summer with three such cases. (New York Journal of Medicine, in North America; Journal of Homœopathy, vol. i. p. 125.)

"*Turpentine* and the *Oil of Male-fern* are specifics in many cases of tapeworm. Would a healthy person taking *Turpentine* continually have tapeworm? * * * The legitimate homœopaths answer the objection to the examples of *Turpentine, Gallic Acid, Oil of Male-fern* thus: if they should produce respectively hemorrhage and tapeworm, etc., this would be *isopathy*, not homœopathy. The objection, however, still holds. Do they produce anything *like* a tapeworm, any *animal* like it? and then the last example cannot be got over" (Routh, pp. 6, 7). To any one at all acquainted with *the* homœopathy founded by Hahnemann, the above extracts will lead to one conclusion only; namely, the lamentable unfitness of the author for the task he undertook. It grieves me to have to point out the absurdities and errors contained in the above few lines; but I *must* do so, for it is a part of my task. It is *not true* that homœopaths would call the production and cure of hemorrhage by *Gallic Acid* and *Turpentine isopathy*. It is evident that Dr. Routh does not know the distinction between *isopathy* and *homœopathy*. In the former, the disease is cured or prevented by one of its own products; namely, the virus which at the same time produces and is produced by it. In the latter, the disease is cured by an agent which produces on the healthy subject a disease resembling it, but not identical with it. I may here give an instance of the difference, which will avoid my reverting to it again further on, when the author speaks of vaccination and of small-pox. Whatever may be the theories now extant respecting the identity or non-identity of the vaccine-lymph with the virus of the small-pox, we cannot look upon vaccination as *isopathic*, because the lymph does *not* produce *small-pox*, but something resembling it. The inoculation of the small-pox virus would be *isopathic*, because it would produce a small-pox pustule and nothing else. Vaccination is, therefore, strictly *homœopathic*. Having thus instanced the distinction between the two, which it is clear Dr. Routh does not understand, although the Greek adjectives which enter into the composition of the words isopathy and homœopathy respectively bear a very dissimilar meaning, and might have led him to comprehend the distinction of the two. In the first the adjective means *equal* or *equivalent to*, in the latter it simply means *similar* or *like to*. If the reader, after these remarks, will therefore read over the above extracts from Dr. Routh, he will perceive that the author has been led into the following absurdity. If *Turpentine* cures hemorrhage *isopathically, then hemorrhage must* and can *produce turpentine*, which is an absurdity!

Dr. Routh asks whether any of the drugs he mentions were ever known to produce tapeworm. Now, in my turn, I ask whether he has ever read in the works of Hahnemann, or any of his disciples, that drugs acting upon the healthy subject could produce tapeworm, or any other animal or vegetable parasite, or even such common diseases as small-pox, scarlatina, measles, syphilis, sycosis, psora, cancer, tubercles, etc.? It is really high time that those who attack homœopathy should first study it carefully, not in the works of a Wood or of a Simpson, but in those of acknowledged authority in the homœopathic school!

Nor has it ever been asserted by Hahnemann or his followers that *Iodine* produced *goitre*, the action of this drug upon glands generally, and upon the thyroid in particular, as instanced in the works of allopathic authors, is sufficient for their purpose. If, however, Dr. Routh is not satisfied with these few words, I shall be happy to enter into a further discussion of the subject at some future period. At present I cannot do so, as much of the space allotted to me has already been wasted in the considera-

Hosted by Google

tion of tedious details, whereas the chief object in view is to enter into an examination of the merits of homœopathy, not in a few chronic complaints, but in *acute diseases* of the most urgent and of the most dangerous character. I might therefore have waived the consideration of these various objections, and told the author that *a system which, based upon a principle or law, and which has produced in the most dangerous acute diseases results far surpassing those obtained by any system previously known,* is not to be pulled down or even shaken by raising objections in matters of detail, or diverting the attention of his readers to questions of secondary importance.

"In some cases of *otitis*," says Dr. Routh, "involving the dura-mater, we have shivering followed by hot fits, exactly resembling the paroxysms of ague, of a quotidian, and sometimes tertian, or other type; and what is still more singular, is, that they seem to be checked for the time by the exhibition of *Bark*. Now *Bark* certainly produces symptoms, as alleged by homœopaths, very *like* those of ague: in addition, intense headache, all the symptoms of cerebral congestion, eruption within the ear (Jahr), etc., and deafness. In this case, therefore, we have the exact application of the principle, *similia similibus curentur*, and yet death would inevitably follow the practice" (p. 7).

The author is unfortunate in his objection. In the first place, the selection of the remedy would not be made by a homœopathist, deserving of the name, upon such vague indications as those given by him. Hahnemann carefully guards us against taking indefinite symptoms, such as "nausea, debility, headache, and so forth" (Organon, § cxlv.), and also against single symptoms, such as the *type* of a disease, or *one-sided* symptoms generally, as the sole indication for the selection of the appropriate medicine. Now, in cases of otitis, involving the dura-mater, there are several symptoms besides those mentioned by Dr. Routh, which would guide the homœopathist in his choice of the medicine. For instance, acute pain in the internal ear, with sleeplessness, perhaps delirium, or a comatose state, the position of the head of the patient, the state of the pulse, etc.. Now, *Bark* does not give any of those symptoms from which *alone* the physician could draw his diagnosis. The supervention of aguish paroxysms would not lead homœopathists to the exhibition of *Bark;* for, supposing the case to be one of otitis, these phenomena would lead him to consider whether suppuration might not be taking place, whether the petrous portion of the temporal bone might not be affected with caries, etc., and then he would study carefully the symptoms of *Hepar sulphuris, Calc.*, or some other remedy that might suit better these symptoms. It so happens that the aguish paroxysms are among the *indefinite* symptoms mentioned by Hahnemann. They are to be found in *Belladonna*, and in *Hep. sulph.*, and *Calc.*, as well as in *Bark;* the homœopathist could not therefore be misled by them, whereas an allopathist might be; therefore the objection solely applies to the old system, not to the new. But I will give a case in point. In Dr. Abercrombie's "Researches on Diseases of the Brain" (London, 1836, p. 30), the history of a patient affected with inflammation of the dura-mater, who was made to take *Quinine*, because *the symptoms assumed an intermittent character*, is given, together with the post-mortem examination.

It is not my intention to enter here into the question of the small or infinitesimal doses, with regard to their power of modifying diseases, further than to remark, that it is not a point to be settled by *à prior* reasoning; neither is the action of the small doses to be explained any more than we can explain numerous other facts which no one doubts, because they come within the range of his daily experience. This question is to be decided by *experience* alone. It is upon this foundation only that homœopathists ground their belief in the power of minute doses of medicine, and it is upon this foundation alone that discrepancies have arisen respecting the quantity of the dose necessary in given diseases. Strange it is, that the author does not perceive that this very circumstance—the different opinions entertained by different homœopathists respecting the quantity of the dose—clearly proves that homœopathists are not led by *à priori* deductions from supposed facts, as he would lead us to believe. This, therefore, so far from being a founded objection to the system, only shows that the amount of the dose is as yet an open question, and that each individual practitioner is only bound by this rule,—to use a dose which must be *sufficient*, but *never excessive*. In ascertaining the sufficiency or the excess of the dose, he must be guided by the experience of others as well as by his own.

(*To be continued.*)

NARRATIVE OF THE INTRODUCTION OF HOMŒOPATHY INTO ENGLAND.

By F. J. Smith.

(*Continued from page* 492.)

Having in our first article shown the huge annual loss to this country occasioned by the accident of illness, the incompetency of allopathy to deal with disease, by evidence adduced from the writings of its most distinguished practitioners, and the improbability of the beneficent Father of the Universe having ordained no law for the preservation and restoration of health; and having deduced from these premises the moral obligation of endeavouring to discover whether any system of medical practice extant is based on an universal law of healing, we now proceed in this paper to observe, that this question involves an investigation into all the medical systems extant. And in vain will the inquirer search for any system even *professing* to be based on an universal law of healing,* till he arrives at that instituted by Hahnemann, and practised by his disciples; and in this system he will find all his *à priori* reasoning fully vindicated—at least professedly.

Having at length reached—at any rate in appearance—*terra firma*, we cannot conceive so philosophical an investigator as our supposed inquirer, to be, doing less than examine with most searching scrutiny whatever has been written by eminent authors, who have trodden the same path before him. We will, therefore, imagine him carefully studying Dr. Joslin's "Principles of Homœopathy," a masterly production; the "Concise View of Homœopathy," by C. W. L., of Dublin, a work of extraordinary merit; the elegant yet demonstrative reasoning of Marmaduke Sampson, Esq., in his various writings; Dr. Quin, "Du Traitement Homœopathique du Choléra," of which Dr. Joslin thus speaks, "probably the best practical work that has hitherto been written on the cholera;" and Dr. J. Rutherfurd Russell's "Homœopathy in 1851," an excellent compilation of many valuable letters and pamphlets that have appeared at various times, connected together with much skill and judgment, and interspersed with some powerful remarks. These and other able productions of homœopathic writers having been well digested, we have no fear of our inquirer stopping short of the immortal works of the illustrious Hahnemann himself.

In a sketch so brief as this narrative must necessarily be, it is not possible to furnish many extracts. On the whole, then, I consider it best to confine myself to the second of the treatises named, more especially because it relates the steps taken by a free and enlightened people in reference to the two medical systems under consideration, and contains the response made to that people by their legislature. In the appendix to this work will be found, amongst other intensely interesting details, a petition presented to the Hungarian Diet, in 1843, founded on facts derived from public record:—

1. That the mortality in homœopathic hospitals was not quite six per cent., whereas in allopathic hospitals it amounted to more than twelve per cent. (S. Tab. iv.)

2. That, in severe inflammation, allopathy loses nearly fifteen per cent., homœopathy not quite five per cent. (S. Tab. vii.)

3. That, in nervous and putrid fevers, allopathy loses twenty-one, and homœopathy twelve per cent. (S. Tab. viii.)

4. That, in the treatment of cholera, allopathy lost fifty-three per cent., homœopathy only eight and three-quarters per cent. (S. Tab. x.)

5. That the average duration of cases, allopathically treated, is 29 days—while that of those homœopathically treated is only 21 days (page 222).

6. That homœopathic hospitals do not require, under equal circumstances, half the expense of allopathic establishments. (S. Tab. vi.)

The language of these petitioners is at once so manly, so temperate, and so forcible, that I cannot forbear to add the following quotation; and would that it might find its way to every statesman—to every governor of every hospital—to every member of every board of guardians—to every philanthropist—and to every parent in this country. The quotation is this: "We prefer laying numbers instead of mere words before the Diet, and if they cannot be shown to be erroneous, it is clear that, with regard to public interests, there is a vast difference between the new and the old system of treatment. We hold it to be our duty to point out to the representatives of the country the two facts, relating to the saving of both human life and public money, without intending to injure any one. We hold this

* Professional hydropathists do not claim for Preissnitz's system this universality. It is very far from being my wish to underrate hydropathy. I believe it to be an excellent palliative in some disorders; and of course, where it is homœopathic o a disease, curative.

Hosted by Google

to be our duty, also, because we are well acquainted with both systems, and we think it advisable now to come forward, because the results obtained in our hospitals are so extensive and comprehensive, that a conclusive judgment may be based upon them."

Accompanying the petition were tabular views of the patients treated, during several years, at the Homœopathic Hospital of Güns, Gyongyos, Vienna, and Linz; and a comparative view of the results of allopathic and homœopathic treatment of patients at the Elisabetherin, Barmberzigen Brüder, the Hospital of the Israelites, and the General Hospital of Vienna; at the Barmberzigen Brüder of Ofen, the Hospital of St. Rochus at Pesth, of the Jacobspital of Leipzig, and the Charité at Berlin. The comparison gives (as an average result) $12\frac{1}{8}$ per cent. deaths under allopathic treatment, and $5\frac{6}{8}$ per cent. deaths under homœopathic treatment. In the homœopathic hospitals, the expense for every patient amounts to twenty-two kreutzers per day; in allopathic hospitals to fifty-two and a half kreutzers (page 174.)

We are happy to be able to add, that the petition addressed to the Hungarian Diet relative to the establishment, at the expense of the government, of a chair and homœopathic hospital at the University of Pesth, was adopted *almost unanimously* by both houses (page 174).

In the appendix, from which I am quoting, will also be found most satisfactory comparative statements of allopathic and homœopathic treatment, as applied to the sick of the 4th Regiment of French Hussars, during the years 1830-31-32-33 and 34, together with some striking results obtained by homœopathic treatment during the years 1835, 1836, and the first six months of 1837, signed and certified as correct by Laburthe, M.D., surgeon to the regiment, and by L de Bragk, colonel of the 4th Regiment of Hussars.

In the same appendix the inquirer will find an exceedingly interesting statement illustrating the comparative merits of the two systems of homœopathic and allopathic practice, in the Hospital of the State Prison at Auburn, New York.

Such are the effects of homœopathic treatment. And if the question be put—what, then, is homœopathy? the answer is brief. It is a medical system, founded on an universal law of healing, expressed by the words *similia similibus curantur*. If the subject be pursued, and a second question asked—when was it first promulgated, and what number of votaries does it boast? the reply is equally brief. It was first promulgated by Hahnemann, in the year 1796, and now numbers nearly five-thousand practitioners;* and if we except those who have graduated at the different homœopathic colleges in the United States, these five thousand practitioners, all educated in the tenets of allopathy, all engaged in practice, all risking income and professional status, for the sake of what they believed, after careful investigation, to be the truth—men whose average attainments will certainly bear comparison with the average attainments of the body they have left; while of some it may be said, that allopathy will search in vain for their superiors in classical knowledge, scientific acquirements, and medical skill.

And here it may not be uninteresting to the general reader to be informed, that hundreds of men, bred to the practice of allopathy, have deserted its ranks, on account of its scientifico-unsatisfactory character. Of these distinguished scientific seceders, perhaps the most conspicuous are, Locke, Smollett, Goldsmith, Crabbe, Sir James Mackintosh, Lord Abinger, and Lord Langdale; to this list we will add but one other name. Amongst the thousands whose diurnal course is from Paddington to the Royal Exchange and back, few are perhaps aware that within a bowshot of Finsbury-square is at least one spot sacred to genius. Northward of this quadrangular pile, to the left, is a terrace of some thirty houses, inhabited by merchants and professional men, while to the right is a lower range of buildings, occupied by tradesmen of various classes. Such was not the case formerly, this terrace, like its more aristocratic *vis-à-vis*, was composed of private dwellings, the fourth of which was the residence of a general practitioner of the name of Rance. He who, some thirty years ago, had occasion for the medical services of this amiable apothecary, on entering a small room designated the "surgery," was addressed by a youth remarkable for the attractiveness of his personal appearance and the elegance of his manners; beyond this mere outward show, probably not one in a hundred saw anything observable. The youthful disciple of Esculapius was, however, revolving great schemes in his fertile imagination; and there were not wanting those who, even at this period, augured a distinguished career from the varied and sparkling conversation that flowed from his lips. In due time, by the aid of literature, he exchanged medicine for the law, and migrated from the noise and bustle of the City-road to the more genial

* Homœopathic Times, February, 1852.

Hosted by Google

atmosphere of the Temple. Here, by the assiduous cultivation of inherited talent, he has taken a high position in the profession of his choice, and become the well-known author of the "Diary of a Late Physician," "Ten Thousand a Year," and other highly popular works. Curiously enough, the successor to this distinguished student also abandoned the medical profession. Finally, the good old man died, and the very house itself abandoned the profession, and has passed into the hands of an optician, whose glittering articles now arrest the attention of the passenger on his way to the city.

We need hardly observe that this episode on medical seceders has been introduced, not because it has any direct bearing on our argument, but on account of its historical and topographical interest. We will now, therefore, return to the main topic of discussion, by observing that we have had before us evidence of an unimpeachable character respecting these two systems of medical treatment. Allopathists have been allowed to speak for themselves; and the homœopathic evidence adduced is the identical evidence that wrought conviction in the Hungarian Diet, and induced both houses to adopt, *almost unanimously*, a resolution to establish, at the expense of the government, a chair and homœopathic hospital at the University of Pesth—the richest university in the world save that of Oxford!

We might now go on to show the estimation in which allopathy is held by homœopathic practitioners; and, considering that such practitioners are acquainted with both systems, their testimony could scarcely fail to be interesting. But inasmuch as such evidence would not advance the argument against allopathy one iota beyond the point to which their own testimony inevitably conducts it—for this would be impossible—we prefer to leave that part of our case where it stands.

The evidence of allopathists in favour of homœopathy stands on a very different footing; and we are bound to adduce it, if only to do honour to the individuals from whom it emanates. We shall select our extracts from the admirable work of Mr. Sampson,* to which reference has already been made, and which the reader is earnestly recommended carefully to examine.

Germany.—Hufeland, of whom we have already spoken as the Nestor of medicine, says: "Homœopathy seems to be particularly valuable in two points of view: first, because it promises to lead the art of healing back to the only true path of quiet observation and experience, and to give new life to the too much-neglected worth of symptomatology; and, secondly, because it furnishes simplicity in the treatment of disease."

France.—Broussais, the founder and champion of the celebrated "Doctrine Physiologique," says: "Many distinguished persons are occupied with it (homœopathy). We cannot reject it without a hearing. We *must* investigate the truth it contains;" and he was thus engaged when his lamented death terminated his important investigations.

Italy.—The venerable Professor Brera says: "It deserves by no means contempt; but, on the contrary, a cool and impartial investigation."

America. — Valentine Mott, justly esteemed the pride of American surgery, observes: "Hahnemann is one of the most accomplished and scientific physicians of the present age."

England. — Mr. Kingdon, the eminent surgeon, on one occasion, read a paper before the London Medical Society (which was subsequently published in the *Lancet*), in which, after stating that his most profitable business is with gentlemen in the city,—"men whose minds are enlarged by education and occupation,"—goes on to say, that these gentlemen having forced homœopathy on his attention, "he sought an introduction to Dr. Quin, of whom he had heard most honourable report;" that he found Dr. Quin, "after a close intimacy of some months' duration, a most honourable, candid, gentlemanlike, and highly-educated man, with too much intellectuality easily to deceive himself. and too much honour to deceive another;" that he (Mr. Kingdon) made many experiments (the particulars he gives), the results of which were highly satisfactory, etc. etc.; and he thus concludes: "Notwithstanding all the trouble required' (to obtain a thorough knowledge of homœopathy), "it is my present belief that it is well worth while to take it; and, after what I have seen. or, if you please, what I have fancied I have seen, I feel that it is the duty of *every medical man* to look into it; for it is certain either that a number of cases are better without medicine than with it, *or*, that these unimaginable doses of carefully-prepared medicines *do impress the nerves so as to influence the actions of life.*"*

* Truths, and their Reception, considered in their Relation to the Doctrine of Homœopathy. Second Edition. Samuel Highley, Fleet Street.

* It is melancholy to think that this paper gave rise to a very angry discussion amongst the members of the Society present, and that a tacit understanding was come to, that the subject should never again be mooted in that assembly.

Hosted by Google

Dr. Combe says: "After the presumptive evidence adduced, if *I* were now in practice, I should hold myself *bound*, without further delay, to test its truth by careful and extensive experiment."

Mr. Liston, of University College Hospital.—Dr. Quin, in a biographical sketch of this distinguished man, which appeared in the *British Journal of Homœopathy*, in January, 1848, after speaking of the cordial intimacy that had subsisted between himself and Mr. Liston for years, observes: "One day in the beginning of January, 1836, Mr. Liston was lamenting over the fatality that attended his treatment of the great majority of cases admitted into his hospital with erysipelas of the head, and stated that, in the physicians' wards the results were much the same as in the surgical wards;" that he (Dr. Quin) "mentioned that he had had several very severe cases, and that they had every one recovered under homœopathic treatment; that he happened to have a case that he had barely commenced, and that he offered to show it to Mr. Liston; that Liston accepted the offer, watched it, and the result was his employment of the same remedies at his hospital, with perfect success; the particulars of treatment appeared in the *Lancet* of the 6th and 13th February, and the 16th of April, 1836. After giving the details of these cases, Mr. Liston thus addressed the students: 'Without adopting the theory of this medical sect (the homœopathic), you *ought not to reject its doctrines* without due examination and inquiry.'"

It would be no difficult task to furnish page after page of evidence of this nature, from the works of men of equal standing with those from whose writings this selection has been made. Enough, however, has been advanced to demonstrate the absurdity of refusing to examine into the homœopathic system of healing. With examination we are content, for honest inquiry was never yet instituted without conviction being the result. And we are ourselves acquainted with the case of one of the leading homœopathic practitioners of London, who sat down to study the writings of Hahnemann, for the purpose of exposing the fallacy of his system, and ended by becoming a convert; like a celebrated infidel, who examined the Bible with the design of producing a sceptical treatise, and ended with writing in favour of religion.

Assuming, then, that the effect of this allopathic testimony in favour of homœopathy has been sufficient to produce a deep and lasting conviction of the folly of neglecting to examine into our system, we may safely request of our readers the favour of a reperusal of the homœopathic evidence adduced, in order to their being the better prepared for realizing the consequences that flow from it

But before we proceed to comment on this evidence, we must be permitted to make one general remark, viz., that the tendency of true science is to advance, as in the case of chemistry: the tendency of pseudo-science to remain stationary, or to decline, as in the case of alchemy. We do not introduce this position as the basis of a substantive argument, but it is at least of value as collateral evidence; and judged of by this test, what is the conclusion to be drawn respecting the two rival systems of medicine we have been considering?

With every discovery of a new drug, we find the Hahnemannic system confirmed, and thus is homœopathy in a constant state of progress: in so far, therefore, it possesses the vital character of a true science. Allopathy, on the other hand, after 2000 years, has to confess that, "without my interference, human mortality would be less!" If, then, allopathy has not been stationary, how fearful must have been its state previously! how slow its advance, if it has been in a state of progression during 2000 years, and has only attained to this point, after the lapse of twenty centuries! and how little hopes are to be entertained respecting it, even on this most favourable supposition. It is, however, far more reasonable to conclude, as the fact unquestionably is, that it has, for all practical purposes, remained stationary; and is thus self-branded with the character of a pseudo-science.

From the homœopathic evidence adduced, we will at present select but one single fact, and connect it with the arithmetical statement with which we commenced this article—£3,750,000 annually lost to this country by the accident of illness.

Now, assuming that homœopathy can cure disease in a period, which, compared with that required by allopathy, stands in the ratio of twenty-one days to twenty-nine days (as stated in the foregoing evidence), it follows that, by the general adoption of the former system, £1,034,483 would be annually saved by this country.

Let us pause for a moment. We have here a medical system, in whose existence all *à priori* reasoning would incline us to believe—supported by the authority of names of the highest order for intellect, medical attainment, and character—silently declaring its capability of saving this country

Hosted by Google

£1,034,483 per annum. Is any statesman justified in neglecting to investigate the evidence on which such a system rests? Whatever may be the answer of *to-day*, our own deliberate conviction is, that posterity will not acquit him from putting aside the question, when the evidence that can be proved to exist at the present time is weighed—as it will one day be—by the impartial tribunal of the future.

But it may be replied that statesmen have more important things to do than to attend to medical disputes, or to investigate the merits of rival systems.

If this answer be intended to assert that statesmen have nothing to do with the physical, moral, intellectual, and pecuniary well-being of the people they govern, we deny the proposition absolutely. And if this be not the intention, then is the answer beside the question.

It may, however, be said that the majority of medical men *i. e.* allopathic practitioners, declare homœopathy to be humbug and quackery. The medical men of Harvey's and Jenner's day used viler names when speaking of those great benefactors of mankind; and now the views of Harvey and Jenner are universally received. Look again at Columbus, Galileo, and a thousand others; in fact, the history of every man or system that has been in advance of the age incontestably proves that scorn and obloquy are the lot of truth on its entrance into this world. So that if this argument be worth anything, it tells against the objector.

But lest any one should demur that these are not the days of Columbus, of Harvey, or of Jenner, and should be disposed to contend, or lead others to draw the conclusion, that truth hath, in these times, but to be presented to the attention of public bodies in order to ensure for it a ready reception, we will refer to the *Times* of this very day (March 5, 1852), where the objector will find, in the leader on the Inns of Court (composed of men of the highest legal position in the country), that men in all ages are essentially the same; that they are distinguished by the same hatred of innovation, and that the only difference that time has introduced, is the *means* adopted to maintain their position.

It is, of course, superfluous to say of a leader of the *Times* that it will well repay the trouble of perusal; our regret is that we have not space for introducing more than the first and last sentences of this admirable article: "Various are the means," says the writer, "by which delinquent public bodies seek to elude the unwelcome ingress of reform* * * * * Twice since then (1845) have they (the Inns of Court) projected reforms (in consequence of a parliamentary committee), and twice *shamefully abandoned* them; and now we (the *Times*) say emphatically with Lord Campbell, that the matter is for the *legislature alone*, and not for the *institutions* which have lost, amidst sloth and corruption, *the wish and even the power of self-regeneration.*"

Having drawn our illustrations of the tendency of human institutions to resist the progress of improvement from the profession of physic and the law, we shall perhaps, be only doing justice to the cause of truth by referring to the other great profession—divinity. And it fortunately happens that a pamphlet on this subject has just made its appearance; so that our evidence will be of the most recent date. The writer, who appears to be a man of prodigious powers of mind, observes: "There cannot be a heavier or more awful charge brought against the Church than this; and so extensive and so perfect in all its parts is this shameful and fearfully ruinous complication, that it is difficult to say where the work of reformation can possibly begin" (page 32.)* Again: "Every parish is a fortified place" (page 33). Again: "The clergy have been the Church's bane; merciful God! let them become the Church's hope" (page 33). Such is the testimony of a clergyman and a man of no common order of mind. And lest any one should be led to imagine from these extracts that the author's object is to disparage that Church of which he is a priest, I am bound to say that the contrary is the fact, and that he appears to be a most zealous advocate for the divine character of that institution. Indeed it would seem that his sole object in thus representing her condition, is to arouse his brethren (to whom the pamphlet is addressed) to a sense of duty and responsibility, just as the object of the *Times*, in the extracts I have given from that journal, and of Lord Campbell, whose authority they cite, is not to destroy the Inns of Court, but to reform them.

(To be continued.)

HOMŒOPATHY IN SWEDEN.

By Dr. Liedbeck, of Stockholm.

In consequence of an article in the *London Pharmaceutical Journal*, by Dr. Hamberg, of Stockholm, we have received a letter from our well-known colleague

* Spiritual Vitality. An Address to the Clergy by the Rev. R. Aitken, Incumbent of Pendeen, Cornwall, etc. London, Parker, 377, Strand, 1852.

Hosted by Google

Dr. Liedbeck, requesting the publication of the following remarks.

Dr. Hamberg, the proprietor of a chemist's shop in Stockholm, says: "The so-called homœopathic apothecaries' shops do not exist in Sweden; they are not necessary, inasmuch as homœopathy does not seem likely to become long-lived here, and will soon become an historical curiosity. It is very probable, indeed I believe it, that in Sweden, as well as in other countries, many hysterical ladies, or *malades imaginaires*, male as well as female, have perhaps derived comfort from the homœopathic sugar-plums, and from interesting conversations with the homœopathic, long-suffering physician. But Swedes in general do not like this kind of medicine; no foreign, and only one Swedish physician practises homœopathy in Stockholm, and, in the country, I believe, not a single one."

As far as the reality of homœopathy in Sweden goes, it has hitherto been rather intensive than extensive, as my contributions to the homœopathic periodicals for many years, in Germany, and of late in England,—and also my many popular works on the subject, in Swedish, as well as my translation of the "Organon," as early as 1835, bear witness. For many years homœopathy was almost entirely confined to the University of Upsala, where my lamented teacher, Professor Wallenberg, and myself, the only medical recipients of the Hahnemannian doctrine, were engaged as public teachers. It was from Professor Wahlenberg's lectures, and afterwards from the study of Hahnemann's writings, that I became a convert to homœopathy, as early as 1826; though my practice properly dates from 1832, for during the interval I was engaged in an official position as physician to the House of Correction at Langholm, and as official provincial physician of Halland. I can sincerely say that the close examination requisite for the treatment of my present patients (averaging from 300 to 400 a year) gives me more mental anxiety and labour than when I occupied my former post as allopathic practitioner, and used to see 300 cases of typhus a week, during the prevailing epidemic in Halland. During my homœopathic practice, up to the present time, on an average, 7,300 cases have been treated by me, not to mention cases of angina or toothache, with which I have had more to do than any Swedish physician who is not a professional dentist. For the first-mentioned disease I introduced, before any other of my colleagues, *Ferrum aceticum* as a remedy, in consequence of my own observations, which were afterwards confirmed by those of Rademacher, as well as from the pathogenetic effects of the medicine.

The epithet of "long suffering" which Dr. Hamberg applies to me is both right and wrong; in short, I have always through my practice been enabled to support a large family, without the assistance of any one, and that shows that homœopathy has supported me. But the Doctor is right in so far as I, more than any man, have "suffered long," to see the widely-diffused system of Hahnemann, with its superior law of healing, so greatly disregarded, and making so little progress in the land of Linnæus, who, with Gustavus Adolphus and with Ling, are surely among the world's worthies. I console myself, however, with these words of Ling—"truth is the image of the Eternal, and is incorruptible," so nearly corresponding to those of our own *Master:* "Is not truth eternal, although it has been discovered but an hour ago?" So much for Dr. Hamberg, who, I hope, will not become hysterical and hypochondriacal, when he learns that at present there are six "long-suffering" homœopathic physicians in Sweden, whose names I shall be happy to communicate in a subsequent paper, with some of their cases. As early as 1832 there were already six physicians practising homœopathy in this country; since that time, however, there have been several defections from our band, from want of moral courage, indolence, want of encouragement, etc., but affairs are somewhat more promising at present; as far as I am personally concerned, my sphere of action has been considerably enlarged since I resigned my official position at Upsala, and public attention has been attracted to the subject, in consequence of the cures which I have been enabled to perform in the capital, where persons of all ranks and occupations have been more and more interested in the matter. Among others I may mention our celebrated authoress, Frederika Bremer, more generally known abroad than any other I could mention.

In addition to former cases communicated by me to your valuable journal, allow me to add the following, which may not altogether be without interest for your readers.

Case I.

Angina faucium et Tonsillaris cured with Camphor and Digitalis.

Mrs. Roos, forty years old, rather corpulent, the mother of two children, having a weak sight, and whose con-

Hosted by Google

stitution, when I settled here (1846), was almost broken up, in consequence of a seven months' course of Hydrargyrus cum cretâ, in allopathic doses of this medicine, which had brought on greenish evacuations and copious vomitings, loss of spirits, and toothache; the teeth were discoloured, with bluish gums; there was also a fatty general deposition; for which ailments *Belladonna* 1, afforded her the greatest relief (especially for the vomitings), as well as *Oxid. Ferri*, which diminished the fat, and acted upon the muscular tissues, so as to produce greater strength and better health than she had enjoyed for years. At any accidental relapse she found very great benefit from the iron. Of late she suffered from a nervous disorder, and without consulting me had applied an empiric remedy, consisting of *Tincture of Opium* and *Valerian*; in conseq uence of which she passed a restless night, with dreams, and had a slight difficulty in swallowing. I gave her *Tincture of Iron* in the beginning of February, 1852, one drop to be taken every hour; but whether the patient during the course of the year was over-saturated with iron, or only suffered from the prevailing epidemic of sore throat, on the 10th of February the angina grew worse; the tonsils, especially the right, became blue red; the throat intensely red; considerable difficulty in swallowing; fever with *throbbing in the region of the cerebellum, isochronic with the pulse*; this symptom, the cure of which I have before mentioned in "Hygeia," xiii. p. 456, and have frequently seen, and heard of being cured by *Spirit of Camphor*, determined me first upon letting the patient inhale it, which she found refreshing, after which I gave five drops in a glass of warm water, a teaspoonful to be taken every quarter of an hour, and, in proportion to the alleviation, one every hour.

In the afternoon the fever had quite disappeared, and the throbbing headache was scarcely perceptible, with greater intervals, and, on closer examination, was found to be isochronic with that pulsation which corresponds to the expiration. I allowed the patient to sleep throughout the night without medicine; on the morning of the 11th the fever and headache had departed, the pulse becoming slow, feeble, and a little irregular. The patient felt herself weak; the sore throat worse than ever, so that during the night she could not swallow at all, in the morning only with great difficulty. The state of the pulse decided me upon employing *Digitalis*, three drops in half a tumbler of water, a teaspoonful to be taken every other hour. This removed at first the dryness in the throat, alleviated the swallowing with every teaspoonful, and gave her new strength. On the 12th she was completely restored.

Observations.—Although in this case I was induced to select *Camphor* as well as *Digitalis*, principally from the state of the pulse, and the correspondence of this symptom in harmony with the pathogenetic action of these remedies, we find, however, as regards *Digitalis*, a still greater correspondence with acute quinsy. Hahnemann (Materia Medica Pura, 2nd German edition) mentions "sore throat (sympt. 13), soreness in the fauces" (82). Hartlaub and Trinks (Reine Arzneimittellehre, vol. iii. p. 161.) "dryness in the throat." Noack and Trinks (Homœopath. Arzneimittellehre, vol. i. p. 681) mention "great dryness in the organs of deglutition" as physiological effects of this remedy; nay, Hahnemann had already cured with it swelling of the glands. Noack and Trinks (loc. cit., p. 60), Rademacher, at a later period, employed *Digitalis* externally as a generally successful remedy in diseases of the glands, viz., in affections of the mamillary, axillary, submaxillary, and parotid glands (Erfahrungs-Heillehre.)

I do not know, notwithstanding, any physician, be he allopathist, homœopath, or of the Rademacher sect, who has observed before me such a rapid cure, or who even has employed *Digitalis* as a remedy in acute amygdalitis. I had certainly some other clue in this case for the application of this remedy, inasmuch as the patient resembled her father very much, who, at the age of ninety, died of hypertrophy of the heart, with disease of the valves, etc., and during my treatment found more relief from *Tinct. Digitalis*, gutt. 3, than any other remedy, though its effects were only temporary.

Case II.

Larygneal and Pulmonary Phthisis quickly and considerably relieved by Ferrum aceticum.

Mr. Törnblom, court valet, aged forty-three, of slender stature, light hair, and born in the country, of healthy parents, had suffered for a year from spitting of blood, afterwards hoarseness, loss of voice, and night perspirations. Under other medical treatment he had used *Cod-liver Oil*, from two to twelve tablespoonfuls a day, till at last he lost his appetite, and after that he took "yellow powders," probably *Iodide of Mercury*, in large doses, so that

Hosted by Google

his breath had become very fetid, to his own annoyance as well as that of his friends. The upper part of one of the lungs yielded a dull percussion on the back; his position was stooping and round-shouldered, weakness, emaciation, sleeplessness, great difficulty of swallowing, but at present no night perspirations. Such was his state on the 5th of February, this year, when he asked my advice, as he said, quite coolly, "Nothing else or nobody else had been able to help him." I prescribed *Ferrum aceticum Rademacheri*, ʒij, one drop to be taken in the hour. The following day (Feb. 6), when I saw the patient, he met me saying that he had not passed so good a night for months, and that he never had taken such a beneficial medicine. The hoarseness was considerably diminished, the swallowing easy, and the fetid breath also diminished. "A new doctor always works a miracle!" will many a sceptic exclaim. The followers of Rademacher and certain allopaths will find the doses too small, others the remedy unfit and incorrect, according to the rules of the art. As it is a fact that most homœopaths do not use iron in such minute doses as other remedies (Dr. Rentsch, of Wismar, one of the advocates for high powers, uses still (1849) one grain of iron for a dose, see Allg. Hom. Zeit., vol. xxxviii. page 2), they will not, however, disapprove of my modification of the ounce-doses of Rademacher. If my colleagues can show me a better remedy, and a more appropriate dose, I shall be glad to adopt it, but I wish for something more than mere assertion—"that if I, for instance, had given 30, it would have succeeded quite as well, if not better." As my own experience, as well as that of others, has satisfied me that this is not the case with the iron remedies, I shall, therefore, be little induced to administer high powers of *Ferrum*, as my challenge to my colleagues to publish their experience with those powers has been still unanswered. I do not find reported any cure by high powers, or even the 30th dilution of *Ferrum*, that can be compared to those obtained by iron in substantial doses, as administered by Rademacher, Kæmpfer, Heinrichsen, Rummel, Kallenbach, myself, and others. Should relapses of bleeding from the lungs occur, many old-fashioned practitioners will say that it was in consequence of iron; but the patient who is able to swallow his food, will not so easily be convinced that the remedy which had saved him from a death of starvation was so dangerous as those who consider iron contraindicated in tuberculosis. Dr. Fleischmann, of Vienna, says that he has not yet seen any case of tuberculous affection of the lungs cured better by homœopathy than by other means. Be it so: is it not, then, our bounden duty to employ anything that alleviates when assistance is so impracticable and art so impotent, and when the hope of the patient is such a powerful engine towards restoration?

Just as I had finished writing this (13th February) I was summoned to attend the patient, who then could eat; the hoarseness had disappeared, but he complained of a difficulty in breathing. His dilated pupils decided me upon trying the leaf of *Belladonna*, to be smoked. I have often before seen emphysematsis, or asthma, tamed and subdued, as well as spitting of blood from tuberculosis at any rate palliated, by this application. I cannot tell whether the smoking of *Belladonna* will be successful in this case, but I am satisfied, from former observations in a similar case of asthma, in which the leaf of *Belladonna* had been freely used instead of tobacco (a pound of it), that no injury was suffered by the patient. Tobacco is also, according to my own proving, far more irritating than *Belladonna*, which, though it burns the tongue more, does not appear to affect the body so much.

(To be continued.)

THE
HOMŒOPATHIC TIMES.

SATURDAY, MARCH 27TH, 1852.

Now that there is a lull in the storm of persecution to which homœopathy was lately subjected—now that the weekly organs of our allopathic brethren are silent concerning us, and we are left for awhile to repose—now that the "Pharmacy Bill," which was designed to give such large powers to the Pharmaceutical Society, from which some saw a designed impediment, in the way of legal enactment, to the practice and progress of homœopathy, has been, if not virtually shelved, sent into committee under strong opposition, from whence it is likely to come forth wonderfully modified—it behoves the friends of our Cause to take time by the forelock, and use the opportunities they have.

In our last number we alluded, as we

Hosted by Google

have so often done, to the desirableness of having for the present only *one* large and effective *Hospital*, wherein scope would be allowed for ample observation of homœopathic practice in all the various diseases and accidents to which mortal flesh is heir.

We are satisfied that such an Hospital would be a great blessing to us all, and a school of experience to medical inquirers, who would no longer feel it necessary to resort to foreign shores.

As a matter of course, statistics emanating from such an Hospital would more impressively arrest attention, and, above all, such an Institution would put an end to unhappy dissensions, about which the real homœopathic public care not one straw. The majority, we believe, only wish to see the funds subscribed by them applied to useful and beneficent purposes.

We have no desire to offend the class-views of any individual or individuals, but we think, as public journalists, we have a right to offer our opinion, the more particularly as we are practically too well acquainted with the painful fact—painful as a hindrance to our auspicious progress—that numerous individuals have not only suspended, but temporarily withdrawn their subscriptions, until they can see and be assured of something like a settled union.

We believe a favourable crisis has now arrived for a permanent settlement of affairs. We do not ask for the amalgamation of the profession in the metropolis, for however much to be desired, *that*, we are painfully convinced, will *never* come to pass, nor is it desirable, from our experience, that there should be any such thing, while the rank partisanship prevails in a body *without*, sufficiently powerful to intrude *class interest*, and who have the bad taste not to see that their idol worship cannot and will not be tolerated. We are bound to speak out. These are the individuals who, in the ardour of all their seeming philanthropic enthusiasm, are the real hindrance to our Cause, and to our progress and union—a *blight* that is more to be dreaded and shunned than the most flagrant allopathic nepotism.

We again say, the public—yes, *the real homœopathic public*—who wish to see such an Hospital as we and they desire, and as we have always advocated, have now a favourable opportunity for an *amalgamation of subscribers*.

We feel strongly on this question, and although there may be some minor points in the constitution of one establishment requiring modification at the next general meeting of its subscribers, we are morally certain, if its executive will look to this, and the question ot a large Hospital, the latter object may *now* be accomplished, without the *amour propre* of the subscribers on either side being in the least compromised.

We have not recently been informed how the Manchester Hospital fares; nor do we know what is the prospect of a homœopathic hospital being instituted at Edinburgh this year. The establishment of such an institution in that ancient city and time-honoured school of medicine would be an epoch in the history of homœopathy; but to effect this, the public require to be appealed to, and should largely contribute.

The proceedings during next month cannot fail to have important results in the way of a triumphant progress, should our hints be listened to, for our doctrine and practice. If there be a check, it can only be temporary, but still we should do better without it; and it would be more satisfactory to announce the triumph than to have to submit to the check. It remains to be seen what will be done, and what left undone.

In Mr. Harrild's beautiful almanac for the current year, we find it announced for the 10th April, Hahnemann (homœopathist) born, 1755—nearly a century since! On the 10th April, 1855, there should be a Hahnemann Jubilee in every country that has received the blessings of his teaching. It behoves those of us in this country who call ourselves his disciples, so to use the interval,—life, strength, and opportunities granted to us,—as to make our British Jubilee worthy of the memory of the enlightened medical philosopher Samuel Hahnemann.

Hosted by Google

THE HAHNEMANN HOSPITAL.

THE Annual Meeting of this Hospital will be held on the 2nd of April next. As some very important events have occurred since the last general meeting, it is hoped that there will be a very numerous attendance of subscribers.

Some of the members of the Board of Management have addressed a circular to the governors and subscribers, in which they state their intention to propose the following Resolution, in reference to the appointment of clinical lecturers with *that title.*

RESOLUTION—"That the formal appointment of Clinical Lecturers by the Board of Management be not confirmed, but that, in accordance with the written opinions of the majority of the Medical Council, clinical instruction and lectures be given by the physicians and surgeons of the Hospital, without title of any sort."

It is clear that all those who take any real interest in public homœopathic institutions, and who have heretofore supported this Hospital, should, either in person or by proxy, give a distinct answer to the circular we have alluded to. From our advertising columns it will be seen that, before the General Meeting on the 2nd April, a pamphlet will appear, etc., setting forth the facts of the case: it may be obtained of any homœopathic publisher or chemist.

In our last week's number, and in our first leader of this week, we have urged the desirableness of the *amalgamation of the subscribers* of the two metropolitan hospitals. This is a "consummation devoutly to be wished."

Obituary.

WE regret to announce the death of Charles Thorold Wood, Esq., which took place on the 13th of March, at Campsall Hall, near Doncaster. He was in his 76th year. Mr. Wood was one of the earliest and most steadfast lay supporters of homœopathy in this country. During his fatal illness, which lasted three weeks, he more than once expressed a wish for his recovery, chiefly because he considered that this would add another triumph to the annals of homœopathy. Although medicine failed in curing the disease, it promptly and certainly mitigated the sufferings of the invalid. Mr. Wood was deeply interested in the success of this Journal, and in all matters relative to the great medical reform. To the last he delighted in conversing respecting the history and prospects of homœopathy. Throughout his fatal illness he was attended by Dr. Dunn, of Doncaster, and by his son, Dr. Neville Wood, of London. Dr. Quin was likewise summoned from London during the course of the malady.

The deceased is interred in the family vault, in the church at Thoresby, near Alford, Lincolnshire. His remains were followed to the grave by his surviving relatives, and by all the tenants upon his estate at Thoresby.

CASES.

CHRONIC GASTRITIS.

January 7th, 1852. M. A— a cook, æt. 23; has complained for some months of a smarting pain in the left hypochondrium, and under the left breast, aggravated by eating, and worse on pressure; fanciful appetite, and confined bowels; menses quite regular. She had taken *Bryonia* and *Sulphur*, with relief of these symptoms. On the evening of the 6th she was seized with a violent fit of vomiting while at work: she fell down insensible, bringing up a large quantity of black fluid, composed of dark blood, mixed with the secretion of the stomach, and undigested food; she soon recovered her senses, but felt very ill after the attack, complaining of very distressing, burning, smarting pain in the stomach, with tenderness on pressure; much pain under the breast, and great tightness of the chest, together with a continual dry cough, which aggravates all her pains; constant thirst; foul taste in the mouth; tongue coated with a thick yellow fur; complete loss of appetite; no fever; spirits very low; great debility, so that she was obliged to keep her bed.

℞ T. Bryonia 3, ♏ j.
Nux, ʒj. M. t. d. s.

8th. Under this remedy the violence of the cough abated, but otherwise no amendment has taken place. She had a very restless night, complaining much of frightful dreams, and fancying that things were in bed with her; feels much pain in the back and in the limbs, with frontal headache; took a dessert-spoonful of *Castor Oil* this morning, which brought away a black motion, composed evidently of blood, like that which she had vomited; throat feels full and uncomfortable.

T. Bellad. 3, ♏ss, to be alternated with
T. Bryonia 3, ♏ss, every three hours.

9th. No better; throat very uncomfortable, with a sensation as if a piece of meat lay in it; it is sensitive to pressure, which causes a tendency to choke; great aversion to food; cough much better; the pain in the stomach remains the same.

℞ T. Lachesis 5, ♏ss.
Aquæ, ʒj. t. d. s.

10th. No better; the menses have appeared to-day.

℞ T. Arsenic. 3, ♏ j. t. d. s.

11th. Somewhat better; is more cheerful, and

Hosted by Google

desirous of sitting up; bowels costive. Continue *Arsenic.*

12th. Decidedly better; tongue cleaner; the burning pain in the stomach is much relieved, and it is not so tender to pressure; bowels moved twice to-day, but little passed; the dreams at night still continue very unpleasant. Continue the *Arsenic.*

12th. Better in all respects; can get about a little; tongue much cleaner; appetite returned; thirst much diminished; the pain in the stomach is liable to be aggravated by any exertion; cough nearly gone. Continue *Arsenic.*

She continued to improve during the 14th and 15th; *Kali bichromicum* 3, globules ij, were then ordered twice a day.

17th. Not much difference; *Natrum muriaticum* 3, gr. ss. b. d.

On the 19th she was better in all respects, and on the 21st so much improved that she was able to bear a long journey home.

The burning pain in the stomach, the capricious appetite, and the vomiting of blood are characteristic symptoms of chronic inflammation of the stomach; in such cases the mischief is often confined to a small portion of the mucous membrane, and if it be not checked in time, it is apt to terminate in ulceration and perforation. In this and in some other cases of the same kind which have come under my care, *Arsenic* has seemed to be of great service in relieving the pain, checking the sickness, and appearing to restore the integrity of the organ. In chronic enteritis, asthenic dysentery, and several other affections of the alimentary canal, it is also of the greatest service. The following case is illustrative of its use in such affections.

January 25th. W. T—, æt. 8, a delicate scrofulous boy; has been out of health for eight months, and for the last two months has been purged as many as twenty times every day. The usual allopathic remedies have been tried without the slightest relief. He is extremely emaciated, and very pale; the abdomen is hard and rather enlarged, and he complains of pain in it, low down in the right iliac region, worse on pressure, and sometimes so violent as to force him to scream out; his appetite is very bad, and after eating he feels much pain across the epigastrium; great thirst; tongue dry, fiery red, with the papillæ raised at the tip; coated at the side and back with a thick yellowish fur; breath offensive; the passage of the fœces does not occasion him much pain; they are only passed during the day; are watery, of various colours, often containing streaks of blood and undigested food; occasionally he feels sick, but he does not vomit; sleep restless, with much screaming, and grating of the teeth; he feels sometimes much pain in the right leg, and has a tendency to limp on that side; spirits very depressed; he feels exceedingly weak and low; pulse 120, sharp and small.

℞ T. Arsenic. 3, ♏ j.
Aquæ ʒj. t. d. s.

26th. Since beginning the *Arsenic*, has had only one motion, which was more solid; ate a little better to-day, and looks more cheerful. Continue *Arsenic.*

27th. Has had motions this morning, which were pale and liquid; pain in the abdomen not quite so acute; thirst less; appetite better; slept much better; pulse 105; tongue continues much the same. Continue *Arsenic.*

28th. Bowels not moved at all since yesterday; in all respects better. Continue *Arsenic.*

29th. Bowels moved only once yesterday, not at all to-day. Continue *Arsenic*, only once a day.

31st. Bowels not moved since the 28th; complains very seldom of the pain in the right side; appetite better, though fastidious; no thirst; more cheerful; and more inclined for exertion; pulse 105; tongue beginning to lose the vivid red colour. Omit *Arsenic.*

℞ Sulph. 6, ʒij. b. d.

After this the treatment consisted chiefly in the administration of *Sulphur* and *Calcarea.* The state of the bowels continued most satisfactory, and no return to the *Arsenic* was called for. With a view to making him more fat, the use of *Cod liver Oil* was resorted too; but it excited so much loathing, that it was soon given up. He is still taking *Calearea* three times a week; his general health is very much improved, and he is recovering his flesh and strength.

ACUTE BRONCHITIS.

January 10th. M. T—, æt. 7; has been poorly some time, and since yesterday suffering from the following symptoms: violent fever, with general uneasiness in the limbs, and unwillingness to move; much cough, causing pain and soreness of the chest; sputa white and frothy, and tinged with blood; pulse 130; tongue foul, with thick white fur; breath offensive; skin hot and dry.

℞ T. Aconit. 3, 4tis horis.

11th. Much wandering during the night, with restless sleep; bowels moved twice; fœces yellowish and slimy; pulse 129, sharp; cough very distressing; tongue furred, white; sibilus and large crepitation over the chest; face flushed; no appetite; not so much pain in the back and limbs.

Alternate *T. Aconite* 3, and *T. Bryonia* 3, every two hours.

12th. Very much better in all respects; pulse 120, much softer; cough not quite so violent; sputa no longer tinged with blood; the sibilus is giving place to rhonchus over the chest; able to get out of bed. Continue *Bryonia*, t. d.

13. Cough nearly well; general health also improved.

℞ T. Sulph. 3. ♏ j.
Aquæ 3, ʒvj. t. d.

She got quite well soon after beginning this.

NARRATIVE OF THE INTRODUCTION OF HOMŒOPATHY INTO ENGLAND.

By F. J. Smith.

(*Continued from page* 508.)

Fruitfully suggestive as is the train of thought we have been following, let it be remembered that it all flows from the consideration of *one* single factin evidence, out of *six* that we have extracted; and that the selection has been made from a perfect El Dorado of medical statistics. We will now endeavour, very briefly, to exhibit some of the consequences resulting from the other five points.

First, then, the average mortality has been shown to be in allopathic hospitals 12 per cent.; in homœopathic hospitals not quite 6 per cent. Excluding from our consideration those who die of pure old age (and alas! how small is that number), and confining our attention to those who die annually of *disease*, if we now bring to bear the comparative mortality table just quoted, we shall see that the lives of more than one-half of this number might be lengthened indefinitely were homœopathy universally practised. And who shall adequately realize this idea? widows and widowers, bereaved parents and helpless orphans, all—and this it is that gives intensity to the thought—all unnecessarily so!—come crowding on the mind, till imagination sickens at the sight of woe.

But before we draw a veil over the heart-rending picture, we must beg the reader to bear with us while we glance for a single moment at one other comparative table of mortality. Allopathy, as we have seen, loses, in the treatment of cholera, 53 per cent., homœopathy only 8¾ per cent. Here is a disease, which, while it selects its victims chiefly from amongst the working-classes, strikes terror into almost every breast when it visits a country, on account of its fatal results under the general system—that is, the allopathic mode of treatment. Sparing neither age nor sex, it hurries its victim into another world all unprepared, too often with no provision made for his dependants, and it affords him no time to make any.

There is scarcely a parish in Great Britain that is not at this moment feeling, in a pecuniary sense, the consequences of the last visitation of this fatal disease, from the widows and orphans it has had, and still has, to provide for. But what is this pecuniary consideration compared with the consequences to these bereaved ones? And could these poor sufferers be made sensible that out of every 106 of the dead 88 might still be alive, what language could express their sentiments? With what feelings would they regard those whom Providence, in placing above them, designed to be their exemplars and instructors, and who, by reason of their superior education and more abundant leisure, are without excuse for not having devoted both these gifts to an investigation into the merits of the rival medical systems we have been considering; and have thus been the means of extending the blessings of homœopathy throughout the length and breadth of the land, and of averting from 88 out of every 106 of the families, whose protectors fell victims to cholera, the crushing calamity under which they now groan?

It has been with no feeling save one of deepest concern, that we have traced out some of the practical results of the statistics we have quoted. The subject is, no doubt, intensely distressing; but that is not philanthropy—it is but a mawkish sentimentality—that cannot endure the sight of truth—how gloomy or revolting soever may be its appearance. Nay, it is from the contemplation of woe in its most helpless and harrowing condition, that true philanthropy learns her profoundest lessons, and acquires the moral power to perform her noblest achievements. Let no one, then, having the slightest pretension to philanthropy refuse to cherish the remembrance of the facts and their results which we have thus laid before him. They should be dwelt upon; every homœopathist should make them known to the utmost limits of the circle of his acquaintance, and every effort should be put forth for extending the blessings of such a life-saving system!

With a sensation of exquisite relief, we

Hosted by Google

now turn to a consideration of the two remaining statistical tables we have brought under notice. From the first we learn "that the average duration of cases allopathically treated is twenty-nine days, that of those homœopathically treated only twenty-one days;" by the second we find "that the expense for every patient amounts to twenty-two kreutzers per day, in homœopathic hospitals; in allopathic hospitals to fifty-two and a half kreutzers." Here we have statistics pregnant with hope and happiness for our poor fellow-creatures. The allopathic hospitals have but to change their system to homœopathy, and for every 21,000 patients they receive, they can accommodate 29,000! so far as relates to space; and as to expense, for every 29,000 now relieved they could relieve 68,545!! Anything in the shape of a comment on such a calculation would be but to weaken its effect.

Our extracts and the reasoning upon them have extended to so great a length, that it may be well just briefly to recapitulate what has been advanced. We have, then, proved by the evidence of allopathic practitioners, that their system "was founded in conjecture," and has no pretension to the name of a scienec ; and that mortality would be less if allopathy did not exist, and patients were left to the *vis medicatrix naturæ*, or, if we may be permitted the privilege of coining a term—to phusipathy.

We have seen from the writings of eminent allopathists, that not only did they teach the necessity of examining into homœopathy, but actually practised what they taught; while one employed the system in his private practice, and two—who, alas! were cut off in the midst of their experiments—introduced it into their hospitals.

We have also shown—by official returns—that the average mortality under homœopathy is more than 50 per cent. less than under allopathy; while, in the case of cholera, out of every 106 persons who have been carried off by that frightful scourge, 88 might have been saved!

On the rapidity of convalescence under homœopathy, arising from the fact that no depleting measures are used, and, therefore, that, the disease being conquered, the patient has nothing to do but to get well; whereas under allopathy, the patient has to recover from the combined effects of the disease and the remedies employed, —on the tendency of allopathy to convert acute disease into some incurable chronic affection—on the tendency of the allopathic system to produce medicinal disease—on the almost unfailing success of homœopathy in scarlet fever, so frequently fatal in allopathy—on the use in homœopathy of a prophylactic in this alarming malady, so that when it enters a family, the other members may be effectually preserved from attack, and the absence of any such preservative in allopathy—on these and many more topics of great interest we do not enlarge. Evidence on these points abounds; but as we have, for the sake of brevity, forborne to introduce it, it is scarcely fair to make such topics subjects of disquisition.

Enough however, has, we trust, been advanced in the way of fact and argument, to demonstrate the moral obligation under which the community is placed, of investigating the evidence on which homœopathy is founded. We will now, therefore, select three classes, on which, as we think, this obligation in a special manner rests, and address a few words to each.

To the statesman we would say—you devote much time and energy to the study of Adam Smith, Burke, and McCulloch; because these writers address themselves to subjects connected with the wealth of nations and the progress of society—in homœopathy you have a system which professes—and the profession is supported by unimpeachable authority—to be capable of adding negatively, if not positively, to the wealth of this country, and to its moral and intellectual advancement. You spend weeks, if not months, every year in debating how a million pounds sterling may be saved to the country, by this measure or by that.—Here is a system which professes to be capable of saving the country £1,034,483 per annum. You appoint your sanitary commissioners to inquire how mortality may be diminished by a fraction.—Here is a system that professes to be capable of reducing mortality by one-half. You have your advocates for this and that measure of Poor-law Reform, that so the burden of supporting the unfortunate may be diminished.—Here is a system professing to be capable of saving the country from the *cause* which throws on your unions for support, numberless widows and orphans prematurely such. The Hungarian Diet listened to homœopathic evidence, and, with a far less amount of fact and argument, was moved to the establishing, at the expense of the Government, of a chair and hospital on the homœopathic principle. Will British senators turn a deaf ear to our appeal, and refuse to *investigate?* All we ask is that you will *investigate.* Let every statesman do *this,* and then carry into practical operation the

Hosted by Google

lessons he has learnt, just as he would carry into practical operation the truths imbibed from the study of the political writers we have named, and we ask no more. The statesman of the present day cannot commit his memory to posterity in sure and certain hope of an honoured reception hereafter, if he have done less.

We come now to the minister of religion and the philanthropist.—The observations we have addressed to statesmen apply with tenfold force to you! *You* profess to be actuated by higher than mere earthly considerations—you profess to have taken under your special care the social, moral, and spiritual condition of the poorer classes, who have neither the time, the education, nor the opportunity to investigate such subjects for themselves—you profess to have traced out an intimate connection between sickness and crime* amongst the lower orders.—Here is a system which professes to be capable of diminishing the days of sickness by one-third, and mortality by one-half. It is an act of impiety—nothing less—in you to neglect to investigate the evidence on which such a system rests.

Parents of England—if the observations addressed to statesmen, ministers of religion, and philanthropists, backed by the earnest, though unexpressed, solicitations of your dependent offspring, animate you not to the task of at once investigating this subject, we have no arguments for you. *You* must be left to your own remorse, when the truth shall force itself upon you—that days of anguish might have been spared your children, and that one *who is not*, might have been seated by your side.

The homœopathic system of healing for which I have thus bespoken an impartial investigation, on the ground that it is supported by *à priori* and *à posteriori* argument of the most cogent character, was promulgated by the illustrious Hahnemann in the year 1796.

Comparatively brief as has been its existence, and requiring, as it has done, on the part of its student an unbiassed mind, willingness to acknowledge himself to have been in error, and readiness at all hazards to embrace the truth; opposed as it is to vested rights, professional prejudice, and party associations; and vilified as it has been—the common lot of truth—by place and power trembling for existence, it nevertheless numbers, as we have seen, at the present time, nearly 5000 practitioners, including men of the highest professional rank and attainments.

If its future career is to be gathered from its past history, and the impetus it has already acquired is to be taken as any criterion of the destiny that awaits it, and if, above all, it be true—"Magna est veritas et prævalebit"— then will homœopathy overspread every land and diffuse its blessings through every family.

And if such is to be its lofty destiny, the history of its introduction into England will one day have to be written. Whether homœopathy has assumed sufficient importance in this country to warrant such an undertaking at the present moment, it concerns me not now to inquire. But of this I am fully persuaded, that—

> "If it be now, 'tis not to come;
> If it be not to come, it will be now;
> If it be not now, yet it will come;
> The *readiness* is all."

And with a view to this "readiness," I propose now to give a brief outline of the introduction of homœopathy into England, from authentic documents. With no such ambitious design, then, as that of writing a history, but in the unpretending character of a simple collector of facts, claiming no greater merit than fidelity, and no lesser than a love of truth, I venture to submit to the homœopathic world a narrative of the circumstances which led to the introduction of this science into England.

(*To be continued.*)

* Lord Shaftesbury, on the 13th of July, 1849, declared it to be his "opinion that ninety-nine cases of crime out of every hundred were the result of want of employment." The connection between sickness and loss of employment is too obvious to require remark.

Lest it should be said that this statement is the result solely of English experience, we will quote from an able pamphlet, by William Gladstone, Esq., the philanthropist, entitled "Report of the Special Committee appointed by the National Assembly of France, to consider the Treatment of Juvenile Offenders." At page 12 we have this most touching announcement. "What is in general the class of these unprotected children? For the most part, they are creatures destitute of any domestic education." It is perfectly obvious that, *cæteris paribus*, in the ratio of sickness must be diminished means; and in the ratio of diminished means, diminished education. This pamphlet should be studied by every one interested in the state of our criminals.

HOMŒOPATHY IN SWEDEN.

By Dr. Liedbeck, of Stockholm.

(*Continued from page* 511.)

As regards the doctrine of doses and its relation to different persons, and the liberty in research necessary in this respect, irrespective of the dogma of infinitesimal doses, and still less of the stereotyped allopathic prescriptions, I do not know for our practice a more instructive case than the following.

Two ladies (H—m), sisters, having married two brothers, consulted me on the 15th December, 1851, against a long-standing and distressing headache. They have

Hosted by Google

both blue eyes and dark hair, somewhat resembling each other, however the one more like her father, the other like her mother. The parents had also suffered from headaches, and one of their brothers labours also under this complaint; symptoms the same as in both the sisters, viz., pain across the vertex, with a shivering sensation, lancinations, and vertigo, especially when stooping; these symptoms are aggravated by eating. I give here an outline of the cases of the two ladies for comparison.

No. 1, aged twenty-one, with dilated pupils, not disposed to shed tears.	No. 2, aged twenty-eight, small and contracted pupils; disposed to shed tears.
No child, after four years' marriage.	Mother to a boy during the first year of her marriage.
High-coloured face, already as a girl, more than her sister.	*Pale;* the period, which formerly continued only for a couple of days, lasts after that time, five or six days.
The headache increased during the periods.	The same.
Headache already as a child.	The same.
Leucorrhœa occurred later than the headache.	No leucorrhœa since the patient became a mother.
No cough.	Dry cough, but the lungs otherwise healthy.
Headache, accompanied with a tension in the eyes; the sight is, however, good; the eyes clear and lively.	Makes use of *spectacles* for *weak* sight; the eyes look dull.
Sensation as if there was a block in the head; likes more *warmth* when the headache occurs.	Pressure over the head, sometimes *clavus;* will have *cold* applications on the head when it aches.
The menses rather diminished since the leucorrhœa begun, though not in a considerable degree.	Has lost a great deal of *blood* whilst in accouchement, after which her headache grew worse; night-perspirations.

It appeared to me in Case No 1 most important to get rid of the leucorrhœa. I effected this by a remedy already recommended by Linnæus (Materia Medica, p. 28, edit. Schœbii), viz., *Ossa Sepiæ*, with the addition of *Sacch. Lactis*, aa ʒj, one teaspoonful morning and evening (Hygeia, vol. xi. p. 54). The headache continued, however, and was increased through an occasional sprain in the back in January, 1852, which yielded within forty-eight hours to a single dose of *Rhus* 3. The remaining headache appeared to me to ndicate *Ignatia.*

According to Noack and Trinks (Homœop. Arzneimittellehre 1843, p. 832), "the inhabitants of the Philippine Islands wear the *Ignatia* as an amulet for all diseases," a fact, which though made known by Murray in the last century, I did not know myself until 1844, when in Munich, where I heard our colleague Dr. Buchner mention that the amulet had been found to be of service, when *Ignatia* taken internally had failed. Since this time I have rather employed *Ignatia* as an amulet, where this remedy has appeared to be indicated, instead of the usual mode of administering it; and I bored a hole in the bean itself, and suspended it by a silk riband at the pit of the stomach. The patient continued well from the 29th January, 1852; but on an attempt to remove the bean, the headache reappeared the following day, and was not relieved until the bean was replaced. She wears it now, and continues well. This is only one of the many cases in my practice in which wearing this amulet has proved successful.

In the Case No. 2, I thought it important to substitute the iron which the system had lost through bleeding, and also to employ iron for its positive effects and its empirically known assistance in cases where blood has been lost. However, she found no relief either from *Ferrum carbonicum*, ʒj nor from *Ferrum phosphoricum*, ʒj, one pinch to be taken three times a day. The night-perspirations did not diminish at all in this case, although the iron appeared to me as essential in her case as *Sepia* and *Ignatia* in her sister's. I gave *Ignatia* 3, without any success. The patient at last requested that she might use the *Ignatia*-amulet, to which I acceded; but she found herself attacked with increased night-perspirations and headaches. I therefore removed it, 29th January, 1852. I gave her *Ignatia* 22, three globules, to be taken night and morning. As she became better in consequence, I tried repeated doses in the middle of the day, but she found herself at that time always heavy and sleepy, and on attempting to give the medicine every morning and evening, I found it was best to administer it only in the evening, as otherwise she became tired and sleepy the whole day.

25th February. She also was perfectly cured by *Ignatia* 22.

Observations.—It is evident that *Ignatia* was in both cases the principal remedy, though the dose was as essential for success. No. 1 was ameliorated and cured only by wearing the amulet. The symptoms of No. 2 became aggravated by the amulet and

Hosted by Google

Ignatia 3, but the 22nd dilution of the remedy effected a cure. It may be easy to say that No. 1 would also have been cured with *Ignatia* 22. But how can one know it? It is enough for me, at present, that the amulet cured No. 1, but not her sister, who, more deepy affected, and with a greater sensitiveness, required a higher dilution. How to find the just dose in every individual case is therefore one of the great difficulties of the reformed medicine. I do not think that the masters of the high powers has a greater knowledge in this respect than the heroes of allopathy, with their traditional grain-doses or their fragments. For these it is the easiest to declare both the amulet of the popular medicine and the homœopathic application of *Ignatia* as nothing but "imagination, charlatanism, quackery," etc., because their grains' quantity has not been used (*habeant sibi!*), or perhaps the headache (of Dr. Hamberg) is considered "imagination," because the diagnosis cannot be proved by physical signs; but as no motive existed for a *feigned disorder* in these two cases, I think myself justified in believing in the reality of the symptoms, as they were stated by the patients, at least till the contrary has been fully proved.

The indifferentists, as well as our antagonists, will at last pretend that the diet effected the cure. Well, then, their fault is so much the greater in not having adopted such a diet for their patients, or made an attempt to get it more followed amongst men in general.

I add only a few words on *Sepia* as a remedy in leucorrhœa. There are a great many cases which are cured by the remedy, and at the same time amenorrhœa. C. Linnæus (Materia Medica) makes a distinction of "*vis*;" absorbens, adstringens, from "*usus*:" gonorrhœa, fluor albus, febris intermittens of *Ossa Sepiæ*. It appears certain that *Sepia*, with its action of chalk, unites something more, which is pretended to have induced Hahnemann to the proving of *Succus Sepiæ*. Dr. Schlesier (Hygeia, xi. 1. c.) has practically found, and I have also confirmed the effect of *Sepia* in cases of leucorrhœa, and though I cannot recommend it as a general remedy, it has proved very active in many cases of this often very troublesome symptom in women. The only thing to wish for is, that this remedy had been so proved as Hahnemann's *Calcarea*, and afterwards reproved; as for instance, *Natr. mur.*, in the Austrian Periodical, iv.; then we could expect to know in future something more decided about the specific action of various species of calcareous substances, either the pure and unmixed chemical, or those from the animal kingdom (*Sepia, Testa Ostrearum, Lapillæ Cancrorum*, eggshells, lobster-shells, etc.), or from the mineral kingdom (marble, chalk, etc.) I think that until these provings have taken place, the pure empiricism (which is not needful) and homœopathy have a large field of action. Because I do not consider myself justified, should I not employ the rich sources of chalk where I find it, in a physiological point of view, necessary as well as iron, even in large doses. For it is not always a question of reproduction and reaction only, but a real *production* and *action* of these substances in the organism.

[We beg to correct a mistake, as regards Dr. Hamberg, in our last Number, who, we have been told, has not for the last four years had any chemist's shop in Stockholm, but is at present Assistant Professor of Pharmacy to the Royal Caroline Institution, and to the Pharmaceutical Institution of Stockholm.—ED.]

THE DISEASES OF CHILDREN.

By Dr. Frederick Augustus Günther.

Part I.—the physical training of the child.

Section I.—first period of infancy.

The Suckling.

Upon an appropriate physical training of the infant in the first twelvemonth of its existence depend in a great measure the health and strength of the man or woman in after-life, and yet there is hardly another subject so imperfectly and ill understood as this most important one. Thousands of infants fall victims to a lamentable ignorance on the part of mothers and nurses of even the plainest and most elementary rules of hygiene; thousands of unfortunate valetudinarians are doomed to drag along with them through life the results and consequence of an unhappy disregard of these rules, or perchance also of the application of some irrational and pernicious system of physical training. On the other hand, it is an equally well-established fact, that a proper and judicious tending and nursing of the first period of infancy will, in many cases, suffice to modify considerably, if not altogether to cure and eradicate, disorders and morbid affections that the child has actually brought with it into the world, owing, in most instances, to a diseased condition of one or both parents.

I think, therefore, a few plain and intel-

Hosted by Google

ligible instructions and hints on a proper mode of physical training of infants and children will not prove unacceptable to mothers and to those intrusted with the care of the nursery.

First and foremost we have—

1. *The Skin.*—The skin is that organ through the medium of which most of the relations of the body with the outer world are conducted; it receives the most important elements of life (caloric, etc.), and conducts them to the other parts of the organismus; it separates and eliminates through its surface, in the form of cutaneous exhalation, those matters which are no longer adapted to aid and maintain the operations of life. The importance of the latter function (cutaneous exhalation) may be readily gathered from the known consequences of a sudden cold striking a body in a state of perspiration.

Now the matter continually eliminated by the skin is always a little sticky, and of a nature to stop up the pores of that organ, if from inattention to the rules of cleanliness it is permitted to remain and dry upon the surface of the skin; and when the cutaneous pores are thus obstructed, a serious obstacle is, of course, offered to the elimination of those matters which, though not positively hurtful, are yet, as already stated, no longer adapted for the purposes and operations of life, and require accordingly to be ejected from the organism. It is, then, plainly of the utmost consequence to provide at all periods of life for the uninterrupted performance of this most important function; but its importance is even considerably enhanced in the case of infants. The skin of the new-born child differs greatly from that of an adult: it is much looser and much more delicate, and less apt to resist surrounding influences, to which it is moreover still much more exposed than the latter; not only does it absorb fluids with which it happens to come into contact much more readily than is the case with adults, but it ejects also from the body a vastly larger amount of eliminated matter, and more particularly of mucus, which latter, in cases when proper attention is not paid to cleanliness, accumulates often to a considerable amount, interfering most materially and seriously with the functions of the skin, to the great detriment of the tender and fragile organismus of the child. The experience of every day furnishes us with ample proofs of the truth of the preceding remarks. How well do children thrive that have a proper care bestowed upon their skin and its functions! how vigorous is the development of their physical and mental power and capacities! how little are they troubled with catarrhs, rheumatisms, and the vast host of cutaneous diseases that usually fall to the lot of those whose parents are eithernot mindful oftheir sacred duties or obstinately reject the light of truth, and cling to some foolish system of their own!

The two principal means to which we resort for the purpose of maintaining and preserving intact and in full vigour the functions of the infantile skin are, the *bath* and the *ablution.*

River-water or rain-water is the most appropriate fluid for the children's bath. As the process of boiling deprives water of the most vivifying and invigorating of its principles, the best way is to boil only a portion of the water, and to mix this with fresh cold water until the required temperature is attained. The temperature of the *first* bath, into which the baby ought to be placed immediately after its birth, should be such that one can bear to hold the elbow in it for some time without feeling any disagreeable sensation. This first bath serves at the same time to cleanse the skin of the caseous coating that covers it, for the readier attainment of which purpose a small amount of wheat bran should be added to the bath, but *no soap*, since this would but ill comport with the tender skin of the new-born infant. Immediately upon its removal from the bath, the child must be placed in warmed linen cloths, tenderly wiped dry with the same, and then cleanly dressed, and put to bed. A bath of this description the child ought to have every day during the first year of its existence, and afterwards two or three times a week. After a time, however, generally two or three weeks after birth, the *temperature* of the bath may be gradually reduced: at the end of the first year of life, it need exceed only by a little that of the room; and at a later period still the bath may be administered quite cold. But care should always be taken to let the reduction proceed as slowly and gradually as possible.

The tub should be of an oblong shape, and of sufficient capacity for the purpose for which it is intended. The water should reach to the breast of the child. The child is to be placed (without a single shred of clothing) in the bath in a half-sitting, half-lying position, and no part of the body, except the head, must be permitted to project over the surface of the water; since the naked skin exposed to the influence of the surrounding colder atmosphere is but too liable to catch cold. During the immersion the whole body of the babe should be carefully and gently rubbed with a nice soft sponge, this in-

Hosted by Google

creases the activity of the skin, and is thus of the greatest benefit to the health of the child. *The head also ought to be washed like the rest,* no matter whether it is covered with the so-called *scab.* The notion entertained by many people that the existence of this scab is most intimately connected with the health and well-being of the child is assuredly one of the most foolish and mischievous. Whenever a child is found to be affected with the scab, the mother or nurse ought at once to soften the crust with oil of sweet almonds, or with unsalted butter, and to remove the softened crust by means of a soft comb, and in a tender and cautious manner, so as not to hurt or injure the child.

After the bath the babe must always be wiped dry, with warmed linen cloths, as expeditiously as possible; it should then be wrapped up in warmed clothes, and its little head covered with a light cap, thus attired it is placed in its little bed, which also ought to be moderately warmed; then it will speedily fall asleep, and enjoy a truly refreshing slumber, accompanied by moderate perspiration.

The following precautionary rules ought never to be lost sight of in the bathing of infants.

1. The bath should always be administered in the nursery, when every precaution should be taken to avoid all draught of air; in winter the nursery should, of course, be moderately heated.

2. The child must never be put into the bath immediately after its awakening from sleep, nor during digestion; ten o'clock in the forenoon is usually the best time for the bath.

3. During the first three or four weeks of life, the babe must be kept in the bath ten minutes only; afterwards the time may be gradually increased to fifteen or, at a later period, even to eighteen or twenty minutes.

Ablutions, although unquestionably also of great benefit to children, must still be looked upon as a very imperfect substitute for the bath. Yet *local* ablutions must often be had recourse to in the case of infants, for the purpose of securing cleanliness; and *general ablutions* in the case of bigger children, who are no longer put into the bath every day.

The danger of the child catching cold is always greater in the operation of washing it than it is in bathing it, since in the former, only one part of the body after the other is exposed to the influence and action of the water.

The precautionary rules to be observed in the washing of children are the same as those just now given for the proper administration of the bath. We may, however, remark, in addition, that the contact of the water with the skin should not be unduly prolonged; two or three downward rubs with the wet sponge ought to suffice, and the washed part should always at once be wiped dry. During the first two or three weeks of the existence of the baby, the water used for washing it should be lukewarm; it may afterwards be used cooler and cooler every succeeding day, so that at last, by the end of the sixth or eighth week, it is brought down to the common temperature.

Hufeland wrote in 1799, on the advantage of cold ablutions, as follows.

"It is incredible of what extraordinary effect and influence this simple practice is. It keeps up cleanliness, hardens imperceptibly the surface, and makes it insensible; strengthens the whole nervous system and the muscular fibre, and lays the first foundation for a sound and active skin—that important organ in the animal economy of which the habitual neglect forms one of the principal and most prolific sources of the many ills and aches that affect man. In my practice I generally have the ablutions of new-born infants performed in tepid water, up to the end of the third or fourth week, when I prescribe a gradual lowering of the temperature, until finally the child is washed in cold water. Children very readily accustom themselves to this mode of proceeding, and there is not the slightest danger in it. However, there are two things which must not be lost sight of, viz.: in the first place, the mother or nurse should always wait about half an hour after taking the child out of bed, before she proceeds to wash it; and in the second place, the operation should always be performed quickly, and the humid parts speedily rubbed dry; since this not only calls forth a salutary reaction of the skin, but prevents also the evaporation of the water from the surface, which is but too apt to lead to colds. In the case of feeble and delicate children, the best way is to perform the ablution in the evening, and to put the child to bed immediately after. Happy those to whom a judicious training has rendered the habit of a general cold wash every day an absolute necessity to their existence. In this they possess one of the strongest protections against gout, rheumatism, nervous debility, catarrh, and many other affections—one of the most efficient preservatives of health. I know at the present time several persons who had been ailing for years, martyrs to gout, rheumatism, and

Hosted by Google

spasms, and who, as a last trial, had recourse to a general cold wash every day, and with the most complete effect; they have got rid of their torments, and enjoy now most robust health. One of the principal conditions to a successful practice of cold ablutions is to keep the skin in the regular habit of them, and never to omit a single day; trifling indispositions, for instance, should not be allowed to interfere with their regular application. Violent catarrhs, however, eruptions, diarrhœas, and fevers will, of course, necessitate an interruption of the practice, or at all events, the substitution of warm water for cold."

Those parts of the infantile body which are exposed to the action of the urinary and intestinal excretions require particular attention. A neglect of the requirements of cleanliness here is but too apt to give rise to even serious inflammations and ulcerations of the parts exposed to the contact of the acrid matter ejected from the body. Whenever a baby becomes restless and cries, without any apparent indication of hunger, it ought to be at once undressed and looked to, and in most cases the cause of its crying and restlessness will be found to be the one hinted at here. The swaddling-clothes should never be used to wipe the parts, since this simply tends to irritate the skin, and to render it more susceptible of the excoriating action of the acrid matter that it comes from time to time necessarily into contact with; the parts should be washed clean with a soft sponge, kept expressly for the purpose, and dipped in lukewarm water, and should then be carefully but gently wiped with a soft, warmed cloth. I think I need hardly add, that the child must then be supplied with clean and dry clothes. Should the action of the acrid excretions already have produced excoriations of the parts in contact with them, these may be healed by repeated washing with cold water, and dusting with worm-dust (worm-dust of birch wood answers the purpose best), or with the powder of dried rose-leaves. Lycopodium powder acts injuriously, and on no account whatsoever should any metallic substance ever be resorted to, such as sugar of lead, calamine powder, calamine ointment, etc.; the application of such substances would involve the greatest danger to the health and even to the life of the infant. Excoriations of a more serious kind or degree require the administration of internal remedies.

The cavity of the mouth must also be carefully attended to, since neglect here leads frequently to thrush and ulcerations Each time the child has sucked, the nurse should wipe the interior of its little mouth with a fine, soft, linen rag wrapped round the finger; the nipples of the mother or nurse's breast should also be carefully wiped each time after having given suck to the child. The child should always be removed from the breast the instant it falls asleep; otherwise the milk remaining in its mouth may turn acid there, and then give rise to the formation of thrush. But under all circumstances it is always best, as a general rule, to wipe the mouth of the infant repeatedly with a linen rag wrapped round the finger, and dipped in cold water.

Part II.—Therapeutics.

Preliminary Remarks.

Therapeutics, or the art of healing in a more restricted sense, is that part of the medical science which teaches the mode of treating and curing diseases.

The remedies employed in homœopathic practice are administered to children best in the form of globules, the doses being respectively, one to two globules for sucklings, two to three for children under seven years of age, and three to five for children above seven years of age.

In acute diseases the doses may and even must be repeated, according to the nature and violence of the affection, every two hours, or every hour, or perhaps even every quarter of an hour. The mother or nurse of a suckling under medical treatment must absolutely conform to the rules of homœopathic diet, and more particularly abstain from coffee, tea, spices, so-called domestic medicines, and carefully avoid all agitation and excitement.

The homœopathic medicines kept for use must be exposed neither to the air nor to the light, nor to very great heat or excessive cold; all strong scents and odours must be carefully excluded from the place where they are kept.

Section I.—Diseases of the first period of infancy.

This section embraces, properly speaking, only those diseases which are prevalent in *sucklings*; but from the nature of the subject, it is impossible to avoid taking in a certain class of diseases also, which occur equally at a more advanced period of infancy. Those diseases, however, which are equally met with in adults, have been omitted here, except such as happen to exhibit in their course or symptoms some material or striking difference, according to the respective age of the patient.

Hosted by Google

1. *Insufficient dilatation and activity of the lungs.*—This is an affection of the most serious kind; its cause is to be sought for in a faulty condition and deficient activity of the lungs; in most cases, it is absolutely incurable, and generally leads even to a *speedy* extinction of life. I will here endeavour to explain its nature.

The first breathing of the new-born child causes the lungs to dilate, from the action of the atmospheric air in the air-cells of the pulmonic tissue. The immediate consequence of this dilatation is the rushing of the blood into the lungs, when that fluid comes into contact with the oxygen of the atmosphere, and undergoes those changes, which are indispensable to prepare it for the part assigned to it in the operations of life. But these several processes can take place only when the first breathing of the new-born child is performed with the requisite vigour and energy; since otherwise the air-cells of the lungs are only partially dilated, and the circulation of the blood through this vital organ is only incompletely accomplished. But in order that the first breathing of the child be effected with the necessary energy, the child (which, as it were, even *during* its birth should continue to undergo a process of maturation and preparation for the functions of life) must, before it sees the light of the world, strongly feel the want of air, and must thus be forced to appropriate this important element to itself in the requisite quantity, and with all its innate energy. Now there are cases in which the birth of a child proceeds *too expeditiously*, so that, at its entrance into the world, the want of oxygen has not yet had time to make itself felt in the economy, and there is accordingly less inclination on its part to make an effort to draw in the atmospheric air. Indeed it breathes but very feebly, and dilates neither its lungs nor the walls of the chest to the requisite extent; the consequence is that the air-cells at the surface of the pulmonary parenchyma alone are dilated, and the deeper-lying parts are left altogether untouched by the air. This again interferes, of course, materially with the oxygenation of the blood, and hence with all the operations of life. In many instances this goes so far indeed, that the manifestations of life become visibly diminished after birth, and the child succumbs in a few hours, without the attendants being able to assign any other cause for the sudden extinction of the little creature, except the very vague one of *general debility*. And how could it happen otherwise? Lungs that are not fully dilated, are unable to receive all the blood conducted to them through the pulmonary artery, and there must accordingly occur in this artery a stoppage of the circulation; moreover, the quantity of atmospheric air being insufficient, the blood cannot be fully arterialized, and thus, retaining in a measure its venous character, it acquires hence a tendency to a sluggish course and to stoppage. An unfortunate little creature labouring under such an affection shows unmistakably all the signs of a serious oppression; the natural generation of heat proceeds but imperfectly, and the nutrition sinks lower and lower, the longer this state lasts. That such deficient activity of the lungs immediately after birth must, if not instantly remedied, speedily lead to the extinction of life, will be self-evident to everybody. If therefore, in the case of a babe that has been born into the world readily, quickly, and without any signs of mechanical pressure, and we observe that the front side of the chest fails to arch sufficiently, and remains rather flat, that the respiration imparts only a trifling motion to the walls of the chest and abdomen, and that the cry of the child sounds feeble, hoarse, or whining, we may assume that the atmospheric air has not yet sufficiently acted upon the lungs. If to these symptoms is added a general paleness intermixed with blueness, and spread all over the body, the assumption becomes a positive certainty. In such case the immediate indication is to proceed without delay to endeavour to establish a deeper and more vigorous respiration, by rubbing either with the hand or with a soft brush the soles of the feet, but more particularly the abdomen, and the parts about the midriff. If this simple operation leads to a vigorous screaming on the part of the baby, there is no doubt of a favourable result; under any circumstances, however, the aid of a physician must be called in *instantly*, since perchance a few hours after the birth all the aid that the medical art can afford may come too late.

2. *Inflammation of the pectoral gland.*—This affection, which occurs occasionally in new-born children, arises mostly from a foolish proceeding on the part of midwives, who fancy they ought to remove the milk contained in the breast of the baby, and resort for that purpose to a pressing and squeezing of the nipples; in some instances it arises also from the pressure or irritation caused by some article of dress; more rarely from internal morbid disposition. In cases when the affection arises from mechanical causes, we observe occasionally induration, instead of inflammation, and which induration will, after a

Hosted by Google

time, resolve itself again and disappear, or change to inflammation. During the inflammatory period, which lasts from about four to six days, the child suffers great pain in the affected breast, is feverish, restless, and sleeps little; however, when the inflammatory period has run its course, and a little abscess has been formed, and the little pus contained in it has been carefully and gently squeezed out, there remains only a little soreness to the touch, and in three or four days all is well again, provided the healing operation of nature be not interfered with by an irrational treatment. If the affection is perceived in time, a few doses of *Arnica Montana* may prevent its further development. If there exists already redness of the part and inflammatory action, *Chamomilla* is indicated, succeeded afterwards by *Belladonna*, and should this prove of no avail, *Bryonia*. If an abscess forms, with suppuration, *Hepar sulphuris* should be given, and a few days after, *Silicea*.

(*To be continued.*)

THE
HOMŒOPATHIC TIMES.

SATURDAY, APRIL 3RD, 1852.

THESE are stirring times for those who take a real interest in our Medical Reform. By reason of the divisions, lukewarmness, and apathy that are unhappily found among us—as they have been found among all advocates of any real reform in all past times—there have been many sore lets and hindrances interposed in our way.

A few years ago some of our foremost men doubted that there was any *homœopathic public*. It is a matter of triumphant satisfaction to us to know that this journal has proved that there is such a thing.

Our excellent colleague, Dr. LIEDBECK, of Stockholm, favours us with some of his valuable experience. *Si sic omnes!*

Dr. OZANNE is worthily engaged in refuting the sophisms of the most respectable author that has yet published in this country a formal attempt at a disproof of homœopathy.

Mr. SMITH is no less worthily engaged in giving us a narrative of the introduction of homœopathy into Britain.

Mr. WILSON has just published a letter, in which he shows some of the causes of the divisions among us. Every homœopathist, medical and non-medical, should read this forcible explanation of the present state of things in one of our public institutions.

It is manifest that no force of our opponents, of hostile medical sectarians, can do us any damage.

What the homœopathic public requires is, a large and effective hospital in the metropolis. Such an Institution should be on the broadest and most liberal basis.

If such an one could be established—and we see no reason why it should not be accomplished at this time—and if it were endowed, at least in a great measure, so as to give it the character of stability—we believe a real work would be done.

This is one of the most pressing things.

A Medical Council has been proposed, of five members, to be elected by their colleagues for a term of years; to which council all matters touching the medical body should be referred, with a promised obedience to its decisions. This we think would be a very useful institution.

Mr. POPE'S case, as so plainly narrated by himself in our present number, shows the necessity of our obtaining a Charter.

It was proposed six or seven years ago, that successive volumes of Transactions, and a Cyclopædia of Practical Medicine, should be published. Nothing of this kind has been yet done; and yet both these works are much wanted.

In fact, the real work of settling and developing our Reform in these kingdoms, is yet to be done. We look on what has been already achieved to have been chiefly the necessary work of the pioneers.

We require a large and effeetive hospital in London; an authoritative Council; a Charter; a digest of the doctrine and practice of homœopathy.

This is work enough before us, and to accomplish it we need a zealous Medical Union, and a public jealous of their true interests, and zealous for the Cause.

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—I have only just seen the remarks you have appended to my note on the "Medical Reform Bill," and trust that you will allow me to say a few words in reply.

I gather from what you state, that you imagine that I have made no efforts to obtain a re-examination from the Edinburgh Faculty; but this is far from being the case. Several letters have passed between Professor Balfour and myself on this subject; and the result of my correspondence has been, that the Dean refuses me any explicit answer to the question whether I shall not be rejected again, because I intend not only to study but, to the best of my ability, to practise homœopathy. Twice, at least, has Dr Balfour evaded this query: in the first instance, by referring me to the resolutions of the Edinburgh Faculty, contained in the *Edinburgh Monthly Medical Journal* for September, 1851; and more lately, by stating that "the Medical Faculty are not in the habit of making stipulations with candidates as to the nature of their examinations." But were more proof wanting of the confirmed obstinacy of the Edinburgh Faculty, I recommend to your notice the review of the Homœopathic Petition to the Town Council of Edinburgh, in their Journal for February, 1852. The whole article goes to show that, despite the Lord Provost's remark, "that every student, whatever his notions regarding homœopathy might be, would henceforth find no barrier to his obtaining degrees," the Faculty will do all in their power to prevent those graduating who intend either to study or practise homœopathy. In one place, the writer, referring to a gentleman who graduated last year, says, he did so "by successfully hiding his homœopathic talent."

These remarks will, I think, show sufficient reason why my trying to pass in Edinburgh is utterly useless. But I have gone farther than Edinburgh.

I have obtained, through a friend, information from an official authority that the "Test Act" was to be established in Aberdeen, and that I had no chance of passing the board of King's College. Upon hearing this, I wrote to Marischal College, Aberdeen, and to the University of Glasgow, but neither of these august bodies deigned to reply to the letter of a convicted homœopath.

Every one knows that, unless a homœopath chooses for the nonce to silence his conscience, he cannot obtain the M. D. of St. Andrew's. I should be very sorry to do this for my degree, and still more so for such a one.

Unfortunately, as it has now turned out, I never intended to practise as a surgeon, but to confine myself as nearly as possible to medicine. Having therefore no intention of applying for the College of Surgeon's diploma, I did not during my curriculum attend to some of the minor regulations of the College, neither did I take out the full number of lectures on anatomy required by that body, and consequently they have refused to admit me to examination until I shall have complied with all their requirements. This would occupy a period of three years, and little would be gained by it in the end, to make up for such a waste of time. I hope the foregoing statements will prove to you that I have not rested quietly on my oars, but have tried every means of obtaining a legal recognition of my medical education. If any of your readers can give me any further hints on this subject privately, I shall feel myself deeply indebted to them. Your statement that I have been "ill advised," is, I think, far from being the case. But whether I have been so or not, I believe that everything has been done with the best intent, and with the most purely disinterested motives, and not only so, but, I believe, that all that could have been done has been so in the best possible way.

I take this opportunity of thanking you, and all those medical and non-medical friends who have interested themselves on my behalf, for the great kindness you and they have shown me.

I remain, Sir, yours truly,

ALFRED C. POPE.

Homœopathic Hospital, Manchester,
March 23, 1852.

[We are glad to have received this full explanation from Mr. Pope. We had been informed, as it were *authoritatively*, that he had not and would not make any application to the Edinburgh Faculty for re-examination. His own letter sets that at rest: he has done everything he could do. This case, as now so fully explained, shows the absolute necessity of a charter for the homœopathists.—ED.]

To the Editor of the Homœopathic Times.

SIR,—"As your periodical has a very extensive circulation amongst non-professional subscribers, the following cases will very probably interest them, and strengthen them in advocating the Cause of homœopathy. The first letter was received by me quite unexpectedly; the writer had resided in Calcutta, where he was attacked with dysentery, and ordered to return to England. He informed me that he was the subject of diarrhœa during the whole of his homeward voyage. You have a *verbatim* copy of the communication, on which I make no comment, it will tell its own "unvarnished tale." I furnish you with the name in confidence, to obviate all suspicion of an attempt to make up a case." I am, Sir, your obedient servant,

P. M. WILMOT.

Southampton, March 25, 1852.

MY DEAR SIR,—If only as a matter of gratitude to you, as well as in the hope that others may be similarly benefited, I feel bound to state to you in writing the unexpected relief, indeed I may say cure, I have derived from your treatment. I am sure when I applied to you with the short detail of my case, which I consider fortunate under the circumstances, having been given in writing, perfect stranger as you were

Hosted by Google

to me, I had little hope of so speedy or so satisfactory a result. The tone of my letter will convince any one of this ; so that it is not *faith* that has cured me. Amongst other lessons I hope I shall have learned never again to ridicule or to pooh-pooh a system or a science, because the theory is opposed to what is termed "natural convictions," or, in other words, because I may not be able to understand the action of a remedy, to determine that it can possibly have none, or to determine, as is constantly done, in opposition to admitted facts, that "matter" so minutely subdivided as the homœopathic system prescribes, *ceases to possess any attribute either for good or ill.* Let those who still maintain this in opposition to all facts and experience, determine satisfactorily *at what point of subdivision* the action ceases. Let me not attribute "motives," but rather refer to the *cures* which the system is constantly furnishing, and particularly to my own case. To use the words of my last medical attendant, "he had gone through the entire Pharmacopœia ; if anything else occurred to him he would let me know ; thought attention to diet only would likely to be of use to me." This is now nearly six months ago, and when I applied to you, I had not for that period taken any drug of any kind ; so it is not *abstinence* from medicines that has cured me. I am anxious to clear the ground a little before I detail my symptoms, because the matters I have noticed are generally fallen back upon by opponents, when beaten upon other more essential points. Well, when I applied to you, I was daily increasing in debility, from the effects of a constant purging, the action of the bowels being excited at least ten or twelve times in the twenty-four hours, night and day, without intermission (not quite so frequent in the first instance or throughout), for nearly two years, an interval of a few weeks only excepted, *induced originally* by a tropical residence, seven years ago. During the first week of your treatment I experienced little or no relief. So sceptical did I continue, that every time I mixed the powders it was with the recurrence of this feeling, to which I more than once gave utterance : "I hope this man is not cheating me with sugar and water ;" consoling myself with the after-thought, that if one such practitioner could be found, surely so large a body of men as the professors of the system now number could never, knowingly, give currency to, and continue to practise, such a deception. The only alteration I made in my diet was substituting cocoa for coffee, at breakfast ; so that it is not *diet* that has cured me. My avocations have been pursued as usual, and the weather has been unpropitious, constant easterly winds. Now if it is neither "faith," "*medicine,*" abstinence from medicine, diet, nor change of air or scene, to which I am to attribute so decided an improvement—for I must tell you my complaint ceased entirely from Tuesday last, just a fortnight from the period at which I first took your remedies—would it be too much to require of those with whom "homœopathy" and "humbug" are terms synonymous, to give *some rational* explanation of the recovery here detailed ? For obvious reasons I do not wish my name published, but you are at perfect liberty to make any use of this statement, authenticating it by referring parties to me when necessary, for I feel too much gratitude not to spare any reasonable trouble in furtherance of the Cause, for the benefit of others.

I am, dear Sir, yours very truly,
To P. M. Wilmot, Esq. M.D.

The subject of the following case is a young lady, not married, aged 22. Her sister consulted me about her, and in answer to a letter the patient sent me the subjoined replies. She was furnished with remedies, and requested to see me at the expiration of a week, if possible.

"The diarrhœa commenced in the winter of 1847, the evacuations light in colour, and liquid ; it was then stopped daily by medicine, which I received from a medical gentleman attending me ; that attack lasted about two months ; it has continued more or less ever since. From my childhood I have suffered slightly from the headache, but ever since the attack of diarrhœa, in 1847, I have seldom been free from it ; the evacuations then occurred seven or eight times in the day, at present they are liquid and dark in colour, no lumps in them, neither is there any appearance of food undigested ; the evacuations occur generally five times in the day ; a day seldom passes without four, they are most numerous in the morning, directly after breakfast, or else in the evening ; none occur in the night, they are preceded by pain across the middle part of the stomach ; exercise does not bring on diarrhœa, but it frequently does the headache ; it is not influenced by atmospherical changes ; vegetables, fruits, and any meat, except mutton or game, increase the disease, likewise wine of any kind, and cold water. I often feel very well for an hour or two after breakfast, but no vomiting ; the tongue looks very white in parts, and red in other parts ; the headaches are more frequent every alternate fortnight ; the head is then seldom free from pain ; the top of the head is most affected, which is very tender indeed to the touch, so much so, that at times I can scarcely bear my hair to rest on it ; the pain is throbbing over my eyes, and piercing like a knife on the top of the head, with a great feeling of sickness ; it is seldom anything is rejected from the stomach besides water, unless I have taken a journey, and then it is of a dark yellow substance. The urine is not passed when the bowels are acted on, but some little time after ; the colour is light when diarrhœa prevails, dark and thick with the headaches. My rest is very disturbed, but no pain in the night, except my back (the centre) and my right side, which are very painful ; no depression of spirits, but a good deal of trembling nervousness, with the diarrhœa ; I have always a feeling of coldness in the feet and hands, and sometimes my legs swell in the evening. I take bitter ale, except when I have the headache, then I take brandy and water, with my dinner and supper. I have taken a great deal of *Calomel,* but not the

Hosted by Google

last three months, *that I am aware* of. My last prescription I enclose, (pills and mixture,) of both of which I have taken considerable quantities the last six months, and likewise plain *Turkey Rhubarb*, from neither of which have I derived the slightest benefit. Pills: *Blue pill, Colocynth, Henbane.* Mixture: *Aromatic Confection* and *Sedative Solution of Opium.*

"I shall feel greatly indebted to you if you can prescribe anything you think will benefit my health, and I assure you I will persevere most strictly with the rules you lay down.

"I remain, yours truly,

"Berwick, Feb. 28, 1852. "A. B.

"I bore the journey home, forty miles, remarkably well, and have had no return of diarrhœa for the last fortnight. I have been free from headache until yesterday, when I suffered from a throbbing pain in the back part of the head. I have no pain in the back or side. "Yours truly,

"Berwick, March, 1852. "A. B.

"P.S—The past fortnight was that always attended with headache."

SERPENT CHARMERS.

(From Dr. Kitto's Pictorial Family Bible.)

In general these serpent-charmers were and are distinct tribes of men in their several countries, professing the power they claim to be an inherent and natural function. The most famous serpent-charmers of antiquity were the Psylli, a people of Cyrenaica; and that theirs was believed to be a natural power appears from the story told by Pliny, that they were accustomed to try the legitimacy of their new-born children by exposing them to the most cruel and venomous serpents, who dared not molest or even approach them unless they were illegitimate. He thinks their power resided in some peculiar odour in their persons, which the serpents abhorred. Lucan says the same; and the passage in which that poet speaks of them affords a complete exposition of the ancient belief concerning the charming of serpents. He chiefly describes the measures which they took to protect the Roman camp. When the encampment was marked out, they marched around it chanting their charms, the "mystic sound" of which chased the serpents far away. But not trusting entirely to this, they kept up fires, of different kinds of wood, beyond the furthest tents, the smell of which prevented the serpents from approaching. Thus the camp was protected during the night. But if any soldier, when abroad in the daytime, happened to be bitten, the Pyslli exerted their powers to effect a cure. First they rubbed the wounded part around with saliva, to prevent, as they said, the poison from spreading while they essayed their arts to extract it.

> Then sudden he begins the magic song,
> And rolls the numbers hasty o'er his tongue;
> Swift he runs on, nor pauses once for breath,
> To stop the progress of approaching death,
> He fears the cure might suffer by delay,
> And life be lost but for a moment's stay.
>
> Thus oft, though deep within the veins it lies,
> By magic numbers chased, the mischief flies;
> But if it hear too slow—if still it stay,
> And scorn the potent charmer to obey,
> With forceful lips he fastens on the wound,
> Drains out and spits the venom to the ground.
> *Pharsalia*, ix. Rowe

In this account we find the voice repeatedly mentioned; and it is to "the *voice* of the charmer" that the Psalmist refers. We may suppose that, as in the passage we have quoted, the charmers used a form of words, a charm, or else chanted a song in some peculiar manner. So Eusebius, in mentioning that Palestine abounded in serpent-charmers in his time, says that they usually employed a verbal charm. This is still one of the processes of the Oriental serpent-charmers. Roberts says that the following is considered in India the most potent form of words against serpents: "Oh! serpent, thou who art coiled in my path, get out of my way; for around thee are the mongoos, the porcupine, and the kite in his circles is ready to take thee." The Egyptian serpent-charmers also employ vocal sounds and a form of words to draw the venomous creatures from their retreats. Mr. Lane says: "He assumes an air of mystery, strikes the walls with a short palm-stick, whistles, makes a clucking noise with his tongue, and spits upon the ground; and generally says, 'I adjure you by God, if ye be above, or if ye be below, that ye come forth: I adjure ye by the most Great Name, if ye be obedient, come forth; and if ye be disobedient, die! die! die!'" In these cases we may be sure that if any true effect were produced, it was by the sound of the voice, not by the form of words, which was doubtless addressed to other ears than those of serpents; and in the latter instance we may conclude the whistling and clucking to have been the most operative parts of the process.

But music is also much employed by the charmers of serpents. By means of pipes, flutes, whistles (calls), or small drums, they profess to attract them from their retreats, to subdue their ferocity, and (when the serpents are tame ones exhibited by themselves) to make them dance, and perform various motions regulated by the notes of the music. We see nothing difficult to believe in the statement that serpents may be, as some other creatures are, influenced or attracted by music, or even the voice of man, properly regulated; or that the proper regulation of the music or the voice for the designated end may not have been discovered and rendered most effective, by men who for successive generations have given their sole attention to the subject. Indeed, it is perhaps capable of proof that music, even in common hands, has power over serpents. Sir William Jones believed so, although not an ocular evidence. Enumerating instances of the powerful effects of music upon animals, he says: "A learned native of this country (India) told me, that he had frequently seen the most venomous and malignant snakes leave their holes upon hearing notes from a flute, which, as he supposed, gave them peculiar delight."

As to their pretensions of being in their own

Hosted by Google

persons insensible to the poison of serpents, we have never met with any satisfactory proof of it. Those which they exhibit, and by which they often allow themselves to be bitten, are confessedly deprived of all or most of their venomous power by the extraction of their poison-fangs. But nevertheless, we know ourselves and have read many authenticated instances of their fearless handling of very venomous serpents in their native state; and it is therefore our impression that they possess some knack in seizing and handling such serpents, which prevents them from biting till their poison-fangs have been extracted. Their presence of mind and the possession of such a secret easily accounts for all the stories told on this point. But when they do happen to fail, and to receive a bite from the serpent, they die as others. They seem also to trust to the effect of their music in so diverting the attention of the serpents as to prevent them from attempting to exercise the fatal power they possess. In this also they sometimes fail. Roberts mentions an Indian serpent-charmer who came to a gentleman's house to exhibit his tame snakes. He was told that there was a cobra di capello in a cage, and asked if he could charm it. "Oh, yes!" said the charmer, and the serpent was accordingly released from its cage. The man began his incantations and charms; but the reptile fastened upon his arm, and he was dead before night. This serpent "would not listen to the voice of the charmer."

We will now briefly specify the principal forms in which the serpent-charmers exercise the powers which they claim. As the houses in some parts of the East are much infested with serpents, the most profitable part of the charmer's business is to detect their retreat and draw them forth. They certainly discover where they are without ocular evidence, and make them come forth, either in the manner already described, or by the notes of a pipe. It is often said that the charmer introduces his tame serpents, and that they obey the accustomed call, and are exhibited in proof of the triumph of the charmer's art. This may sometimes be the case; but instances are known in which there could not have been any collusion or contrivance; and, after the severest test and scrutiny, many have been obliged to rest in the conclusion that the charmers do really possess the physical means of discovering the presence of serpents without seeing them, and of attracting them from their lurking-places. This is Mr. Lane's conclusion, who also suspects that they discover the presence of serpents by the smell, and compares their attractive powers to those of the fowler, who by the fascination of his voice allures the bird into his net. In the *Missionary Magazine* for March, 1837, a missionary to India (G. Gogerly) states that some incredulous persons, after the most minute and careful precautions against artifice of any kind, sent a serpent-charmer into the garden. "The man began playing with his pipe, and proceeding from one part of the garden to another for some minutes, stopped at a part of the wall much injured by age, and intimated that a serpent was within. He then played quicker, and his notes were louder, when almost immediately a large cobra di capello put forth his hooded head, and the man fearlessly ran to the spot, seized it by the throat, and drew it forth. He then showed the poison-fangs, and beat them out; afterwards it was taken to the room where his baskets were left, and deposited among the rest." From the statement of the precautions used on this occasion, for which we refer to the publication, this was a very fair trial. Does not his beating out the poison-fangs explain the Psalmist's meaning? "Break their teeth, O God, in their mouth." This is usually done by the serpent-charmers, who then tame them, and use them in various exhibitions. These exhibitions are much the same everywhere. The most usual are thus described by Mr. Gogerly, in the paper above cited: "Taking out eight or ten different kinds they cast them on the ground. The animals immediately made off in different directions. The *sap-wullah* (charmer) then applies his pipe to his mouth, and sends forth a few of his peculiar notes, and all the serpents stop as though enchanted; they then turn towards the musician, and approaching him within two feet, raise their heads from the ground, and bending backward and forward, keep time with the tune. When he ceases playing, they drop their heads, and remain quiet on the ground." He adds, that there is another and inferior kind of serpent-charmers, who are Bengalese of the lowest caste. They do not use the pipe, but merely beat with their fingers a small drum which is held in the hand. Sometimes these men, sitting on the ground, hold the cover of a basket with one hand, and with the other pull the tails of the serpents, and otherwise irritate them, until the animals become so infuriated that they dart forward and seize the naked arm of the *sap-wullah*, which he exposes for the purpose. They sometimes allow their arms to be bitten in this manner till they are covered with blood.

Other serpent-charmers allow large serpents to twine around their bodies, as if merely to show their perfect tameness, and the impunity with which they are able

> "To dally with the crested worm,
> To stroke his azure neck, or to receive
> The lambent homage of his arrowy tongue."

Others, again, in this situation, allow themselves, when compressed in the serpent's folds, to be dreadfully wounded in many places (the poison-fangs, of course, being wanting), till, when streaming with blood, tortured, swollen, and in a really dangerous condition, the coadjutor makes his appearance, and applies the pipe or whistle to his lips. The serpents listen to the music, gradually unloose their coils, and creep back to the cage from which they had been released at the commencement of the awful and cruel exhibition.

THE DISEASES OF CHILDREN.

By Dr. Frederick Augustus Günther.

(*Continued from page* 524.)

3. *Sleep.*—"The sleep in the first six months of life is a sacred sleep," says Hufeland. "It is the workshop of ever-active nature. It is an indispensable condition to the healthy development of the child; it ought never to be disturbed or meddled with in any way whatsoever; and the gradual shortening of the time allotted to it should be left entirely and alone to the natural instinct of the child itself."

Yes, truly, sleep quiet and undisturbed, and hence refreshing and invigorating, is a most indispensable condition to the healthy development of the child; and it behoves therefore those that are charged with the care of infants, scrupulously to remove and avoid everything that might tend to deprive the slumber of the infant of its essential requisites. Loud noises and dazzling light, especially, ought to be kept away from the couch of the sleeping infant; and care should also be taken to protect it from troublesome insects. The temperature and ventilation of the nursery also ought to be properly attended to.

The but too common practice of nurses to prevent their nurslings from indulging their natural inclination to slumber at certain periods of the day, because they are afraid that the infant may afterwards be restless at night, and then disturb their own sweet slumber, is also sufficiently injurious to the well-being of the poor infant; but still more hurtful and inexcusable is another trick which nurses have, to wake the infant suddenly, and to snatch it out of its little bed, exposing it thus to the almost certain chance of catching cold, in addition to the unpleasant effect of the sudden interruption of its slumber (restlessness, crying, disinclination to take nourishment, etc.) On no account whatsoever ought an infant to be disturbed from its sleep. Nature is the best judge of the proper duration of an infant's slumber.

The *position* of the child in bed also is by no means a matter of indifference. A child should never be made to lie on the back, or in an horizontal position, but always on its side (best, alternately one day on the right, the other on the left side), and the head and chest raised, but not extravagantly high. Lying on the back has this great disadvantage, that it interferes with the easy breathing of the infant; moreover, the saliva and phlegm are thereby prevented from running out at the corner of the mouth, and may thus unluckily find their way into the windpipe, when they are sure to produce serious and distressing fits of coughing, which may eventually end in positive suffocation.

No infant ought to be put to sleep immediately after having taken suck, since the inevitable consequence of such a proceeding must be to interfere seriously with the digestive functions. The safest way is to carry the child, after it has had its suck, about on the arm, with a little gentle dandling, until the breaking of wind, either upwards or downwards, indicates a properly advanced state of digestion; the infant may then, after the removal of all articles of clothing confining or pressing upon its body, be safely put into its little bed.

When the infant awakes from sleep, it should be taken gently out of bed and laid on the dressing-bolster or cushion, when its evacuations will take place, and when it may be properly cleaned. The nurse should particularly avoid to bring the tender eyes of the just-awakened infant into sudden contact with any strong or dazzling light.

To keep an infant, when not asleep, in bed for the whole day, is both cruel and hurtful.

Sleeplessness in infants may proceed from many causes. In cases where the child does not cry or is even lively, sleeplessness is probably owing simply to the absence of any want of sleep on its part, or perhaps there may be too much noise in the room, or the light may be too strong. On the other hand, if the child is crying, this may be simply an intimation on its part that it does not want to stay in bed, or that it is hungry, or that it lies uncomfortably, or is troubled with wind, or

Hosted by Google

pricked by a pin in its clothing, or feels too hot in its little bed, etc., etc. A judicious mother or nurse will generally be able to find out to which of these causes she has to ascribe the restlessness of her infant or nursling. I may add here that the crying and screaming of an infant is not by any means invariably a sign of discomfort or a symptom of pain. In many instances it is simply a manifestation of vigour and vital energy, and an admirable means to which nature resorts to strengthen the organs of respiration, and to expel the flatus that may have accumulated in the digestive tube.

Nothing can be more dangerous and reprehensible than certain modes and means which nurses and nursery-maids and even mothers will sometimes not scruple to have recourse to, for the purpose of putting a restless infant to sleep. Of these I may mention here, more especially, decoction of *Poppy-seeds* and other preparations of *Poppy*, and even of *Opium*, tickling of the abdomen, etc. Even the gentler and more harmless means of lulling and singing infants to sleep are not without their disadvantage: the child gets but too speedily accustomed to being thus coaxed to sleep, and will afterwards insist upon the repetition of the same process every time it is put to bed.

I think I need hardly add here that sleeplessness, proceeding from actual illness of the infant, can be expected to give way only with the removal of that illness.

3. *Clothing and Linen.*—The natural and legitimate purpose of clothing is simply to cover the body in obedience to the laws of decency, and also to protect it against hurtful influences from without. But as *fashion* has done in the matter of the dress of grown-up people, so *prejudice* and *custom* have unfortunately been permitted to interfere more or less seriously and injuriously with the mode of clothing infants.

The clothing of infants should be neither too light nor too warm, and on no consideration whatsoever ought it to be tight-fitting; common sense should teach people that any pressure upon the young and tender limbs and organs of an infant must of necessity seriously interfere with the free and natural development of their limbs and organs.

All those articles of baby's clothing that are intended to come into immediate contact with the skin of the infant ought to be made of nice soft linen that has already previously been worn somewhat, since even the finest and apparently softest *new* linen will be almost sure to irritate the exceedingly sensitive skin of an infant.

And here let me recommend again to mothers and nurses the utmost cleanliness. Not only ought the swaddling-clothes, etc., soiled by the infant, to be speedily removed, and dry and clean ones put in their stead, but the whole of the linen clothing of the infant should be changed every day, and the other articles of clothing, at all events, every third or, at the latest, every fourth day.

Especial care should always be taken to place on the infant none but thoroughly dried and moderately warmed clothes.

The infant should always be let suck first before it is dressed and swathed in the morning; since, if the child be dressed on an empty stomach, the subsequent omission of nutriment into the latter will be almost sure to expand it beyond the generally rather narrow limits assigned to that organ by the swathing, bands, even when they have not been drawn very tight; the pressure on the stomach resulting from this state of things generally leads to vomiting, etc.

4. *The Nursery.*—The selection of a proper room to serve as a nursery is a matter of paramount importance in the physical training of infants. Wherever the means of the parents will admit of it, a large, dry, lofty, airy, and well-lighted room ought to be chosen, sheltered from draughts, and removed as far as possible from the din of the street.

Light is one of the most essential requisites for the proper development of organic bodies in general. As a plant reared in darkness will inevitably be stunted in growth, colourless, and without perfume, so also man, deprived of the genial influence of the light of day, exhibits a sickly, bloated appearance, and grows weak, lazy, and apathetic, though even he be plentifully supplied with the other necessaries of life. Light is, therefore, an essential requisite for a good nursery. On the other hand, however, nothing can possibly be more injurious to the tender visual organs of the newborn infant than the direct acting upon them of the solar rays, or of the beams of some bright lamp or candle. The windows of the nursery should, therefore, be screened by green curtains from the too vivid light of the sun, and a screen should be equally placed before the evening lamp. The head part of the little bed ought to be arched over with a piece of green sarsnet, to prevent the rays of light falling over the brow into the eye, since this imparts to infancy a morbid tendency to turn the eye upwards. Nor ought the window or night-lamp occupy a position in which it may

Hosted by Google

attract the side glance of the child, since this has a tendency to induce squinting.

A pure and wholesome air is one of the most indispensable conditions to the proper and healthy development of the infant. Let, therefore, everything be kept away from the nursery that may tend to vitiate the air in that room, and more especially all night-chairs or vessels, warming-pans, smoky lamps, or candles, dirty linen, articles of furniture painted fresh with oil-colour, odorous flowers, and, above all, every species of incense or fumigating powder. The introduction of a coal-pan, for the purpose of keeping hot food or drink of the child, ought also to be strictly prohibited, as well as the drying of clothes, or of wood, or of herbs in the nursery.

A fearful abuse is carried on with the kissing of infants. It is by no means judicious on the part of a mother to imprint long kisses on the lips of her infant, since she thus compels the poor thing to breathe the air which she herself exhales, and which has, of course, lost its vitalizing powers. But it is actually reprehensible to let the poor infant receive the kisses of everybody who may choose to bestow that delicacy upon it. In how many instances have not disgusting diseases been thus actually *breathed* into the poor baby!

5. *Jaundice.*—The jaundice of new-born infants differs in many essential points from the disease of the same name in adults. The intestinal excretions of adults affected with this disorder are clayey and whitish, and do not indicate the presence of bile in them; whereas in the case of new-born infants, the defecations look green or yellowish-brown, and contain an undue proportion of bile. On the other hand, the urinary secretion of jaundiced adults is of a brown or dark-yellow colour, and betrays the presence of a large quantity of bile; whereas that of new-born infants labouring under an attack of that disease remains perfectly unaltered and colourless, owing to the natural lack of vigour in the secretive functions of the kidneys of infants.

In adults, jaundice proceeds, in most instances, from an abnormal direction of the bile; in new-born infants, it owes its origin to an over-large amount of bile secreted by an over-active liver. This organ is, in fact, very large and active in new-born infants in proportion to their size, and this tends naturally to promote an abundant secretion of bile.

With the exception of the greenish coloration of the alvine excretions, and the yellow hue presented by the skin all over the body, but more particularly in the face, the infant exhibits hardly any signs of indisposition; indeed it does not thrive, nor does it grow any way bigger, but it mostly continues to suck and sleep well-with occasional starts and screams, however, indicative of transient pain in the intestinal tube. There is hardly ever any fever, except when the jaundice happens to be complicated with some other disorder.

The most common and frequent determining cause of the jaundice of new-born infants is a cold; if proper care be taken, therefore, to shield the little patient effectively from further continuance of the action and influence of that cause, nature will, in most cases, effect a speedy cure: in four to six days the skin and the alvine excretions will recover their natural colour, and the infant be again as well as it was before the attack. But if the child continues to be exposed to the action of the determining cause of the disorder, if it is placed to sleep in a damp bed, or swathed in damp clothes. the jaundice may continue for weeks, and assume even a more serious character.

The removal of the determining cause, then, is the most effective way to cure the jaundice of new-born infants. The homœopathic remedies indicated against it are, *Aconitum, China, Digitalis, Pulsatilla, Mercurius vivus,* and *Acidum phosphoricum.*

The jaundice of new-born infants is, however, often also the result of the action of some rhubarb draught or electuary which the poor infant has been obliged to swallow; in such cases *Nux Vomica* is indicated.

6. *Trismus or Lockjaw.*—Trismus, at any time of life, is one of the most serious and dangerous affections that man is liable to. In the case of new-born infants, the danger is even greater than in adults. The malady makes its appearance suddenly, usually within the first week or fortnight after birth. The lower jaw of the infant is, in such cases, found immovable, and either firmly set against the upper or fixed at a few lines from the latter, so as to leave a small opening between. In either case the child is deprived of the power of sucking. At first the tension of the contracted muscles will sometimes give way for a time, and the mobility of the lower jaw will return, together with the power of sucking. But, if help be not speedily afforded to the little sufferer, the spasm will return, and at last continue without intermission till death closes the scene, which is generally about the second, third, or fourth day after the invasion of the disease. The concomitant

Hosted by Google

symptoms of trismus are signs of general suffering, peculiar paleness of the face, difficult breathing, groans, sleeplessness to a greater or lesser degree, sluggish action of the rectum and bladder, general debility; fever, however, is not always present.

The trismus of new-born infants originates sometimes in a severe cold; in which case it is usually complicated with jaundice; but it results also often from graver causes, such as lesion of the brain, and stretching (distension) of the spinal cord, suffered during the process of birth. The gravity of these causes is in itself sufficient to explain the fatal nature of the affection to which they give birth; if we add to this the serious impediment opposed by lockjaw to the nutrition of the child, we can hardly wonder that this affection should so frequently terminate fatally.

Nux Vomica is the homœopathic remedy against trismus. Good results have been obtained from it in many cases of lockjaw; it is usually administered in small doses, every six hours. In cases where the lower jaw is firmly set against the upper, the globule may be dissolved in a teaspoonful of water, and a few drops of the solution be squirted up into the little patient's nose, or one or two drops of one of the lower attenuations of *Nux Vomica* may be added to a clyster of water. If the spasm gives way a little, so as to restore the mobility of the lower jaw, the child may be put to the breast, care being taken to facilitate to it, as much as possible, the act of sucking; or the milk may be squeezed from the breast into its mouth, should it be unable to accomplish suction. Enemas and baths of cow milk may also be administered to support, in some measure, the strength of the little patient. I think I need hardly add, that in an affection of so grave and fatal a character as lockjaw, the aid of a physician ought always to be claimed without delay.

(*To be continued.*)

CRITICAL ANALYSIS OF DR. ROUTH'S "FALLACIES OF HOMŒOPATHY."

By John Ozanne, M.D.

Entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

V.

The author next directs our attention to some remarks of the Editor of the *Homœopathic Times* upon the use of *pilules*, or large-sized globules. He quotes the following words:—"Some practitioners who practise homœopathy, so far as they can, *secretly*, in cases where their patients like active treatment, make use of all shifts to conceal the fact that they are giving homœopathic remedies. * * * * It is obvious that pills or pilules greatly facilitate this mode of doing business." The meaning of these words is so evident, that I wonder any one could think of putting upon them the interpretation given by Dr. Routh. "Others," says he, "have adopted a larger-sized globule, which they call *pilule*, so as to be able to give *larger* doses." Now, he says himself that such a pilule, "when medicated, contains about the *fourth* part of a drop of the tincture" (pp. 9, 10). This is given as a very important circumstance, greatly shaking the character of homœopathists for consistency, when all the homœopathic periodicals teem with details of cases in which the tinctures and triturations of the medicines are given by drops and grains. The question, whether pilules, globules, or drops of the tinctures are to be preferred, is merely one of convenience; for it must be remembered that globules and pilules are only medicated with *diluted* tinctures, and that, as regards a quantity, a globule of a given centesimal dilution is equivalent to an entire drop of the dilution next to it. But the meaning of the Editor evidently is, that those medical practitioners who, although believers in homœopathy, are too deficient in moral courage or too careful of their pecuniary interests to avow their belief openly, would find their "mode of doing business" *secretly* greatly facilitated by the use of large pills, approaching in size the pills of the ordinary mode of practice. Nothing but the wish to perplex the reader could lead to such a perversion of the sense of the words quoted by Dr. Routh from the Editor of the *Homœopathic Times*.

"Again, there is another objection that *can be* offered;" this objection relates to the possible admixture of *carbon* with the common sugar, or sugar of milk, of which the globules are made, which admixture the author thinks would neutralize the medicine with which the globule has been medicated. Many other objections of the same kind *might* also be made. But what importance is to be attached to such objections, founded as they are upon mere supposition? If, after all, there is no carbon left with the sugar after its purification, what becomes of the objection? Let me again remind Dr. Routh, that homœopathists do not, as he imagines, base their belief in the action of

Hosted by Google

infinitesimals upon *à priori* grounds. Their belief rests upon *experience*. Now, as experience has pronounced in this case, and has shown that, whatever may be the impurities admixed with the globules in the course of their preparation, they nevertheless do possess curative powers, what have we to do with objections founded upon bare probabilities?

We now come to a series of objections, to which, if we may judge by the space devoted to them, the author attaches no small value.

"Their remedies are too subtle for appreciation even by the most erudite. They depend exclusively on the good faith of those who serve them; and all their experiments are open to fallacy, unless we feel disposed to grant them, what we cannot do, perfection. The force of this objection has been felt, and attempts have been made to evade it. *This very undiscoverable subtilty in their effects*, after attenuation and infinitesimal division, so as to evade the most delicate tests, chemical, mechanical, or otherwise, *has been explained by pretended analogous comparisons;* for instance, malaria or other contagious miasmata, the influence of powerful odorific substances, vaccination and inoculation, the influence of mineral and other waters containing infinitesimal quantities of medicinal substances. I shall speak of these *seriatim*" (p. 12). The objections raised, be it remembered, are brought forward to disprove not the medicinal properties of the medicines, but the *pretended analogous comparison* by which the *very undiscoverable subtilty* in their *effect* is explained by homœopathists. I ask pardon for the phraseology; it is not mine. I cannot, however, help using the author's own words, although obscure. I ought perhaps to say, I must use them *because* of their obscurity, for I should otherwise not be sure of giving a faithful account of his meaning. I cannot help remarking likewise upon the obscurity of the objections themselves, which has given me more trouble to make them out than their intrinsic worth can at all entitle them to.

In his first objection, Dr. Routh says "we have no right to argue *à priori* that because certain medicines taken by inhalation, and thereby at once absorbed into the blood or acting on the mucous surface, produce certain effects, that therefore the same result will follow the employment of such substances taken as ingesta, *i. e.* by the mouth and submitted to the influence of digestion." The argument is in itself correct, but, like many others in the book, it is *misapplied*. No homœopathist has ever, to my knowledge, reasoned in this way, and I think the author would have done far better to quote the opinion of homœopathic writers and combat them, than to ascribe to homœopathists the creations of his own fancy. Dr. Routh's facts, however, call for a few remarks. He does not, in stating that different effects are produced by the direct absorption of a medicinal or other substance into the blood, and its absorption after being submitted to the process of digestion, make a distinction, which is so obvious, that I wonder he should have overlooked it. There is, then, a great difference between substances which are poisonous because they are *undergoing decomposition*, such as *putrid flesh* (instanced by the author), or the products of animal organisms in disease, such as "the *black vomit* of patients affected with malignant fever in Africa" (instanced by the author), or *pus*, or some products of animal organisms in health, such as the *venom* of serpents and *medicines* truly so called. Animal or vegetable substances undergoing decomposition, morbid secretions, pus, the venom of serpents, may be, and probably are, transformed in the stomach by the gastric juice, undergoing a real digestion, the results of which are not injurious to the system if absorbed; but this does not hold good, or at least only partially, for the majority of drugs. If Dr. Routh could prove that medicines taken by the mouth produce *no effect*, his objection might be deserving of consideration, but as this is opposed to the experience of all men, his objection falls to the ground.

I cannot quit this subject without making one additional remark in connection with the process of digestion and the ingestion of medicines into the stomach. Dr. Routh's objection, founded upon the action of digestion upon medicines, applies in some degree to most allopathic preparations, which must, from their form, excite the secretion of the gastric juice, and their activity may in many cases be thereby impaired. But this does not apply to homœopathic preparations, which, for the most part, may be absorbed by the mucous membrane of the mouth or œsophagus, without descending into the stomach at all, or if they do, it is probable that they do not excite the secretion of the gastric juice, hence no decomposition can take place. But this remark is offered simply to contrast the preparations used by the two schools, not to prove the action of those of the new system, which must be proved by its influence on disease, the only test we need acknowledge.

The second objection is supplied by the

Hosted by Google

example of vaccination and inoculation. "It is commonly adduced," says Dr. Routh, "in support of the action of homœopathic remedies, that these operations are instances:—1st. When very small quantities of medicine may produce very powerful effects," and 2nd, that inoculation and vaccination prevent smallpox or render it milder; "so, upon the same principle, medicines which in health will generate the disease, or one analogous to it, will, when taken internally by the mouth, cure the disease" (pp. 13, 14). The author says that, the argument, if applicable at all, is true only of *isopathy*, not of *homœopathy*. In my last paper I gave a sufficient reason for calling vaccination *homœopathic*, which is, that the vaccine lymph *neither produces nor is produced by smallpox*. Inoculation of the smallpox virus, as a preventive of smallpox, is of course *isopathy*.

In his third objection, the author says that "it is not true that medicines inoculated or injected into the blood always produce the same symptoms as when taken internally by the mouth" (p. 14). His examples of substances injected are *oils, milk, alcohol, acids, alkalies*, which kill respectively, by *obstructing* the blood-vessels or by *disorganizing* by their chemical action the mass of blood. He adds, "the simple *inoculation* of many oils, milk, etc., will produce no effect." Why will they not, is it because they are medicines or because they are not? I am sorry to take up the time of the reader with such futile reasoning. Who will not perceive that a certain *quantity* of oil, of milk, of water, of *blood even*, injected into the veins may kill, not that they possess any *medicinal* or poisonous qualities, but because, if admixed in a certain quantity, they render the blood unfit to circulate through the capillary vessels. If by inoculation, milk and oils, which are neither *poisonous* nor *medicinal*, produce no effect, it is simply because so little is absorbed that the blood is not thereby rendered unfit for circulation. These facts have not the slightest bearing upon the question at issue.

In the fourth objection we have an example of a confusion of terms, which is, to say the least, unaccountable. "The preventive effect of inoculation or vaccination is confined only to smallpox. Measles may be produced in like manner; but then the disease is not rendered milder. Erysipelas, ringworm, scald-head, charbon, itch, and many other diseases, may be produced by inoculation; the *disease is neither prevented, arrested*, nor rendered milder, if present. It is not fair, therefore, to generalize or deduce a universal conclusion from exceptional facts" (p. 15). It is a *confusion of terms* to say that a disease, which *has been produced* by a given agency, is *not thereby prevented!* Dr. Routh wishes to make an objection. He has a confused idea of what kind of objection *may be* made; but he does not seem to be acquainted with the facts he talks of with sufficient clearness to avoid falling into an egregious blunder. I will therefore help him out of his difficulty, but in doing so I must point out, that this is the man who sets himself up as the judge of the reasoning, of the acts and the *motives* of others.

The objection, if any, applies to isopathy, not to homœopathy. The prevention of smallpox, and its transformation by vaccination into a milder disease, is a blessing which homœopathy may fairly, by the strictest rules of scientific deduction, claim as its own. The isopathic process of inoculation is followed by a disease which is generally less virulent than the same disease would be if contracted in any other way. By a like process measles are not rendered milder. The author adduces, as further examples of diseases which are transmissible by inoculation, those named in the above extract. But here, with the possibility of transmission by inoculation, the analogy stops. The essential difference between the first two (smallpox and measles) and the others being, that the former very rarely occurs more than once in the same individual. The susceptibility of contracting the disease is, as it is generally termed, *exhausted* by one attack; hence the advantage of inoculation, that is, the production of a mild attack of smallpox, in the place of what may be a severe attack of the same. It is because of this peculiarity that we may inoculate, but for no other reason. On the other hand, vaccination—the *homœopathic process*—possesses great advantages over inoculation. In like manner, the homœopathic remedies for measles and the other diseases instanced possess marked advantages over the inoculation of them, that is, if we admit the fact, of which for my part I have great doubts, that the inoculation of them leads to any advantage at all. I rather suspect that Dr. Routh falls here into the error of most of those who write against homœopathy, which is, that they look upon homœopathic treatment as a system which pretends to cure a disease by the *very agency* which has produced it. If he do entertain this notion, it would in a measure account for the absurdities in the paragraph I have quoted from him.

The last objection is a curious one, "the alleged infinitesimal quantities of

Hosted by Google

substances in mineral waters, and which even allopaths admit to possess medicinal qualities, is no argument in favour of homœopathy. * * * Infinitesimal doses are precisely those *which are not appreciable or detectible even by the most minute chemical tests.* * * * The word 'infinitesimal' cannot thus fairly be applied, especially if we do not confine our attention to one ingredient only, but to all" (p. 15). It is thus clear, that in Dr. Routh's mind the word *infinitesimal* is *synonymous* with *homœopathy.* Homœopathy consists in infinitesimals and in nothing else! I have already shown that although all, or nearly all, homœopathists admit the curative power of infinitesimals, they rarely use them in acute disease. In the diseases respecting which Dr. Routh has entered into his inquiry they are used only by a few homœopathists, and yet it is upon the supposed fact that they have been treated by infinitesimals, that he denies the cures of nearly all the cases to which his attention has been directed in his book.

The admixture of *Iodide of Potassium,* in the proportion of one to five per cent., with the salt in daily use, as a preventive of *goitre,* which, it is now believed, is due to the presence, in the water drunk, of too large a proportion of salts of magnesia, "cannot be fairly adduced as favourable to the infinitesimal doctrine" (p. 15). Probably not. I rather think the *Iodide of Potassium* is here neither allopathic nor homœopathic, that it is merely *antidotal.*

I will now conclude this paper with the following objection to the explanation of the possibility of infinitesimals being capable of influencing disease, by means of analogous facts taken from the wide domain of nature.

"Again, with reference to the subtle ethereal influence, this question is sometimes asked :—How much scent remains *behind after* a hare, so that the dogs may detect it? Here is an example of an infitesimal dose exerting a sensible effect. I must answer, how is it that in frosty weather the scent is destroyed and the dogs lose it, and yet the hare passed equally over the ground? Second, how do we know that it is not owing to an undulating movement that smell is diffused? It is so for light—so for sound—so for touch" (p. 13).

Why not! but this new theory of the transmission of smells, broached for the purpose of supplying an argument against infinitesimals, would only be tenable if the author could show that the emanations from scented bodies are governed in their movements by laws analogous to those which govern light and sound. If scents consist only in undulating movements, they must be capable of reflection from the surfaces of bodies in accordance with given laws, and of transmission through solids under certain conditions. Again, if, like the rays of light or the waves of sound, scents consist in undulating movements, they are scarcely capable of being confined within a glass-stoppered phial! Who ever heard of a ray of light or of a sound preserved for years in a well-corked bottle? The action of frosty weather on scents, instead of favouring the author's theory, is only a further proof against it. Who does not perceive that it proves that the emanations from scented bodies are capable, like other vapours, of condensation in low temperatures?

(To be continued.)

NARRATIVE OF THE INTRODUCTION OF HOMŒOPATHY INTO ENGLAND.

By F. J. Smith.

(*Continued from page* 517.)

That a subject of such stirring interest to the present generation as the introduction of homœopathy into England, and which will, in all probability, be of far greater interest to future ages—embracing millions of human beings where thousands are now numbered—should be left to the ordinary casualties of events, can be regarded as little less than criminal, when materials are known to exist which require but to be recorded in order to avert the calamity which delay would most probably occasion.

Those who are acquainted with the literature of the past will immediately recognise the force of this remark; for it will at once occur to them that scarcely has one great man lived, or any great event occurred, respecting whom or which various and conflicting accounts do not exist, much of which contradiction would have been avoided had authentic information been collected at the time. For a century after the death of Isaac Newton—to mention but one instance—no other account of his life and pursuits appeared than those supplied by the Eloge of Fontenelle, and the few details given by the friend of his latter years, Dr. Pemberton; and every one is familiar with the fact that it required a committee of the Royal Society, in 1712, to settle the dispute about the discovery of fluxions.

And if such were the fate of Newton and of fluxions, a hundred years may easily steal away—and a quarter

Hosted by Google

of that period is already gone—before a full detailed history of the introduction of homœopathy into England is published: many of the records now existing may be destroyed; pseudo materials, with that marvellous tenacity of life which belongs to the lowest class of being, may survive; the task of the historian be rendered perplexing, and his conclusions possibly erroneous.

Nor are these apprehensions mere speculations derived from analogical reasoning. Already has appeared, in at least three publications, a most erroneous narrative of the introduction of homœopathy into England. The first of these is the *Allgemeine Homœopathische Zeitung*, which ascribes this honour to the noble family of Shrewsbury. Its story runs thus: "That the Countess of Shrewsbury having married the Italian Prince Doria Pamphili, the latter was followed into England by his body physician, Dr. de Romani, in 1830—that the Queen Dowager Adelaide, having been given up by her allopathic physicians, was saved by Dr. Stapf, an eminent homœopathic physician in Naunberg, who had been expressly sent for to Germany—that this cure opened the mansions of the nobility to the new system; and that Dr. Quin, who was at this time physician to King Leopold, and resident in Brussels, hearing of the success that attended homœopathic practice in this country, threw up his situation and settled in London, where he soon obtained a very large practice."

Now, it so happens that there are scarcely two words in the whole of this anecdote that are correct:—

1st. The Countess of Shrewsbury, for the simplest of all reasons, did not marry Prince Doria Pamphili, her husband being then alive, which he is at the present moment. It is true that the Prince did marry a Talbot, but the member of this ancient family with whom the alliance was contracted, was a daughter of Lord Shrewsbury—the Lady Maria. The marriage, however, did not take place till the year 1838—eleven years after homœopathy had been introdueed into England.* Dr. Romani certainly visited this country in the winter of 1830, with Lord Shrewsbury; but remained here only six months, residing at Alton Towers.†

2nd. Queen Adelaide was not given up by her allopathic physicians. She suffered for years from a chronic affection of the respiratory organs, which ultimately terminated her valuable life. Being on a visit to her brother, the Duke of Saxe Meiningen, in the summer of 1833, the Queen, already favourably disposed to homœopathy from the circumstance of some of her household being under the care of Dr. Quin, acquiesced in the Duke's request that she should see his physician, Dr. Stapf. Under his care she appears to have received some temporary benefit. In 1835, he was again consulted in London by Her Majesty. Her Majesty was also attended, for a short time, by Dr. Harris Dunsford, (an excellent and much-lamented homœopathic physician), to whom she graciously acceded the permission to dedicate to her his valuable work, entitled "The Practical Advantages of Homœopathy." In deference to the wishes of her husband, the Queen discontinued the treatment, and remained to the last an allopathic patient, under the care of Sir David Davies and Dr. Bright.

3rd. It is true that Dr. Quin was physician to the person to Prince Leopold when H.R.H. resided in this country as a member of our Royal Family. It is also true that Dr. Quin received the appointment of physician-in-ordinary to H.R.H., when he became King of the Belgians; but Dr. Quin did not follow the King to Belgium—never resided there, and could not, therefore, either in 1830 or 1835, have thrown up his situation in Brussels to practise in this country. The fact is, as we shall presently see, that Dr. Quin had been practising homœopathy already eight years previously to the visit of Dr. Stapf.

Replete as this narrative of the *Allgemeine Homœopathische Zeitung* is with historical errors, it nevertheless has obtained a very extensive currency, from the circumstance of its being copied into a highly respectable* periodical, the *Quarterly Homœopathic Journal*, edited by Dr. Becker, and published in Boston (U. S.), in January, 1849.

But a circumstance still more to be regretted than either of the former, is, that the *Homœopathic Times* of London, forgetful of its inaugural address, follows, in March 1850, the same incorrect authority, and gives substantially the same account of the introduction of homœopathy into England.

The sacred fidelity of history forbids us

* Vide Elogio di Lady Guandalina Talbot, Principesssa Borghese, da Francesca Romani.—Napoli, 1840, page 16.

† Ibid., page 15.

* It is not intended by this to imply that the *Allgemeine Homœopathische Zeitung* is not also a highly respectable journal; on the contrary, we hold that periodical in great esteem. We use the words in a positive sense, and simply mean to assert that the circumstance of a highly respectable journal, published in the *English* language, copying the narrative in question, obtained for it a very extensive circulation.

Hosted by Google

to pass over this discrepancy, even though committed by a periodical that has rendered such eminent service to the cause of homœopathy as the *Homœopathic Times*. Indeed, the higher the standing of a literary work, the more important does it become that its mistakes should be corrected. We should not, therefore, be fulfilling the task we have undertaken with that impartiality which can alone entitle this effort to respect and confidence, if we forbore to extract, and confront with one another, the contradictory passages to which we have referred.

The first passage is as follows: "More than twenty years have now elapsed since the homœopathic system of medicine was *first introduced* to the notice of the profession in this country by Dr. Frederick F. Quin, physician to the King of the Belgians and the Duchess of Cambridge, the present distinguished President of the British Homœopathic Society."—*Homœopathic Times*, August 4, 1849, vol. i. p. 1. The second passage runs thus: "Dr. de Romani, under the auspices of the Shrewsbury family, and Dr. Belluomini, FOLLOWED BY DR. QUIN, were the first pioneers of homœopathy in England, nearly a quarter of a century ago."—*Homœopathic Times*, March 23, 1850, vol. i. p. 502.

Having thus acquitted ourselves of a painful duty, it will not be improper to remark, that it may be taken as an axiom in respect of periodical literature, that the inaugural number is the result of the concentrated care and consideration of weeks, if not of months. On that number much of the success of the journal is known to depend; error in any point—*e. g.*, the history of its subject—would be well-nigh fatal. The tendency of use, and especially of success, is to engender confidence and to lead to the abandonment of precaution. And it may be that occasional contradiction, in incidental matters, is a thing practically unavoidable in such publications; for, even supposing one and the same editor to write every leader, he could not be expected to keep constantly in mind every name and date he had incidentally introduced in the course of his labours. This being impossible, he must rely on well-accredited works for such materials, and his authority having been misled, he would be misled too; and thus contradiction would arise. The chances of occasional incidental contradiction are further augmented by the fact, that all the leaders of any given publication are not, and cannot, in the nature of things, be written by the same individual. Be this as it may, it follows from the principle we have laid down that, in respect of accuracy, the inaugural number of any periodical is more likely to be correct, as to the history of its subject, than any subsequent number. And applying this reasoning to the case before us, it is obvious that the inaugural address of the *Homœopathic Times* is more likely to be accurate than its leader of March, 1850.

Now, in the inaugural address in question, we have the introduction of homœopathy into England ascribed to Dr. Quin in the year 1827. This is in unison with Dr. Black's admirable article on cholera in the *British Journal of Homœopathy*, vol. i., published in 1843, wherein he says, "Dr. Quin was the first physician who introduced homœopathy into England;" and with an able pamphlet by "Aliquis," published by Mr. Headland in 1848, where, amongst the errata correcting the text, we find,—"at page 9, it is stated 'homœopathy was introduced into England seventeen years ago;' it was introduced by Dr. Quin in 1827."

On the other hand, we have, as already noticed, three publications ascribing the introduction of homœopathy into England to the noble family of Shrewsbury and Dr. de Romani, viz.:—1st, *Allgemeine Homœopathische Zeitung*; 2nd, the *Quarterly Homœopathic Journal*, for January, 1849, of Boston (U. S.); 3rd, the *Homœopathic Times* of 23rd March, 1850. But we have already shown that the second and third of these periodicals took the first for their authority; and we have also shown that the narrative, as given by that journal, is inaccurate throughout.

It only remains for us to add, that we have searched in vain for any account* which ascribes to any other individual or individuals the honour in question. The Shrewsbury-Romani story, then, being completely disposed of, Dr. Quin is left in undisputed possession of the field.

The positive necessity for obtaining an undebatable starting-point for homœopathy must be our apology for this long and, we fear, somewhat tedious dissertation on the conflicting evidence we have been compelled to examine. Having, however, succeeded—as we trust we have to the satisfaction of our readers—in clearing away the obscurities that have hitherto beset

* It may, perhaps, be necessary here to observe, that Mr. Warne, in a letter published on the 17th January last, in the *Homœopathic Times*, on this subject, introduces these words:—"Every homœopathist is, I fancy, aware of the large expenditure incurred by Mr. Leaf, in the introduction and advancement of homœopathy in this country." We feel persuaded that neither Mr. Leaf nor Mr. Warne would wish us to comment on this quotation. It is enough that it does not, in the slightest degree, invalidate our statement.

Hosted by Google

the path of the historical student, we will now proceed, without further preface, with our narrative.

[We should have no difficulty in convincing our historian, and any good reasoner, that it does not follow that an inaugural address, on any given topic, must be more correct than any subsequent one. The Whateley school of logic does not reason in this manner.

Mr. Smith points out a discrepance between a statement in our first number and that in a subsequent one, as to the introduction of homœopathy; but we can assure him that on each occasion we had information, at the time, which was supplied to us by reliable authorities, as we thought. Progress and correction generally go hand-in-hand, and we have no doubt, if there be any lay or professional parties who are in possession of facts which our much-esteemed historian so much desiderates, they will be induced to come forward, and supply him with those facts.

(*To be continued.*)

THE
HOMŒOPATHIC TIMES.

SATURDAY, APRIL 10TH, 1852.

IN the most magnificent Institution of Polity that was ever framed, whereby men were to be influenced and guided through the medium of their senses and their imagination, because they had not reached the standard of full-grown men, that is, were incapable of self-government by pure reason and austere faith, there was not only a hierophant, and a splendid staff of subordinates of a princely order, but there were "hewers of wood and drawers of water."

In all human attempts on the part of numbers for a common object, this gradation of minds and spirits must hold true. While the operatives are engaged in the coarser work, and do their duty as subordinates, the master-spirits, not content with the full appreciation of the scheme which is being elaborated, follow out, by prevision, the consequences, and look forward to permanent results.

It is human to err; it is proper if any go wrong, that they should be willing to retrace their steps. The seers have not always unclouded vision, and the philosophers have not aways a clear judgment, and none, of whatever intellectual calibre, are justified in neglecting the just claims of

"The bold athletic mass
Whom freedom leads, and brotherhood combines."

Our founder, SAMUEL HAHNEMANN, left a precious bequest to his disciples—not the mines of Golconda, nor the treasures of El Dorado, but something far more priceless—the unfolding of thehealing law for the physical reparation of mankind:—he left them *work* to perform, not wealth to enjoy—he left them the full tasking of all their powers, according to their different capacities of body and mind, and their different opportunities. *Each has something to do.*

Shall men dig and delve in California or in Australia for the yellow dust that makes what the creatures of the world call wealth, and shall the disciples of Hahnemann not dig and delve in the mines of Nature for health-imparting remedies?

Hospitals have been established in Britain for the propagation of this true and downright Medical Reform. But the object of the far-seeing is not to have the *name* of hospitals, the *ad captandum* frippery of a *soi-disant* public service of successful practitioners, but the reality of an unmistakable work.

It is clear that, to produce a real conviction, real results on a large scale must be shown; and therefore a large hospital is needed.

Now those who are entitled, or think themselves entitled, to the leadership, or any office of trust, in the working out of our Reform, should be men both capable and willing to take a large view of the past, the present, and the future: they should follow out the consequences, and look to the permanent results of any scheme they originate. As a cosmopolite and a citizen, a man is useful in his generation, or he is nothing.

Now what real work has been done for the *secure* establishment of homœopathy in these realms?

We pause for a reply from any who may think themselves able to answer the question.

A quarter of a century has passed since homœopathy was introduced into these countries—nearly a generation of men.

Hosted by Google

Has the work done been proportionate to the time, the means, the appliances, the opportunities, and the men? we trow, *not.*

Our vindictive enemies say we, the medical advocates of homœopathy, have taken it up and pursue it from sordid motives and for gain. We do not know *one* individual who has made a fortune by it; if our adversaries know any such, let them be named.

Let there be united action—the wisdom resulting from deliberate counsel — let there be a wide-spread basis of operations, and a large scheme, and let it be carried out with an intelligent eye to the *consequences* and the *permanent results.* None must build houses of cards for the pleasure of puffing them down—as children do.

The character of *permanence* must be stamped on our Institutions.

To the Editor of the Homœopathic Times.

Sir,—An esteemed medical friend, but a determined enemy to our great Cause, placed in my hands yesterday the oration of which I send you two extracts, and as I have not observed any notice of this "oration" in your journal, perhaps the perusal of the extracts may afford you some amusement.

Dr. Little, it will be perceived, has, like most others of his class, passed by the great law, propounded by Hahnemann, and plunged at once into the question of infinitesimal doses.

This mode of dealing with a subject so important to the best interests of all classes must result from ignorance or dishonesty, and Dr. Little is quite welcome to select which of the terms is applicable to himself.

If we are to take Dr. Little's mode of opposing the spread of homœopathy as a sample of that which will in future be recognised by our opponents as the only way of stopping the onward progress of the heresy, its ultimate success is certain: and I cannot avoid saying, that the precious extracts I now forward to you of Dr. Little's oration are totally unworthy of a place in an oration before the Hunterian Society, and until the medical profession shall grapple with the great law of "*similia similibus curantur,*" all the abusive terms which may be made use of can and ought to go for nothing, and will indeed be disregarded by all who soberly and honestly seek the truth.

I am, Sir,
Your very obedient servant,
M. Marshall.

Bank of England, March 30, 1852.

REPORT

Of the Hunterian Oration, delivered before the Members of the Hunterian Society.

By W. J. Little, M.D.
Delivered 4th February, 1852.

.....Page 4. This annual gathering of the members and friends of the Hunterian Society affords, amongst other advantages, an opportunity of reviewing some matters of general interest to our profession which have occurred during the past year. Amongst these we may survey the progress or decadence of empiricism within and without our ranks. The stand is at length made against homœopathy. It is a subject of congratulation, nevertheless, that the profession has so long left this quackery unnoticed. In the land of its origin, its hollowness and falseness were soon apparent, and the monster absurdity was strangled almost in its birth. Here no master-mind like Stieglitz has, until lately, deemed it worthy of exposure and refutation. Homœopathy has, in fact, been abandoned to its course; left by physicians to mere contempt. In this tolerant community, however, the scorn of the profession has been mistaken for fear; but as long as the freedom of thought and action conceded to homœopathy was confined to itself—as long as homœopaths were content to be homœopaths—as long as its mysteries were confined to a separate sect, who made no claim to belong to the regular ranks, but who rather boasted of their divergence from us, it was not desirable that our profession should openly notice it; but when homœopathy seeks to invest itself with the mantle of orthodoxy; when it aspires to invade the halls of our universities, and to instil its virus into the minds of our alumni, it is full time for the profession to oppose with energy the double imposture. This opposition has now become a necessity—nay, indeed, it has become an imperative duty; for the tendency of the delusion, with its exaggerated belief in the efficacy of drugs, and its assertion of the potency of infinitesimal doses of medicinal agents, is to engender universal scepticism as to the value of medicinal substances. As in theology itself, so in medicine, extremes will meet; the larger and more unreasonable the demands made upon the credulity, the imagination, and the superstition of the disciple, the greater his proneness to fall into utter disbelief.

With the profession fully alive to the tendency of the new claims of the followers of Hahnemann and others; with the certainty that hereafter both sides of the question will be kept before the public—"Magna est veritas, ac prævalebit!"

Hosted by Google

That portion of society which has yielded to the seductions of this quackery will be undeceived. Whilst another generation is springing up, perhaps some new folly, which, in its turn, will share the inevitable fate of homœopathy—to be consigned to the contempt and derision of society, as soon as its novelty has subsided, and the halo of mystery which surrounds it has been dissipated by the steady radiance of truth: moreover, the mere multitude of elixirs vitæ, homœopathy, hydropathy, mesmerism, and other "*isms*" without end, must in time bewilder the beguiled, and eventually lead to the regular physician for refuge. The number of the homœopathic pretenders is said to have increased, yet the interest to credulous or dishonest men to continue to labour in the diffusion of these absurdities must diminish as their number is augmented; and even such men will find that legitimate medicine is equally or even more profitable in a pecuniary sense; when, of course, they will make a virtue of necessity, and return to the beaten path of science and of common sense. The spread of so many quackeries in the present day, even among educated men, has occasioned surprise; yet when the inducements to empirical practice are so numerous, and possess such solid attractions, there is little cause for any astonishment. All educated men are not proof against evil temptations, nor inaccessible to sordid motives.

Besides, every system of quackery may contain some element of good, however much that element may be obscured or abused. Homœopathy, for example, pretends to cure with globules, while the really effective agents which it can wield are pilfered from the armoury of the regular practitioner; and, indeed, from this point of view, each so-called *system* is but an additional compliment to regular medicine, an unintentional homage to that true system of the healing art established by the unwearied searches of devoted inquirers on the basis of knowledge and sound philosophy. Thus each pretended system is but a gigantic hypocrisy, unconsciously rendering, as it were, the usual tribute of vice to virtue. Each consists but of a leaf taken from the venerable book of medicine—the accumulated and recorded experience of ages—and prostituted to the purpose of acquiring a distinction unattainable by honourable rivalry and competition in the arena of legitimate practice; or, as an excuse for non-possession of the education, the acquirements, or the diploma of the regular practitioner,—a leaf expanded into a huge system of credulity and imposture. These terms would be harsh if applied to the members of any sect rightly claiming to be cultivators of science; but surely those of the homœopaths who really believe in the efficacy of infinitesimal doses—of doses so small, a billionth or decillionth, for example, whose very expression in figures notation can hardly bring upon its tablets—may at least be justly termed credulous; whilst the remainder, if they have not so debased their intellect as to credit the doctrine, are plainly obnoxious to the charge of imposture, for their adoption of a practice repugnant to their own common sense, merely as a profitable livelihood.

The most charitable supposition would be, that such intelligent men as have embraced homœopathy had previously become sceptics as to the value of drugs, under any mode of administration, following in this the theory of those physicians who assert that the average duration of disease and the average mortality of mankind (all other things being equal), are the same whatever be the medicines administered. This scepticism of the value of drugs may by some be regarded as an excuse for practising with them in a harmless form, relying upon expectancy, diet, and hygiene.

Now this covert reliance upon time, diet, and hygiene constitutes the hypocrisy of homœopathy. It is true that expectancy, or the belief that nature alone is competent to cure every curable disease, and intuitively to teach what aliment to withhold and what to administer, has long existed as a doctrine in medicine, and, when legitimately entertained and modified, it holds a place in the creed of every rational practitioner.....

Yet in the present day a system of gymnastics, called kinesopathy, is gravely propounded for the cure of disease! Behold the abuse of another leaf from our book.

Our book, I say, because, "rich with the spoils of time," it is the repository of all the recorded wisdom of our noble art, and each and every pretended new system will be found, if scrutinized, to rest upon the abuse of some page abstracted without acknowledgment from its almost exhaustless treasures.

This is the secret of the partial or temporary success of every quackery—Morisonianism, brandy-and-saltism, Hollowayism, White-mustardism, St. John Longism —quackeries in every way worthy to be classed with homœopathy and hydropathy.

Correspondence.

HOMŒOPATHIC HOSPITAL FOR CHILDREN.

To the Editor of the Homœopathic Times.

SIR,—Allow me, through the medium of your columns, to address the homœopathic public upon a subject that I have had long at heart. It is nothing less than the establishment of another homœopathic medical charity, of a nature that I sincerely believe will give more than twice the relief to the sick for the same expenditure, than any of the present existing hospitals, and its funds will be obtained from a source that will but little, if at all, interfere with the resources from which the present medical charities draw their support.

I propose that a hospital should be established devoted exclusively to the relief of children. The idea was suggested to me about a year ago, by a medical man of eminence, who stated it to be the only way of showing the full superiority of the homœopathic system.

The great majority of cases in ordinary hospitals are so concatenated with drug diseases, the result of long-continued allopathic treatment, that simple diseases have been rendered complicated, and in many instances incurable. I am given to understand, that the chance of cure in a child hitherto undrugged is as four to one greater than that of a middle-aged man having swallowed the average amount of medicines. I have only estimated it at half this.

I propose that the subscriptions to this hospital shall be limited to the sum of five shillings; it will be observed that there are scarcely any subscriptions to the other hospitals lower in amount than one pound. Thus far, the funds of the hospital may be considered as being drawn from a source peculiar to itself; but as donations will also be received for the children's hospital, to a very limited extent these may interfere with funds that might otherwise have gone to another hospital. However, the main dependency of the children's hospital will be upon the multitude of small subscriptions.

With regard to the medical staff, it is not proposed to make the belonging to a particular society a qualification, as in the London Homœopathic Hospital, neither is it proposed to have a large number of medical men attached to the hospital, upon a principle of equality, as was formerly the case in the Hahnemann Hospital.

The qualification for a medical officer of the children's hospital is proposed to be that he shall follow the precepts of Samuel Hahnemann, as laid down in the Organon. Take the definition of a physician from the words of Dr Constantine Hering, of Philadelphia.

"I acknowledge as 'practitioners of our school,' such only as are accustomed to observe the general, practical rules laid down in the Organon, *i. e.*, those which require the most careful inquiry into the symptoms of each case, as a case by itself; the writing down of all the symptoms, the selecting of one remedy according to the characteristic similarity, and the administering of that one in the smallest doses, and at the longest intervals the case allows."

It is perfectly true that, in this age of rapid progression, it is impossible to stereotype a system—that improvements and change *must* take place; but in this instance mere change, without improvement, is in general easily to be distinguished from an advance in knowledge, from the circumstance that the change, without improvement, is generally to save the labour of the physician.

A true homœopath, when he undertakes a case, may perhaps spend an hour or two in his closet studying the symptoms that he has before laboriously collected; he then gives a minute dose of a carefully-selected medicine, and the germs of a serious illness may at once be eradicated. The patient pays his fee, treats the matter lightly; there was little the matter with him; one dose cured him; he would probably have got well of himself.

A second physician takes no such trouble; he administers at once the medicine that he thinks will alleviate the symptoms the patient most complains of; then attacks a second and a third symptom, which are in their turns alleviated, while the vitality of the disease is only partially affected. This treatment is something like the economy of giving bad wine, it not only costs less at first, but it lasts a great deal longer. There is, however, this difference, *the patient is satisfied* with the medical treatment, the symptoms that he complains of are one by one alleviated, and he gets well in the end, and sooner than he would under allopathy. *The mere selfish interests of the physician are not the same as those of the patient*; the inferior mode of practice often paying the best.

Take, on the other hand, an instance of improvement in the science of homœopathy. Hahnemann always gave his medicines singly; his favourite pupil Bönninghausen constantly gives them in alternation, but *only after lengthened, laborious research into the affinities of medicines;* he never gives drugs in alternation, without having previously ascertained by experiments their effects in alternation. If he gets increased power by this change in treatment, he has got it at the expense of increased labour to himself.

How different this from the man who, to save himself trouble in investigation, gives one medicine for one symptom, and another in alternation for another symptom, without knowing anything of their combined effects in alternation.

The best mode that we have of the carrying out the true principles of the Organon is, by

Hosted by Google

asking only those to subscribe who wish to see those principles carried out, and these carefully selecting their Board of Management. Perhaps it might be well if the physicians were periodically called upon to select a case each for publication, as a specimen of their work.

Now with regard to funds: to the ladies I look first. Ought we not to calculate that each mother, whose child's life has been saved by homœopathy, will give five shillings to help to save the lives of the children of her poorer fellow-creatures.

Next I turn to the numerous body of homœopaths, whose faith is great but whose worldly circumstances are small. To you I say, that if you will only subscribe your five shillings, and *attend regularly the general meetings*, give a careful vote in the selection of your Board of Management, and, as far as lies in your power, see that they do their duty, you will do more good to the hospital and to homœopathy than a man that gives ten times the amount, and troubles himself no further on the subject.

To the rich I address myself, reminding them that the proposed scheme admits of large donations; and that though the hospital may be carried on chiefly by small subscriptions, yet we require something in hand to start with.

I shall be happy to receive any communication on this interesting subject from *any one*, who is willing to co-operate with me, on the principle of true faith in homœopathy.

Should this proposal appear to meet with approval, a meeting will be called after Easter.

I have the honour to remain,

Your obedient servant,

A. H. MACDONALD MORETON.

112, Gloucester Place, Portman Square.

AMALGAMATION OF THE LONDON HOSPITALS.

To the Editor of the Homœopathic Times.

SIR,—I am sorry to see that you are all at loggerheads; you will remember I predicted as much when on a sudden uprose two committees, two dinners, two hospitals, two medical staffs. It grieved me at the time, and I think it might have been avoided, had the Cause been kept in view, in lieu of the self-aggrandizement of a few individuals. My own views may be peculiar, but I will state them. The medical men should resign in a body in both hospitals, and leave the lay-supporters to choose the staff, one-half to be for life, the other half for three years, and then a re-election; the two hospitals to be amalgamated, and one school and one hospital worthy the name would spring up as if by magic. I know that hundreds would ere this have subscribed, but for the divisions and squabbles, and jealousies of medical men. When will medical men understand their high calling, and feel and act rightly to each other, to patients, and to God?

I cannot leave here even for a day, and if I could I would not, except it were to assist at a *fusion*. I am going to build forthwith a small hospital, and I shall feel obliged if you will give me the names of any wealthy people that would be likely to assist me. I am not rich, but will make much sacrifice for the Cause.

Yours sincerely,

RUSTICUS EXPECTANS.

April 3, 1852.

[The above note is from an excellent homœopathic practitioner. We make no comments on it. Some will think the plan good and comprehensive, some will think it Utopian.

We shall be very glad to receive the "*benevolence*" for his hospital from any who are disposed to give help in that direction.—ED.]

HYPOCHONDRIASIS.

A MARRIED woman, aged thirty-two, consulted me in October, 1837. Four years previously she had lost a child; and, whilst watching it during its illness, was suddenly seized with terrific apprehensions. From that period she became very low-spirited, and *dreaded being alone;* and imagining she was pursued by an evil spirit, she ran from room to room, and felt as if she must fly from all around her. She experienced a throbbing headache and a feeling as if the eyes would burst, and fancied that she "saw a spot on her forehead which passed down to the stomach;" she had thirst, and occasionally slight shivering. This state was completely relieved, in about three months, by the employment of *Platina*, *Belladonna*, *Tinct. Sulph.*, *Stramonium*, and *Phosphorus*. The patient, although naturally of a nervous temperament, has remained to the present time free from the malady, and is now in very good health.

A gentleman in the city, aged thirty-five, engaged in laborious mental exertions, complained of great weakness of sight with dizziness; occasionally, the power of vision suddenly forsook him for many seconds. He suffered also from headache attended with a dragging sensation, extending from the eyes to the back of the head. His sleep was disturbed, his spirits were greatly depressed, and he felt a desire to be alone and in the dark. He complained that his memory of late had become defective. The remedy I considered most appropriate to the case, *Nux Vomica*, was of immediate benefit. The nervous system became tranquil, the spirits improved, and he was able to write and read with but little inconvenience. *Chamomilla* was given to relieve biliary disturbance, and *Nux Vomica* afterwards repeated, which, in about six weeks, completely dispersed the remaining evils.

THE DISEASES OF CHILDREN.

By Dr. Frederick Augustus Günther.

(*Continued from page* 532.)

Whilst the nursery is being swept and cleaned, the baby ought to be put into another moderately warm room; should this, however, be impracticable, care must be taken to cover the floor with moistened sawdust, and to draw the broom lightly over it, so as to avoid the rising of dusty particles into the air which the child has to breathe. Among the very poor, when a single small room, with low ceiling, is generally made to answer the several purposes of kitchen, parlour, nursery, bedroom, etc., and in which parents and children live crowded together, perhaps even in company with a pig or some other animal, frequent ventilation and purification of the air is a matter of the highest importance. The best and simplest means to effect this is to open the door and windows, both in the fore and afternoon, no matter what the state of the weather may happen to be. The baby should in the meantime be carefully protected from the draught by wrapping the bedclothes around it, and placing a screen before its couch. There is no necessity either to leave the door and windows open for hours together, as some people fancy; a few minutes at a time will suffice, provided the operation be repeated from time to time. Ventilators in the windows are very useful contrivances for the purification of the air, but better still are those placed in the wall near the floor, in some corner or other of the room, since the lower layers of the air contain always the most injurious matter, which, from their specific weight, sink to the ground.

A moderately warm *temperature* which, like light and air, is indispensable to the growth and development of animals and plants, is equally one of the most important requisites for a properly-constituted nursery. The too much is here as hurtful as the too little. The proper temperature of the nursery is about 65 to 70° Fahrenheit. The door and windows of the nursery ought to be close shutting, to guard against draughts. In summer, the temperature may generally be kept at about 70° by the opening of the windows, by curtains, etc.

I have already had occasion to remark that a calm and undisturbed rest is most beneficial to infants. It will certainly be granted that the ear of the new-born child is a most delicate organ, and one would imagine that common sense should suffice to deter people from assailing this tender organ with any kind of noise; but it is by no means so. Scarcely has the infant been born into the world when a host of grandmothers, aunts, cousins, and gossips pounce upon the helpless little creature, and inflict on its acutely sensitive ear torrents of female eloquence in commendation of its beauty, and of the strong resemblance which it bears to either or to both parents; to scrutinize and ascertain the which more closely and minutely, the poor innocent is, mayhap, dragged to the bright light of day, or of a lamp, which, of course, cannot fail to inflict ineffable torture on the equally tender and sensitive visual organs of the infant.

The nursery ought, where it is practicable, to be placed in a part of the house removed as much as possible from the noise of the street. All loud noises, screams, harsh and grating sounds ought to be strictly prohibited. The door should be opened and shut gently. Nothing can possibly be more foolish and hurtful than the much prevailing practice to still children by loud drumming on a box, or against the window, or by making a deafening noise with a mortar, bell, drum, trumpet, etc.

7. *The Infant's Couch.*—The wicker or basket cradles, which were formerly so much in vogue, have deservedly fallen into discredit now, on account of the facilities which they offer to the location of bugs. *Rocking-cradles* of any kind or material are positively objectionable. I do not mean to say that rocking in moderation is hurtful to the infant; yet there can be no doubt that it presents always this inconvenience, that the infant gets speedily accustomed to it, and refuses afterwards to go to sleep without it. But long-continued rocking is ab-

Hosted by Google

solutely hurtful to the child; it has the same narcotic effect upon the system as the juice of the poppy. At first the child is lulled thereby readily enough into a species of forced sleep; but in proportion as the infant gets accustomed to the sensation of rocking, a longer and longer continuance of the operation becomes necessary, until at length even the most violent and incessant rocking fails to effect its purpose; whilst, on the other hand, it tends to heat and excite the child, and to prevent the evacuation of the stools and of the urine. Violent and long-continued swinging and rocking produce, even in adults, many disagreeable symptoms and sensations, such as giddiness, nausea, retching, vomiting, lassitude, etc. Common sense, therefore, ought to tell us that its effect upon tender infants, with their soft, almost still fluid brains, can only be highly injurious.

The child ought accordingly to sleep in a *standing* bedstead, made either of soft or of hard wood, or, better still, of iron bars. The wood of the bedstead should either be left in its natural state or French-polished, but on no account painted with oil-colour or any composition containing turpentine; at all events, a bedstead so painted ought to have been exposed for two or three months continually to the atmosphere, so as to get rid of the noxious emanations of the ingredients composing the paint. As regards the polishing of wooden bedsteads, I must here remark that French-polishers are in the habit of staining the wood by means of nitric acid. Now, this is a most powerful and subtile agent, that cannot fail to exercise an injurious action on the health of the child. Anybody who doubts this, may speedily convince himself of his error, by placing an article of bronze or copper in the vicinity of a piece of furniture stained by means of nitric acid; the metal article will speedily turn black, even though the furniture may have left the shop six months. Care ought to be taken therefore to prevent, at all events, the bedsteads intended for the nursery being stained with nitric acid. Lime-water may be advantageously substituted instead of the acid; but the safest way is to leave the wood altogether unstained.

The most appropriate form of bedstead is that resembling a chest, resting on four legs, and the upper part, to the extent of one-third of the depth, consisting of open trellis-work. The bedstead ought to be of sufficient depth to guard against the possibility of the child's tumbling out over the sides.

The *bedding* should consist of—1, a mattress, loosely stuffed with horsehair, or, better still, of a bed filled with oat-chaff, over this is spread a linen sheet, folded double or fourfold, and upon this is laid a piece of flannel; 2, a flat pillow or bolster, loosely stuffed with horsehair; 3, a cotton coverlet or blanket, lined with cotton. In winter, a very light cover-bed, stuffed with down, may be added; but this must be withdrawn as soon as the weather gets warm again.

On no account should children be made to sleep on feather-beds, since these are much too hot, and impede the free exhalation of the skin, and favour moreover, from the yielding nature of their material, the tendency to curvature of the spine. The bed whereon the infant lies, ought to be horizontal, and only raised a very little at the head part. It must be always kept dry and clean, and ought to be aired every day. If an oat-chaff mattress is used, the stuffing material must be renewed from time to time. Warming-pans should be had recourse to only in the case of new-born infants, and during the winter season.

8. *The Nursery-maid.*—The selection of the person to whom a mother intrusts the care of tending her child or children is a matter of high importance. A nursery-maid or nurse should neither be too old nor too young; twenty-four to thirty years is about the proper age. Young girls are generally careless and thoughtless; old women, on the other hand, are rarely in robust health. Persons of a very advanced age should never be let tend children or carry them about in their arms, since the child may thereby suffer a serious loss of vital power through animal-magnetic influence.

Health, kindness of disposition, sweetness of temper, affection for children, cleanliness and neatness are qualities almost indispensable in a good nursery-maid or nurse.

(*To be continued.*)

THE HAHNEMANN HOSPITAL.

Communicated by the Honorary Secretary.

At the Annual General Meeting of the Subscribers, held at the Hospital, on Friday, April 2, 1852, the following proceedings took place, the Lord Robert Grosvenor, M.P., in the chair.

The minutes of the last Annual General Meeting were read.

The Honorary Secretary then read the following Report:

The Board of Management, in making their Second Annual Report to the subscribers of the Hahnemann Hospital, are pleased to have it in their power to refer to the statistics of the

Hosted by Google

Hospital, not merely as a satisfactory testimony of the benefits which it has been the means of bestowing on the suffering poor, but also of the wide-spreading and increasing knowledge of the homœopathic system.

From the following summary of the statistics it will be seen that upwards of 6047 patients have, since the commencement, been partakers of the benefits of the Hospital treatment, which it is to be hoped will be still fu ther extended.

Total number of patients from commencement	6047
Out-patients from 16th March, 1851, to 16th March, 1852	3966
In-patients from 16th March, 1852, to 16th March, 1852	254
Total	4220

Deduct out-patients left under treatment last year	529	14
Total	3966	254

In the Report of the Board to the First Annual General Meeting, adopted by the subscribers, the objects for which the Hospital was founded were set forth, and the third object was there stated, viz., "to afford facilities to the medical student or inquirer, for obtaining a knowledge of the homœopathic doctrine and practice; at the bedside of the patient; by clinical lectures; and by lectures in the Hahnemann School to be attached to the Hospital, on Homœopathic Therapeutics, and Materia Medica."

The Medical Council, on the 4th March, 1851, resolved, "That those lectures should be forthwith commenced, and delivered at the Hospital at least once a week, and oftener if practicable;" and five clinical lectures were consequently delivered by the officers on the *rota* of March and April, 1851.

Finding that these lectures were discontinued by the succeeding Medical Officers in *rota*, the Board of Management, from July, 1851, sought from the Medical Council the resumption of this important means of communicating medical knowledge, and establishing a medical school.

Being desirous, as laymen, that the whole of the matters connected with these lectures should be supervised by the Medical Council, the Board continued that question before the Council, and it was, from time to time, considered and much discussed by them; and, on the 22nd December, the Medical Council resolved, "That the Board of Management having, on various occasions, heard the opinions of the Medical Council, it be left to themselves to act upon their own judgment in the matter."

In consequence of this resolution, and in pursuance of the recommendation of the Medical Council of 5th November, the Board of Management determined to accept the offers of Drs. Dudgeon and Epps, to deliver lectures on the General Principles and Practice of Homœopathy, and on Materia Medica; and of Drs. Curie and Henriques to deliver Clinical Lectures.

Much earnest discussion prevailed amongst the members of the Medical Council in reference to the establishment of these lectures, but it was satisfactory to the Board to find that the importance of the lectures was admitted by all; yet although the differences pertained to what, in their opinion, was of comparatively minor interest, they regret that, in the warm and earnest minds of some of the Medical Staff, these points were deemed so important as to lead the following gentlemen to withdraw their professional services, viz., Drs. Chapman and Chepmell, Messrs. Hands and Wilson.

However much the Board deplore these differences, they have the satisfaction of assuring the subscribers that their benevolent purposes have been well fulfilled in regard to the healing of the sick and afflicted, and to the promotion of homœopathy.

The Board cannot but express their hope that these benefits will be continued, and that by the establishment of a Medical School at the Hospital the advantages of the system may, and doubtless will, in course of time, be still more widely diffused.

The Board have now to report upon the financial condition of the Hospital, which they regret does not exhibit that favourable aspect which the good effected in it should warrant.

The balance in hand on April, 1851, was	£1337	0	4
Subscriptions and Donations since received	1246	17	5
From the Bazaar has been already received	480	0	0

which has yet to be increased.

And here a grateful tribute of thanks must be rendered to the Ladies' Committee, by whom and through whom alone this welcome addition to the funds of the Hospital has been achieved.

The expenditure for the past twelve months has been, as the Board believes, managed with the strictest economy, relatively to efficiency. It amounts to £2158 18*s.* 7*d.*, and leaves a balance in hand, after all liabilities are paid, of £904 19*s.* 2*d.*

In addition, there are still promised subscriptions and donations not yet received, amounting to £350, which the Board hope will be, before long, remitted to them, and which have, doubtless, been hitherto inadvertently deferred.

If, however, the Hahnemann Hospital is to prosper, the Board can in no respect qualify the expressions in the last Report with regard to the paramount necessity of an endowment fund and a capital fund, and they cannot too

Hosted by Google

strongly impress upon all friends of homœopathy the urgent need of supporting an Institution which in its infancy has already effected so large an amount of good, and which, they trust, is yet destined to extend the blessings of homœopathy over a still larger field: on this subject, while warmly thanking the subscribers for the support bestowed, the Board cannot do better than re-state the concluding paragraph of their last Report, viz.:—

"Still, without a large increase of annual subscriptions, and still more noble donations, the good work cannot prosper; wherefore the Board beg to commend the good Cause to the earnest advocacy and support of every present subscriber, with a humble hope that, under the blessings of the Author of all good, this commencement of a beneficent Institution may be followed by such generous and self-denying contributions as may give it a deep and lasting foundation."

Agreeably to Law V., the twenty-one elected members of the Board now go out of office, and it rests with the Annual General Meeting to choose the same number of non-medical subscribers to be of the Board for the year ensuing.

The Board having availed themselves of the proffered services, *pro tempore*, of Mr. J. J. G. Wilkinson, desire to recommend him for election as one of the Medical Officers of the Hospital.

In conclusion, the Board consider that the warmest thanks of the subscribers are eminently due to the members of the present Medical Staff of the Hospital, as well as to the members who have retired, for their valuable and effective services; the gratifying results of which have been displayed in the daily increase in the number of patients, who have thronged to avail themselves of the assistance so ably and liberally rendered.

To the noble President the thanks of the subscribers are also especially due, for his unwearied attention to the interests of the Hospital, and to the promotion of the Cause which the establishment of the Hospital, it is hoped, will for ever sustain.

It was moved by PHILIP SANDOZ, Esq., seconded by G. H. FLETCHER, Esq., and passed in the affirmative, "That the Report now read be received, and be printed and circulated under the direction of the Board of Management."

It was moved by F. SANDOZ, Esq., seconded by W. A. CASE, Esq., and passed in the affirmative, "That J. J. G. Wilkinson, Esq., M.R.C.S.E., be one of the Medical Officers of the Hahnemann Hospital."

The following gentlemen were then elected members of the Board of Management for the year ensuing:—

W. H. Ashurst, Esq.	Thomas Higgs, Esq.
W. T. Berger, Esq.	T. H. Johnston, Esq.
W. A. Case, Esq.	C.P.Leslie,Esq.,M.P.
J. M. Douglas, Esq.	John Miller, Esq.
G. H. Fletcher, Esq.	Lieut.-Gen. Sir Chas. Pasley, K.C.B.
John Fowler, Esq.	F. Sandoz, Esq.
Jos. Glover, Esq.	W. Stephenson, Esq.
S. Hanson, Esq.	W. Warne, Esq.
S. Sugden, Esq.	C. Wilkinson, Esq.
A. Templeton, Esq.	S. Wilson, Esq., Ald.
Major Tyndale.	

The thanks of the meeting having been voted to the Honorary Secretary, Mr. Warne,

It was moved by the Hon. A. H. MORETON, and seconded by A. P. PHELPS, Esq., "That the formal appointment of Clinical Lecturers by the Board of Management be not approved."

This motion was put, and negatived by a large majority.

The thanks of the meeting were then unanimously voted to the noble President, when his lordship addressed the meeting to the following effect:—

The members of the Board who may have attended at the many discussions which have taken place on the subject which has been principally mooted this day, will confess, that in the position I have the honour to hold, I have endeavoured to keep my opinion to myself; but it does appear to me that the time is now come when, as every one else has expressed his opinion, and the discussion is ended, I also may without impropriety express mine. It has been said that the principles on which the Hospital was founded have been departed from. I regret that the gentleman who made this assertion should have left the meeting before I could have the opportunity of making these few remarks. I remember well when certain gentlemen, among whom were two of those who have lately seceded from the medical staff, called upon me to ascertain whether I was willing to be the President of a Hospital which they had some hopes of establishing; and I recollect saying to them, "But, gentlemen, are you sure that you can let the past be the past, and that the jealousies and prejudices that have so notoriously kept you divided among yourselves, and weakened the Cause, will not again recur; unless you are quite sure on this point, I see not the use of this effort;" and it was only because of their earnest and positive assurances that such should be the case, and that those feelings which have been revived should not be revived, that I consented to have my name associated with the undertaking. I remember, too, that one of the measures contemplated by these gentlemen, and one which they most urgently insisted upon as essential to the broad principle on which the Institution was to be established, was *that the government should be entirely* A LAY GOVERNMENT, altogether independent of medical men and medical influence and interference. I can assure you, gentlemen, that I have given much attention to the subject which has led to division among us, and have read and considered all the documents relating to it with the utmost possible care; and I confess to you, that I cannot agree with the opinion which has been expressed as to the violation of the principles of this Institution by the proceedings of the Board. Had I seen any departure from those principles, I would most assuredly have retired from my position as president. I can, however, trace nothing of the kind, but, on the contrary, I believe that the proceedings of the Board have been fair and right; I fully concur

Hosted by Google

in them, and know of no act of theirs of which I can disapprove. I deplore the secession, which the Board, with the greatest courtesy and kindness, endeavoured to avert, and I can throw no blame on the Committee as the cause of it. What they have done I consider right; and although one result may be some loss to us for the present, if the same comprehensive principles are kept to, I hope next year that we shall be found to have recovered from it, and have outlived the unpleasant effect of the present proceedings.

The meeting then dissolved.

[Our readers will, no doubt, be pleased to have, in addition to this statement furnished us by the Honorary Secretary, a full abstract of the report of our own Reporter.—ED.]

Another Report, being a full Abstract from a Verbatim Copy of Notes furnished by a Short-hand Writer.

A General Meeting of Subscribers of the above Institution was held at the Hospital, 39, Bloomsbury Square, on Friday, April 2, 1852, Lord R. GROSVENOR in the chair.

The SECRETARY read the minutes of the last general meeting.

The CHAIRMAN, in opening the business of the meeting, spoke as follows:—Gentlemen, it becomes my duty, as President of the Hospital, and as chairman of the present meeting, to open and commence the proceedings of this day, and I will do so by making a few, and a very few, preliminary remarks. The time has now arrived when it becomes necessary for those to whom you last delegated the management of this undertaking to give an account of their stewardship, and also to ask your directions with regard to its future management. The general summary of what has taken place will be given to you in the Report which will shortly be read; and also it will give you an account of the most interesting and prominent events which have taken place during the past year. Generally speaking, I think it inexpedient for the chairman to allude to any of the details of a Report, partly because, in so doing, he might be apt to give a partial view of the subject, which will come before you by means of the Report itself in its full detail. I shall consequently not attempt to call your attention to any portion of the Report, but allow it to speak for itself. Unfortunately, however, circumstances have happened which will not now be brought before you for the first time, but circumstances which unhappily have become matters of notoriety; and, also, a circular has been sent round to the various subscribers of this Institution, signed by four members of the Committee of Management, stating that it is their intention to move a vote, calling in question the conduct of the committee to whom you delegated your authority last year. It is necessary for me to say one or two words on this subject, and I shall trespass on your time for a very short period. Now, what I wish to say is this, certain acts were done by the managing committee, which have led to the resignation of four gentlemen who this time last year were a portion of our medical staff. That act of resignation was acquiesced in most reluctantly by the Committee of Management; but, however, as unfortunately that determination was persevered in, I can now only allude to them as four gentlemen who are no longer on your staff, but who formerly formed a part of it. Now as these gentlemen, at least one or two of them—I do not know exactly how many—but as Mr. Wilson is here, and as some others may be here who may desire to say something on this subject, and as I also stated before, that some gentlemen are about to make a motion calling in question the conduct of your committee, I mention these circumstances for the purpose of giving weight to the appeal which I am now going to make to the gentlemen composing this meeting; namely, to make a request that any gentleman in the course of his address to this meeting will have the kindness to address himself to me as the chairman; in the next place, that he will do the utmost in his power to avoid using any irritating expressions or any personalities of any description; and lastly, that those who are here will give as patient attention as they possibly can to all that may be be said in contravention of what may have been before stated. I am quite sure I shall not make this appeal in vain. I feel certain that our business on this occasion will be conducted with calmness and good temper, and I can only express a wish in the language which is familiar to all those who attend the early part of the meeting of the House of Commons when our prayers are said, that laying aside all private interests, prejudices, and party affections, the result of our deliberations may tend not only to the permanent maintenance of this Institution, but also that it may be very largely extended in that direction which we all desire, because we conceive it to be a matter of the utmost importance not to ourselves only, not merely to the interest which any one of us may have as regards ourselves, our families, or our friends, but we consider it to be the means, and it certainly will be if we are able to continue and extend it, under Divine Providence, of conferring a lasting benefit on the country to which we belong, as well as to mankind at large. Having, I hope, not transgressed the boundaries that I set myself, I will now call on the Secretary to read the Report.

Mr. WARNE, the Secretary, then read the Report, and also the statement of the receipts and expenditure, and the statement of the number of patients.

Mr. P. SANDOZ said he had great pleasure in proposing a motion to the effect—"That the Report now read, and the acts and proceedings of the Board of Management be approved and confirmed, and that the Report be printed and circulated under the direction of the Board of Management." The Report that had been read was not quite so satisfactory in one respect as he should like it to be, he alluded to the small balance in hand; but that was a matter that did not come within the control of the Board of Management, it was one of those things that they could not help directly, but

Hosted by Google

which they hoped to be able to improve by further assistance.

Mr. G. H. FLETCHER seconded the motion.

The CHAIRMAN.—Before proceeding any further, Mr. Moreton is going to move an amendment to that proposition; but I wish the meeting to take this into consideration—I never knew of such a phrase as this being used in a motion of this kind; "that the acts and proceedings of the Board of Management be approved and confirmed." Now, I understand the position in which we stand to be this, that the subscribers delegate their authority to a certain body, who, not all being able to transact the business at once together, delegate it to a smaller body to have it properly transacted, but in order to make them responsible for their acts, they delegate it only for a certain time, and at the end of that time they are called to account for the acts which they have done. During the year the authority of the subscribers is represented by the Board of Management, and after the expiration of that time they have to account to the subscribers. When the time comes round for holding a public meeting, the Board of Management do not appeal to the subscribers for any confirmation of what they have done, except indirectly, in this way—the subscribers can turn them all out if they do not choose to continue them, and that is a sufficiently conclusive hint that they are not satisfied with the conduct they have pursued; but I think it is not only very unusual to proceed in this way, but that it is also informal.

Mr. F. SANDOZ merely wished to say a few words on the question of order. He thought it was a very common thing that the Board might report their proceedings at an annual meeting, and a motion might be put that the Report now read be received and approved, where, as in this case, circumstances are related which actually call on the subscribers for the expression of their opinion; the words might perhaps be surplusage, but he contended that it was in the breast of the mover whether he would simply say that the Report be received, or if the word "approved" was wished to be added, it might be in the breast of the seconder.

Mr. PATERSON addressed the meeting in opposition to the motion.

The CHAIRMAN.—I am entirely in the hands of the meeting in this matter, but I still hold the same opinion. I think it is very unusual, and not an orderly mode of proceeding; I think you should merely move that the Report be received. If any gentleman has an objection to that Report being received, he may state it. I do not think it would be wise to put these words in. If the meeting are of opinion that they had better remain in, I must of course bow to their decision; but you do not appeal for confirmation of your acts at all in any other way than by resigning your office, and being elected again or not. I mention it simply for the sake of order. Unless you have a special rule to the effect that the acts of the Board of Management shall not be considered as binding and valid till they are confirmed by a general meeting, then I can understand the object of your motion. You have made a Report, and the question is whether that shall be received, printed, and circulated in the usual form. I had better put it in this shape, that the Report now read be received, and printed, and circulated, under the direction of the Board of Management.

Mr. F SANDOZ said, if the four gentlemen who had given notice of their intention to move an amendment to the resolution, would shape it accordingly, it might do; for the notice of resolution to be put as an amendment was "that the formal appointment of clinical lecturers by the Board of Management be not confirmed."

The CHAIRMAN.—That resolution cannot be put.

Mr. F. SANDOZ said, with that understanding, he was perfectly satisfied to leave it in that shape; and he would move that the Report be received in the words that his lordship proposed.

Mr. FLETCHER seconded the motion.

The CHAIRMAN then put the motion in the form last proposed.

The Hon. A. H. MORETON rose to make some observations on that part of the Report wherein it is stated that the Board of Mangement "accepted the offers of Drs. Curie and Henriques to deliver clinical lectures." He stated that this was not exactly consistent with the fact, for these gentlemen *offered themselves as lecturers in answer to an official advertisement as candidates for the clinical lectureships*. Their offers were accepted, and they were appointed *clinical lecturers* to the Hospital. They returned, in writing, thanks to the Board of Management for their appointments; and, in consequence of these appointments, four medical officers of the Hospital resigned. Let it be remembered, that it had been frequently stated that if clinical lectures were given by any gentlemen simply in virtue of their office without any specific title, no objection would be made to any appointments of any gentlemen as medical officers for in-door service. It was notorious to all that there had been a considerable difference of opinion among the members of the Board of Management; it therefore appeared to him absolutely necessary that the opinions of the subscribers to the Hospital should be taken on this subject. He acknowledged that it was a disagreeable necessity; but the difference of opinion, which appeared at first sight to be trifling, was really of importance, namely, whether the gentlemen giving clinical lectures should be called the Clinical Lecturers of the Hahnemann Hospital, or whether they should simply deliver their clinical lectures as medical officers of the Hospital, without any title or distinction being conferred on them. No doubt it would occur to many people that it was a mere matter of moonshine under which term they deliver their clinical instruction, and he confessed that at first he attached very little importance to it. It was not until three letters were received by the Board of Management from Drs. Chapman and Chepmell and Mr. Wilson, stating that they considered the Board were raising certain members to a higher eminence than others, and that it would give great

Hosted by Google

dissatisfaction to the medical body, and be injurious to the interests of the Institution, that he became aware of its importance. It was on that ground that he voted against the appointments, and supported an amendment, which was moved, "that clinical lectures should be given by the medical officers without any distinction whatever." The amendment was, however, unfortunately lost, and the consequence was that four of our medical staff thought it their duty to retire, and he feared that more deplorable consequences would follow, if the Board persisted in the course they had adopted; he for one could not continue his support to the Hospital. Perhaps, to obtain a clear view of the subject, it would be most convenient to go through the different transactions that had taken place on the subject of clinical lectures. First, one of the purposes for which the Hospital was founded was to give instruction to medical pupils. Next, lectures were given by Messrs. Curie, Henriques, and Hamilton, medical officers of the in-patients. Next, in their turn, Drs. Chapman and Chepmell and Messrs. Wilson and Hands became medical officers of the in-patients. The printed Report states that these gentlemen refused to give any clinical lectures. Mr. Moreton observed that, though true as to formal lectures, it did not appear to him to give a fair representation of the state of the case, and he begged to read a letter that had been read at the last meeting of the Board of Management:—

"To Dr. Chapman, Dr. Chepmell, Mr. Wilson, and Mr. Hands.

"Gentlemen,—You will readily believe that we the undersigned students of homœopathy have been intensely and anxiously waiting the result of the misunderstanding which has lately arisen between the Board of Management and the Medical Council of the Hahnemann Hospital.

"Into the merits of the case we would not presume to enter. As respects ourselves, we cannot for a moment entertain the idea of your withdrawal as medical officers of the Hospital without the deepest regret.

"We beg to acknowledge with gratitude that we have at all times received from you every aid, assistance, and instruction in the study of homœopathy; and we earnestly hope any differences of opinion leading to your resignation may not be of so insurmountable a character as to deprive us of your clinical instruction; on the contrary, we trust you will conceive the true noblenese of duty to consist in making sacrifices in behalf of the educated spread of homœopathy by your disciples, as well as the welfare of the numberless patients who seek to avail themselves of your treatment.

"We remain, with every feeling of respect and esteem, "Gentlemen, yours obediently,

"George Rogers, M.D., M.R.C.S., L.A.C.
A. E. Blest, M.D., M.R.C.S.L., *Retired List, Madras Army.*
S. Wielobycki, M.D., L.R.C.S.E., *Practitioner of Homœopathy.*
John Anderson, M.R.C.S.L., L.A.C.
F. L. R. Suss Hahnemann, M.D., *Surgeon-Accoucheur.*
David McDonnell Reed, Licentiate of Medicine, M.R.C.S.E., *Practitioner of Homœopathy.*

"Hahnemann Hospital,
"22nd January, 1852."

The Board of Management next sent a circular to the twenty members of the Board of Management, asking the opinion of each of them "as to the present system of medical officers of the Hahnemann Hospital with special reference to the delivery of clinical lectures," etc. Of the twenty, fifteen returned answers; two of these were of opinion that clinical lectures should be given by professors; the remaining thirteen thought that medical instruction should be given by the medical officers of the Hospital without appointment or title of any sort. Next we come to a joint meeting of the Medical Council and Committee of Board of Management, at which it was agreed that "clinical lectures on medicine and surgery should be established, and that two medical officers should be selected for that purpose." The Board of Management then advertised for candidates to fill these offices: only two candidates offered—Dr. Curie, for the clinical lectureship on medicine, and Dr. Henriques, for the clinical lectureship on surgery. These offers were referred to the Medical Council for their approval on December 15th. The Medical Council declined recommending them, but resolved instead that the Council, having considered the subject submitted to them by the Board, are of opinion that the previous scheme for appointing lectureships should be modified, and instead of appointing lecturers, the medical officers of the in-patients should be bound to give lectures; no title to accompany the giver of such lectures. They then adjourned the subject for confirmation to another meeting, and directed that those members who could not attend should be requested to forward their views in writing. At the next meeting letters were read from five absent members, all being in favour of lectures by simple physicians, without any appointment of lecturer. The Council then resolved that "the Board of Management having on various occasions heard the opinions of the Medical Council, it be left to themselves to act upon their own judgment in the matter." The honourable gentleman observed that he thought that was the most sensible resolution the Council had come to, as the Board of Management had lying upon their table the written opinions at length of fifteen out of twenty of the Medical Council; that it appeared to him that by letters was the only way to really ascertain the sentiments of the Medical Council upon any important question, as they were a body scattered over Great Britain; one was in Edinburgh, another in Bristol, another in Brighton, and so on. A question, however, had arisen, whether the Medical Council should be considered as having decided in the manner represented in the Report; for if any weight was to be given to the written opinions of absent members, as was resolved at the prior meeting, who were all in favour of confirming the former resolution, the former resolution must be considered as confirmed. He, however, thought

Hosted by Google

it of very little importance whether they confirmed the last meeting, which was against having any appointed clinical lecturers, or referred the Board of Management to the recorded opinions of the members of the Medical Council, which were as thirteen to two against the appointment of medical lecturers. The next point he called their attention to was a special meeting of the Board of Management, called to appoint lecturers. At this meeting letters were read from Drs. Chapman and Chepmell and Mr. Wilson, objecting to the formal appointment of clinical lecturers, as placing certain medical men in a position of superiority over their fellows, as creating discontent amongst the medical officers, and being likely to do much injury to the Hospital. Acting upon the advice contained in these letters, and considering these appointments as quite unnecessary, he voted against them. Immediately the resignations of Drs. Chapman and Chepmell and Messrs. Wilson and Hands, as medical officers of the Hospital, were sent in. The minority of the Board of Management, considering that this schism in the Hospital was very injurious and quite unnecessarily brought on, called a special meeting, to try to induce the Board of Management to reconsider their decision, it now appearing clear that these medical titles were considered of very high importance. The four medical gentlemen resigned because they considered that it gave the medical men holding these offices a superiority over the others of the medical staff; and in the honourable gentleman's opinion, the Board of Management conferred these titles upon these medical gentlemen for the purpose of giving them a superiority over other medical men. (Cries of "No, no.") He then stated that at the special meeting held to consider this question, he had distinctly stated that if these same gentlemen would give these same lectures to the same audience, simply as medical officers of the Hospital, with the sanction of the Board of Management, without calling themselves the Clinical Lecturers of the Hospital, their opposition would be at an end, and they would be satisfied. The case then stands thus: these gentlemen were appointed clinical lecturers to the Hahnemann Hospital by the Board of Management, after thirteen out of fifteen members of the Medical Council had declared these appointments unadvisable; after they knew that these appointments would occasion the resignation of one-third of their medical staff, and thus appointed these two individuals to these two offices without their having been recommended to them by the Medical Council, or by any part of the same, either directly or indirectly. From the time that they first apprehended a danger of schism, he (Mr. Moreton) and those that acted with him had used all the exertions that they could to avert it; from the time of the first warning that they had, from the letters sent to the Board of Management, up to this time when the subscriptions have fallen off, as compared with last year, to the amount of some hundreds of pounds, they (the minority of the Board of Management) feeling confident that they have acted for the benefit of the Hospital to the best of their judgment, offer the following resolution for your approval: "That the formal appointment of Clinical Lecturers by the Board of Management be not confirmed, but that, in accordance with the written opinions of the majority of the Medical Council, clinical instruction and lectures be given by the physicians and surgeons of the Hospital, without title of any sort."

A SUBSCRIBER suggested that they had better receive the Report, and then let Mr. Moreton's motion come as a substantive motion.

The CHAIRMAN.—Mr. Moreton can either move the omission of the paragraph in the Report which he objects to, or he may bring his own motion forward in an altered form, after the Report has been received and before any re-election of the Committee of Management takes place. He might then move it somewhat in this way: "that the appointment of clinical lecturers in this Hospital is not in accordance with the written opinions of the majority of the Medical Council."

The Honourable A. H. MORETON.—I consent to withdraw my motion at present, upon the understanding that it is to be entertained after the Report has been received.

Mr. F. SANDOZ asked if his lordship would now put the motion for receiving the Report.

Mr. GILL.—Before that is done, allow me to speak to the motion. I regret that I cannot consent to the reception of that Report in its present form. I object to the wording of that portion of it which relates to the recent establishment of clinical lectures by the Board of Management. I made the same objection in committee, and feel bound to state my reasons to the subscribers. The paragraph I allude to is so worded as to convey to every reader the idea that the offers of two gentlemen to deliver clinical lectures at this Hospital have simply been accepted by the Board of Management. If this were the fact, it would be a matter of deep congratulation; but I am sorry to say that this paragraph does not represent the true state of the case, but is rather an ingenious misrepresentation of it, as I shall presently prove to this meeting. I hold in my hand a paper printed by order of the Committee of Management, or at least averred to be so, which gives notice that clinical lectureships have been established in this Hospital, and that Drs. Curie and Henriques are the two appointed lecturers. How, then, is the statement in this paper to be reconciled with that in the paragraph of the Report? Why, the two cannot be reconciled; for there is a wide difference between accepting an offer to deliver lectures made by one of the physicians or surgeons on duty, and a special appointment to a formal lectureship. I say there is a wide difference; for in the one case any member of the medical staff might offer and obtain an equal share of audience and attention; whereas, in the other, a specific and very conspicuous pre-eminence is conferred upon the person appointed; for I believe it is only usual to confer the chair of clinical lecturer in a Hospital upon those who have attained to considerable renown in their profession. Now, my lord, although the Report does not say as much, such appointments have been made in this Hospital by the

Hosted by Google

Committee of Management, and that too without the sanction of your Medical Council. These appointments are contrary to the principle of equality upon which the Hospital was established, and have been strongly opposed by those who are desirous of maintaining that principle in its integrity; and I suppose it is for that reason that they are only alluded to in the Report in the ambiguous manner which I have pointed out. But the framers of that Report well know, however they may attempt to pass over the fact in silence, that the "offers" of Drs. Curie and Henriques were offers of candidateship for the honourable post of Clinical Lecturers; that the appointments are made, and the gentlemen appointed consider themselves as formally in office; and that their office clothes them with a dignity, as well in the eyes of the profession as of the public, which they did not possess before the Committee of Management conferred it upon them by these appointments. I will not now stay to point out the disastrous effects of the course adopted by the Board in this matter, they are unhappily too evident, if, indeed, you have yet experienced all you will have to experience; but I cannot forbear to express my surprise, if the principle of medical equality was in any case to be departed from, that the Board of Management should have taken upon themselves to prescribe when and in favour of whom that departure should be exercised. It would have been more seemly, if a chief physician must be elected, to have left it to the Medical Council to determine who of their number should be so honoured. I have only to add, that I consider the Report in its present form, as far as it relates to clinical lectures, as totally untrue, and calculated to mislead the subscribers; and, as a member of the Board of Management, from which it is supposed to emanate, I entirely disavow it, and must vote against its reception.

Mr. F. SANDOZ replied to the observations of Mr. Gill, to the effect that the statements in the Report were not true. He asked, should this be considered as a question of confidence or no confidence in the Board of Management, whether they should be trusted or mistrusted; and he would say for himself that he should not have the honour of serving them again at the Board of Management. His feeling was this: he would work, where there was labour, with all his heart, but where there are enmity, jealousy, or malice, never; and he for one should back out. But he would ask the meeting to confirm the past, and upon this one fact, that the Board had had no view whatever but the general good. He should therefore vote for the reception of the Report.

The CHAIRMAN said, it had been moved by Mr. Moreton, and seconded by Mr. Gill, that this Report be not received.

Mr. F. SANDOZ understood the question was, receive or not receive, without any amendment at all.

The CHAIRMAN.—They have stated their reasons, that it does contain matter which is not matter of fact. Does any gentleman wish to address the meeting on that subject?

Mr. ASHURST said, he must say a word or two, in consequence of Mr. Sandoz having spoken of malice existing on the part of those gentlemen who had opposed them. He (Mr. Ashurst) was a member of the Board of Management, and had had frequent opportunities of judging of the conduct of those gentlemen, and he felt bound to say that it had always been characterised by the utmost candour, courtesy, and fairness; and although he was opposed to them in the view they had taken on this subject, he believed that they were acting from conviction and upon principle. He felt that the duty of the Board of Management, as laymen, was to take counsel. They had their attention called to the up-coming of the science of homœopathy; they felt that it would be best spread through the means of clinical instruction, and it was most important that those who were competent should be induced to give it. It was agreed that there should be clinical lectures. They found that that was discontinued, and they called the attention of the Medical Council to it. For six months they had kept that question before them, and he thought it mattered little whether they were or were not called lecturers, inasmuch as anybody who heard of a lecture would necessarily consider the person so delivering it a lecturer, whether he had that title or not.

Dr. EPPS then addressed the meeting in favour of the appointment of lecturers, contending that a great distinction ought to be made between those medical men who had devoted the greater part of their lives to the prosecution of their studies in order to attain the summit of their profession, and those who were considerably their juniors in years and experience.

The CHAIRMAN then put the question, that this Report be now received, which was carried by a large majority.

Some conversation here ensued, which resulted in four of the gentlemen who opposed the reception of the Report announcing their wish to retire from the Committee of Management.

Mr. G. P. NICHOLS said, it was a great pity there should be any misunderstanding—he meant with respect to the gentlemen who had retired from the Committee of Management. It ought not to go before the subscribers and the public that there was anything like internal dissension; and he was quite sure that if those gentlemen would continue their places at the Board, it would give great satisfaction.

Mr. GILL would say a few words in answer to the gentleman who had last spoken. The difference which existed between himself and colleagues and the rest of the Board of Management was not so slight as was thought; it was a difference which went to the foundation of the whole constitution of the Hospital. He would mention that another hospital had existed in London for some time previous to the establishment of this. That hospital had been so exclusive in its appointment of medical men as to cause many gentlemen to be excluded from its medical staff, and this Hospital was established to give those gentlemen who were so excluded the opportunity of displaying those talents

Hosted by Google

which Dr. Epps had so eloquently dilated upon It was the express condition upon which this Hospital was founded, that there should be a medical equality. He contended that the appointments recently made by the Committee were a direct breach of that condition, inasmuch as they do establish what Dr. Epps had allowed to be a medical superiority. Now, whether the principle of medical equality was a tenable one or not, was not the question. If his opinion were asked he should say it was not; but so long as subscribers paid their money on the faith of that system being acted up to, it was most improper to infringe upon it. For his own part he could not conscientiously be a party to it, and should not only retire from the Board of Management, but withdraw entirely from the Hospital as at present constituted; for even if the principle of equality were dispensed with, he could not approve of the system adopted by the Committee of appointing their chief officers without the sanction of any medical council, thus depriving the public of the only guarantee of their efficiency which could be of any value.

Lieut.-General Sir C. PASLEY bore testimony to the great benefits of homœopathy as experienced by himself and a member of his own family.

Dr. CLARK said, the object of this Hospital was to benefit the poor, and not to benefit any particular class of medical men, and if any gentlemen withdrew their subscriptions, they were not withdrawing them from the medical officers but from the poor, for whose benefit it was applied.

Mr. GILL explained, that he thought it a doubtful benefit to the poor, submitting them to treatment in a hospital whose medical men were appointed not by the vote of a medical council, but without the sanction of that body, through private influence in the Board of Management, which was composed of laymen. The poor should not want what he could afford to give them, but he would take care to subscribe it to an Institution scrupulous in the execution of the trust confided to them.

The CHAIRMAN said, the proposition now was, that the former Board of Management be re-elected, with the exception of five gentlemen who retired.

This having been agreed to,

The CHAIRMAN put the question, whether certain specified names should be substituted for those who had retired, which was carried.

The proposal for the temporary appointment of Mr. Wilkinson as medical officer of the Hospital was also carried.

The CHAIRMAN.—Gentlemen, Mr. Moreton wishes to have his motion regularly put from the chair.

This announcement was received with loud expressions of dissent.

Mr. MORETON arose, and complained that he had temporarily withdrawn his motion, on the condition that it should be so put; but the noise was so great, that his remarks were inaudible, and the honourable gentleman was ultimately obliged to sit down.

The motion of the Hon. A. H. Moreton was then put and negatived.

Dr. EPPS proposed a vote of thanks to the Honorary Secretary, Mr. Warne, which was seconded by Mr. ASHURST, and carried unanimously.

Mr. WARNE returned thanks.

A vote of thanks to the Chairman was next proposed, and carried unanimously.

The CHAIRMAN. — Gentlemen, I have to thank you, and shall do so as briefly as possible. I will for one moment refer to what took place at the commencement of this Institution, when I was requested to preside. I said, "If I do endeavour to render what services I can, will you promise me that all professional jealousies shall be laid aside; that you will not suffer irritating questions to arise; that you will submit to be governed by the majority; and that we shall all really unite together, heart and soul, to carry forward this good work?" They said, "We will promise you that." And I added this. I said, "Depend upon it, if you do allow them to interfere, you will only be giving yourselves trouble in vain, and the superstructure you are attempting to raise will be based on a rotten foundation." In that assurance I undertook the office which I have the honour to hold, and I did expect that, after those solemn assertions, great forbearance would be shown by all the medical officers. I want to reconcile everybody, if I can. I did foresee that, unless people came frankly to the scheme, it would be impossible to carry it out. The principle upon which the Hospital was established was this: that there should be no medical clique—that no person should become a member of the medical staff who should assume any superiority or direction. Why, what was the cause that gentlemen left the other Institution? It was the independent cause, that it should be a board of lay management. Now, I have perused the minutes of this committee with the greatest attention, and I declare that, if that principle were violated, I would give up my office of President; but as I consider that that principle has not been violated, I cannot conceive the extraordinary objections that have been taken. I cordially concur with the Board of Management in the proceedings they have taken; and I do so for this reason: the immense sacrifice of time, the great patience and courtesy with which they followed up their resolution, and the forbearance which they have shown, excited a great feeling of satisfaction on my part. If they had not shown those feelings, I may appeal to those who know me, whether they think it likely that I would have supported them? That being the case, I deeply regret this secession, and these unfortunate differences; but I cannot accuse the Committee of Management of having done anything to contribute to it. My belief is, that they have done every single thing in their power; they have acted honestly, honourably, and impartially. I do not blame the gentlemen who differ from them in supporting their own opinions, they are perhaps quite right in thinking as they do; but I am very sorry that they should think it necessary to

Hosted by Google

withdraw, that they should let it go forth to the world that there are dissensions amongst us. But although this may cause us some damage and loss for the present, I hope, and I am quite sure, that if a well-principled course is pursued, that next year we shall find we have survived it, and are not at all in bad odour wth the public.

The meeting then separated.

THE
HOMŒOPATHIC TIMES.

SATURDAY, APRIL 17TH, 1852.

THE HAHNEMANN HOSPITAL.

WE have before us the report of the proceedings at the Annual Meeting of the Hahnemann Hospital, furnished by the Honorary Secretary; another report, of much greater length, with the speeches that were made, being an abstract of full notes taken by a short-hand reporter; and we have, in addition, Mr. WILSON'S letter to the governors and subscribers, which, to our mind, conclusively settles the question.

The circumstances that led to the secession of some of the members of the Medical Staff are to be regretted, for the sake of a public Institution, that was commenced under such flourishing auspices.

The whole case lies in a nutshell. The Hahnemann Hospital was founded for the treatment of patients on the homœopathic principle; the Medical Officers were to be on a footing of perfect equality, touching their *status*, being subject only to the natural and inevitable inequalities of differences in industry, talent, and attainments; furthermore, the Board of Management was to be guided by and act according to the advice of the Medical Council in all "medical arrangements."

At the public dinner of 1851, the first open disturbing cause, in our opinion, arose, in the glorification of one medical officer by several of the speakers, and by the noticeable fact, that the noble chairman volunteered as a toast the health of that individual — thus emphatically designating him as the head and chief of the Medical Staff.

It was afterwards frequently debated whether or no there should be a Medical School. The majority of the Medical Council recommended that lectures on the Principles and Practice of Homœopathy should be given, and also on the Materia Medica. They further recommended that clinical instruction and lectures should be given.

After many discussions, the whole question of clinical lectures was referred back to the Board of Management, with the obvious intention that they should collate the votes of the Medical Council, and come to a decision in accordance with the advice of the majority of that Medical Council, which was, that clinical instruction and lectures should be given, but without any title of Clinical Lecturer or Professor.

The Board of Management, however, appointed two lecturers on the Principles and Practice of Homœopathy and on the Materia Medica, to which the Medical Council made no objection; but they also appointed two Clinical Lecturers or Professors, *with the title*, in direct opposition to the advice of the majority of the Medical Council.

There were other signs and tokens also of the elevation of the individual Medical Officer, already indicated, to the foremost and pre-eminent station of representative of homœopathy in the Hospital; while his superiority in intellectual and moral fitness, as well as in medical science and professional skill, was not allowed by the great majority of his colleagues.

The Medical Staff originally consisted of twelve, but was by this time reduced to ten, by the resignation of one and the absence abroad of another of its Medical Officers.

Of these ten, *four* at once resigned their medical appointments, and two others joined them one day in the act of resignation, but withdrew their signatures the day following, on a pretext explained in Mr. WILSON'S letter.

At the Annual Meeting a proposition was made to reconsider the appointment of Clinical Lecturers or Professors, but was

Hosted by Google

rejected by a great majority of the governors and subscribers present, who also refused that *proxies* should be taken as votes, all of these having been sent for the withdrawal of the obnoxious titles.

We believe that the majority of the Medical Council was right, and the majority of the Board of Management was wrong, in the matter of dispute between them. We presume that the members of the Medical Council who constituted the majority will resign their appointments; and that the four members of the Medical Staff who have resigned their medical appointments, will withdraw altogether from the Hospital.

We think the two Clinical Lecturers or Professors who maintained their pretension and claim to an invidious title, in opposition to the majority of the Medical Council, and the Board of Management which decreed in opposition to the advice of that majority, cannot be aequitted of blame in causing this disruption in an Institution so young, founded on such comprehensive principles, and capable of such future good to successive generations of the dwellers in the metropolis.

We satisfy ourselves with this concise *résumé* of the proceedings, and with the few remarks we have made. Our readers can judge for themselves, and to their judgment it may be left to acquit or condemn those who have seceded—or those who have in a manner, as we think, compelled that secession; especially when they consider that it is known that peace may have been preserved, and the disruption in the Hospital prevented by the withdrawal of a claim to an invidious title on the part of individuals, and by the concession of the Board of Management to the declared opinions of the majority of the Medical Council.

THE NORTHERN HOMŒOPATHIC MEDICAL ASSOCIATION.

THE first meeting of the Northern Homœopathic Medical Association was held in the Homœopathic Dispensary, Leeds, on the 11th of March. The following gentlemen were present:—Drs. Irvine, Ramsbotham, Ransford, McLeod, Cameron, Wright, Craig, Johnson, and Atkin; Messrs. Phillips, Holland, Pearce, Brady, and Booth. Mr. Spencer Hall and Mr. Turner were present as visitors.

Letters of apology for unavoidable absence had been received from Drs. Drysdale, Hilbers, Russell, Sutherland, Dunn, McDowal, Norton, and Tuckey; Messrs. Moore, Scholefield, Harrison, Sharp, J. J. Grey, and Pope.

Dr. Irvine, who had acted as chairman at the preliminary meetings, took the chair, and proposed Mr. Phillips as president; this motion was seconded by Dr. Ramsbotham, and unanimously agreed to.

Mr. Phillips having taken the chair, and made some preliminary observations, Dr. Atkin, the general secretary, read the minutes of the preliminary meeting.

The following rules were agreed to, and adopted as the rules of the Association.

1. The Association shall be called the Northern Medical Homœopathic Association.

2. The Association shall be composed of qualified medical practitioners.

3. The Association shall meet at least half-yearly, in some town in Lancashire or Yorkshire.

4. At each meeting the time and place of next meeting shall be appointed.

5. Each meeting shall choose a chairman, who shall hold the office and title of president until the next meeting.

6. The Association shall have two secretaries: a general secretary, to be chosen annually, whose duties shall be to preserve the records of the Association, minutes of meetings, etc.; and a local secretary, to be chosen at the preceding meeting, to assist the general secretary, and make the requisite local arrangements for the meeting.

7. The meetings shall be regulated by such laws as always govern public meetings, and five members shall be necessary to constitute a quorum at any meeting.

8. Each member shall pay an annual subscription of five shillings, to be paid to the general secretary, at the first annual meeting each year.

9. The business of the meeting shall consist of communications on the progress of homœopathy, practical papers, and descriptions.

10. Gentlemen desirous of becoming members of the Association, must transmit their names, with a recommendation signed by two members of the Association, to the general secretary, a month before the meeting. The application and recommendation shall be circulated with the notices; and the admission shall take place by ballot at the next meeting; a majority of two-thirds of the members present being necessary for election.

11. No alteration nor addition to the rules of the Society shall be considered, unless notice of the proposed alteration or addition shall have been given to the general secretary a month before the meeting.

In addition to these, it was proposed that the Association shall have the power of expelling any member who shall have been guilty of a breach of professional etiquette. After some discussion, the consideration of this rule was postponed to the next meeting; and Dr. Cameron was requested to prepare a draft of the rule.

It was moved by Dr. Irvine, seconded by Mr. Pearce, and unanimously agreed, that all who, by paying their subscriptions before the end of April next, afford proof of their intention of joining the Association, shall be considered original members.

A letter from Mr. Harrison was read, calling the attention of the Association to Clause xxvii. of the new Medical Reform Bill, prepared by the Provincial Medical and Surgical

Hosted by Google

Association. Messrs. Phillips, Holland, and Dr. Atkin were appointed to watch over the progress of the bill, and to take such measures as they may deem requisite for the protection of the interests of homœopathic practitioners.

Dr. Craig read an account of his proving of *Cotyledon Umbilicus*, and also some cases in which it had been used successfully. Several members took part in the discussion which followed; and the thanks of the Association were given to Dr. Craig for his interesting communication.

The next meeting was appointed to be held in Huddersfield, on Friday, 2nd July, at half-past two p.m. Dr. Ramsbotham was appointed local secretary.

The thanks of the Association were given to the committee of the Leeds Dispensary, for the accommodation they had afforded the Association, and to Mr. Phillips for his conduct in the chair.

The members dined together in the evening.

CASES.

CROUP FOLLOWED BY BRONCHITIS.

February 21st, 1852. T. G—, æt. 3½, a stout, healthy boy; was quite well up to last night, when he was attacked about midnight with a hard, dry, croupy cough. Both he and his sister have been subject to attacks of croup, particularly during the prevalence of north-easterly winds, which were now very piercing; the attacks have generally yielded to emetics of *Ipecacuanha Wine;* in this instance, however, the disease rapidly increased, and the cough and breathing became much affected towards morning. I saw him at eight a.m., and finding no fever upon him, prescribed *Spongia* 3, gr. j, 3tiis horis. I was called to see him again, at half-past two p.m., and found that he had been much worse since the morning; his pulse was now 132; respiration 36, loud and harsh; constant cough, hoarse and ringing; great restlessness; constant putting of the hand up to the throat; short slumbers during the remission of the paroxysms of coughing; face red and bloated.

℞ T. Aconit. 3, ♏ ss.
T. Spongia 3, ♏ ss.

To be administered every two hours alternately.

The disease continued to increase during the next hour, and the medicines were ordered to be administered every half-hour.

Evening, half-past nine. Better decidedly; there has been no violent return of the cough, which is still loud and harsh, but more inclined to loosen; respiration not so loud; pulse 128; respiration 82. Continue.

February 22nd. The cough was rather worse from eleven p.m., till two a.m; after two, however, he fell asleep, and did not awake till seven a.m. He is much better this morning; there is no noise during respiration, and the cough, though resonant, is loose; he is cheerful and active; skin quite cool; pulse 108.

℞ Hepar Sulph. 3, gr. ss.; 4tis horis.

23rd. Was restless and feverish through the night; coughing very much, but without any croupy sound. Much better this morning; running about down stairs, and very cheerful; some rhonchus on breathing. Continue.

Evening, about three p.m. Much hard, dry cough came on, and he became hot and uncomfortable; larynx entirely unaffected; has probably caught cold, in consequence of imprudent exposure during the morning; pulse at present quick. He is very restless and hot.

℞ T. Aconit. 3, ♏ ss.

Occasionally through the night.

24th. Passed a very bad night, sleeping but little; rambling occasionally; skin burning hot, and dry; occasional hard, dry cough, during which he complained of pain in the chest and head. Towards morning he beeame better, the cough got looser, and was attended with less pain; he slept more quietly, and the skin became moist; there is now much nasal coryza, with some headache; has had a warm bath, which has much refreshed him; bowels relieved; after the bath, he slept five hours, coughing but very little; much better to-day; skin cool; no thirst; cough looser, with a little headache and slight wheezing in the chest; pulse 115.

℞ Spongia and Belladonna, alternately every two hours.

25th. Rather feverish and restless through the night, is better to-day; cough quite loose; pulse soft, 108; skin moist; bowels rather inclined to be relaxed.

℞ Sulph. ter die sum.

26th. Had a very good night; to-day is considerably better in all respects. Continue.

27th. With the exception of a slight cough, is quite well.

ASTHENIC APOPLEXY, WITH PARALYSIS.

Mrs. W—, æt. 49, a very thin and abstemious woman, of sedentary habits; she has lately been taking more exercise than usual, without mending her diet, and for some days has been complaining of headache, affecting the top of the head. Early yesterday morning, February 23rd, 1852, whilst alone in her bedroom, she fell down insensible; when I got to her, I found her recovering her senses, and paralysed completely on the left side; she could speak, but not distinctly, and was tolerably conscious; able to swallow liquids; fæces and urine passed involuntarily.

℞ Bellad. 12, gtt. xij.
Aquæ ℥iij. M. ℥ss. 3tiis horis.

At eleven a.m., six hours after the fit, was quite conscious and able to speak distinctly; has been sick two or three times, bringing up badly-smelling mucus. The left side of the face is quite paralysed, together with the left side of the neck, the arm, and the leg; tickling the side of the foot excites feeble movements of the great toe; very little sensation in the paralysed limbs; complains of no pain anywhere. Pulse 85, irregular. Ordered small quantities of brandy, beef-tea. Continue the *Bellad.*

In the evening I found that she had been sick constantly through the day; she now looks more

Hosted by Google

prostrated, lying with the eyes shut, and taking no notice of anything; speaks if spoken to, but immediately relapses into the same state of apparent stupor.

℞ T. Ipecac. 3, ♏ ss. 2dis horis.

February 23rd. About half-past twelve a.m., seemed much worse, but revived after this, and had a good night; had no return of the sickness after taking the *Ipecac.* To-day she is more flushed; the face is red and swollen; pulse 93; skin hot; does not complain of any pain, and speaks only when spoken to; bowels not relieved; this feverish state increased during the day, and in the evening the pulse was 100, strong and full. She has passed urine. Omit the brandy.

℞ T. Aconit. 3, ♏ ss. 2dis horis.

24th Passed a good night, and to-day is much better; the flushing of the face has subsided; pulse 90, quiet. She continued to improve during the day; spoke more readily, and took more notice; has manifested much desire for food; she is able to move the foot a little; the hand is perfectly motionless; no relief from the bowels; she passed urine early this morning, but has not been able to pass any since. In the evening I drew off a pint with the catheter, with much relief to her. Continue the *Aconit.*

25th. Continues to improve; appetite very good; fever quite subsided; pulse 90, irregular; speaks distinctly; slept well; suffers no pain. Catheterism in the evening. Continue *Aconit.*

26th. Had not so good a night; cheerful to-day, and is able to be lifted out of bed and placed in an arm-chair; bowels not relieved; has passed no urine.

℞ Ol. Ric. ʒij, statim.

Continue *Aconit.* Catheterism in the evening.

27th. A warm-water enema was administered this morning, with relief to the bowels; in all respects improving; has passed urine naturally to-day, in small quantities at a time.

℞ Baryta carb. b. d.

29th. Is improving much under the *Baryta;* passes urine quite freely; the paralysed side is improving wonderfully; she can move the leg freely; the hand is more under her control, but not nearly to the same extent as her leg; the distortion of the face is less, and she talks and smiles in a more natural manner; appetite much better than it was before her attack; very cheerful; sleeps well; bowels regular. Continue the *Baryta.*

March 3rd. Is well enough to be brought down stairs. Continue.

5th. Can walk across the room with her attendant's help; moves the hand much better. Continue.

10th. Gets out in the open air in a hand-carriage; can use the hand, and walks very well. She is continuing to progress in the most satisfactory manner.

OTITIS.

March 13th, 1852. J. P—, æt. 9. On the 9th instant was severely boxed about the ears by his schoolmaster; the next day he complained of a pain the right ear, with a discharge of thin ceruminous matter; the ear then got better, but deafness in it remained. On the 11th, the left ear became affected in a more violent degree; the pain in it was very intense, resisting fomentations and other domestic applications, and it was accompanied with much fever. To-day he is complaining of violent attacks of pain in this ear, which come on occasionally, are of an acutely darting, stinging character, much aggravated by talking or attempting to chew, and preventing him getting any sleep at night; there is much throbbing pain of the ear, with violent beating of the carotid and temporal arteries, and a slight purulent discharge runs from the ear; he is very deaf in both ears, so that he can only hear a watch tick at the distance of about an inch from the meatus; pulse 120; skin very hot and dry; tongue covered with yellow fur; breath offensive; great thirst; no appetite; no pain in the right ear.

℞ Aconit. and Puls., every three hours alternately.

14th. The pain left him about an hour after taking the first dose of *Puls.*, and he had a very good night; to-day has had a little pain, which soon passed off; very much better in all other respects; pulse 108; appetite and hearing much improved. Continue *Puls.*

15th. Has had no return of pain, and feels almost well; deafness considerably better.

16th. Quite well.

In another case of otitis, brought on by exposure to north-easterly winds in crossing the Channel, *Mercurius* relieved the intense pain, when *Pulsatilla* had failed.

J. C. Lynch, Sudbury, Suffolk.

Miscellaneous.

Melancholy Results of Passion.—Mr. G. Collard, of Elverton Farm, near Dover, had been engaged in a somewhat angry altercation with one of his tenants on the grounds near his residence, and the parties had separated only a few paces, when Mr. C. fell and almost instantly expired. The deceased appears to have been previously in his usual health. He has left a wife and family of 16 children to bewail their loss.

A Woman frightened to Death.—On Thursday as Mrs Shele, living at Box-hill, was walking towards the Box station, with the intention of going by rail to Bath, the day mail-train, which leaves London at 10 15 a.m., passed her at full speed, and so alarmed her that she fell down insensible. She was immediately removed to the station, and medical assistance having been obtained, she was put to bed at the Station Inn, and the usual remedies applied. The shock, however, was too great for human skill to alleviate, and she expired at midnight.

THE DISEASES OF CHILDREN.

By Dr. Frederick Augustus Gunther.

(*Continued from page* 544.)

9. *Ophthalmia* in new-born infants arises usually from the sudden transition from darkness to light, which the infant usually experiences at its entrance into the world, and may accordingly, in most cases, be readily guarded against by shielding the infant from any sudden impression of bright or glaring natural or artificial light; the room in which the accouchement takes place and in which the infant lies ought to be half-darkened by curtains in the day-time, and by lamp or candle-screens at night. Moreover, the room must be kept perfectly free from smoke, fumes, or dust of any kind; and, above all things, the drying of wet clothes ought to be strictly prohibited.

In infants affected with ophthalmy, the eyeballs look red and puffed up, a thin, sharp, whitish matter trickles from the eye; after a time the matter gets thicker, and assumes a yellowish tint; it accumulates, during sleep, in the inner corner of the eye, where it stiffens and hardens, and keeps the eyelids closely agglutinated. If the malady be allowed to continue its career unchecked, the inflammation spreads to the eyeball, the white of the eye gets red, the affected parts are burning hot, and the infant suffers great pain, as is evident from its moaning, crying, and restlessness. These symptoms are attended with running from the eyes of a hardly credible amount of mucus (erroneously mistaken by many for purulent matter), and even of sanguinolent water. Incurable affections of the eye, and even total blindness, may be the final issue of this grave disorder, if proper means be not taken in time to arrest its progress.

As soon as the first symptoms (redness of the eyelids, etc.) make their appearance, the mother or nurse of the suckling must take a dose of *Aconitum*, and repeat the same every six or eight hours; after two or three days, a dose of *Ignatia amara* must be given, and repeated every twenty-four hours. In the case of children that are being brought up by hand, the remedies must, of course, be administered to the infant. Should diarrhœa be present, *Chamomilla* is indicated. If these remedies fail to check the evil, recourse must be had to *Sulphur* or *Calcarea carbonica*; in many cases, it will be found advantageous to give the two latter remedies one after the other (of course, at proper intervals). If the inflammation is of a catarrhal nature, a few doses of *Aconitum* should be given first, and, if required, *Euphrasia*. If the inflammation is attended with running from the nose, *Pulsatilla* and *Rhus* are indicated; if the discharge from the nose is sharp, virulent, and biting, *Arsenicum* must be had recourse to. Complication with a so-called dry cold in the head requires the selection to be made from *Bryonia*, *Nux Vomica*, and *Ignatia amara*. If the evil is of somewhat long standing, *Veratrum*, *Phosphorus*, *Hepar Sulphuris*, and *Graphites* should be studied.

It is a practice in great favour with mothers and nurses to apply their milk to the inflamed eyelids, particularly for the purpose of softening and removing the hardened mucous matter which gathers in the corner of the eye, and between the lids generally. This practice is most objectionable; the action of the milk upon the affected parts tends to increase the secretion of mucous matter, and thus to aggravate the very symptoms against which it is intended to act; besides, the repeated application of milk causes also, after a time, excoriation of the borders of the eyelids, which is an additional aggravation. Leeches, also, are objectionable; the bite of a leech causes always considerable irritation, and we know that even a trifling irritation of the skin is often suffices in new-born infants to cause extensive local inflammation of that organ.

10. *Diarrhœa* is one of the most frequently-occurring affections of the first period of infancy; it arises from manifold causes, but mostly from gross dietetic transgression on the part of the mother or nurse, or from the ingestion of bad or acid milk; and very frequently also from the infant's catching cold. In most cases the

Hosted by Google

diarrhœa of infants is not very dangerous, and it is better to endeavour combating it simply by dietetic means, than to suppress it by remedies.

A species of infantile diarrhœa, for instance, which frequently occurs during dentition, ought not to be meddled with at all, since its suppression might actually endanger the life of the child. The intestinal tube of the infant is possessed only of very limited digestive power, and has not sufficient tone to resist the operations of the natural chemical process; the ingestion of matters, already on the point of turning sour, or of any difficult digestible alimentary substances, must therefore necessarily lead to diarrhœa.

In cases where dietetic measures fail to check the diarrhœa, homœopathic remedies must, of course, be resorted to. If a cold has been the exciting cause, and if the diarrhœa has made its appearance suddenly, *Opium* is indicated; if the diarrhœa is not attended with gripes or pains in the belly, *Dulcamara* should be given; the same remedy will answer equally in cases where a certain time has intervened between the catching cold and the manifestations of the symptoms of diarrhœa. If the evacuations are very watery, slimy, greenish, and fetid, and attended with gripes, and perhaps also with nausea and vomiting, *Chamomilla* will be found useful. *Bryonia* is a most excellent remedy against diarrhœa from a sudden cold. Flatulency, tenesmus, evacuations with slime and blood, require the administration of *Nux Vomica*. In all such cases, however, the best way is to consult a homœopathic practitioner; and this is even absolutely indispensable if *Nux Vomica* fail to produce the desired effect. If the dejections (in diarrhœa from cold) happen to be remarkably watery, sharp, and of a brownish colour, *China* will be found to answer. In cases where the diarrhœa arises from dietetic errors, *Ipecacuanha* will generally give relief, if vomiting is a concomitant symptom; *Coffea cruda*, if the patient is sleepless and excited; *Nux Vomica*, if the evacuations are followed by great prostration, and if nausea and pains in the belly are present. *Pulsatilla* is indicated under these circumstances, if the diarrhœa has arisen in consequence of the ingestion of an over-rich and fat milk.

11. *Hiccough.*—It stands to reason that the atmospheric air, even in a warm room, must at first make a rather adverse impression upon the new-born infant; no wonder then, that in the first few days or weeks of life the slightest exposure to a somewhat colder air than usual should induce hiccough. But this symptom is, under these circumstances, of no importance or consequence whatever, and may be left entirely to nature; in proportion as the child gets a little stronger, the hiccough will make its appearance more and more rarely, and at last discontinue. However, some parents cannot help feeling a little apprehensive about this hiccough, particularly if it happens to be the first child, and if the fits are of frequent occurrence, and of some duration. The best and simplest means against it is to put the infant to the breast, and to let it get warm there; or to give it a small quantity (the third or fourth part of a teaspoonful) of finely-pounded sugar.

(To be continued.)

CRITICAL ANALYSIS OF DR. ROUTH'S "FALLACIES OF HOMŒOPATHY."

By John Ozanne, M.D.

Entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

VI.

There is a dark page in the history of the allopathic opposition to the progress of homœopathy that I fain would leave unopened. In it are recorded accusations against homœopathists, which aim at nothing short of holding them up to the world as a set of base deceivers, whose statements are unworthy of credit, and whose characters are mean and contemptible.

Although disclaiming "abuse" in the introductory part of his work, as a mode of disproving and arresting the progress of the homœopathic doctrine, although protesting against the manner in which the new system has been hitherto opposed, the author soon forgets all his fine professions, and consents to make himself the channel for the propagation of the same system of attack upon the *characters* of the disciples of Hahnemann. His "fairness" and "impartiality" allow him to repeat the same groundless charges and unjustifiable imputations of dishonesty. He consents to identify himself with those whose conduct he condemns: let him, then, not complain, should some part of the censure which they so fully deserve fall to his share.

It is not without much reluctance that I approach this subject; for it leaves me no choice but to give the most unqualified con-

Hosted by Google

demnation of a spirit which no prejudice can excuse, since it exhibits itself in the most barefaced violation of truth and propriety. Hitherto I had thought that truth was in itself an object worthy of the exercise of our most strenuous efforts, and as a sufficient recompense, when discovered, for continued exertions, sustained perhaps throughout the whole extent of the life of an individual. But here—and this is a fact significant of the character of the movement against homœopathy, significant in the highest degree of the spirit of those engaged in it—but here this bright jewel is sacrificed to serve the interests of a party, who, we are told, have "no interest to deceive," but whose every step belies this assertion—who, whilst professing to be guided by fairness and impartiality, are following a course in which their impartiality appears clothed in the most inveterate prejudices; and their fairness assumes the garb of the most bitter spirit of persecution!

The charges brought forward against homœopathy by Dr. Routh are, for the most part, not new: nearly all of them, moreover, have already been refuted elsewhere. But as it seems to be the settled plan of the allopathic champions resolutely to advance a set of stories more or less detrimental to homœopathy, and, regardless of truth, to repeat them again and again, even when proved to be without foundation, I cannot, if I would faithfully discharge my duty, avoid taking notice of them.

In doing so I request the reader to bear in mind these two circumstances: first, that a true story can generally bear a close scrutiny in all its parts, or is at least correct in the more important of the particulars which it narrates; and, second, that a mode of attack, which, in default of other arguments, consists chiefly of imputations upon the character of opponents, is, if such imputations be groundless, thereby characterised as lying and slanderous, and hence devoid of all claims upon our attention.

I have carefully picked out all the charges brought forward against *homœopathists* in Part I., and find them to be nine in number, exclusive of allusions to the so-called *magnetoscope* and to the *mixed practice*, said to be commended by those whose authority in the homœopathic ranks is deservedly entitled to much weight.

In the first series I have classed the cases brought forward to show that homœopathic medicines are totally inert, and that homœopathic chemists are in the habit of selling globules which, although carefully bottled, corked, and labelled with the names of medicines, are nevertheless—and this with their full knowledge and consent—totally *unmedicated.*

Charge 1st: Dr. Simpson's box of globules.—"It is in this way (the powerlessness of the medicine) that we can explain the non-distinction by the homœopathic physician of globules of all kinds completely intermixed by a child, and which produced precisely the same effect on the system as those duly separated and labelled by the most careful of homœopathic compounders (see Simpson's 'Homœopathy,' 2nd edition)."

This story has been endowed with more importance than it originally had any claim to, by having gone the round of the metropolitan and provincial newspapers. It may well, therefore, arrest our attention for a few moments.

When I inform the reader that the homœopathic physician alluded to was Dr. Henderson, and that Dr. Henderson had published his "Reply" to Dr. Simpson's attack before the second edition of the latter was issued, he will feel somewhat surprised that Dr. Routh did not, in that spirit of fairness to which he lays a claim, notice Dr. Henderson's explanation. This omission compels me to quote rather largely from Dr. Henderson.

"The story of the box, in which all the medicines are said by Dr. Simpson to have been mixed before they were given to me, meets me in the published speech in a somewhat different form from that in which I heard of it formerly from the author of the petty narrative. He told me on that former occasion, on the 10th of June last, that I had said to him, some six or seven years ago, 'your box has converted me.' I remember well, sir, and so must Dr. Simpson, that I replied to him emphatically on that occasion that *I did not believe that I had ever said so*, and that because it would have been untrue. My first experiments on homœopathy were made by medicines from five different sources, in addition to Dr. Simpson's box. The 'respected secretary of the Society' favoured me with a box, in connection with which there was, as became his character, no trick, but all that was fair and honest. Dr. Russell supplied me with many other medicines; Headland, of London, did so too; the chemist in this city at a later period did the same; and some I prepared with my own hands. The results were published, and drew from Dr. Forbes, of London, the admission that, had the cases been treated according to the rules of the ordinary school, he would have regarded the results as 'very satisfactory.' Among them were 'some wonderful effects and

Hosted by Google

cures,' which I have always regarded as evidences of the power of homœopathic remedies; but that they were due to 'Dr. Simpson's own former homœopathic box,' in which the trick was, I do not believe that I could have ever averred, because I was not in the habit of noting in each case from what source the medicines I employed were taken, for I suspected no trick. Since Dr. Simpson made his trick public, I have suspected, reasonably enough, that some of the failures, which I could not formerly account for but on the ground of my own want of skill, must have been due to the dishonest box" (Reply, p. 80).

Let this story be a caution to those who may be desirous of testing homœopathic medicines. Let them beware of receiving their medicines through the hands of men who are not above practising *a trick*, and who will only divulge it if the decision of the experimentalist be favourable to homœopathy.

Charge 2nd.—"*One of the first, if not the very first, wholesale firms in London was in the habit of supplying its customers simply with Sugar of Milk globules, labelling them, however, according to the different homœopathic names of drugs;* this statement having been made by the agent of this firm at the house of Messrs. Gilpin and Co., druggists, Newcastle."

The reviewer of Dr. Routh's work, in the last number of the *British Journal of Homœopathy*, remarks upon this: "The allopaths have been often challenged to give the name of this 'wholesale house,' but they have never condescended to do so. It would be sufficient, therefore, to dismiss the slander with contempt; but we may as well observe that there is no *particular wholesale* homœopathic druggist in London. We believe, however, that the story has arisen from the fact of some homœopathic druggists being in the practice of purchasing pure sugar globules from the confectioners, for the purpose of medicating such by tinctures."

Charge 3rd.—"*It is in this manner (the want of power of infinitesimal doses) that we can explain the secession of Dr. Holland, late physician to one of the London Homœopathic Hospitals.*"

Dr. Routh is deserving of commendation for this discovery. He has decidedly "a turn" for explanation. In this field he displays considerable ingenuity; but by some "unfortunate coincidence," for which he will I hope account satisfactorily, his explanations are seldom, if ever, *correct.*

As Dr. Routh has quoted from the Report of the London Homœopathic Hospital (vide Appendix, p. 82), aud had therefore access to the following explanation as given in the speech of Dr. Quin (Report, p. 29), I should feel some surprise at his not noticing it, were it not that in his work there are other examples of omissions of the same kind, when that course happens to be the most convenient to him.

"He (Dr. Quin) must be pardoned for taking this opportunity to allude to the retirement, some months ago, of one of their colleagues from the medical duties of the Hospital. Dr. Calvert Holland, whose attainments both as a physician and a writer, were well-known and highly appreciated, had, from a sensitive regard for the interest of the hospital, considered it his duty to withdraw, fearing that his continuing to hold office might expose the institution to a portion of those illiberal and ungenerous attacks with which he had been assailed, on the pretext of a recent publication of his. He (Dr. Quin) could assure the meeting from his own knowledge, that that work had been written a long time, and had actually been printed some months, though he believed not published, before Dr. Holland's acceptance of the office of Provisional Physician to the Hospital."

The attacks to which Dr. Quin alluded in his speech, and of which he complained rather bitterly, were made, and this I have on the best authority, not by an allopathic periodical but by the *Homœopathic Times*, the Editor of which could not, of course, be aware that certain practices recommended in Dr. Holland's work were the result of a state of transition in the mind of the author, from which he had fully emerged some time before his appointment to the Homœopathic Hospital.

My quotation from Dr. Routh would lead the reader to the belief that Dr. Holland had left the Homœopathic Hospital thoroughly disgusted with homœopathy. That such was not the case, the extract from Dr. Quin's speech fully testifies. But this is not all. I am informed, both by Dr. Quin and the Honorary Secretary of the Hospital, that Dr. Holland is still a homœopathic practitioner; that he is now settled at Sheffield, the scene of his former literary labours; that they have repeatedly heard from him, and that he continues to hold homœopathy in the highest estimation.

Charge 4th.—"*The resignation of the late House Physician of the Leipsic Homœopathic Hospital, who, convinced of the nullity and danger of the system, gave up the appointment, and published an exposition of the practice pursued in the hospital.*" The worthy man!

There is some reason to believe that if

Hosted by Google

Dr. Routh were fully acquainted with the character of this individual, who, to quiet his conscience, gave up an appointment, he would be careful not to take any notice of this portion of his career.

The reviewer in the *British Journal of Homœopathy*, already quoted, says upon this subject: "This is a mistake: the gentleman alluded to did *not give* up the appointment, but was *given up* by it, and *dismissed therefrom for mal-practices.*"

I have made some inquiries upon this subject. One of my correspondents, who knows a good deal about the German Homœopathic Hospitals, says, in a letter to me, "I know nothing about the renegade house-surgeon, unless it was one Fickel, who stole the funds of the Leipsic Hospital, and is now expiating his crimes at the hulks." Of this Fickel, Dr. Henderson, in his "Reply" (p. 15), says: "We certainly find him eventually a house-pupil in a common gaol, studying the consequences of *swindling*." Dr. Routh evidently quotes what he says of this house-surgeon from Simpson's "Homœopathy." Dr. Simpson, in his turn, quotes from Mr. Lee, whose authority is a work published at Leipsic in 1840, the title of which is "Ueber die Nichtigkeit der Homöopathie:"—"Can he be the person, of the same name, selected by Mr. Lee as a credible witness against homœopathy, and who published in 1840, at Leipsic too, a work entitled 'Direkter Beweis von *die Nichtigkeit der Homöopathie* als Heilsystem?' If so, Mr. Lee, Herr Fickel, and Dr. Simpson deserve the cordial thanks of the homœopathic world for their respective, and about equally *respectable*, performances in this matter."

The second series of charges comprises cases brought forward to show that homœopathists are guilty of a mode of deception—the admixture with their medicines of the most active allopathic drugs, which he, ever ready with an explanation, easily accounts for: "Occasionally, however, it becomes necessary to show that homœopathic medicines have really an effect, and this is especially useful with unbelievers. Our strongest active principles are put in a homœopathic pill or pilule, and administered."

The instances of this "treachery" which he condescends to give us, are the following:—

Charge 5th.—"*Indeed, chemical analysis has proved to what extent this fraud is carried on occasionally;* one-third of a grain of *Morphia*" has been found.

This case of a third of a grain of *Morphia* having been found in a dose of medicine given by a homœopathic physician is not specific; but we recognise in it a story which was by no means new when taken up by Dr. Simpson, and which gained nothing in novelty when repeated by Dr. Routh. Dr. Taylor has been challenged again and again in the *Homœopathic Times* to name the practitioner whom he accuses of this piece of inconsistency. He has not thought fit to do so. What are we to infer from his silence?

By these remarks I do not wish it to be understood that homœopathists never give *appreciable* doses of medicine. But I do not believe that any homœopathist ever gave so large a dose of *Morphia*.

Dr. Routh seems to be under some strange delusion respecting the practice of homœopathy, when he states, in

Charge 6th—"*Appreciable doses of Mercury have been found.*" Why not? If Dr. Routh had taken the trouble of reading the cases published in the various homœopathic periodicals; if he had consulted *Hartmann's Therapie*, and other standard guides to the homœopathic treatment of disease, he would have found that the first and second triturations or dilutions, both centesimal and decimal, are frequently prescribed by homœopathists. He, moreover, ought to know that, by means of the *Protochloride of Tin*, the *galvanic* and the *silver* tests, *Mercury* could be detected in the second centesimal and in the fourth or fifth decimal dilutions or triturations.

As further examples of fraud and treachery, we have—

Charge 8th.—"*It was owing to such treachery that the Duke of Cannizzaro was killed by three homœopathic globules.*"

I might dismiss this charge by quoting the following from Dr. Henderson's "Reply:" "I have information from a friend of the deceased duke, that he died suddenly in Sicily some ten or twelve years ago, and that no rumour existed, at the time, of his death having been caused in the way mentioned by Mr. Lee" (p. 17).

But I think it proper to prove, from Dr. Routh's own statements, that the death of the duke could not have been caused by the homœopathic medicines.

Let us suppose the globules to have contained "a concentrated preparation of *Nux Vomica*," as it is stated on the allopathic side. Now, what is the smallest quantity of *Nux Vomica*, or rather of *Strychnia* (its most active principle), that will kill a man? We are told that "the *smallest dose* which has yet been known to prove fatal, was in the case of Dr. Warner, who swallowed *half a grain* of the *Sulphate of Strychnia* by mistake for *Morphia*." (Taylor on Poisons, p. 777.)

Hosted by Google

We are also told by Dr. Routh (p. 9), that seventy-five globules will only absorb one drop of tincture. Let us suppose that each drop of the tincture contains fifty per cent. of the *Salt of Strychnia*, it would require 150 globules to absorb a quantity of tincture containing one grain of the poison; three globules would therefore only contain the fiftieth of a grain. But Taylor tells us that the smallest quantity which has been known to kili a man is *half a grain;* therefore the death could not be due to a concentrated preparation of *Nux Vomica*, as the allopathists declare. Dr. Routh has been simple enough to be deluded by his belief that allopathists have "*no interest to deceive*" into the adoption as truth of a manifest falsehood.

But I cannot so readily acquit him of all intention to deceive, when he states that "one-fiftieth of a grain of *Aconite* may kill." The drift of the whole paragraph (p. 10) is to show that homœopathists are dangerous persons, and occasionally *kill* their patients by "*fraud*" and "*treachery*." Let not, however, my reader, if unacquainted with the details of *toxicology*, be in the least alarmed upon this score. Dr. Routh, if quoting from "Philips's Pharmacopœia," or from Liebig's "Organic Chemistry," ought to have said—"*the fiftieth* of a grain of *Aconitine* may kill *a sparrow*."

Let us, however, see whether the duke might not have been killed by *Aconitine*, of which it is said by Christison, that "*it is perhaps the most subtile of all known poisons*." One grain of the solution of *Aconitine*, in spirit, could scarcely contain more than fifty per cent. of that principle; one grain therefore would only medicate 150 globules. Three of these globules, the number said to have poisoned the duke, would thus only contain the fiftieth of a grain of *Aconitine*, the quantity which will only kill *a sparrow*.

Charge 9th.—"*The death of Mr. Horace Green, of New York, who swallowed in sport a number of homœopathic globules, is explained in the same way*," and I might add, is *likewise disposed of in the same way;* for who will, after the careful analysis of the eight preceding charges given above, feel disposed to look upon this last, unsupported by evidence of any kind, as at all more credible than its forerunners?

I have patiently gone through this series of charges, because I could not avoid doing so. Despicable as is this mode of attack on a system of medicine, which appeals to real and tangible facts in support of its claims to our most earnest consideration, I cannot say that I was moved by the overflow of indignation which may have disturbed the equanimity of others; but this I will say, that I have been moved by the deepest commiseration for the author's melancholy situation, compelled as he was to do battle with borrowed arms, in the use of which he was so little skilled, that his blows were more fatal to his friends than to his foes, and his exertions more likely to bring discredit than honour upon himself. Let him leave those wicked fabrications to those who have concocted them, and let him no longer be deluded into the belief, that if allopathists have, as he thinks, "no interest to deceive," they are on that account incapable of deceiving.

(*To be continued.*)

[We have received distinct information that Dr. Calvert Holland has entirely withdrawn from homœopathy. We think he is bound, in all fairness and honesty, to say whether this is true or not.—ED.]

NARRATIVE OF THE INTRODUCTION OF HOMŒOPATHY INTO ENGLAND.

BY F. J. SMITH.

(*Continued from page* 538.)

THE introduction of homœopathy into England being, by common consent, ascribed to Dr. Quin, and the year 1827 being, beyond dispute, the date of this important event, it must now be our object to record the steps taken by him to whom the British Isles are thus so deeply indebted, to qualify himself for so great and arduous an undertaking.

And this, through the courtesy of the brother of an eminent allopathic physician of London, we are enabled in some measure to do. Resident in Naples at the period in question, and for some years previously, was an artist who enjoys an European celebrity from the power with which he delineates nature on canvas. Between this artist and Dr. Quin (who had been practising in that city since 1821) a friendship of the most intimate character appears to have sprung up. Our artist was the brother of the gentleman just referred to; and in the course of the correspondence between these distinguished kinsmen, frequent mention occurs of Dr. Quin. Fortunately, the letters are preserved, and it is to these that we are indebted for the information we are enabled to supply.

Under date, Naples, April, 1825, we learn—"Dr. Quin came out to Italy several years ago with the Duchess of Devonshire .... He has for some time past been engaged in investigating a new system of medicine practised by a German physician, Dr. Necker. Necker, however

Hosted by Google

is only a disciple of the founder of the system, whose name is Hahnemann."

This extract does not, certainly, give us the history of the circumstances that led Dr. Quin to investigate the subject of homœopathy. This we shall obtain from other sources hereafter. We have introduced the quotation merely to show that in April, 1825, Dr. Quin had been "*for some time*" engaged in the investigation of homœopathy.

Under date, Naples, June, 1826, the same writer observes:—"Necker's practice, or rather Hahnemann's doctrines, occasioned so much talk in the medical world, that Dr. Quin has considered it necessary to go to Germany to study and investigate it more closely than he can here. He is now in the neighbourhood of Leipsic, staying with Hahnemann, who is very proud of his English scholar. He appreciates the spirit and love of his profession, of Dr. Quin, in leaving a lucrative position at Naples, where he was reaping a rich harvest, to come out to him and put himself again to school."

Lest it should be considered that we are travelling at too rapid a pace, and, *per saltum*, instead of systematically tracing Dr. Quin's progress step by step, we beg to assure the reader that it is our intention to fill up the sketch before we have completed our task; meanwhile we must be allowed to lay down certain points in our chart, that the course of our narrative may not be interrupted hereafter by the necessity for reference to authorities.

From this extract, then, it is evident that Dr. Quin was in June, 1826, studying homœopathy at the feet of Hahnemann, somewhere near Leipsic.

The same authority informs us: "Naples, March 8, 1827. Dr. Quin has come back from Germany, if not a complete and declared convert to the doctrine, at least so impressed with its importance as to continue its study with much perseverance and order, and Quin is anything but a trifler."

It may reasonably be inferred from this extract, that Dr. Quin's return to Naples took place at no very remote period from the date in question. The topic had evidently not been mentioned in the writer's preceding letter, and the freshness with which he speaks of the event, shows that it was a circumstance of comparatively recent occurrence, and yet sufficiently remote to allow of Dr. Quin's studies being spoken of as characterised by "perseverance and order."

We shall avail ourselves of but one more quotation from these interesting letters. It is dated Naples, May 3, 1827. "You will soon have Quin in London, and I shall soon follow, for Naples will lose more than half its charms. He has been invited by Prince Leopold of Saxe Coburg to become his physician, and to travel with his Royal Highness. Dr. Quin says he shall be able to make you *stay in the room* whilst he explains to you Hahnemann's system. Quin is no enthusiast, nor is he easily won by any out-of-the-way thing. He laughed as much and as long as anybody about the subject, till it was forced upon his observation in a way that made him determine on investigating it, and he has seen enough to convince him that his laughter was out of place. He does not practise it as yet *exclusively* to any extent, but he is always ready to seize any opportune case to apply medicine in this way; and he tells me the investigation of the system has given him new notions of the powers of medicine. He certainly went the right way about it. He learnt German on purpose to read the works written upon it, and, not satisfied with the results which he had witnessed here, he went to Germany, to the fountain-head—Hahnemann, and became acquainted with almost all the professors in the different towns in Germany who practise it."

There are, as it appears to us, several facts of great interest contained in the preceding extract, and important in an historical point of view to be borne in mind. To trace to their origin causes that have exercised a vast influence on society can never be uninstructive; and from this letter we learn that the proximate cause at least of the establishment of homœopathy in this country was the appointment of Dr. Quin to the post of physician to Prince Leopold. It might be curious to speculate on the state of this science in England at the present period, had the royal favour fallen on some other physician. This, however, is not the place for such dissertations: we merely throw out the suggestion, *en passant*, for those who are fond of indulging in such speculations, and we pass on to observe that we gather, also (constructively at least), from the letter under consideration, the aversion of a learned allopathic physician of London to homœopathy; for it appears that he had intimated his determination not "to stay in the room" should the subject be introduced; and we happen to know that this gentleman lived to regard the science in a very different light. Finally, we are admitted, by this extract, to a view of the effects of homœopathic evidence on the mind of Dr. Quin. Its first announcement was received with ridicule; evidence roused a spirit of inquiry; and study wrought conviction.

Hosted by Google

But the circumstance that will give rise to the most curious debate amongst our readers is probably this—that he who had thrown up a lucrative position in Naples that he might study a new medical system in Leipsic; and who returned to the former city a convert to the system, should not at once have commenced practising it *exclusively*.

Now, it is of great importance that this apparent contradiction should be distinctly explained and apprehended; more especially, as our conviction is that the history of almost every homœopathic practitioner would furnish evidence of a very similar character. We take it, therefore, that some general cause is at work, and it must be our aim to discover and point it out.

It has probably been oftentimes felt, if not expressed, that if allopathy be "based on conjecture" not on truth; and homœopathy be based on an universal law of nature; that, no sooner are these truths apprehended by the mind of the physician, than the former system would be *absolutely* abandoned and the latter *exclusively* practised. And this is unquestionably true in the abstract, but, like most abstract truths when applied to human practice, admitting of some modification. For it must be borne in mind that, while the skill in diagnosis possessed by the new convert is the result of the study of his professional life, and applies equally to both systems, his experience in the application of homœopathic remedies is measured by the period of his conversion. If he decide on the one right remedy, the disease, as a rule, yields to his treatment. If his selection be incorrect, the medicine, as a rule, is unavailing—useless. While, then, homœopathy is not at fault, in the case of failure, but the physician, it follows, nevertheless, that a very intimate knowledge of the Materia Medica Homœopathica is essential to the successful treatment of disease; and it may be safely affirmed that this is not to be fully obtained by the study and experience of a few months—perhaps not even of years. Here, then, we think we find the cause of what we believe to be the rule—that allopaths, after their conversion to homœopathy, continue to practise for a time allopathically in severe cases, and employ the homœopathic remedies only in non-dangerous cases at first. It is not that they doubt the power of homœopathy, but that they lack confidence in their own knowlege; and the fact that they go on to adopt it *exclusively*, is the best evidence of their not doubting, but, contrariwise, entertaining the most entire confidence in the system itself.

And we are prepared to maintain that this was the proper course for a conscientious physician to take in the infancy of the science, who did not go the length of Dr. James Johnson in believing, that "without allopathic interference, human mortality would be less than it is." For, who but a physician shall adequately realize in all its intensity the tremendous consideration, that life and death are, humanly speaking, dependent on his individual skill? If, then, under such awful circustances, he could be found to admit the false sentiment of consistency to prevail with him, and lead him to the employing of his newly-adopted system, while yet conscious that he had not, and could not have, thoroughly mastered its Materia Medica, what language would be fit to employ in characterising so vain and wicked a trifler?

Nor, does this reasoning apply exclusively to the transition from allopathy to homœopathy. It applies equally to the transition from one mode of allopathic treatment to another; and it is a recognised rule of hospital practice not to adopt at once any new means of cure, however high the authority from which it emanates, but to select cases for its application.

Now, this was precisely the course taken by Dr. Quin; it is, as we believe, the course followed by many transition-allopaths in the present day, and it is further sanctioned by general hospital practice. And we think we have shown that not only was this course judicious in the comparative infancy of the science, but that it was the only course open to Dr. Quin as a moral and accountable agent.

Now, we are very far from approving of this mixture of practice; and we do not hesitate to declare our opinion to be, that the day in which it should be tolerated has passed for ever, as respects this country. Here, there are facilities enough for an allopathic practitioner to make himself master of homœopathy; and this he is bound to do before he ventures to practise that system. In the present position of affairs, however, in the medical world, there is no security against any allopathic practitioner—but half-informed on the subject of homœopathy—commencing as a homœopath, and thus bringing discredit on the cause. Were a council established for the examination of allopathic practitioners desirous of practising homœopathy, and empowered to grant certificates of qualification, this great evil would be avoided; as lay homœopaths might be put on their guard—after the establishment of such a council—against the employment of any fresh convert who had not applied for and obtained such

Hosted by Google

certificate. This, as it appears to us, would be an effectual preventive of a great evil with which, as we think, homœopathy is threatened; for, in proportion to its extension will be the inducement for practitioners to abandon the old for the new system; and if this arrangement be not speedily made, it may soon be too late to establish it.

To return to our narrative—the letter on which we have been commenting, is unquestionably couched in language calculated to lead to the belief that Dr. Quin was at this time (May 3, 1827) residing at Naples. The employment of the present tense may probably be accounted for on the supposition that the writer was expounding the known sentiments and relating the conduct of Dr. Quin, during his brief sojourn at Naples, after his return from Leipsic, or transcribing the thoughts contained in some letter he had received from the new convert. Certain, however, it is that at this very date Dr. Quin was already in London, which he appears to have reached some time in the month of April.

From the month of April, 1827, then, is to be dated the introduction of homœopathy into England.

Had a Lyell or a Rawlinson returned to this country after a sojourn of a considerable period in foreign lands, devoted to the investigation of geological or antiquarian phenomena, and in possession of important facts, the course they would have pursued would have been to attend the first meeting of the Societies to which they respectively belong, and to lay the facts they had collected before their scientific brethren, accompanied with the reasonings which to their minds these facts suggested. That Dr. Quin did not adopt a similar course, appears to us to present in strong contrast the medical and the scientific societies of this country.

The scientific societies of this country—to their glory be it recorded—are ever on the alert for facts; ever ready to listen to the arguments of their members. They are not established for the advocacy of an hypothesis or a theory, but for the discovery of truth.

From his acquaintance with the medical institutions of this country, it probably did not occur to Dr. Quin to present himself before them, for the purpose of submitting to his brethren his newly-acquired knowledge. If such a suggestion ever passed through his mind, it is clear that he did not put it into execution; nor is it less certain that bootless would have been his enterprise, as demonstrated by the recent demeanour of the Edinburgh Universities.

On H.R.H. marriage with the Princess Charlotte—the idol of the English nation—Prince Leopold, after residing some time at Camelford House, took up his residence in this country in the royal palaces of Marlborough House and Claremont. Hither he was accompanied by his physician, Dr. Stockmar. The doctor subsequently succeeded to his father's title of baron, and was appointed to the post of comptroller of his Royal Higness's household. A vacancy of physician to his Royal Highness's person in consequence occurred, and Dr. Quin, whom his Royal Highness had previously often consulted professionally, was selected to fill this honourable position. It was perfectly well known to the prince that Dr. Quin had become imbued with the doctrines of Hahnemann; but, rightly judging that this superadded knowledge did not detract from his merits as a general physician, the prince intrusted him with the care of his health; and the herald of homœopathy returned with H.R.H. to this country.

Having established the fact that, for two years at least, Dr. Quin had been engaged in the investigation of homœopathy; that he had studied the science under Hahnemann himself, and returned a convert to Naples; and that, leaving that city, he reached this country in April, 1827, we have now to consider the course he pursued with a view to establishing the new doctrine in England.

And if the argument as to the expediency of caution, as applied to Naples, be regarded as valid, it must apply with augmented force to this country. Here Dr. Quin stood alone. In cases of danger and difficulty, when it is customary to call in medical associates for consultation, with no one could he consult had he treated his patients homœopathically. To be convinced that homœopathy could do more than allopathy was one thing. To be confident that *he*, with his comparatively limited knowledge of the science, could do more for a patient than the associated allopathic wisdom of London, was another. Moreover, homœopathy does not affect to cure every disease in every stage, else, instead of the statistics we have exhibited, showing an average decrease of mortality under homœopathy as compared with allopathy of fifty per cent., we should have to proclaim homœopathy to be an universal panacea, save in the case of extreme old age, where the human habitation was absolutely worn out. We do not say that this will not be the case when homœopathy shall have attained its maturity—on the contrary, we believe that such is the destiny that awaits its progress—but we do say that this is not its present state: still less was it its state in 1827. Since then

Hosted by Google

some must have died of severe disease in 1827, although treated with the greatest homœopathic skill; and since the death of such patients might have been visited on the system instead of on the fatality of the attack; and since, should this unjust verdict have been pronounced, the cause of homœopathy would have suffered, and its progress have been greatly retarded—we maintain that the homœopathic physician who stood alone in this country in 1827, exercised a laudable discretion—and a discretion for which every homœopath in Great Britain probably has cause to be grateful at this moment for—in selecting his cases for treatment, and in refusing to treat homœopathically such cases as involved the possibility of a fatal termination.

It is therefore with gratitude we record that the conduct of Dr. Quin was characterised by the laudable discretion we have advocated. Cases of a non-fatal character, both acute and chronic, abound in general practice. On these he had ample opportunities of demonstrating the advantages of the new system, and in these cases he never failed to employ it. And thus, as his patients began to appreciate its advantages, and to gain confidence in its power, and as he became more and more versed by study and practice in the resources of the homœopathic science and art, he gradually introduced it, until he ceased to employ allopathic remedies altogether.

London, Claremont, Esher, and Hampton Court were the localities where the blessings of the new system were first made known. There, alike in the palace, the mansion, the cottage, and the hovel, were its powers felt and appreciated. Amongst the early distinguished converts to homœopathy may be mentioned the names of the Neapolitan Ambassador, Count Ludolf and family; Lady Seton; Sir Richard Acton; the Dowager Lady Acton; Prince Lieven; Lord Ponsonby; General Lord Lynedoch; Lady Keith; Count Sibolesk, the Russian Chargé d'Affaires; Prince Czartoryski; Count Zamunlic, and others.

To these illustrious names we would willingly add, were we in possession of them, some of the early converts to homœopathy from amongst the poor. We doubt not that many an interesting tradition is floating about the neighbourhood of Claremont and of Esher which might be woven into a touching narrative of devotion and self-sacrifice. We know enough of this class of the community to feel satisfied that there must have been many an instance of self-abnegation which would entitle the devotee to take rank with the potentates of the earth. We can conceive of a mother—perchance a widow—whose only son, after being given up by his allopathic attendant, was saved through the instrumentality of Dr. Quin. We can imagine the sentiment of gratitude in such a case rising into a passion, and elevating its subject into a heroine. We can conceive the widow sacrificing her time and energies—elements on which every physical comfort in this class depends—to the making known the blessings of homœopathy. We can imagine her obtaining the consent of some poor neighbour (albeit sceptical of the powers of the new system, yet desperate from the consciousness that the resources of the old had been exhausted in a vain attempt to save her drooping and afflicted child) to submit to homœopathic treatment. We can conceive the anxiety of the advocate now giving place to a fearful sense of responsibility for the life of the patient, and the reputation of the system. The case given up by allopathy, and therefore desperate, yet admitting room for the bereaved mother, should it terminate fatally, to throw the blame on the new system, and indirectly on the advocate! how fearful must have been the felt responsibility! The only chance of a successful issue would be seen to lie in the strictest attention to the physician's directions; the medicines must be administered at stated times; the case must be carefully watched. But the widow's love for that system which gave back to her her only son is inexhaustible. Her daily toil ended, her own domestic duties performed, she sallies forth to her neighbour's cottage, and takes her place at the bedside of the patient, and through the silent watches of the night she tends the sufferer, administering to her wants, and giving her the medicines. At length Nature, thus assisted by the powers of the new system, asserts her supremacy, and the patient is convalescent. It is not for us to trace the emotions of the respective individuals. We are simply concerned with the devotion to homœopathy exhibited. And we declare, on our knowledge of the poor of this country, that this imaginary sketch is, in all human probability, a reality, and the type of numerous instances that occurred at the time. We lay it, therefore, on the inhabitants of Claremont and of Esher to investigate the traditions of their localities, and to record them in your columns; for no history of the introduction of homœopathy into England will be *complete* which does not assign to each class of the community

Hosted by Google

the share it respectively had in advancing the Cause. Neither will any history be *just* that does not place side by side with the illustrious by birth who rendered service to homœopathy in its infancy, the names of the poor, how humble soever they may have been, who rendered themselves illustrious by their acts of devotion.

(*To be continued.*)

[We were not before aware that Dr. Quin had ever studied the science (homœopathy) under Hahnemann himself. What time of study? We should be very glad of Dr. Quin's own statement of his homœopathic studies. His simple declaration of dates would at once settle the point who introduced homœopathy.—Ed.]

THE
HOMŒOPATHIC TIMES.

SATURDAY, APRIL 24th, 1852.

We have just been on the border of the illimitable Ocean; we have seen, according to Æschylus, the infinite dimples of the immeasurable laughter of that vast Body; we have seen, while the penetrating East wind swept the shore, patches of Cærulean blue, like the prophetic eyes of Hope, amidst the clouds—and these are to us *signs*.

It is recorded of Sir Isaac Newton, that, after he had made his great discoveries in astronomical science, on being congratulated thereon, he said, "Well! I feel like a schoolboy who has been picking up a few shells on the shore of Eternity." An expression sublime as it was simple.

It is the case with the best of us. We are *here* to-day, and to-morrow we are *there*.

With such thoughts we are not *precisians*. But immense, indeed, is the task of each homœopathist, who understands or has even a glimmering of understanding of the doctrine and practice of Hahnemann.

Such an one cares not a jot for a name as a watchword of party; such an one holds in scorn all inferior motives, aims, and desires—rejects disdainfully the paltriness of a mean self-glorification; and manfully breasts the ascent that he may reach the hill-top of Truth.

Hard measure, indeed, has Hahnemann received—called by *judges* a myriad-minded man, by the ignorant a visionary and a theorist. But yet Samuel Hahnemann towers above his fellows in the might and majesty of a gigantic intellect, as well as in the force of his moral character.

We are passing through one of the surges of our Medical Reform—there are *breakers* ahead, *breakers* astern, *breakers* all round us—but still there is smooth water amidst them, and Hahnemann, as he lives in his writings, is our pilot.

Nothing has yet been done in the way of an establishment of a large hospital for the treatment of the ailing on the principle of homœopathy. It is all yet to be done.

A small affair of the sort is, of necessity, a ridiculous thing: we have always said so.

Vastness is an essential element of the sublime, even though that vastness be made up of molecules, of atoms. So is this earth made up; and so, doubtless, is each of the planets that moves round its particular sun.

Will the homœopathic public remain dumb and irresponsive to our frequent appeals? Will the medical men remain indifferent to the necessity of united action? We know not; but this we do know, that Truth is indestructible.

It is on this principle we make our stand, and we have no fear whatever for the issue. We care not for Czar nor for St. Simonian—the two extremes of civic and political life. We look to the end: we have done our duty, according to our conscience, faithfully; and we care not for misrepresentations. We bide our time hopefully and confidently. *Stare loco nescit* is not our motto, any more than is the *stare super antiquas vias*.

We are open to conviction, but we have fixt principles for our guides; and the vast Infinity is before us, around us, and beyond us.

Hosted by Google

THE HOMŒOPATHIC HOSPITALS.

We lately gave the Report of the Hahnemann Hospital for the year; we have now before us the Report of the London Homœopathic Hospital. The expenditure of the last twelve months has been less than half that of the other Hospital; nor is there much difference in the number of in-patients.

The expenditure of the Hahnemann Hospital for the year was £2,158 18*s.* 7*d.*, that of the London Homœopathic Hospital was £1,013 2*s.* 7*d.* The number of in-patients at the former for the year was 254, in the latter was 212.

It will be at once obvious that most of these cases, in each Hospital, must have been of those suffering from chronic maladies.

The number of patients in each is ridiculously small. We (the writer of this article) have *heretofore* prescribed for many patients, most of them suffering from acute disease, in one long day, as have been treated as in-patients at either of these Hospitals *in one year.*

This is a manifest absurdity; and it is to be deplored, that in the great capital of the greatest of earth's empires, there should be any burlesque on so grand an institution as an "Hospital," and especially in connection with homœopathy. We trust that the homœopathic public will come to the rescue, and provide at least *one large* hospital, from which satisfactory statistics of the homœopathic treatment of acute diseases may be derived.

The total balance remaining to the Hahnemann Hospital is £904 19*s.* 2*d.*, that of the London Homœopathic Hospital is £984 11*s.* 7*d.* So that in funds they are about equal. In the former, 3,966 out-patients were treated; in the latter, 3,008.

The ladies who patronised the Hahnemann Hospital, by their Bazaar obtained £480, which has yet to be increased.

Two hundred and twenty-six ladies, including H.R.H. the Princess Mary of Cambridge and the Ladies Somerset, obtained for the London Homœopathic Hospital during the past year £146 12*s.* 3*d.*

We are very sorry indeed that, excepting as dispensaries for the treatment of out-patients, both our London Hospitals have failed, so far, and have afforded so few statistical results.

Our readers will remember that we have always argued the necessity of the establishment of one large hospital, on a broad basis, with comprehensive principles. We have no bias for either of the metropolitan Hospitals. We should like to see them united, and we believe that *then* the homœopathic public would *endow* such an Institution.

FIRST ANNUAL REPORT OF THE CHESTER HOMŒOPATHIC DISPENSARY.

PHYSICIAN—J. E. NORTON, ESQ., M.D.

THIS Institution was opened April 1st, 1851 and during the year ending March 31st, 1852, the total number of patients has been 614.

Correspondence.

To the Editor of the Homœopathic Times.

Manchester,
April 12th, 1852.

SIR,—In the last number of the *Medico-Chirurgical Review* (alas! no longer Forbes's) is a review of "Routh's "Fallacies of Homœopathy," in which the homœopaths are liberally pelted with mud, the theory of dynamization is especially stigmatized as absurd. At page 560 of the same number is an extract from the *Bull. de Thérap.*, tom. xli., p. 373, to the effect that M. Fredericq treats epilepsy with benefit in cases deemed incurable by *Belladonna;* and on the opposite page is a quotation from *L'Union Médicale*, 1851, No. 150, to the following effect. "To the present time, pharmacologists have always considered pulverization as a mere change of form in bodies, each particle of the divided body being regarded as a diminutive, without change of property, of the entire mass."

While admitting that in most cases this is a mere expression of the fact, M. Dorvault believes that there is a greater number of substances than is suspected, in which this operation induces a modification of their chemical characters and *medicinal* properties. At present he can only adduce two or three examples in justification of this opinion. Every one knows that sugar, on being powdered, loses a portion of its solubility and sweetening power. Is this referrible to an altered electrical condition of the sugar, as the phosphorescence which is developed during pulverization in the dark might lead us to suspect? Again, gum arabic, when powdered, possesses neither the same taste nor solubility as when entire; and pulverization so diminishes the solubility of arsenious acid, that while a kilogramme of water will dissolve forty grammes in the vitreous state, it will only dissolve fourteen of the powder. In the above examples, the modification is exhibited by diminution of solubility, but in other cases it may manifest itself in other directions.

Both these are testimonies to the truth of homœopathy. The latter is the discovery of Hahnemann. Go on, M. Dorvault, and prosecute what Hahnemann began, but do not claim the credit of the discovery, for verily it belongeth not to thee.

We thank the gentle Editor of the *Medico-Chirurgical Review.*

I am, Sir,
Your obedient servant,
CHIRURGICUS.

[We are much obliged to our correspondent, and we will look to the articles he refers to. The allopathists are taking many leaves out of our book. We have now before us a prescription in which *Nux Vomica* is clearly indicated, written by one of the foremost of the physicians of London. We transcribe it for the benefit of the multitude.

℞ Ext. Nucis Vomicæ, gr. vj.
Sacchar. Lactis, gr. xxiv.
Tere optimè in mortario, et adde Glycyrrhiz.
℈jj. Fiant pilulæ xxiv.
Sig. One on every second night.

The dose is *small*, on allopathic principles of treatment. The case is one of spinal irritation, and defect of vital force from that cause.

The truth of the matter is (*pace* Dr. Little), that the allopaths take many *leaves* out of our books. Nine-tenths of the men of ability, who practise allopathy, do *not believe in druggery*.—ED.]

THE COLLEGE OF SURGEONS AND HOMŒOPATHY.

To the Editor of the Lancet.

SIR,—The Council of the College of Surgeons have sent the following reply to the memorial of the meeting of the medical men of this town and neighbourhood, praying them to express some opinion on the doctrine and practice of homœopathy.

"College of Surgeons, March 9, 1852.

"SIR,—I am desired to acquaint you that your communication, enclosing copies of resolutions of a meeting of the medical profession of Hull and its neighbourhood, held in the Hull General Infirmary on the 6th of January last, on the subject of homœopathy, has been laid before the Council of this College, and that the Council,

Hosted by Google

after mature deliberation, consider it inexpedient to interfere in the matter.

I have the honour to be, etc.,

"EDM. BALFOUR, Secretary."

The members of the College will hence perceive that they must not look to their nominal head for sympathy or assistance in the humiliating contest which they are compelled to maintain with this impudent but successful imposture.

I remain, Sir, your obedient servant,

HENRY COOPER, M.D.

Hull, March, 1852.

CASE.

(From the Practical Advantages of Homœopathy, by the late Dr. Harris Dunsford.)

ASTHMA.

A LADY, of very high rank, had suffered several years from severe attacks of asthma, which, for six months before I was called in, had scarcely ceased, and for some weeks previously they were so severe that the patient had not been able to lie down at all, and had scarcely slept during that period. This distinguished lady was under the care of two of the leading physicians of the metropolis, and there being evidently an imminent danger of water in the chest, they both declared their inability to prescribe any other remedies but palliatives; and expressed their fears that these would be more injurious than beneficial. Under these circumstances, in the autumn of 1839, I was requested to prescribe. There was frequent severe cough, chiefly at night, extreme difficulty of breathing on the least motion, even on walking across the room; constant wheezing; œdema of the feet; pallid, tumid countenance; and, on some occasions, a livid hue, with blackness of the lips. I at once administered *Hyoscyamus;* and, during the night, the patient slept at intervals com posedly, a relief she had not experienced for a considerable period. On the following day *Arsenicum* was taken in solution, and continued, in very minute doses, for a fortnight. Under the use of this remedy, the sleep returned, she was able to lie down in a horizontal position, and the asthma ceased almost entirely. *Nux Vomica* was given, with a view to correct functional derangement of the liver, to which the patient is subject; and, subsequently, *Cuprum.* The result was highly gratifying. This eminent lady, in less than a month, was relieved from the distressing symptoms she had so long experienced, and has remained entirely free from them to this time; the general health being nearly restored. Many attacks of asthma may be effectually relieved during the fit, even when there is little hope of a radical cure. I was suddenly called up to prescribe for a young lady, then under the care of another physician, who was out of town upon a professional engagement. The patient, being unwilling to consult any other medical man, had remained resting on her knees and elbows for several hours, finding that the only position in which she could obtain a little relief. Spasm of the glottis, however, occurred, and naturally occasioned the greatest alarm. I administered *Hyoscyamus* in solution every half minute, until the danger of suffocation had passed, and, afterwards, *Arsenicum* dissolved, every five minutes; and, in less than an hour, the patient was able to lie on her back; she slept comfortably, and was relieved altogether from that paroxysm.

Miscellaneous.

SINGULAR ATMOSPHERIC PHENOMENA.—On Good Friday morning, shortly before one o'clock, the various persons passing over the metropolitan bridges, as well as many thousands on the south side of the river, were alarmed at beholding a singular appearance in the heavens, which at once led them to conclude that a terrible conflagration had broken out in the neighbourhood of the Old Kent-road, near New-cross, or Deptford. Messenger after messenger arrived at the Brigade and West or England fire-engine stations, requesting the aid of the firemen to subdue what was supposed to be a terrible fire. The parties in charge of the engines, upon looking out of the windows of the fire-stations were equally deceived, and forthwith the engines of the Brigade belonging to that side of the water, started in search of what was expected to be a dreadful conflagration, followed by Mr. Connorton with the West of England engine and firemen. The scene that presented itself was one of fearful brilliancy. The heavens presented at the south-eastern quarter an appearance of sheets of flame, of various hues; first, the light lemon tint, then changing to deep orange, after which they changed to a deep vermilion. The engines were driven with all possible speed in the direction of the supposed fire, but after proceeding some miles, the moon shone out with the greatest splendour. The engines were therefore ordered back to their several stations.

POISON-EATERS.—The first court of assizes, with trial by jury, established in Styria, was opened at Cilli ten days ago. A man was tried for having poisoned an old soldier. Amongst questions submitted to the jury was one to the effect, whether the deceased had been a "poison-eater," to which the jury replied in the affirmative. This caused some surprise in Vienna, and inquiries were made as to what it meant. It turns out that in the districts of Lower Austria and Styria, near the Hungarian frontier, there are men who make a practice of eating small portions of arsenic with the soft part of bread. This gives them a clear complexion, and increases the intellectual faculties, but if persisted in causes languor and shortens life. The men are called by the peasantry "poison-eaters."

NARRATIVE OF THE INTRODUCTION OF HOMŒOPATHY INTO ENGLAND.

By F. J. Smith, Esq.

(*Continued from page* 567.)

A treatise on the consequences of events regarded, at the moment of their occurrence, as simply fortuitous, could scarcely fail to be interesting, if not instructive. We are disposed to believe that, if this task were performed with minuteness and precision, it would be found that in no inconsiderable proportion of cases, circumstances that were at the time considered accidental, if not unfortunate—courses which all human prudence would, had it been possible, have avoided—turned out, in the sequel, the very best means of effecting the end to be accomplished.

And the case under review is, as we think, a remarkable illustration of this proposition. Unquestionably, prudence would have suggested the propriety of the first apostle of homœopathy to England locating himself in London, and becoming a permanent resident in the metropolis. We are far, however, from being certain that the very necessity of Dr. Quin's position compelling him to travel whithersoever H. R. H. went, was not the most effectual method that could have been devised of spreading throughout England a knowledge of homœopathy, while it was, beyond a doubt, the means of making known the science in various parts of the Continent, in a manner, and with a rapidity, which could in no other way have been accomplished.

In order to a just appreciation of the whole bearings of the case, it must be premised, that it was usually the practice of H. R. H. to travel at the close of that period of the year called "the London season;" that Dr. Quin's patients were principally amongst the nobility and higher classes; that it is the custom of a portion of these classes to pass the ex-London season in foreign travel; and that whereas, when in England, such persons confine themselves, as a rule, to some one medical man, when abroad they gladly avail themselves of the services of any English physician of note whom they may meet.

And if these circumstances have a general application, they must be admitted to apply with peculiar force to the case of a man accredited as the physician to a member of the Royal Family of England. It will therefore, we presume, be readily understood that numerous opportunities for practice must have been afforded to Dr. Quin when travelling abroad—greater, indeed, than could have fallen to his lot had he remained at home during the ex-London season; and, consequently, that he must have thus had greater facilities for making known homœopathy to English families resident or travelling abroad, than by adopting that course which prudence, as we have intimated above, would probably have dictated.

And it is important that it should be clearly apprehended, that science is not like an article of merchandise—a thing that may be puffed, advertised, or in any other way *forced* into notice. Neither is it permitted to medical men, even if they could stoop to such practices, to imitate the obtrusive acts of successful tradesmen. Medical science is essentially a matter of experience—*quoad* the public. Let laymen find themselves more speedily and effectually cured by one mode of treatment than by any other, and they will adopt and recommend it. The medical man who aspires to a distinguished and honourable reputation, apart from the walks of literature—and these, be it remembered, were not at this time open to the practitioner, for there was as yet no British homœopathic public to address—must therefore put forth all his skill in curing the patients that wait upon him. In search of patients he cannot go. He is bound by a code of etiquette as uncompromising as the laws of the Medes and Persians; and he who should violate that code would bring odium on himself, and involve his cause in disgrace.

The question, then, assumes this form: Given a new method of medical treatment superior to any known, and the herald of this system practising in London amongst a class of Englishmen, almost all of whom, at a particular season of the year, quit

Hosted by Google

London, adjourning either to the country or the Continent, and when abroad willingly avail themselves of the medical services of any English physician of eminence—how shall this herald most effectually make known his mission? To this question there can, as it appears to us, be but one answer, viz., to adjourn to the Continent himself. And such was the course which the position of Dr. Quin, as physician to Prince Leopold, actually necessitated; and thus was the very accident of position rendered tributary to the advancement of the cause of homœopathy in England.

Taking, however, a broader view of the subject, and regarding the whole human race as one vast family—the light in which that race must surely be regarded by the Father of us all—we can trace distinctly a great and altogether undebatable advantage accruing from the fortuitous circumstances of Dr. Quin's connection with the household of Prince Leopold.

In the course of the continental excursions he was, in consequence, compelled to make, Dr. Quin visited many parts of Europe where homœopathy was, if not unknown, as yet unestablished. In Paris, for instance, there was at this time no homœopathic practitioner. When Dr. Quin, therefore, reached the metropolis of France, besides being consulted by his own English patients who happened to be there, and such of his countrymen who preferred an English to a foreign physician, he appears to have had the honour of being called in to prescribe for, and thereby to make known homœopathy to, some of the most celebrated personages in France. Of these it will suffice to instance some members of the Royal Family and court of the unfortunate Charles X., and the already distinguished Duke (Louis Philippe) of Orleans, so soon to become King of the French, and subsequently an exile at Claremont—one of the official residences of his English physician.

Paris, however, was but one spot amongst many visited by Dr. Quin in the course of these travels, and where he became the means of either establishing or extending a knowledge of homœopathy. In Saxony, the birthplace of our great medical reform; in Austria, where its most decided extra-Prussian conquests had been won; and in Italy, where it had made for itself a home—in all these great European divisions there was many a town where homœopathy was unknown, or struggling for existence; and these, as opportunity served, he visited, promulgating the new doctrines and encouraging the adherents.

That Dr. Quin's continental success was considerable, no one has ever ventured to deny. And while we are disposed to concede to his admirers the possession, on his part, of talents, acquirements, and skill of no ordinary kind, embellished by a felicity of manner but rarely met with, we are not prepared to admit that to these is to be attributed, by any means, the totality of that success which marked his career, or of that influence which, as we shall hereafter have occasion to show, he acquired abroad.

Besides the immediate influence which accompanied (as we have already shown) Dr. Quin's rank as physician to Prince Leopold, there was another accident arising out of this position, which probably contributed not a little to the end we are now considering.

Of all the obstacles to the reception of new truths, the greatest, perhaps, is scepticism as to the sincerity of the advocate. Novelty of doctrine is regarded by most minds as an argument against its reception; and the circumstances of the advocate must be peculiar indeed, if he escape suspicion.

Now, when a physician attached to royalty is travelling abroad in company with his august patient, he is, of course, liable to be summoned at any moment to quit the place of his temporary sojourn. Under these circumstances, he cannot regard himself as a practitioner of the locality, and can only consent to undertake cases subject to the condition of a sudden removal. Thus released from the ordinary obligations of a practitioner, Dr. Quin could not, as we have ascertained on undoubted authority, be prevailed on to accept remuneration for his attendance.

However absurd and unjust it may be, there will always attach more or less of suspicion to the herald of a truth, provided personal interest be connected, albeit accidentally, with his mission. In the case under review this great *deterrer* was absent. The most suspicious of mortals might repose with confidence in the sincerity, at least, of the gratuitous adviser; the most malignant of opponents could not insinuate a motive of self-interest; while generosity of mind must have recognised in this unrequited labour, a love of science and a conviction of truth calculated to allay, in a great degree, the prejudice which novelty of doctrine is apt to excite, and to which homœopathy is peculiarly exposed, on account of its *apparently* disproportionate agency for combating disease.*

* This idea of *disproportion* is based on the prejudice that large doses of medicine are necessary to overcome disease. We call it a *prejudice*, because it appears to originate thus in the mind: large doses

Hosted by Google

Without, then, denying great personal merit to the herald, and nothing doubting that the *éclat* of position aided his conquests to the cause of homœopathy, we are still of opinion that the circumstance of Dr. Quin's determination of practising without remuneration, whilst travelling with Prince Leopold abroad, contributed in no slight degree to the success with which his continental efforts were crowned.

In the list of these conquests to the doctrines of Hahnemann, we recognise many a name now sacred to history; of these we will record only H. S. H. the Duke of Mecklenburgh Schwerin, the Queen of Bavaria, the Duke of Leuchtenberg, Princes of the House of Saxony and Prussia, H. S. H. the Duchess of Sagan, sovereign of Courland, Prince and Princess Metternich, different members of the reigning House of Cobourg, the Duke and Duchess of Grammont, Prince Talleyrand, the Duchess of Dino, the Duke and Duchess of Guiche, and the unfortunate Duchess of Praslin, who fell by the hand of her wretched husband. This list might be greatly extended; we will add, however, but two more names, and worthy of all honour are their Royal Highnesses the Duke and Duchess of Lucca, for, the former having been cured by Dr. Quin of an obstinate chronic disease which had utterly baffled the ordinary method of treatment, these illustrious individuals have bestowed on homœopathy their warmest support, and have ever since had each a homœopathic physician attached to their persons.

We have purposely anticipated somewhat the chronology of our subject, that we might dispose generally, and in a few words, of that which, while it can scarcely be said to come within the limits of this undertaking, could not be omitted without some prejudice to that service which was rendered by British enterprise and zeal to the cause of homœopathy abroad. Having thus briefly laid claim, on behalf of this country, to the merit in question, we will now proceed with our narrative from that point to which the reader had been conducted before we were tempted to diverge.

(*To be continued.*)

were universal before Hahnemann's (so-called) discoveries, and are still general where his system does not prevail; hence the mind, associating power with mass, concludes (and this is the *prejudice*) that large doses are essential to the cure of disease. It is obvious, however, that the whole case resolves itself into a question of experience from the mere fact, that, while allopaths give grain-doses of one remedy, they give ounce-doses of another. The dose, therefore, is regulated by the ascertained power of the agent employed, *i. e.*, by experience. Whether the infinitesimal dose, prepared after the homœopathic plan, and administered on the homœopathic law, be capable of producing the effect ascribed to it is therefore and must be solely a question of experience, and does not admit of being determined by any process of *à priori* argument. But when the mind concludes that infinitesimal doses *cannot* possess the power ascribed to them, it ignores experience, and is therefore the victim of prejudice.

CRITICAL ANALYSIS OF DR. ROUTH'S "FALLACIES OF HOMŒOPATHY."

By John Ozanne, M.D.

Entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

VII.

The second part of Dr. Routh's work is entirely taken up with the discussion of the circumstances which may influence the results of treatment in given diseases, and hence influence, to a certain extent, our estimate of the value of particular methods of treatment. "If," says he, "it be shown that the homœopaths neglect these wholly or in part, so must their conclusions in support of the efficacy of their treatment be *disbelieved*."

His division of this part of his work is best given in his own words: "There are general causes which occasion a difference in mortality, which require consideration. These are—1st, the effects of difference of locality; 2ndly, the constitutional type of prevailing diseases; 3rdly, peculiar mental epidemics or idiosyncrasies, if I may so term them, which at different times, in the histories of nations or epochs of individual life, influence health and modify general mortality; 4thly, hygienic discipline."

This looks all fair and good, and I may say that if the discussion of the question at issue, namely, the relative value of the two rival systems of practice, were undertaken in a proper spirit, each of the above points, forming the heading of a chapter of the inquiry, much might be done towards the elucidation of truth. In this manner many objections, frequently brought forward against homœopathy by persons only superficially acquainted with it, would be for ever silenced, and, as an immediate result, the attention of all conscientious inquirers would be directed to the questions upon which the whole controversy rests; thus making a real advance towards a *bonâ fide* judgment of the merits of the rival systems. Unfortunately, our author's mind is so biassed by prejudice, that he can neither see the truth nor state it correctly when he does see it. This unfits him for the task he undertakes. However, as free discussion can only lead to good, we may follow him throughout his remarks, pausing here

Hosted by Google

and there to consider his *facts* or *assertions of matter of fact*, whenever we meet with any. This has already been done in the preceding papers, for the obvious reason that a writer who brings forward statements on the authority of other persons, without quoting their words, or telling us the book or place where we may verify the authenticity of these statements, is much in the position of a witness before a court of law, the value of whose testimony in things which cannot be verified by the judge, is *tested* by a careful scrutiny of its accuracy in things which can be verified. We thus proceed in things scientific; from what is known or can be verified, to what is unknown and not within the reach of our means of verification; the writer, whose testimony in things which we can verify, is found to be trustworthy, is likewise trusted, and reasonably so, in all his other statements. Be it remembered that I am not alluding to matter of *opinion*, but to matter of *fact*.

Before entering into particulars, it is proper to remark that, although Dr. Routh has devoted a very considerable part of his work to these inquiries, he has failed to do *one thing*, which any plain matter-of-fact person would have thought a *sine quâ non* of the inquiries, namely, to show that this dissertation on the circumstances which may affect our appreciation of statistics *in general*, has anything to do with homœopathic statistics in *particular*. Failing to do this, his dissertation cannot be looked upon as a part of his inquiry. What was then the motive for introducing it, my reader will ask? The motive is obvious enough. I have already had occasion to allude to it, in my survey of the *fallacies* which vitiate the author's whole line of argument. By this means *a thing is proved*, which most readers will imagine bears in the most marked manner upon the question at issue. I say *most readers*, for this work is evidently designed for the *people*, not for the *profession*. Now, this thing proven does not bear upon the question at issue in the least. A scientific mind will see through this at once. But not so the mind unaccustomed to submit facts and reasoning to a careful and patient examination: such a mind *will be deceived*. Is it by such a process that the advance of homœopathy is to be checked?

To show how little these various points affect the question at issue, I request the reader to examine Dr. Routh's Appendix, in which the homœopathic and allopathic statistics are placed side by side.

If he take care to compare the results obtained in the two sets of cases in such a manner, that his terms of comparison will only comprise cases occurring *in the same place* and *at the same time*, he will at once silence the three first objections. As for the fourth — hygienic discipline, — it is almost too ridiculous to require comment. However, I may as well remark, that in Dr. Routh's Appendix, hospital results (Fleischmann's) are given of a date as far back as 1835. Now, Dr. Fleischmann was under the obligation of giving *monthly returns* to the Government Medical Inspector of Hospitals; is it to be supposed, that if Dr. Fleischmann's results, so far superior to the allopathic, were due to hygienic discipline, and that if this discipline were a thing so patent, the allopathic hospitals would not, years ago have adopted it?

We may now pass on to Dr. Routh's different headings, with the view of examining the *facts* adduced in proof of his propositions.

1. *Difference of Locality.* — The author says, that "mortality may be expressed generally by life-tables, not far different from one another, at least for Europe, etc. Yet due regard must sometimes be paid to special circumstances. It is thus a common source of fallacy among homœopaths to assert, that because in a certain country or city a certain favourable result has followed treatment which they have directed, therefore in all countries or cities similar results would follow their practice. Unfortunately, experience belies this assertion" (p. 18). What assertion? The reader would imagine that the assertion is, that *homœopathic results are, or would be, superior in all countries*. So far as we know, they *are* superior; and we may fairly infer, that as we have for the basis of our appreciation of the powers of homœopathy results obtained in almost every country in Europe, they would probably be superior in all other climes. But Dr. Routh's facts are brought forward not to disprove this assertion, but the inference that the facts observed in one country do not afford sufficient grounds for the belief that similar results would follow a similar practice in other countries. It is *this inference* which he says is *belied* by experience, not the *assertion* that homœopathic results are superior. His facts are directed against the inference, not against the assertion. This is a further example of that looseness of phraseology, which involves the question to be solved in inextricable confusion. It is a fault so frequent in this book, that it is deserving of the most marked censure.

In support of his statements, Dr. Routh appeals to his own observation of disease during *his visit* (we hear nothing here of

Hosted by Google

the constitutional type of prevailing disease) to the Continent. In England, he had seen acute inflammatory fever as a frequent consequence of surgical operations, requiring "most energetic treatment, perhaps sanguineous depletion." But, says he, "a visit to the Parisian hospitals convinced me that a totally different order of things prevailed there. The inflammations after operations were usually suppurative and *aplastic;* adhesions by the first intention were of rare occurrence," whereas in England these inflammations "were usually *plastic* in kind." But, strange to say, whilst in the *surgical* wards of the hospitals in either country this difference prevailed, the state of things in the *medical* wards was exactly the reverse, for in England, in the medical cases, "this dynamic type was less certain;" whilst in Paris, "the inflammations were more dynamic, and bore depletion well.' This fact, if founded upon accurate observation, would be worthy of the investigation of scientific men. To persons of ordinary understanding, however, a fact of this kind is too anomalous to be admitted without extensive and careful observation; for it seems, in truth, an absurdity to declare that, in any given locality, men, whose customs, whose food, and whose constitutions are as nearly as possible similar, should be affected with a "*dynamic*" inflammation if in the fever wards of an hospital, but if in the surgical, with inflammation of a low kind; and that in another locality, they should be affected with a "dynamic" inflammation in the surgical, and with one of a low kind if in the fever wards.

There is, however, a very simple mode of solving the difficulty. Dr. Routh's inferences are drawn from the kind of treatment supposed to be requisite. In one case depletory measures are said to be required, or to be "well borne," but not in the other, although it is not said that they were ever tried in the latter. In proof of inflammatory disease being "more *dynamic* at Paris," he adduces "the success of M. Bouillaud's *jugulating* system" in pneumonia. But Dr. Routh forgets to state that the *superiority* of the *jugulating* system is contested by nearly all the leading allopathists in Paris! I will not, however, content myself with a bare assertion; I refer the reader to the chapter in which Grisolle treats of bleeding in pneumonia, and in which he shows that M. Bouillaud's results are in no way superior to those produced by more moderate bleeding (*De la Pneumonie*, pp. 581, et. seq.) I may also add, from my own knowledge (having officiated during two years as *élève externe* in Professor Foucquier's clinical wards, adjoining those of Professor Bouillaud), that in 1837-38, it was remarked by my fellow-pupils, that by M. Bouillaud's system the disease was not alone more frequently and more rapidly *jugulated* but the patient likewise, and that a larger proportion of deaths occurred in his wards from acute diseases in general, than in those of his colleague in the clinical professorship.

With reference to adhesions by first intention, after surgical operation, I do not look upon Dr. Routh's assertion, that they are "of rare occurrence," as correct.

He next gives us the results of his observations at Vienna; but if not more accurate than those made at Paris, they are certainly not deserving of much confidence.

He asserts, amongst other things, that at Vienna, "in the medical cases, the inflammations *were generally slight in kind*, and did not require depletion;" and yet in *his* Appendix, in which the statistics of the Vienna allopathic hospitals are given, we find that, with the exception of *peritonitis*, the proportion of deaths to recoveries is as great at Vienna as in the Scotch hospitals, the statistics of which are given in the same tables. In *fever* and in *dysentery* there is scarcely any difference worth noticing. What are we to think after this fact, of the author's accuracy? If I abstain from charging him with the intention to deceive his readers, I cannot acquit him of a degree of negligence in making his statements, which, in a matter of such importance as the question at issue, is most blameable.

Our author next introduces a subject which is made to play a very important part in the course of his work—namely, the *relative frequency* of Bright's disease of the kidney. He asserts that it is by far less frequent at Vienna than in other places. The fact asserted by him (which I have shown from his own tables not to hold good, except in the single case of peritonitis), that many cases terminated more favourably at Vienna than they would have done elsewhere, is thus explained: "I attribute much of this to a most important pathological fact, which I cannot too strongly insist upon, namely, the extreme rarity of *Bright's disease of the kidneys*. Of this I am satisfied, not only from clinical observations in the wards, but from positive examination of the dead. * * * * Speaking generally, I should say, from memory, it did not occur in five per cent. of the cases examined. The proportion is probably much larger" (p. 19). As the relative frequency of *Bright's disease* is

Hosted by Google

made to play a very important part in Dr. Routh's attack upon homœopathic statistics, he ought, in all fairness, to have stated from the statistics of British hospitals, of which he has made so much use in his book, the exact proportion of cases in which that disease is met with after death.

In order to explain the superiority of the homœopathic results at Vienna in *pneumonia* and in *pleurisy*, Dr. Routh brings in *Bright's disease*, which is, he says, "very rare at Vienna, and very common here." He states its frequency at Vienna to be about five per cent., or one case in twenty. He does not state its frequency at home. I have no means of ascertaining the proportion of cases in which it occurs in London. But that is not necessary; for in all the homœopathic works which I have seen, with one exception,* the only institution in the United Kingdom with whose statistics of pleurisy and pneumonia the homœopathic results, under Fleischmann's treatment are compared, is the Royal Infirmary of Edinburgh. I will therefore state the proportion of cases in a Report of the Infirmary, which I have before me. I will also endeavour to ascertain it from the Reports of the Glasgow Infirmary during four consecutive years.

Amongst a series of tables, admirably arranged by Dr. Peacock, we find, in his "*Appendix to the Reports regarding the Royal Infirmary of Edinburgh*," p. 15, a statement, in a tabular form, of the cases of granular disease of the kidneys (*Bright's disease*) treated between 1st of October, 1841, and 1st of October, 1842. There were six deaths among the males, and four among the females; the total number of deaths for the year, from all causes, being 443. This gives only one death from *Bright's disease* to 44 from other causes. At Vienna the proportion is stated to be 1 to 20.

In the years 1846-47-48-49, at the Glasgow Infirmary, there were 38 deaths from *renal dropsy* and from *diseased kidney*, to 2,518 deaths from other causes,—that is, 1 to 66; the proportion at Vienna being 1 to 20. I have not been able to find in the Glasgow Reports—recommended for their completeness by Dr. Routh—any other deaths that could be ascribed to *Bright's disease;* but, in order not to leave the shadow of a doubt in favour of the objection, I will add the cases classed under the headings of *anasarca*, *ascites*, and *general dropsy*, the only ones that might possibly be ascribed to *Bright's disease*. These amount, in the course of the above four years, to 41, which, added to the cases of *renal dropsy* and *kidney disease*, give an aggregate of 79 cases, being in the proportion to the total of deaths from all causes as 1 is to 31; the proportion at Vienna being 1 to 20. But I must here declare, that these deaths from *general dropsy* cannot fairly be classed with the cases of death from *Bright's disease*, because the patients having died in the Infirmary, the post-mortem examination would have revealed the granular disease of the kidney, *if it had existed;* therefore these deaths can scarcely be ascribed to *Bright's disease of the kidney*.

II. "*The constitutional type of disease* may vary in the same country or locality, at intervals of years, months, and even days." This is perfectly true, if understood within reasonable limits; but if we ascribe, with Dr. Routh, to this cause alone the great revolutions in allopathic practice which have from time to time occurred, we expose ourselves to the risk of falling into grievous errors.

To the change in type of a given disease, he thinks "the high praise formerly bestowed on many medicines, now recognised to be almost inert, may have been due in part;" but I might appropriately add, that it was *chiefly due to imperfect observation*. The only apparent object of this section is to state, that epidemics often decline in severity as each week passes on, and that "whoever had treated the last cases would be considered the best doctor, and the homœopaths, if so circumstanced, might boast of having cured the largest per centage of cases—*a trick, I fear, more than once resorted to*" (p. 21). Why does he not give a single instance of such a trick?

He mentions as an instance of the changeable characters of epidemics, that in puerperal fever, "on one occasion, after the most fearful mortality, *Ipecacuanha* was *accidentally* found to act as a specific; and yet two years afterwards, on the recurrence of a similar epidemic, it entirely failed to do any good." This case, and Sydenham's confession of his difficulties in the treatment of every new epidemic, show that the *accumulated experience of ages*, of which the allopathic school so often boasts, is, in epidemic disease, a very fallacious guide. "In every new epidemic," says Sydenham, "it is as much as (nay, it is more than) I can do to avoid risking the lives of one or two of the first who apply

* In Dr. Marsden's "Notes on Homœopathy," p. 35, a series of cases published by Dr. A. Todd Thomson, is introduced as a term of comparison with Fleischmann's tables. This series comprises thirty-eight cases, of which eleven terminated in death.

Hosted by Google

to me as patients" (*Epidemic Diseases*, chap. ii.) It is one of the great advantages of homœopathic treatment, that it may be carried on successfully without risking one or two lives at the beginning of every epidemic. The *Ipecacuanha*, discovered by *accident*, was in reality discovered to be good, in the same way as all remedies are discovered in allopathy, namely, *ab usu in morbis*.

Dr. Routh gives, as his chief illustration of the change of type of disease, the practice of Dr. Clutterbuck in fever, so different from the present mode of treatment of that disease.

"Thus, twenty years ago, Dr. Clutterbuck brought in free venesection in cases of continued fever, and *the plan was eminently successful*." Whereas, "during the whole of last year, in the Fever Hospital (London) no blood-letting, not even by topical abstraction, was called for" (p. 20). Dr. Routh's statement respecting Dr. Clutterbuck's success is not correct. His inference, that venesection could be better borne twenty years ago than at present, is therefore without foundation. Dr. Clutterbuck had a theory of fever, and was apparently blinded by it, in his appreciation of the results of his treatment. Dr. Graves evidently alludes to it, when he says of bleeding, and more particularly of arteriotomy in fever: "Nothing was more common than to see a physician ordering the temporal artery to be opened on the eighth, ninth, or even tenth day. This was very much the practice during the time when the doctrine of typhus being the result of inflammation of the brain prevailed in this country (Ireland) and England, and *a very unsuccessful practice it was*" (*Clinical Lectures*, 2nd edit., vol. i. p. 147).

I quote the following from Dr. R. Williams's *Elements of Medicine*, p. 79. "The evidence in favour of the practice of bleeding is not of the same amount, neither is it of the same value. Dr. Clutterbuck is among the first who attempted to revive the practice of bleeding in fever. He considers the disease to be essentially inflammation of the brain, and bleeding to be the rule of treatment. The quantity of blood to be drawn to be in the inverse ratio of the duration of the disease. In support of this *methodus medendi*, Dr. Clutterbuck gives fourteen cases treated by severe depletion, and in some cases exceeding sixty ounces of blood, but of these cases three died, and in one the disease ran on: a mortality certainly evidencing no remarkable success. *But much difficulty exists as to the admission of the cases;* for in all, he bled early in the disease, and in one instance, within six hours after the attack, a period of time too short to allow the most discriminating physician to determine between fever and those many ephemeral febriculæ which simulate the first symptoms of typhus."

(*To be continued.*)

THE
HOMŒOPATHIC TIMES.

SATURDAY, MAY 1ST, 1852.

THE AMERICAN JOURNAL OF HOMŒOPATHY.

It affords us, amid the storms that rage, no small gratification to perceive that our energetic and ably-conducted popular contemporary, the *American Journal of Homœopathy*, speaks of the *Homœopathic Times* as follows:—"This is a most valuable journal for homœopaths in the U. S., enabling them to keep themselves 'posted up' to every thing that is going on in Europe in homœopathy."

We only wish the same honest and kindred feeling of brotherhood actuated our domestic colleagues: if it were so, the truth of the adage would be falsified—"Benefactors are seldom appreciated in the country of their birth."

The highest compliment which we find paid to our labours is in the reprint of many of our articles, for which we entertain no sort of jealousy, but have the most anxious wish to reciprocate civilities; and as a by no means inappropriate introduction with the motto of our cotemporary—"The agitation of thought is the beginning of Truth."—We proceed with much pleasure to transcribe into our pages an article which so entirely breathes our sentiments, that to alter in the least would damage; therefore we make no further apology.

"THE ALLOPATHIC SCHOOL.

"If we were to yield to our feelings, we should never pen another article against our opponents. But our judgment dictates to us that it is our duty, with the means at hand, to continue to exhibit to the public the evil of a

Hosted by Google

system of medicine which is destroying the health of our citizens, and filling thousands of graves prematurely. We cannot find it in our heart to wound the feelings, without a good and sufficient reason, of any one of our professional brethren who are opposed to us in doctrine and practice. But truth demands, the public good demands, that we should inflict the wound, however severe the pain.

"As a starting-point to the subject of this article, let the reader distinctly understand that there can be but two modes of administering medicine to the sick, viz., allopathic and homœopathic. The former admits of an infinite variety, without a singly clearly-defined principle; while the latter cannot be practised except by chance, unless its principles are clearly perceived and strictly followed. The one is exact and approximates certainty; and the other is loose, indefinite, and uncertain. These are now established facts which at this period cause the most unheard-of writhings throughout the entire allopathic school.

"We can scarcely believe what we hear and see—the phenomena to which we refer are unparalleled in the history of the world. For twenty-four hundred years a mode of medical treatment of the sick has been pursued without any essential change, and for thirteen hundred years of that time the doctrines and practice of one man controlled every acknowledged practitioner, no one of these daring to gainsay or express a doubt of the truth of the commonly-received doctrines; and not only so, but the image of allopathy, notwithstanding her ugliness, was seemingly indelibly stamped upon the minds of the people in every part of the civilized world; and her system advocated with a zeal and honesty worthy of all praise, by the most talented and learned men the world ever knew; yet with all this fortress-like protection, which could only be disturbed by the power of Omnipotence itself, fifty years ago, the sufferings of a sick world became so extreme by the very means employed to relieve it, that the cries of the distressed reached the throne of God. He, in his usual way of government in the management of human affairs, selected and qualified one man as the medium of conveying a safe and more certain mode of relieving human maladies than had hitherto been known. The system of healing revealed through Hahnemann was so directly and completely opposed to that which prevailed, that his theory alone accomplished but little; but when one and another, afflicted with what was thought, and declared by old-school physicians, to be incurable maladies, tried the new system of treatment, and found rapid and permanent relief, the people began to proclaim their happy experience of homœopathy, and the number increased from year to year, every one bearing the same testimony. The influence thus combined became a sort of battering-ram to the old walls.

"Allopathy has been building for ages structures which were deemed so thick and strong, that they were thought quite impregnable. But truth, that mighty antagonist of error, has accomplished wonders in the last fifty years in exposing the false theories of allopathy, as well as demonstrating the dangerous tendency of her practice.

"So powerful has been the influence of homœopathy on the profession, as well as on the people, that the allopathic school itself is in a state of amazement. It is deeply mortified to find the rapid inroads which homœopathy is making, the effect of which is, that the practitioners of allopathy have been compelled to modify their practice by almost renouncing the lancet, leeches, and cupping; by diminishing the quantity of medicine, and an acknowledgment that salivation by mercury is not necessary. True, there are those who still adhere to the 'heroic' practice, but they are comparatively few, and generally esteemed the most ignorant of that school. Things have changed in another respect, since the promulgation of homœopathy. The time was that a physician was hardly acknowledged until he was at least forty years old, but now the juniors, who are not wedded to old and doubtful measures, secure the confidence of the people by yielding gradually to the convictions of their own minds, induced by the prevalence of homœopathy; and although their practice is yet uncertain and unsafe, still it is not so pernicious as the old 'heroic' practice by the lancet, emetics, cathartics, etc.

Another change has been going on for the last few years, which begins to be manifest, and causes much anxiety among the professors of our colleges. That to which we refer, is the spirit of toleration which prevails among students of medicine. A very large proportion of the graduates of our medical institutions will not allow themselves to be unduly [prejudiced against homœopathy, but resolve to investigate, secretly or openly, the claims of the new system of medicine. In one college, of over 400 students, an unjust attack upon homœopathy and homœopathists would not be endured; a single attempt was promptly put down by a decided expression of disapprobation on the part of the students.

"In a word, the old allopathic practice has already received a blow, from which it can never recover; and the advice of Dr. Forbes begins to produce effect everywhere, and the restorative powers of nature are applauded to the skies, and thereby allopaths pretend to account for and acknowledge at the same time the success of homœopathic practice.

"Allopathy is beyond doubt doomed to annihilation, and the time of her execution depends upon the strictness of homœopathic practitioners in adherence to the law *similia similibus curantur*."

LONDON HOMŒOPATHIC HOSPITAL.

The third anniversary festival of this Institution took place at the Albion Tavern, Aldersgate street, on Wednesday evening, the 21st instant, and was numerously attended. The Earl of Albemarle presided on the occasion, and was supported by the Marquis of Douro; Culling C. Smith, Esq.; Dr. Quin; M. B. Sampson, Esq.; T. Uwins, Esq., R.A.; J. P. Knight,

Hosted by Google

Esq., R.A.; Rev. J. Gosset; Dr. Trueman; Ambrose Moore, Esq.; Rev. J. Burnett; E. Esdaile, Esq.; N. Barton, Esq.; Dr. Hamilton; H. Bateman, Esq.; Captain King; Captain Branford, R.N., and upwards of 100 medical and lay-supporters of the Hospital. The galleries were graced by a large number of ladies, whose presence added very much to the brilliant appearance of the festival.

The CHAIRMAN introduced the toast of "The Queen," by proposing her to those around him as the model of a chief magistrate, and to those above them (the ladies in the galleries) as the model of every domestic virtue. (Loud cheers.) The toast was enthusiastically received.

The "Health of Prince Albert and the Prince of Wales" was then duly honoured.

The next toast was—"The Duchess of Cambridge, the patroness of the Institution." (Loud applause.)

Mr. PAYNE proposed the toast of "The Duke of Wellington and the Army," and having alluded to the progress of homœopathy, accompanied it with a desire that the new medical science of which they were the ardent supporters, might be the means of further prolonging so valuable a life. (Loud cheers.)

The Marquis of DOURO responded. He most gladly re-echoed the prayer that the life of the noble duke might be prolonged for many a year. (Cheers.) He was happy to say that the noble duke still enjoyed not only the advantages which should accompany old age, but that there was nothing to interfere with his health and usefulness. (Renewed cheers.) This could not fail to be satisfactory, not only to the company present, but to the whole nation. He (the Marquis of Douro) was not one of those who apprehended that the enemy was at the gate; but to those who entertained that apprehension it must be satisfactory to know that the duke was "within it." (Loud and long-continued cheers.) The noble marquis concluded by proposing the toast of "The Navy," as a branch of the public service which he was sure could and would do whatever could be expected from it, and that was—everything. (Cheers.)

Captain BRANFORD, R.N., returned thanks, and was much applauded.

Mr. YELDHAM was called upon by the noble chairman to propose the next toast, "The immortal memory of Samuel Hahnemann, the founder of Homœopathy." In doing so, Mr. Yeldham said that that great man (Hahnemann) had, by the happy instinct of his genius, been able to discover the true principle of medical science, and had by this discovery dispelled the cloud which had enveloped medicine for three thousand years. (Cheers.) There was something ennobling in the contact with truth. No man could receive and act upon a great truth without being raised in moral and mental worth by it. In the case of Hahnemann his whole life was an argument in proof of the correctness of his principles. Pure and simple in his wants; active, enterprising, and earnest in the development of the great principle which he so happily discovered, he was an illustrious example whom every homœopathist should endeavour to imitate. (Loud cheers.) Entertaining these views, he might perhaps be asked why he had refused to subscribe to the monument in memory of this great man which had recently been erected in Germany. His answer was simply this:—While he was much gratified to find that the Germans were doing honour to the fame of their illustrious countryman in his own country, he felt that the genius of Hahnemann must, at no long period, be known and honoured in every part of the civilized world; and wherever it was so known, monuments of the most enduring and useful kind—monuments of brick-and-mortar Hospitals for the reception of the sick poor—would eventually be raised; and as this had been done in England, he gave all his influence to the attempt which they had that evening met to celebrate—the successful attempt to establish the "London Homœopathic Hospital." (Loud cheers.) This was the reason why he had not taken any active part in promoting the erection of the monument in Germany, and he trusted his explanation would prove satisfactory. (Cheers.) After pressing upon the attention of the company the necessity of homœopathists bearing contentedly the opposition they must meet with—as every new truth had hitherto been so met, Mr. Yeldham concluded by proposing "The immortal memory of Hahnemann," which was drunk in solemn silence.

The Earl of ALBEMARLE then said the toast he had to propose was a natural corollary to that which had preceded it. It was "Success to the London Homœopathic Hospital." The pleasing task he had before him was to recommend it to their notice. All around him were doubtless aware that in dramatic entertainments there was generally a middle-aged gentleman who took the "heavy business." (Laughter.) On this occasion their manager (Dr. Quin) had very judiciously "cast" his parts. They had heard eloquence from Mr. Yeldham, and he (Lord Albemarle) would have to trouble them with the "heavy business," but he hoped he should be enabled to make up for his deficiency in eloquence by business-like proceedings. (Cheers.) It was nearly half a century since an English Hahnemann endeavoured to introduce the science, and, like the pioneers of all great changes in long-established customs and usages, he was met by many obstacles, and that, to medical men, most fatal of stigmas, "charlatanery." It was to be remembered, however, that Galileo, when he first made known his so-called heresies relative to the motion of the earth, met with a harder fate even than that, but yet posterity has done justice to that great man. (Hear, hear.) If he (the Earl of Albemarle) knew anything about the English character, it was that they liked a bold stand-up fight and no favour. (Hear.) He would not say that he would never enter upon a course of treatment under the allopathic system, but as the new system had been so eminently successful in instances where allopathy had failed, he thought that it should have fair play; and it was in that spirit that he had come there that evening. (Cheers.) Proceeding to business matters, it was necessary to inform their friends that the

Hosted by Google

London Homœopathic Hospital was established in the month of October, in the year 1849, but was not opened for the reception of patients until April, 1850, on the anniversary of the birthday of Hahnemann. It thus appeared that the Institution was scarcely two years old, but he must say that it was a very thriving child, considering the hard treatment to which it had been subjected by its professional opponents during its nursing—(laughter)—and he thought that if it went on thriving as during the past two years, it would prove a credit to its (glancing slily at Dr. Quin) "papa." (Cheers and laughter.) It appeared from the statistics of the Hospital, that the number of patients during the first year was 156, of whom 97 were discharged cured, and 6 died, the remainder having been either relieved, dismissed, or under treatment; and during the year ending on the 31st March, 1852, the in-patients numbered 213, the number cured 128, and deceased 7. The total number of patients received during the year ending 31st March, 1851, was 1,703, and during the year ending on 31st March, 1852, 3,221, making altogether 4,924 persons under homœopathic treatment. From the statement of the accounts, it appeared that whilst the number of patients had largely augmented, the charges had, oddly enough, become homœopathic—(laughter)—indeed, one of the wonders of the infinitesimal system. The expenditure of the two years had very closely approximated; but it was to be remembered that nearly double the number of persons had been relieved during the latter year, and the charge per head was 8*s*. 9¼*d*. (Hear, hear.) He must, in speaking and pleading for success, remember that they all liked economy in the abstract, to whatever political party they might belong. There was one point—the apothecary's bill—that even the allopaths would understand—(hear and laughter)—and that also particularly deserved the attention of the supporters of the Institution. He recollected that in his youth the draughts black, red, and yellow were not only very nasty but also very expensive. What did they think of 5,000 patients and an apothecary's bill of 23*l*. for two years? (Laughter, and prolonged cheering.) He believed that if all medical establishments were conducted as theirs had been, there would not be a living for one-twentieth of the present number of those gentlemen—no, not even one; and he would probably be thinner than the starved practitioner described in *Romeo and Juliet*. (Laughter.) The number of patients cured in the Hospital in the first year being 97, and during the second year 682, he had reason to say that the child was an infant Hercules to have increased so much in that brief period. (Cheers.) The bulk of the cases were chronic—in fact, the Rejected Addresses of other Hospitals, and not very likely patients for empirics to found a reputation on. (Hear, hear.) The noble earl, in continuation, stated that the reports of the Registrar-General proved that the annual depopulation of the United Kingdom arising from preventible causes amounted to the population of a whole country, and adverted to the power of homœopathy to mitigate the fearful waste of human life. With respect to the comparative success of the homœopathic and allopathic modes of treatment, he stated that the tables of various Continental and English Hospitals showed in cases of acute disease, that the proportion of patients dying under homœopathic treatment was in one case 3½ per cent. against 28 per cent. under the old system. In another 9 per cent. against 22½, and in one description of disease—of the chest and lungs—of 331 patients admitted, 229 were cured and 102 died under the allopathic system; and under homœopathy, out of 278 patients afflicted with the same disease, 251 had been cured and only 27 died. (Cheers.) In conclusion, the noble earl said he feared his zeal in the cause had outstepped his discretion, but as he was desirous of performing well the "heavy business" his manager had allotted him, he trusted his audience would excuse him. He then proposed, with pleasurable feelings "The Success of the London Homœopathic Hospital." (Much cheering.)

The toast having been drank with much enthusiasm,

Mr. BARTON shortly proposed "The healths of his Grace the Duke of Beaufort and the Marquis of Anglesey, the vice-presidents of the Institution."

The toast having been cordially responded to,

Dr. QUIN rose for the purpose of proposing the health of the noble chairman. (Cheers.) He felt certain that the company would agree with him as to the admirable manner in which the noble earl had gone through the intricate proceedings of the evening. The "heavy business" had never been more lightly or elegantly done on any boards. (Cheers and laughter.) The Institution was, however, more deeply indebted to the noble earl than his hearers were perhaps aware, for he had arrived the previous evening from Paris with the express object of presiding at their festival, but at the same time totally unaware of the arduous duties he had to perform. It was, however, an example of the readiness with which the nobles of the land were willing to lend their aid for the benefit of their more humble fellow-creatures. All parties could meet, and all party feeling and distinctions be banished, on the neutral grounds of charity. (Applause.) On the occasion of their first festival they had had the happiness of having a distinguished disciple of the late Sir Robert Peel; last year an ardent admirer of the noble lord the present Premier; and the presidential chair was now occupied by a firm and effective supporter of Lord John Russell. (Cheers.) It would ill become them not to express their sense of the manner in which the nobility came forward on occasions of that sort. (Hear, hear.) It, however, was necessary for him to advert to some points connected with their Institution. It was known that a charge had been made against them that the council was composed of a medical clique, and another Institution had claimed peculiar support from the public on the ground that its affairs would be administered by a lay council. He disclaimed the imputation that their affairs were not *de facto* under lay management, the medical officers on the council

Hosted by Google

studiously abstaining from interference unless their opinions and interpositi n were asked (hear, hear); and he would say further that he attributed their present proud position to the fact that their affairs were under lay-management. (Cheers.) As to the charge of the medical officers being a clique, he could assure them that the contrary was the fact, they having English, Irish, Scotch, German, and Polish physicians in connection with the Hospital. The only qualification required by the council was that they should have received a thorough medical education and training. Dr. Quin then stated that the daughter of Hahnemann occupied a seat in the gallery; and that his grandson, Dr. Lüsse, was one of the medical officers of their Institution. (Cheers) He then proposed the toast—"Health and prosperity to the noble earl in the chair"—and concluded an effective speech by an enumeration of the military services of his lordship, and also his valuable contributions to literature, both geographical and historical, and said that it was not a little honour to them that the noble earl should preside on that occasion. (Cheers.)

The Earl of ALBEMARLE, in returning thanks, said, that his modesty had been put to severe proof by his kind friend, who had been an allopath in praise, whatever might be his profession. His noble friend (the Marquis of Douro) had spoken of military subordination, and subordination had placed him in that chair; for as a grateful patient of Dr. Quin's, who pressed him, when suffering from a severe attack of neuralgia, to take the chair, he felt that as he had afforded him so much relief he had a right to command, and consequently he had accepted the honour. (Cheers.) The gracious and kind and indulgent manner in which he had been received had left him no cause for regret at having done so. (Loud cheers.)

CULLING C. SMITH, Esq., then proposed the "Health of the Princess Mary of Cambridge," through whose influence, in conjunction with a committee of ladies organized for the purpose, their Institution had been much benefited—a penny subscription having ripened into the golden harvest of upwards of £146.

On the health of the Medical Officers and the Members of the British Homœopathic Society being given,

The Rev. J. H. GOSSETT said,—Rejoicing as I do over the progress of homœopathy, I come here to add to my joy in that particular. The details of the success of homœopathy in the metropolis particularly interest me. I had no idea that I should have been called on to address you this evening. I have to propose the health of the Medical Officers of your Institution, and of the Members of the British Homœopathic society. I have some claims on this undertaking, as you will acknowledge, when I tell you I have medical blood in my veins; and that I am the grandson of a physician, who deserved well of his country, and of mankind. He was also an antiquary—an F.R.S.A. In one particular I differ from him—I am irreverent towards the stocks and stones of old allopathy. But from him I inherit a love for medical science, and though I belong to a profession yet more important than that of medicine, I hope, please God, to dedicate some of my sons to the medical science; and I trust they will follow in the wake of the great Sage of Saxony. In proposing this toast, I look on these gentlemen and the society from which they are to be recruited as specimens of that small though valuable body, which has been brought out from the midst of the medical profession of this country. I look on them as the gold-diggers in Australia and California regard the grains of gold they have washed out, painfully, from the auriferous earth. I regard the homœopathic medical body as the fine gold extracted from the allopathic mass of heterogeneous matter. At much self-sacrifice have the individuals of this meritorious body left their old position; and after much toil have they taken their present stand, and worthy are they of our esteem and regard. But I am one of many, who feel the want of homœopathic medical practitioners in the provinces. I have been nine years an earnest disciple of homœopathy, but only within the last three months have I had a homœopathic practitioner within a comfortable distance of my house. For some years I had none nearer than forty miles. I know of no means so likely to provide us provincials with homœopathic medical advisers as the establishment of hospitals, for the treatment of disease on the homœopathic principle. Every gentleman who works in such hospitals, is working for the benefit of the homœopathic public in the provinces. This work they do from a love of the Cause, for I do not suspect it profits them materially in their private practice. Let me suggest to you one topic of consolation: if you have not cured many, you have not *killed* any patients. You are not to be numbered among the skilled destroyers of your kind. You could not say as much if you were the medical officers of an allopathic Institution. I will give you the opinion of one of their own body, whom I met in the shop of Mr. Headland a few days since. He was a doctor of the old school, but had himself derived benefit from homœopathy; but being no longer young, and having a sufficiency, he did not care to qualify himself to practise it. Speaking of some of the doctors of the old school, he observed they were regular "Joe Mantons, sure to kill." I give then, *ex animo*, the health of the "Medical Officers of your Institution and of the Members of the British Homœopathic Society."

Several other toasts followed, which were duly responded to, and the company separated at an advanced hour. The subscriptions during the evening were announced by Mr. R. Buchan, the honorary secretary, to have reached £712 6*s*. 2*d*.

The musical arrangements were under the direction of Mr. G. Buckland, assisted by Messrs. Benson and Francis.

MANCHESTER HOMŒOPATHIC HOSPITAL AND DISPENSARY.

(*From the Manchester Guardian.*)

THE annual meeting of the Manchester Homœo-

Hosted by Google

pathic Hospital and Dispensary, Bloom Street, was held on Wednesday morning, in the large room of the Town Hall, there being a numerous and very respectable audience, including a large number of ladies.—R. Barnes, Esq., mayor, presided; and among the gentlemen upon or near the platform were the Revs. Canon Slade, Vicar of Bolton; R. Durnford, Rector of Middleton; Wm. Burchell, Rochdale; R. Frost, Richard Fletcher, J. Kendall, R. Jones, E. Morris, and H. H. Jones, F.R.A.S., of the Rusholme road Cemetery. Drs. Walker, Hon. Sec. of the Institution, Norton, H. Johnson, Tuckey, M'Dowall, and Pope; Alderman Sir John Potter; Messrs. Salis Schwabe, James Thompson, Joshua Knowles, Joseph Heron, Town-clerk; Wm. Hoyland, Nicholas Heald, E. C. Holland, Joseph Adshead, H. P. Rée, Edward Phillips, Wm. Armitage, Edwin Waters, Henry Dixon, Wm. Heron, H. Waterhouse, G. Wildes, E. Grundy, C. H. Rickards, G. Bradshaw, H. Pope, jun., Ivie Mackie, C. Dufield, etc. The Chairman said he presided on that occasion not because he had been personally benefited by the science of homœopathy, or because he was fully acquainted with its details and working, but because he felt it to be his duty, in his public capacity, to occupy the chair, inasmuch as he believed the object of the Institution was to promote the public good, by ameliorating, in the most pleasing and agreeable manner, the "ills which flesh is heir to." There wera now many adherents to homœopathy in Prussia, Belgium, France, the United States, and this country; it was now become, in a great degree, a recognised agent, and the footing it had gained here and elsewhere entitled it to their consideration and support. When he remembered the rapid strides which had been made of late years in chemistry, astronomy, geology, and other sciences, he did not understand why the science of medicine should be an exception; and he thought that everything which, like homœopathy, claimed to be an advance should be properly received and fully investigated. (Hear.)—The Secretary read letters of apology for their absence, from the Earl of Wilton, President and Patron of the Institution; Professor Scott, Principal of Owen's College; Revs. A. A. Bagshaw, E. Walker, R. Litler, and W. Thornton (of Stockport); and from Mr. E. Benson. Professor Scott said, "I regret that I shall not have the opportunity of declaring my unshaken conviction that homœopathy is true, and, in accordance with the resolution you put into my hands, that it is particularly the cause of the poor." The Secretary next read the following Report for the last year.

"In presenting the Second Annuai Report of this Institution, the committee have to meet their friends and subscribers under circumstances which are very encouraging. The Dispensary has been in operation ten years, and this is the fifth year in which it has been conducted in part on the self-supporting principle; those patients who can afford it being required to pay 1s. each per month. The present attendance of patients averages 100 per day, or about 30,000 per annum; and of this number 3,294 have been new cases, although there have been two or three other homœopathic dispensaries opened in the neighbourhood during the past year, all of which are well attended. 4,580 monthly payments have been made, yielding £229 to the funds of the Institution.

"HOSPITAL.—This is the second year since the Hospital was opened, and in this department of the Institution the committee have been equally encouraged as regards the success of the treatment. The number of cases received into the Hospital for the year is 166; fewer than the committee at first expected to be able to admit, as they contemplated receiving some gratuitously, and others as low as 2s. 6d. each per week. The very heavy expenses in necessary alterations, and furnishing the Hospital, have, however, kept the funds in so limited a state that the committee have not felt warranted in adopting a lower rate than 5s. each per week. This operates very unfavourably as regards the extent of the usefulness of the Hospital, many of the working-classes being unable to pay that sum. A few patients were, indeed, admitted at 2s. 6d. each per week, at first, but the committee were soon compelled to increase the charge. The attention of the subscribers and friends is particularly directed to the tabular medical report and the analysis of cases appended to the Report. It is proposed to publish a review of the nature of each case admitted into the Hospital since the 10th of April of last year up to the same date of the present, drawn up by the resident medical officer of the Institution, Dr. Pope. The conclusions which have been arrived at by that gentleman, from the experience of the past year in our Hospital are as follows:—First. That every acute case, admitted as such, has recovered, and that in a shorter time and with far greater ease than usually happens in similar cases, under allopathic treatment. Secondly. That many have recovered who had previously sought assistance at other institutions without relief. Thirdly. That a large number of cases of chronic disease, where complete recovery was (on account of organic lesions) impossible, have been greatly improved, and their lives thereby rendered much more comfortable to themselves, and in all human probability lengthened. Fourthly. That all the cases which have been discharged, as being either incurable or unaltered, were with one exception, in a condition, on admission, which placed at defiance all means of relief. Fifthly. That in those which have died and been inspected after death, disease was found to exist to such an extent as to render prolongation of life perfectly impossible; and in those, too, where a post-mortem examination could not be obtained, the symptoms during life were of such a nature as to compel a similar conclusion. Sixthly. That the experience of the past year in this Hospital, where no case holding out a prospect, however distant, of affording even temporary relief, has been refused admission, proves that the principle of homœopathy is a guide whereby diseases may be cured both speedily and effectually. The committee are deeply sen-

Hosted by Google

sible of their obligations to the honorary medical officers, for the very efficient services rendered during the year, oftentimes at great inconvenience to themselves; and hope to be favoured with a continuance of their valuable assistance. The cash account shows a balance of £270 11s. 1d. due to the treasurer, which the committee sincerely trust their friends will not only enable them to repay at an early date, but also vigorously to carry on the benevolent objects proposed by the Institution."

The cash account contained the following items:—Subscriptions and donations, £396 16s. 4d.; received from dispensary patients, £229 7s., at 1s. each per month; hospital patients, £196 13s. 6d., at 5s. per week. Owing to the bank, £208 6s. 11d.; to the treasurer, £64 4s. 11d: making a total of £270 11s. 3d. Owing to the bankers at the beginning of the year, £197 0s. 3d.; paid for medicines, £77 17s.; provisions, £324 8s. 4d.; wages and salaries, £225 7s. The expenditure for the year had been £1,093 8s. 1d.—The Rev. R. Durnford moved "That the Report now read be adopted and printed." He was glad to hear from the mayor that he considered the Homœopathic Hospital a necessity; for himself, he (Mr. Durnford) thought there was plenty of room for both systems; and he thought it was not without reason that the founders of the Homœopathic Institution had exerted themselves to meet the prevailing necessities of the enormous population by which we were surrounded. The resolution he had moved did no more than call upon those present to say that the Hospital was a necessity in Manchester, and to pledge them to support it to the best of their ability. The necessity was shown by the people who had swarmed to the Hospital; the sacrifices which those people had made to avail themselves of the peculiar system of treatment; and the immense success which had attended that treatment. He hoped their opponents would soon become content to allow them to do good in their own way, as they were entirely content to allow their opponents to do. He had been a subscriber to the Royal Infirmary ever since he came to Manchester; but from the very moment when, thirty years ago, he turned his attention to medical subjects, he was convinced that there was another and a truer system, and he was glad to find now that that truer system was established, side by side with the prevalent one, in Manchester. He saw, from the papers, recently that it was determined to merge the House of Recovery with the Royal Infirmary. He did not pretend to give an opinion as to the propriety of that course; but he observed that at the meeting a very decided opinion was expressed that further hospital accommodation was needed, and he saw in this a strong argument in favour of the general support and enlargement of the Homœopathic Hospital. It was a mistake to suppose that homœopathists read none but the books of Hahnemann. Their medical men paid willing homage to the mighty luminaries of former ages, Hippocrates, Galen, and others. All they said was, that in aftertimes there arose a master mind, who gave the key to all accumulated facts, which enabled them to harmonize the various theories, and afford a principle on which medicine could rest. The homœopathic medical men had endured the coldness of friends, the hatred of enemies, and even persecution itself; they had sacrificed their name, and, in the opinion of many, their character, to uphold what they conscientiously believed to be the truth; and in doing so they had conferred untold benefit on millions of their countrymen, not only in connection with medicine, but in bearing thus clear testimony to the power of conscience and truth, beyond all human considerations. The only way in which those services could be properly repaid was for their friends to step forward and clear the Hospital of the incumbrance which now beset it.—Mr. Salis Schwabe seconded the motion. He hesitated, at first, when, two or three years ago, he was requested to accept the treasurership of the Homœopathic Institution, because he had long been connected with and felt a deep interest in the Royal Infirmary; but he hesitated no longer, when he reflected that the Homœopathic Hospital must be an advantage to the Infirmary and the dispensaries of the town, at least to the extent to which it provided for out and in-patients. He had seen vast good to the Report fully proved that the Hospital deserved result from homœopathy; and he thought that public support. He highly approved of the principle by which the Institution was made partly self-supporting; and he believed that the same principle might to some extent be applied to the Infirmary, many of the patients in which would, he was sure, if they had the opportunity, rather pay something for what they received, than receive that assistance gratuitously. He was not inclined to be favourable to the adoption of homœopathy, to the entire exclusion of allopathy, or the reverse. He thought the professors of one ought to avail themselves, in cases where they thought it suitable, of the practice of the other; and he thought that as there was a Homœopathic Hospital in Manchester, the general body of medical practitioners ought to make themselves acquainted with the science. If homœopathy was founded on a delusion, that delusion should be exposed; if the cures said to have been performed by it were the effect of imagination, let it be so proved: but, for himself, he could not believe that imagination had ever brought about the cures which he knew to have been effected in the Homœopathic Hospital. On this point there was also the answer afforded by the undeniable effect of homœopathic medicines on infants. He thought a little more charity and less of vituperation and ill-will on each side could not fail to result in great good to the public.—The resolution was unanimously agreed to. The Rev. Canon Slade moved the second resolution. He said that he rose from a plain sense of duty, in the first place, to a charitable institution, which he was sure was calculated to confer immeasurable good upon this city, and in whose welfare he took a deep and warm interest; and in the second place, to acknowledge the benefits bestowed by homœopathy on himself, on his friends, and on many of his poorer

Hosted by Google

neighbours,—and thus to record his own opinion and judgment, such as they might be, in favour of the system. He was not deterred from this course by what he knew to have been asserted, that none adopted homœopathy but knaves and fools. He preferred homœopathy, because, as compared with allopathy, its cures were more frequent, more speedy, and more lasting; and also becaure they left none of those injurious consequences which were so apt to be produced by the depletions of the other party, those consequences being often more dangerous and difficult of removal than the original disease. He admitted that the infinitesimal doses seemed very absurd, and he was not surprised at the ridicule which had been heaped upon them; but putting aside the question of small or large doses, both systems must be tested by experience; and he knew that there was as certain an effect produced by *Aconite* or *Belladonna*, administered homœopathically, as by *Bark*, *Colocynth*, *Rhubarb*, or any other drug, allopathically administered. The rev. gentleman related several instances of successful treatment by homœopathists, which had come under his notice, and predicted that the system would ultimately triumphantly prevail. — Mr. W. Hoyland seconded the motion; and it was unanimously agreed to.—In moving the next resolution, Mr. Adshead referred to his connection with the Royal Infirmary, and said that he was satisfied he was aiding that Institution by doing what he could to promote the success of the Homœopathic Hospital and Dispensary. Those who were writing and talking about the necessity for a second hospital in Manchester, would find, if they extended their inquiries to Bloom Street, that we already possessed a second hospital, which only needed encouragement and support to make it extensively useful. Mr. H. Dixon seconded the resolution. He said there were many heads of families who were now in doubt, in case of sickness, as to which system they should place the patient under. In order to do away with this state of things, he would suggest that fifty or sixty patients, taken indiscriminately, should be treated homœopathically in one of the wards of the Royal Infirmary, and that an equal number of patients, as nearly as possible under similar circumstances, should be treated allopathically in a second ward. A committee of intelligent gentlemen should be appointed to watch the progress of those patients, and the result should be by them made public. In proof of the advantages of the homœopathic treatment, the speaker read the substance of a petition, founded on facts derived from public records, which was presented to the Hungarian Diet, in 1843, as follows:—

"1. That the mortality in homœopathic hospitals was not quite 6 per cent., whereas in allopathic hospitals it amounted to more than 12 per cent. 2. That, in severe inflammation, allopathy loses nearly 15 per cent., homœopathy not quite 5 per cent. 3. That, in nervous and putrid fevers, allopathy loses 21, and homœopathy 12 per cent. 4. That, in the treatment of cholera, allopathy lost 53 per cent., homœopathy only 8¾ per cent. 5. That the average duration of cases, allopathically treated, is 29 days—while that of those homœopathically treated is only 21 days. 6. That homœopathic hospitals do not require, under equal circumstances, half the expense of allopathic establishments."

The resolution was unanimously agreed to. The subsequent speakers were Mr. Joshua Knowles, Revs. William Burchell and R. Fletcher, Mr. H. P. Rée, and Mr. Joseph Heron. Mr. Catlow, surgeon, attempted to speak when two of the resolutions were being put, but the chairman decided that his doing so would be out of order. Alderman Sir John Potter having taken the vacated chair, a vote of thanks to R. Barnes, Esq., the mayor, for his kindness in presiding, was moved by Mr. Schwabe, seconded by the Rev. R. Durnford, and carried by acclamation. The mayor briefly acknowledged the compliment, and the proceedings then terminated shortly after half-past one o'clock.

CASE.

(From the Practical Advantages of Homœopathy, by the late Dr. Harris Dunsford.)

PHTHISIS.

A butler, aged thirty-three, consulted me in June, 1829; he had suffered for some months, from slight hacking cough, with expectoration of thick yellowish matter of a nauseous taste. He complained of shortness of breath; his pulse was accelerated; he could not lie on the right side, which was dull on percussion; and he had frequently spit florid blood. Several members of his family had died of consumption. *Pulsatilla* was at first administered, which diminished the cough as well as the expectoration, and also lowered the pulse. Under the employment of *Stannum* he rapidly improved, and he could lie on the right side. In a month, so great a change had taken place, that the sound on percussion had become improved; and, in a few weeks more, had entirely resumed its natural character. The pain at the chest gradually ceased, and this patient has since completely recovered, and returned to his situation.

[Judging by the date of this case, Dr. Harris Dunsford was one of the earliest practitioners, some say the earliest (which seems doubtful since the appearance of Mr. Smith's narrative), of homœopathy in this country. He died in the prime of life, and was deeply regretted by his friends and patients, all of whom hold his memory in lively respect and esteem. He was a very able and successful homœopathist; he was industrious, pains-taking, honest and sincere.—ED.]

THE DISEASES OF CHILDREN.

By Dr. Frederick Augustus Günther.

(Continued from page 558.)

Section II. Nutrition of the new-born infant.

1. *The Milk of the Mother.*—"Every healthy mother ought to suckle her child," says Jörg, in his address to mothers. "I will not base this maxim upon the obligations of moral duty. I know too well how little weight these obligations have with mothers that are disinclined to fulfil them; therefore I address myself entirely to your understanding, taking from the never-erring book of Nature alone those reasons which I shall adduce here in support of the principle that it is my desire to inculcate in you. You must know that even after the birth of the child an excess of nutritious matter continues to be elaborated in the organism of the mother, and that the final process of gestation—parturition—causes simply a change in the direction of that excess, which now flows towards the lacteal or mammary glands, where it appears as milk, and continues thus to afford appropriate nutriment to the child. In addition to this I must inform you, that in the same way as Nature has fixed at nine months the period of gestation, so she has also fixed at nine months the time the mother shall continue to feed the child from her genial bosom. Nature wills and directs that the child be fed and maintained on the natural food furnished by the mother, for a period of eighty weeks altogether, the first half *in utero*, the other half by lactation; and it is acting just as much against the laws of Nature to endeavour to shirk and to delegate to others the performance of this nutritive function in the last forty weeks, as it would be to try to do so in the first forty weeks, if such a thing were within the range of possibility. Now the laws of Nature cannot be set at nought with impunity; Nature never proceeds *per saltum*, and least so, assuredly, in the nutrition of the child through the mother. In the same gradual way as this function progresses and increases from the time of conception to the period of delivery, so it ought to be let decrease again, in the natural way, down to the proper period of weaning. In the first weeks of pregnancy, the fœtus is very small, and requires accordingly but little of the maternal juices; but as time wears on, and the fœtus increases in size, it requires a proportionably increasing amount of nutritive matter: and Nature has so arranged that the child, after its birth into the world, should for six months longer depend entirely for its nutrition upon the maternal breast, and continue after to do so partially for three months more. When the infant has reached the age of six months, and begins to be able to partake of other alimentary substances besides the milk of its mother, the lacteal secretion enters on the period of its gradual diminution, which terminates at last, in a few months more, in its total cessation; that is, of course, if the dictates of Nature have been properly obeyed. But when the natural power is arbitrarily interfered with, when the nutritive function devolving upon the mother is cut short in the middle, and the suckling of the child delegated to another person, the mother has to pay the penalty; inflammation of the breasts, suppuration of the breasts, too often puerperal fever, and a host of other disorders, are the usual consequences of a mother's refusal to listen to Nature's instinct—the nutrition of the child."

But it is also for the *child's* sake that every mother is in duty bound to afford the natural nourishment to her child. The new-born infant requires a nutriment as much as possible analogous to that which it received *in utero*, and this nutriment is to be found in the mother's milk alone. This fluid being a product of the same body that maintained the fœtus in life and health up to the period of birth, is alone fit to serve for the nutrition of the new-born infant; it is the only alimentary substance adapted to the capacity of the delicate digestive organs of the infant, which possess only the faculty of absorption, but certainly not that of assimilation.

However, there are, of course, certain

Hosted by Google

obstacles which will interfere more or less absolutely with the *faculty* or *fitness* of the mother to nurse her child. Thus, deep-rooted chronic and infectious diseases, reputed incurable, or at all events known to be curable with difficulty only, as epilepsy, chorea, hysteric affections, gout, scrofula, pulmonary consumption, itch, tetters, etc., ought always to be held to disqualify a mother for the task of nursing her child.

Also mothers, who, though not actually ill, exhibit unmistakable signs that they bear within them the germ of some serious disease ought to be prohibited from nursing. To this class belong more particularly females of tall and slender shape, with flat and narrow chest, and shoulderblades protruding, wing fashion, and with circumscribed flush on the cheeks, and a tendency to perspire; and also women labouring under great sensitiveness, weakness, and irritability of the nervous system.

Habitually sickly and weakly females also had better abstain from nursing, more particularly if they happen to have had a difficult and protracted labour, attended with considerable loss, or if they are liable to violent emotions.

But the glands themselves oppose frequently more or less serious obstacles to suckling: thus, it occurs often in the case of very youthful mothers that the glands are not completely formed and developed; there may be also other physical obstacles. In others there is a positive and permanent suppression of the secretion of the milk; in others, again, the sucking of the child causes a peculiar, sharp, lancinating pain, which extends through the glands to the spine, and manifests itself at times with so much intensity, that the mother actually faints away.

The highly important question,—*When is the new-born infant to be put for the first time to the breast of the mother?* has been solved by many practitioners in a most irrational manner; a foolish fallacy has been allowed to prevail on this subject, viz., that the *first* milk of the mother has an injurious action on the child, and that it is necessary to free the bowels of the latter from the excrementitious matter contained in them before it can be allowed to suck. In accordance and conformity with this immensely absurd notion, the unfortunate little creature is, upon its very entrance into the world, treated to a dose of rhubarb-syrup, or of manna, or of aniseed or fennel-tea, or infusion of chamomile, or some other drug,—of course, all for "poor baby's good." Now if the people who act in this manner would only for one moment reflect upon the delicacy of the infantile organs, they could not fail to see that medicinal agents, even of the mildest description, will and must exercise a most irritating and hence injurious action upon the tender stomach and intestines of the new-born infant, and they would cease to wonder that spasms in the stomach, abdominal pains, dyspepsia, diarrhœa, jaundice, etc., should so readily seize upon the darling, "that surely had everything done to make it comfortable, and was so nicely purged, and in such proper time."

No, let these foolish, old notions of our grandmothers be discarded for ever; there is no more appropriate purgative for the new-born infant than the first milk of its parent, and nothing can possibly be more absurd than to remove this first milk, as is frequently done, by artificial means. But even if the first milk should fail, as will occasionally happen, to bring about the desired evacuation, there is no need whatever for the slightest anxiety or apprehension on the score of this matter. The innate organic force of the child will mostly suffice to get rid of it in the natural way. Should, however, twenty-four hours have elapsed after the birth of the child, and the expected evacuation not yet make its appearance, a simple clyster or two with lukewarm water will be sure to bring it about; but on no account whatsoever should purgatives be resorted to.

A few hours after birth, when the mother has recovered a little, and the infant has enjoyed its first sleep, it should be put to the mother, and this even in cases when the mother intends to engage a wet-nurse, since her own safety absolutely requires, during the first days after confinement, that the glands should be relieved. Although the child obtains generally at first only a small quantity of milk, yet by its sucking it contributes to induce a more copious secretion of that fluid. As I have already stated, it will happen sometimes that the breasts of the mother contain as yet no secretion; the attempts at sucking must be repeated, notwithstanding, from time to time during the first twelve to twenty-four hours. On the first day of its life the child may, without inconvenience, do without any nutriment at all, if care be only taken to keep the mouth moist by instilling now and then a teaspoonful of milk-warm water. There is, accordingly, no danger of starvation for the infant in the continuance of these attempts to bring about a proper secretion of milk. Of course, should twenty-four hours pass without the desired result being obtained, a wet-nurse must be had recourse to, or the child must be brought up by hand.

Hosted by Google

The first attempts at nursing meet also occasionally with obstacles, in some instances imputable to the faulty manner in which the child is held to the breast; in others, to disinclination of the child, or to some natural defect in the organ of suction. Thus, for instance, the infant may not feel the want of nutriment, or it may be too weak to suck, or the tongue-tie is too long; or the child is held to the breast in a manner to impede the respiration through the nose, etc. All such obstacles may usually be removed with greater or less facility.

(To be continued.)

CRITICAL ANALYSIS OF DR. ROUTH'S "FALLACIES OF HOMŒOPATHY."

By John Ozanne, M.D.

Entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

VIII.

III. *The Influence of the Mind.*—There are, according to Dr. Routh, "three ways in which it may be supposed to act: 1, by imagination and credulity; 2, emotionally; 3, epidemically."

As the author ascribes all the recoveries which take place under homœopathic treatment either to the *vis medicatrix naturæ* (the sanative power of nature), seconded by good hygienic and dietary rules, or to the *vis medicatrix mentis* (the sanative power of the mind), or to both, it behoves us to inquire into the evidence brought forward in this section, for the purpose of shaking our confidence in the statistics of homœopathic hospitals. This evidence ought to be of the most undeniable character. It ought, moreover, to bear upon disease of every kind, and more especially upon those serious forms of acute disease which are made the subject of inquiry in the second section of Part III. For it must not be forgotten that this dissertation upon the circumstances which may affect our appreciation of *statistics in general*, although bearing in no particular way upon homœopathic more than upon allopathic statistics, is ushered in, nevertheless, by very strong language indeed. "In testing the value of statistical returns, there are several sources of fallacy which must be guarded against. *If it be shown* that the homœopaths neglect these wholly or in part, so must their conclusions in support of the efficacy of their treatment be disbelieved" (p. 18). Who would not suppose, that in a work entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries upon which the Results of that Practice are estimated"—who would not imagine that our author has really *shown* that homœopathic statistics are, more than the allopathic, open to the sources of fallacy which he enumerates? That he has not done so, the examination of the various facts adduced in support of his opinions will, I believe, fully prove.

But here the thought arises in my mind, that perhaps the author is speaking of the *absolute* value of the homœopathic statistics, not of their *relative* value, when compared with the allopathic.

If so, the inquiry is perfectly legitimate, and the dissertation quite in its place. But if it be indeed so, the whole book is nothing but a great deception practised upon the public, who will never look upon it in any other light than as an essay intending to show that the superiority of homœopathic results of practice, as asserted by homœopathists, is a mere fiction, not a reality; the results of deception, not of a *bonâ fide* statement of facts. Finally, if it be so, I am discussing a question of the most serious import with one who, whilst he attempts to explain the *superiority* of the results obtained by homœopathic practitioners, by ascribing them to agencies which are not the exclusive property of either system (the influence of the mind, of diet, of good hygienic discipline, of the sanative tendency of nature), avoids inquiring into the *inferiority* of allopathic results, the notable degree of which, seeing that he does not believe that homœopathic medicines are *really curative*—ought to have raised in his mind the doubt whether the allopathic remedial means are not in reality *destructive of human life*.

But in an inquiry such as this, at a time, too, when our materials for forming a correct estimation of the *absolute* value of either system are alike scanty and uncertain, when the most we can do is to compare, as closely and as accurately as possible, the results obtained by the old schools and by the new—in an inquiry such as this much could have been done by ascertaining the following points. 1. The frequency of cures by mental influences of any kind. 2. The nature of the diseases believed to be so cured, whether fevers, inflammations, etc., or simply the class of diseases usually called *nervous*. 3. Whether such cures are more frequent in homœopathic than in allopathic institutions *of the same kind*, at *the same time*, and in *the same place*.

Had Dr. Routh's efforts been directed towards the solution of a few such ques-

Hosted by Google

tions, instead of collecting, as he has done, examples of extraordinary recoveries from disorders, be it observed, of the *nervous system only*—had he given examples of cures by mental influences in inflammations of the *lungs, pleuræ*, or *peritoneum*, in *dysentery*, in *typhus*, or in *cholera*—had he, moreover, shown that in the latter diseases mental influences can in any way account for the great superiority of homœopathic results, then would he be justifiable in casting a doubt upon the validity of our statistics.

I will now proceed to examine the facts brought forward in support of his opinions.

First. The mind may act by *imagination* and *credulity*. We are here told that vexation, annoyance, or care may bring on dyspepsia, diarrhœa, or even mania. We are also told that the author cured a patient affected with "hypochondriasis of some duration" by means of two bread pills; the fact that *this* hypochondriasis of some duration could be cured in so short a time by any means makes me doubt the correctness of the diagnosis. We are also told that the author "once effected a cure upon a very susceptible individual, about forty, *labouring under intense cerebral congestion*," by the mere threat of venesection; the mere preparation of his apparatus almost brought about syncope, and in the course of *a few minutes* all necessity that might have existed to bleed ceased." This is certainly an easy mode of curing "*intense cerebral congestion*," but I doubt its efficacy in any case of that disease, or indeed in any other case than one of headache, with great nervous excitement, such as this was.

The most curious part of this section, however, remains to be told. It appears that Dr. Routh does not think it so highly reprehensible to practise deception upon his patients as most of my readers would do; and that, after all, I may perhaps have been wrong in resenting so warmly the accusation of deception which he brings forward against the disciples of Hahnemann; for it would seem that he thinks deception is in certain cases justifiable. Hear what he says. "I was myself struck at the results of some experiments I conducted in some fifty or sixty cases * * * I also experimented with coloured water. My plan was to employ three kinds of coloured water—red, yellow, and blue—to work upon the imagination of my patients, *describing this water to be a deadly poison*, and having it labelled *accordingly, giving express caution to keep the medicine from the children.* I invented a series of symptoms as likely to follow" (p. 24). With a genius so fertile in caution and invention, for the mere purpose of ascertaining the power of imagination in producing a disordered condition of the nervous system—for this was the only effect produced—where is the assurance to the reader that, for the purpose of arresting the progress of homœopathy, a like process has not been *most innocently* followed?

Second. *Mind may act emotionally.*—In this section we are told how "a lady, who for several years had lost the use of her lower extremities, was startled by a rat running near her. Having an extreme antipathy to this animal, she made an effort, and sprang upon a table near. The power, however, was not permanently restored" (p. 26). How Sir B. Brodie restored the power of walking to "a young lady, who had lost all the power of her legs," and who declared that the attempt to walk would kill her, by *insisting that she should do so*, and this in a few days only (Ibid.) How Dr. Bright met with the case of another young lady, who "for nine months had been laid on her back, and had lost the use of her legs," and who, "if she attempted to move, was thrown into a paroxysm of agitation and excruciating agony," and who nevertheless suddenly recovered all her powers, "under a deep religious impression" (Ibid.) We are also told of a poor woman who had been bedridden for years. "On one occasion, the house took fire, and she fell down upon her bed, through the ceiling, into the street. From that moment she got up and was enabled to walk; cured by a strong emotion of terror" (p. 27); and finally, we are told of the late Dr. J—, of Christchurch, who "was a martyr for years to asthma. On one occasion, while superintending the works in a house he was building, he fell down the staircase from a height; from that moment the asthma disappeared" (Ibid.)

None of these cases, it seems to me, enable us to advance much into our inquiry, namely, to ascertain how it is that Dr. Fleischmann's results at Vienna, for instance, are superior to those given in the statistics of the allopathic general hospital of that city. Neither do they show how the influence of the mind can have much to do with this superiority. For if, for the sake of argument, it were granted that occasionally Dr. Fleischmann might be at liberty to burn down a wing of his hospital, that a few of his bedridden patients might have an opportunity of falling through the floor into the street, and then to rebuild it, that a few of his asthmatic patients might have the privilege of superintending the works and of falling down stairs "from a height," it is obvious that such means could only be used now and then, and not

Hosted by Google

systematically. But granting that, occasionally, strong emotions may tend to produce the sudden recovery of patients afflicted with diseases of the nervous system, is there any evidence that by such means *pneumonia, pleurisy,* or *cholera* can be cured in a larger proportion of cases than under the best-directed allopathic treatment? That is the question.

Third. *Mental Epidemics.*—It is clear that "mental epidemics"—such is the term sanctioned by usage, under which are described great convulsions of the public mind under the influence of national calamities, such as pestilence, famine, great wars, etc., or of superstition—it is clear that mental epidemics can be taken into account to explain the superiority of homœopathic statistics only when such epidemics really do exist. Dr. Routh has advanced nothing to show that Dr. Fleischmann's success at Vienna, or that of Dr. Tessier at Paris, during the years 1847-48-49, was due to *mental epidemics.* Indeed, if we compare the results obtained by the latter in the years 1848-49, with those obtained by Grisolle several years previously—the results obtained among the labouring population of the Faubourg St. Antoine during the excitement of the Revolution of 1848 and for months after, with those obtained by Grisolle in the full prosperity and quiet of Louis Philippe's reign, as we shall do—we are instituting a comparison between cases treated homœopathically under unfavourable circumstances, and cases treated allopathically under ordinary circumstances.

We have next a neat little *episode,* in the shape of a chapter upon *coincidences.* Dr. Routh is right, as every one will admit, in stating that "it does not follow, that because a patient takes a certain medicine and recovery follows, that the cure was the effect of this medicine" (p. 29). Neither does it follow that we are greater gainers by coincidences than the allopathists; but this at least is certain, that in a large number of cases the average of coincidences must be pretty equal on both sides.

"To get over these sources of fallacy, homœopaths appeal to the experience derived from their practice among animals and little children, *who, they allege, have no reasoning powers,* and on whose diseases therefore the mind cannot exert any influence" (p. 30). Dr. Routh is here again open to the reproach I have already made: he advances statements of what homœopathists have written or said, which are neither correct in form nor true in substance. This assertion that little children and animals have no reasoning powers was never, to my knowledge, made by any homœopathic writer, and I defy Dr. Routh to produce a passage from a homœopathic work implying it.

The fact of the matter is, that to the objection made by allopathists to homœopathic cures, that they are the result not of medicinal action, but of the *imagination* of the patient, it has been answered that cures in infant children or in animals cannot be explained in that manner; therefore that the objection falls to the ground. But, as I have said before, these mental influences have not been shown to produce a larger per-centage of recoveries in serious inflammatory diseases or in cholera; therefore they are entirely foreign to our present inquiry, which is chiefly into the relative merits of the two systems, in respect of these forms of disease.

Dr. Routh "very much questions the truth of the conclusion that animals or infants cannot be influenced by psychical causes" (p. 34); and since animals have reasoning and emotional faculties, "*a fortiori,* must this influence be found among infants? The power of memory in after-life to recall sensations experienced in childhood may be limited; but to deny that children, even infants, are insusceptible of pleasing or displeasing emotions, would be manifestly unphilosophical" (p. 35). But who denies that children have both intelligence and feeling? Certainly not the homœopathists.

But the singular feature in Dr. Routh's theory is, that it inevitably leads to the conclusion, that beings who are endowed with thought and feeling are therefore capable of recovering through mental influences. In the case of an infant incapable of speaking or of understanding others by the faculty of speech, knowing and caring nothing of life or of death, neither wishing for the continuation of the former nor fearing the latter, knowing nothing of homœopathy or of allopathy, neither moved by confidence in the one nor dread of the other—in an infant, therefore, if there be any mental influence at work, it cannot be excited from without; it must be from a spontaneous effort of the mind, directed towards the state of the internal functions, and capable of restoring them to healthy action, if disordered. Of the possibility or impossibility of such a thing, we have no means of judging. But the theory of mental influence being *sanative* in infancy is curious. It is an application to medicine of the famous axiom of the philosopher of old; the foundation of psychology—the γνῶθι σεαυτὸν—becomes the foundation of a new system in medicine.

REVIEWERS REVIEWED.

By a Progressist.

"After a calm comes a storm." The medical editors, finding how rapidly new science is operating against them, deem it necessary to continue their abuse of homœopathy and hydropathy. In No. 91 of the *Medical Times and Gazette*, March 27, 1852, there is a notice of Dr. Routh's "Fallacies," also a notice of Dr. T. R. Armitage's book on "Hydropathy as applied to Acute Disease." They commence thus: "As a system of quackery, the more modern hydropathy rivals, if it does not exceed, the danger and fatality of homœopathy." Let us conceive a person attempting to convince the world upon some point on which it is predisposed to join in the conviction. He, of course, exerts every possible ingenuity in forming his documents, and framing the appearance of a chain of testimony in support of his statement. It is quite possible that he might thus deceive a considerable number of credulous persons, and that others, who did not believe his statement, might yet find difficulty in proving its fallacy. The case before us is literally this. A young physician walks through most of the German hydropathic establishments, and a large hospital at Berlin, and then considers himself fully justified in asserting that the powers of diagnosis of the hydropath is utterly unworthy of confidence, and that frequently all the knowledge afforded by common sense, or acquired by a fatal experience, are insufficient to prevent them from committing grave errors in the application of their treatment. In pneumonia, on the whole, he finds it extremely inferior to the ordinary antiphlogistics. In fever, he says that the whole duration of the disease is little affected; that the delirium and stupor are greatly relieved, and the general per centage of recovery a high one; and because a young physician writes a book *against* hydropathy, the reviewer recommends the profession to read it, and informs them they "will find it an interesting, and in some respects an original, contribution to our knowledge of a valuable agent."

It is to be regretted, for the progress of science, that young men, with their heads brimful of the dogmas of the schools, should endeavour to bring themselves into notoriety by partially investigating a subject, and reporting on it generally.

After seeing, a young physician's vanity might be seized with the desire to narrate, to gratify the passions of those he desired to please. What was not seen might be imagined. Our opinions, it is well known, are often formed by our feelings. An uneasy feeling produces assents or dissents of different kinds. True philosophy is simple and intelligible; but we owe confused systems to men of vague and obscure ideas. Theories should always be understood as only made for a time, and considered capable of improvement.

What the result of water-treatment in pneumonia may be I can offer no opinion, never having seen a case treated hydropathically; but of its effect in the treatment of fever I can say that cold water, in the form of wet-sheets, plunges, etc., will effect more towards a diminution of the heat and fever than the allopathist can, let his therapeutic agents be ever so varied. The hydropathist abstracts heat, the allopathist abstracts blood. The patient treated with water is well in a few hours. The patient who has lost blood is low, languid, and wretched; has either a long state of convalescence, or sinks into a state of chronic disease. In the *British and Foreign Medical Review*, vol. xxiii. p. 271, there are eight cases of fever reported by J. H. Stallard, Esq., Surgeon to the Leicester General Dispensary, where this treatment was pursued. "The cases," says Mr. Stallard, "I have reported are not *selected cases*, they are those which presented themselves as being most proper for the trial, and are all which came under my *entire* observation in the Fever Institution." Seven recovered, the eighth died; but Mr. Stallard remarks, "the last case, though terminating fatally, does not furnish a single argument against the use of the cold-sheet. The death was, no doubt, caused by sudden congestion of the lungs, to which fever patients are especially prone, and the tendency to which was probably augmented by the dose of *morphine* administered over night to allay the excessive restlessness." "To say that cold water, employed in the mode lately introduced by Priessnitz, is not a powerful therapeutic agent, is simply to express ignorance of a common and well-known fact."*

The universally-adopted plan of the allopathist, when he perceives that any new therapeutical agent has been introduced, if the *modus operandi* does not come within his comprehension, or that effects more beneficial and curative result than can be produced by "old physic," is to term it quackery or humbug. "Shall those arts which have discovered a thousand instruments for inflicting pain or suffering on civilized man, never discover any new

* Dr. Forbes, British and Foreign Medical Review, vol. xxiii. p. 269.

Hosted by Google

means of making him happy? Shall the fruit of the tree of knowledge always continue bitter--shall it never be ripened by the radiance of the sun of benevolence? If there be any sufficiently cold-hearted to believe this, let them remain idle. To us, hope, which though it should be vain, is yet an eternal source, will remain; it will ever prompt to actions which, though they should deserve no laurels of triumph from mankind, will never have raised them by watering the earth with blood."*

The same Editor,† in noticing Dr. Armitage's book, says, "for the huudredth time we must reiterate the notorious fact, that what is now known as hydropathy, the universal panacea of an ignorant peasant, has been for centuries a valuable adjuvant to the therapeutics of legitimate medicine."

We tell the reviewers that Priessnitz did not use water as an adjuvant, he used it as a specific. It had "indeed fallen into a subordinate position," until Priessnitz told them how to use it. They call him an ignorant peasant; if the reviewer, when reviewing his own acts through life, could conscientiously lay his hand on his heart and say he had effected half the good that Priessnitz had done, he might congratulate himself. Let him look to other men who made the road for these reviewers, that they have nothing to do but to follow; so complete do they consider the law has been established, that they have not even the trouble of thinking. John Hunter immortalized himself by studying and teaching anatomy and surgery. Priessnitz immortalized himself by the introduction of the wet-sheet, and the present system of water-treatment. Priessnitz was the son of a farmer. The father of John Hunter and William Hunter possessed a small farm; so far, in the beginning of life, the Hunters and Priessnitz were equal. Bloomfield, who wrote the "Farmer's Boy," was a shoemaker, and worked in a garret. The Editor of the *British and Foreign Medico-Chirurgical Review* informs us that a "tradesman of Taunton managed to get admitted to examination at the College of Surgeons by the production of fraudulent certificates;" if we are to believe Mr. Blake's statement, published by Highley in 1848, which appears to be quite as credible as the testimony of the other medical men, the certificates are not fraudulent. Mr. Blake has been sneered at because he was a tradesman. Does the reviewer recollect that John Hunter was a tradesman, and worked three years as a cabinet-maker, in Glasgow?

* Last Days of a Philosopher, by Sir H. Davy.
† Medical Times and Gazette.

Hydropathy is based upon sound hygienic and physiological principles. It is only where it gets into the hands of lay proprietors, carried on either with or without an experienced medical man, becoming merely a trading establishment, that the profession should manifest their scornful rejection, and use their utmost endeavours to rout out the whole phalanx of such harpies. These are the instances reviewers should seek and expose, and withhold the pen of scurrility from their brethren, whose only fault is that they have thought more deeply than themselves.

A grand objection the reviewers bring forward against homœopathic writers is, that they write that they may be understood; "the public is an unfit tribunal, incompetent to decide." Make them competent then, teach them physiology; let them have a knowledge of their own frame; teach them "the general principles of the human constitution, and of the circumstances in which man is placed." We are glad to hear that the grievance and wrong inflicted on those taxes known as the "Taxes on Knowledge," will be among the first that will occupy the attention of our new Chancellor of the Exchequer, and although it is not likely that these taxes will be repealed in the expiring parliament, we know that this minister is known to have such literary sympathies as to dispose him to give an earnest attention to the subject, and study the question for himself. A very striking instance of talent, training, and discipline has been displayed by this gentleman. Laughed at by the House of Commons, in his maiden speech, as he concluded he said, "I will sit down now, but the time will come when you will hear me." He remained quiet for a time, but gained great approbation in the education and copyright questions, with other masterly speeches, and in a few years he received the highest honours the House could bestow; being gratified also by the spontaneous tribute of Lord John Russell, "that his talents and services fully entitle him to the office he holds." Educate the people we say, they will then be able to choose their *own physician.*

Among the numerous advantages which the present age possesses, none appears more conspicuous than that derived from cheap literature. The stores of information, which in the days of our forefathers were only accessible to few, are now placed within the reach of almost every aspirant to wisdom. It is evident, from the prodigious sale of various periodicals of the present day, of the favourable countenance

Hosted by Google

they receive, and it is an infallible sign of their great utility, that they are universally spread and appreciated by all classes. The learned read for relaxation, the ignorant for instruction, the poor for the cheapness. It is an undoubted fact that this species of literature has contributed more to enlighten the majority of the people than any other cause; and the high degree of intelligence possessed by the middle and even the lower classes of society in this nation, when contrasted with that of neighbouring countries, may be wholly attributed to the influence which these publications have had over their minds. The great Tully cried out, in raptures, "What is there, oh, ye gods! more desirable than knowledge? what more excellent and lovely? what brings so much quiet satisfaction?" How would he have rejoiced had he beheld the present intellectual state of society in England? The press—daily, weekly, monthly—pours fourth a flood, at which all who thirst for knowledge of any kind may have their thirst slaked. "Knowledge," said Lord Bacon, "is power."

There is now an earnest desire, even in the mind of the humble inquirer after truth, which gains strength as it advances. How presumptuous is it then for reviewers to suppose they can direct the thoughts of the public, by announcing to them that they are "incompetent. "Show light," said a very intellectual friend of mine, "and darkness will disappear." It is striking to remark how closely the philosophy of human nature harmonizes with the declarations of the sacred writings.

"This is the condemnation, that light is come into the world, and men loved darkness rather than light, because their deeds were evil. For every one that doeth evil hateth the light, neither cometh to the light, lest his deeds should be reproved. But he that doeth truth, cometh to the light, that his deeds may be made manifest that they are wrought in God."

This nineteenth century abounds with valuable information, for the scientific industry and stirring enterprise of the period are unprecedented. "The human mind without instruction is," as Addison has observed, "like marble in a quarry, which shows none of its inherent beauties till the skill of the polisher fetches out the colours, makes the surface shine, and discovers every ornamental cloud-spot and vein that run through its body. Knowledge, in like manner, when it works upon a noble mind, draws out to view every perfection."

(*To be continued.*)

THE
HOMŒOPATHIC TIMES.

SATURDAY, MAY 8TH, 1852.

HOMŒOPATHIC HOSPITAL AT DONCASTER.

DR. DUNN, the very excellent and spirited representative of homœopathy in that ilk, is about to institute the Doncaster Homœopathic Hospital. This is a very admirable enterprise.

He is isolated, and therefore the design is the more courageous. His scheme well merits the full encouragement and cordial assistance of all who are friendly to homœopathy, medical and non-medical.

He has *begun* the work, and it would be indeed "too bad," if he were left unaided. He is fully *determined to succeed*, and will spare no pains and no sacrifice to accomplish his purpose.

The district in which he lives is thinly peopled; he has, it is true, received the greatest encouragement from those in his neighbourhood, but it is absolutely necessary that he should receive *material assistance*, in the shape of large pecuniary help, from every locality where homœopathy has been established.

He is surrounded by many difficulties; he is the target, in his own place, at which the envenomed darts of hatred, malice, and uncharitableness are vindictively cast.

Cold indeed must the heart be, and intensely selfish and egotistical, that does not respond to Dr. DUNN's appeal for aid and support in his arduous undertaking.

We shall be glad to receive donations and subscriptions for the Doncaster Homœopathic Hospital, or they may be sent direct to Dr. DUNN, Doncaster.

To the Editor of the Homœopathic Times.

SIR,—I am greatly obliged by your notice of my projected hospital. You will be glad to hear that I have met with support from all parties, and one friend has headed the list by presenting me with the land, valued at £232. Yet I am aware how much I need the assistance of the benevolent, wherever situated; and this induces me to request you to give insertion to this

Hosted by Google

letter in your valuable paper. Placed in an isolated, and comparatively thinly-peopled district, few can imagine the toil, anxiety, and vexation that accompany the lonely homœopath. Medical men shun him, and are not very scrupulous as to the means of annoyance. In a small town like this the difficulties are immense, and were it not for the inward and deep conviction that homœopathy is the greatest temporal blessing that was ever granted to mankind, it would require more than human courage to brave them. It is in the hope of extending this blessing to thousands, that I have determined to erect an hospital where all comers may be treated on its mild and salutary principles; and I appeal with confidence to a benevolent public to aid me in such a bold though necessary undertaking. I shall soon have the elevation engraved, when I shall ask yonr kindness to insert it.

If my success be complete, as I have every reason to believe it will, homœopathy will have a name and status in Yorkshire, worthy of the Cause. Had I such spirited, wealthy, and benevolent patrons as Mr. Leaf, Lord Robert Grosvenor, or the Earl of Albemarle, I should not have to seek aid from a distance; but here we are few and not wealthy, and I shall therefore feel deeply obliged if you, as the organ of the homœopathic body, will receive subscriptions for the "St. James's Hospital," Doncaster. I am, Sir, your obedient servant,
Doucaster, April 28, 1852. GEORGE DUNN.

Obituary.

(Commmunicated).

THE DEATH OF MR. DALRYMPLE.

THIS event occurred on the 1st inst., and the loss of so eminent an ophthalmic surgeon cannot be easily replaced.

Mr. Dalrymple has for some years occupied the first place in this department of surgical science. His books on the "Anatomy of the Eye," and on the "Pathology of the Human Eye," and his admirable illustrative plates are well known to the profession.

He was not only a consummate surgeon in the department to which he confined himself, but he was a man of fine moral and intellectual faculties. The departure of such a man is always a loss to the community.

With respect to the treatment of the diseases of the eye, which has for the most part been engrossed by operating surgeons, it is quite a mistake on the part of the public to suppose that only surgeons should treat them, and that they constitute what are called "surgical cases." Wherever or whenever a surgical operation is needed then the expert surgeon is required; but nine-tenths of the cases that are seen in the consulting-room of the pure surgeon, in the case of those who practise ophthalmic as well as of those who practise general surgery, are in fact strictly medical.

In truth, the two originators of Ophthalmic Institutions in Britain and in Europe were both physicians, Dr. Saunders and Dr. Farre; the latter of whom still lives in the body, enjoying a green and honoured old age. The first Institution was founded, we believe, in 1805.

If there would not be any great advantage to the public or advancement of pure homœopathic practice, certainly there would be essential service rendered to our own body, if several of our rising homœopathic practitioners would devote themselves more exclusively to rigid diagnosis in specialties, after the manner of allopaths, to obstetric surgery, ophthalmic diseases, and those of the ear.

Not that we have greater respect for or confidence in a man who dubs himself obstetrician, oculist, aurist, or dentist; for we believe that specialties, as at present understood and practised by allopaths, are in too many instances mere claptraps, craftily adopted to cajole the anxious and credulous public.

No doubt, one using the well-directed energy of a mind amply endowed and qualified for the prosecution of a special inquiry in special diagnosis, a master-mind, which does not, in its all-absorbing pursuit of diagnosis and morbid anatomy, neglect the due appreciation of what Hahnemann implies by the "totality" of symptoms, would be a special diagnostician, invaluable on many occasions to many of his brethren, and certainly well-fitted to check allopathic arrogance.

The public have, by long custom, been educated to expect, in protracted and dangerous and intricate cases, such special consultations; and we have, therefore, a duty to perform to our patients, as well as a conscientious path to tread for the good of our fellow-beings.

But as it is, we fearlessly pronounce that diseases of the organs of sight and hearing are far more successfully treated by homœopathic remedies, administered according to the homœopathic law, than by the best resources of allopathy.

The lamented death of the honoured and honourable John Dalrymple suggests another reflection. In medical and surgical practice, as well as in military life, every blank made in society by the death of an officer, or one in large practice, constitutes a prize that is eagerly contended for by the survivors.

The place of Dalrymple will be stepped

Hosted by Google

into, even as he stepped into Tyrrell's; may the successor, in this instance, be as worthy! But who is to supply the place of a Hahnemann now; and, after their departure, who are to supply the places of Constantine Hering and Bœninghausen? In proportion as the philosophy of Hahnemann is more profound than that of any Medical School that existed before him, and as the successful practice of homœopathy is more difficult than that of any other school, so is the difficulty increased in supplying the place of our Worthies.

Mr. Dalrymple had been in very ill-health for some years, but he continued in harness almost to the very last.

SPRING ASSIZES.

Northern Circuit, Durham.—March 25, 1882.

THE learned Judges arrived in this city yesterday, and opened the commission. This morning Mr. BARON SELDEN charged the grand jury in the Crown Court, and at twelve o'clock Mr. JUSTICE BLACKSTONE commenced the civil business in the Nisi Prius Court.

The civil list has three causes entered, two of which are special juries. The crown calendar contains the names of five prisoners; of whom one is indicted for murder, and the remainder for minor offences.

Crown Court.—(*Before* Mr. BARON SELDEN.) *James Simpson* was placed at the bar, charged with the wilful murder of Richard Edgar, by administering to him medicines and other treatment, in quantities and qualities, not according with regular practice.

Cases of this description having been for some years exceedingly rare, this trial had long been anticipated with the greatest interest, and the court was densely crowded at an early hour; large numbers of the members of the neighbouring families of the nobility and gentry, including many ladies, being present.

The Hon. STEPHEN YELDHAM, Q.C., appeared for the prosecution; the prisoner was defended by Mr. WAKLEY.

The prisoner, who is a man of gentlemanly appearance, but with a remarkably obstinate expression of countenance, pleaded *Not Guilty*.

Mr. YELDHAM stated the facts of the case very clearly and concisely, pointing out to the jury the distinction which was to be drawn between the regular and legitimate practice now recognised by authority, and that antiquated and irregular system, to which, unhappily, a few ignorant persons still adhered; in doing which, the learned counsel appeared to great advantage, from his well-known scientific knowledge of the principle, theory, and practice of medicine; particularly in regard to the various forms of acute disease.

The widow of the deceased was then called, a most respectable-looking, rather delicately-featured woman, with a very pale, mournful face; she appeared extremely weak, and was allowed a chair to sit on during her examination.

What is your name?—Sarah Edgar, sir.

Are you the widow of Richard Edgar?—(In an agitated manner) I am.

Were you with your husband when he died?—No. I was very ill and unable to attend upon him.

Then did you not see him during his illness?—Only for a few hours, just at the first.

Who nursed him?—Mostly Edward Price, a kind neighbour, and a girl, who came in from the village school at odd times to help.

Where do you live?—In Hazelhurst parish.

Of what did your husband die?—Here the poor woman hesitated and faintly whispered, I am not sure.

Mr. YELDHAM, kindly, but firmly.—Speak up, my good woman, we cannot hear you. *Of what did your husband die?*—The witness, again hesitating, at length replied, in a louder and more distinct tone, I'm afraid he was murdered, sir.

Here Mr. WAKLEY interposed, exclaiming—I really must protest against such questions! Surely, it would have been more seemly to have had a coroner's inquest held on the body.

The widow, in a state of great excitement, was allowed to stand down.

The second witness was Edward Price, an intelligent, good-looking countryman.

I believe you knew Richard Edgar?—Very well, your honour.

What sort of a man was he?—A rather fine, handsome man.

Yes, but I mean in character?—A truly good man and very kind neighbour.

Was he a sober man?—Quite. He once wanted to take the pledge, but his doctor wouldn't let him; he said it might be all very well so to do, for them as hadn't no higher motive for temperance, but for a steady, sober man like him, who had a constitution which now and then needed a little mild, home-brewed ale, it would be more of a snare than a help, and so he never did.

Were you with him when he died?—I was.

And during all the time of his illness?—Very nigh, for I was so fond on him, and I was slack of work just then; and his wife, poor thing, was taken very badly, and there was nobody to see to him but me like, and a bit of a lass from the school.

Did you fetch the doctor?—Yes, but he was not a right one—I mean—that is—at least—he was not his own doctor.

Who was his own doctor, as you call him?—Dr. Alfred Pope; but he was gone a long way into Devonshire, to see his father, who was very ill.

What doctor, then, had you?—A Dr. James Simpson, from a parish hard by, but folks don't like him; he is such a contrary man to Dr. Pope, contrary—that is, in his ways.

Mr. WAKLEY.—How can you be a judge of a doctor's ways?—Why, sir, you see as how poor Richard was given to have such fevers, and oft-times I was in and out, and gave him

Hosted by Google

his medicines; and I was once errand-lad to a potecary, and so picked up a thought of physic-learning. And once afore, when his tidy wife was gone to see her old mother, many a mile away, he was very ill, and nobody was with him but me, so I know'd a deal about it; and Dr. Pope, who is a wonderful clever man, and very pleasant and free-spoken, tell'd me how to give the things. He don't *practise*, as they call it, now, as he once did, but he lives in a fine house near, and he has such a darling, bonnie wife, and such jewels of children; and they say he's got a mint of money, and so he must, for he gives such a power of it away. But as this is a lone place he is very good, and goes to any poor body as sends for him, and won't take no money. Folks do say as how, when he was a young man, the Faculty in Edinburgh wanted to stop him from being a doctor, but I canna quite credit that; for he's so mighty wise in doctoring and other matters, and—

Mr. WAKLEY, suddenly interrupting him—Come, man, do go on about Edgar; we don't want to hear all the life and most surprising adventures of either Robinson Crusoe or of Dr. Alfred Crosby Pope.

Well, sir, and so, as I was a-saying, he showed me how to give the physic; but dear a me, there was scarce aught to give but some little white morsels; I was obligated to put on my glasses for to see 'em, and they looked all alike, though they were very different and powerful in their workings, and very soon cured him, always.

Cross-examined by Mr. WAKLEY.—Are you, Edward Price, certain that there was nothing given to the late patient by Dr. Pope, clandestinely, that is to say, on the sly. Recollect, man, you are on your oath!

And sure I wouldn't speak false if I were not; but it's quite true, that there was nought whatsomdever.

Mr. YELDHAM.—Did you hear the names of any of the medicines?

One was *Aconitie;* made, Dr. Pope was a-saying—for he explained a good deal of things to me, and though I was main puzzled at first, it all seemed reasonable and plain after—of a tall, dull blue-flowered, poisonous plant, like what grows in our plot of a garden; we call it Monkshood. I used to be afeard on it, when the bairns were young, lest may happen they should eat any on it; but now I'm fain to look at it, and think what a blessed thing it is for fever and inflammations.

Was there any other medicine?—A very trifle of *Belladonnie*—a wild weed as grows in lanes and hedges, and among old ruins—and something else, but I don't just now hit on the name.

And was Edgar *never* bled, nor leeched, nor blistered in those severe attacks?—Oh no, sir, *never!* Dr. Pope tell'd him as how, though he was of a somewhat inflammable nature, he must never be bled; that he never had too much blood in him, and that if, where it was bad, some were to be drawn out, it wouldn't make the rest good, no more than thick wine being taken out of a cask would make the rest clear. No, no, says he, physic must do the deed, not blood-letting. It was that as made Richard so loath to be bled when the new doctor come, and so he says a many times, and begs hard about it; but at last Dr. Simpson gets angry, and says as how he were a doctor, a physician, a professor, and a feller of the Royal Society of Edinburgh—I think them was the words—and that, forsooth, sure he ought best to know.

Can you tell us anything of his treatment of the patient?—Alack and well-a-day, sir, and can't I! for I tended him night and day, and many was the tear I shed for him; but I could'nt do no better nor I did. Once axed I, "shall I gang o'er to Durham and fetch another doctor? who I know'd was a great friend of Dr. Pope; but Dr. Simpson flies into quite a passion, and says, if you do "under" any "pretences," I will never consent to "meet" him "in consultation, or hold professional intercourse with those who practise homœopathy." I think as them was the very words, indeed I'm sure on't; but I did'nt justly ken all about it, nor why one doctor should'nt like to talk to another; particular to one as had cured hundreds of sick folks to my knowledge—a many more than I have ever known him to do—and some on 'em as Dr. Simpson had tried his hand at, but all for nothing at all. But he was very much fashed, and I was afeard on him making a noise about it when poor Richard's head was so bad, and I said no more.

And then what did Dr. Simpson do?—Oh! why, first of all he felt his pulse, and said, he must try to cut the fever short by blood-letting, so he bled him a good matter of a basinful: and, says he, keep that till to-morrow; then, as soon as the arm was bound up, he, that is Richard, had a vomit, after that he had a many doses of physics, *Calomie*, *Opium*, and *Antimony-powder*, and some *sudorifie*, but I did'nt rightly know what that was; and there were other strong things. This went on for some six or seven days. and Edgar, who was never over-strong, got weaker and weaker, and was very badly indeed. But stay—I forgot; the second day when the doctor come, he takes down the basin from the shelf, and looks now at it and then at Richard, and I fancied I heard him say, "very buff coat." I did'nt ken what that meant, but I was afeard it was about a strait waistcoat, for you see, sir, as how Richard, though he was quite the man—some said a proud man—was very mild and gentle, and did'nt want no restraint, but I said nothing. And then the doctor said to himself, but just so as we could hear him, he *decidedly* ought to be bled again. Then says Richard, "Please not, sir." Then says the doctor, *very* slowly, after a long time o' thinking, "*Well, I'll wait awhile, perhaps it is better to leave Nature to herself and not to interfere with her.*"

Did Dr. Simpson seem to think him very ill?—No, sir, not so very; he said as many were as bad, and got over it: and every day he came he said as how we must persevere with active treatment, and that he was a-doing as well as

Hosted by Google

could be expected—till the very last night; but then he shook his head as he was a going out of the door, and said, "He's very ill; but I have done my utmost—that is a comfort,—and have left no stone unturned. Let me know if you want me again." But wait—I'm getting on too fast; as I was a-saying, he got weaker and weaker; then the doctor said he might take any little thing he fancied, but not beefsteak nor mutton-chop; but, poor dear soul, he couldn't take nothing at all but a drop of water, or a sup o' gruel. At last he seemed a *leetle* stronger; but just then he got violent delirious, and I got frightened, for I couldn't hold him all by myself. So I sends for Dr. Simpson, and he comes. And then Richard's head was shaved, and ice, from our good Squire's, put afore and behind his head, and just at top a blister; then he was quieted, and altogether pacified; only he began to mutter strange words, about how he must not be bled—that he should die if he was bled,—and then who would take care of his dear Sarah and the sweet babies. Then his tongue looked very dry and brown, and the limbs became all powerless like; then we had to send again to the Hall for wine, and other nourishing things for him; and his poor feet had mustard plasters on; but he sank—sank—sank—and died!

And did Dr. Simpson call again?—Yes, about two hours after he died; but he didn't see him: he just says, it was a common kind of fever, which he had oftentimes known to end in that fashion; and good-morrow, and left us.

William Brown was then called.

What are you, Mr. Brown?—A grocer and linendraper, sir, and a dealer in china, glass, and earthenware.

Is that all?—And druggist, if I may so say. Once that was my only profession, but that golden age is gone by.

Did you send any medicines to Richard Edgar in the course of last November?—Yes, a good many; all that were ordered for him by Dr. Simpson.

Are you sure, Mr. Brown, that there were no mistakes in the dispensing of them?—Quite certain; for I compounded them all myself, and I know the drugs were genuine, for I bought them many years ago at Apothecaries' Hall, and had kept them most carefully ever since.

The case for the prosecution having closed, the prisoner's counsel addressed the jury, contending that, although the prisoner had treated the deceased upon a system that had been superseded, yet that the indictment could not be sustained, merely because a better system had been latterly introduced; and called several witnesses to character.

The Judge then summed up the evidence, and continued:—Gentlemen of the jury, I feel it to be my serious duty to make a few observations on this very painful case. It is remarkable that it is the *third* of the kind I have had under my notice during the present assizes. Of the two other practitioners—being also north-country-men—you have doubtless heard. I have endeavoured to be as lenient as possible in those instances, but a third has compelled me, after mature deliberation, to realize the obligation I am under, of doing all in my power towards putting an end to all such irregular practice. It is most lamentable to reflect, that, with so very large and most respectable a body of regularly-educated medical practitioners, there should still be any persons left so infatuated as to adhere to the "fallacies," "delusions," and "impostures," of allopathy,—a system "so utterly opposed to science and common sense, as well as so completely at variance with the experience of the medical profession, and, I am happy to say, now equally unsanctioned by law, that it ought to be in [no way or degree practised or countenanced;" but, at the same time, I feel "anxious to state, that" I am "actuated" solely "by a strong sense of the importance of the subject in its relation both to humanity and morals;" for I "most conscientiously believe, that the countenance afforded to the form of charlatanry," to which I have alluded, "is detrimental to the true interests of the public;" and is, moreover, "subversive of that strict integrity which ought" ever, and, I am glad to avow, in most cases, does "characterise our practitioners of medicine, and which has long distinguished the profession in these kingdoms." Still, as it does not appear that there was any *malice prepense* towards the unfortunate deceased, whatever there may have been towards the system of homœopathy and its adherents, and as there is a strong feeling in the public mind in these days against capital punishment, as, too, the law permits a jury to reduce the offence to manslaughter, you will probably feel it to be your duty to take the more favourable view of the case, but this discretion is placed entirely with *you*, and you will retire to consider your verdict.

The jury, without retiring, brought in a verdict of manslaughter. The learned baron immediately sentenced the prisoner to three years imprisonment; and the court adjourned.

Nisi Prius Court. — (*Before Mr. Justice Blackstone.*) The causes in this court to-day were of no interest.

Correspondence.

To the Editor of the Homœopathic Times.

SIR,—I have not had time this week to continue my Narrative. I have much pleasure, however, in forwarding to you a condensed report of Professor Faraday's lecture delivered last Saturday, at the Royal Institution, on ozone. I have condensed this account from the report given by the *Chemical Record;* a publication on which I have more than once had occasion to comment with severity, because of the unfairness with which it dealt with homœopathy. I am happy to see that this journal has, of late, confined itself to the treatment of subjects in a purely scientific manner, and has now taken rank with the leading journals of that class of literature, while it seems destined, on account of the importance which chemistry is assuming in this country, and the felicitous style in which

Hosted by Google

it renders this science comprehensible by persons of ordinary education, to become one of the most popular journals of the day.

I am, Sir,
Your obedient servant,
May 1, 1852. F. J. SMITH.

PROFESSOR FARADAY ON OZONE.

Those who have operated with an electric-machine will not have failed to notice a peculiar smell which occurs in an apartment where the machine is in action. This has been denominated the "electric smell," and it presents a marvellous field for philosophic contemplation. What is this smell? Does it depend on a substance *formed?* Does it depend on a substance *modified?* Such are the two questions which *first* present themselves for consideration. Numerous questions then rise involuntarily up for solution in the mind of a thinking philosopher. Is this smell consistent with any other manifestation? Yes: for if a piece of paper be moistened with a solution of starch and iodide of potassium, the paper is tinged blue; now, this tinging blue is an indication of the liberation of *iodine*, and this liberation of *iodine* is an indication of the agency of oxygen; hence, thus far has been established a connection between oxygen in an active condition and the electric smell.

It remained for Professor Schönbein, of Bâle, to develope the germ of knowledge conveyed by the electric smell—to expand and generalize it; to show that the same smell and its corresponding agency might be generated at pleasure by various means, which it was the object of Professor Faraday's lecture to set forth—to render manifest, for instance, qualities of bleaching, of intense oxidation, of deodorization; to show that the agent on which all this depended was constantly generated in the stupendous laboratory of the physical world; and, lastly, to prove that the mysterious gaseous agency was neither more nor less than oxygen —oxygen gas existing in an allotropic form. Seeing then that oxygen gas may exist in this state, it may be asked, in what does chemical identity consist? In what will these developments of allotropism end,* and whether the so-called chemical elements may not be, after all, mere allotropic conditions of one universal essence?

Having obtained a supply of oxygen, the lecturer now proceeded to lay before his audience a test of its presence. "If I take a jar of this colourless gas," he remarked—"no matter what it is called—and, passing the jar which contains it under the water of a pneumatic trough, then invert the jar, and liberate its contents into another jar containing oxygen —an orange-red colour results, and the gaseous volume, which before this treatment remained of permanent bulk when in contact with water, now becomes diminished by absorption. Now, no known gas, save oxygen, or a gaseous mixture containing it, will effect this change; and hence it follows that the gas in question becomes a specific test for oxygen."

The lecturer now repeated the experiment, merely substituting atmospheric air for the pure oxygen, which he operated upon previously, and the same orange-red colour resulted; hence it was demonstrated that the atmosphere contained oxygen.

Mr. Faraday now drew the attention of his audience to the contemplation of oxygen gas, as it exists in the atmosphere; how apparently bland and inactive, bathing continually not only our external skin, but the most delicate air-passages of our lungs, without injury. He next expatiated on the apparent inactivity of oxygen, as it exists in water, and in flint and clay.

Rising from the contemplation of oxygen suggested by these examples, how surprising, how wonderful is it to view and speculate upon the glorious manifestations of power it exhibits when brought into an active state!

These exalted agencies of oxygen constitute what are ordinarily termed the phenomena of combustion, and which in their ordinary occurrence are familiar to all; oxygen being the portion of the atmosphere which alone promotes this agency.

Mr. Faraday now impressed upon his audience the necessity of creating two primary ideas of gaseous oxygen. Firstly, the idea of oxygen gas in a state of rest; secondly, the idea of this gas in that intense condition of activity characterised by the phenomena of combustion. A third idea he would desire them to create by and bye; and indeed a consideration of this third or interposed idea would constitute the main object of his present lecture. The extremes he, however, desired his audience to limit their attention to at first,—the mean should be interposed.

Pointing to a little phosphorus in an open funnel, and therefore in contact with the atmospheric air, the lecturer remarked, that although phosphorus had a great tendency to combine with oxygen, and the latter to combine with phosphorus, yet the resulting action was very slight; the oxygen being in a passive or waiting condition. On charcoal, similarly exposed, oxygen exercised no effect; on wood, an effect that was at best only slight. Nor were these conditions greatly intensified if the substances in question were plunged into pure oxygen gas; all these instances served to illustrate one primary idea of the qualities of oxygen gas;—an idea which represented the one end of the scale of its phenomena.

If now, the same phosphorus and the same charcoal were plunged respectively, whilst ignited, into jars of atmospheric air, the active qualities of oxygen would be recognised; and the phenomena would be still more intensified if pure oxygen gas were employed instead of atmospheric air. The lecturer here performed the experiment just indicated.

Having thus developed the qualities of oxygen gas, as manifested at the two ends of the scale

* May it not be well for homœopathic chemists to consider whether, in the trituration of medicinal substances, a change does not take place, which imparts to the substance acted on or developes in it new powers—on which this subject of allotropism throws some light?

Hosted by Google

of its phenomena respectively, namely, in its passive or waiting, and in its active state, Professor Faraday now proceeded to interpose between these two extremes a mean, namely, oxygen in its intermediate or allotropic condition of *Ozone*. He developed this part of the subject by dipping into a jar of atmospheric air a piece of test-paper for the presence of ozone; namely, paper on which had been laid a mixture of iodide of potassium and starch. The paper remained unchanged. The lecturer now put into the same bottle, containing a little water, a piece of clean phosphorus, and allowed it to stand for a few minutes. Then, dipping the same test-paper into the bottle, the paper became blue, thus demonstrating the presence (firstly) of oxygen, (secondly) of oxygen in a condition of greater activity than ordinary oxygen; demonstrating, in point of fact, the presence of ozonized oxygen.

In this latter state oxygen has acquired some very remarkable properties: it bleaches rapidly—an effect which the lecturer demonstrated by pouring into it a solution of indigo. It acts on substances on which it exerted no agency before. Thus the metal silver, even in the condition of thin leaf, is unacted upon by ordinary oxygen; but, when immersed into ozonized oxygen—whether unmixed or forming a constituent of atmospheric air—silver-leaf rapidly crumbles into oxide. In point of fact, under the influence of oxygen in this state, silver is no longer a noble metal. Not only does the preceding experiment demonstrate the activity of ozone, but demonstrates it to be oxygen;—because only oxygen could have formed oxide of silver by union with that metal. Moreover, the same fact can be demonstrated by passing ozone through a red-hot tube. It goes in ozone at one end of the tube, and comes out mere common oxygen at the other.

In addition to the qualities of ozone already detailed, it has others, and very remarkable ones. If a piece of tainted meat be immersed in it, the ill odour immediately departs. Hence, if viewed merely in relation to its deodorizing and disinfecting qualities, ozone must be destined by nature to perform some highly-important functions.

There are various methods of preparing ozone besides electricity and the agency of phosphorus. One only of these the lecturer could show, owing to the restricted limits of his time. The plan consists in immersing a heated body into a mixture of ether vapour and atmospheric air. Taking a wide-mouthed jar, the lecturer tested it for ozone by means of paper imbued with iodide of potassium and starch; but no ozone was present. He now poured in a few drops of ether, and tested it again, bnt still no ozone was there. Now, immersing into the mixed vapour a heated glass rod, he tested it once more—when the test-paper indicated an abundant presence of ozone.

"It would be readily inferred," remarked the lecturer, "that this ozonized condition of oxygen must necessarily be formed in nature's grand economy, and it wus doubtless intended to subserve some highly-important uses." Schönbein had speculated on its relations to disease and health—speculations on the consideration of which the lecturer was precluded from entering on this occasion. The most casual reflection on the qualities of ozonized oxygen would be sufficient to cause an appreciation of its influence on the changes of eremacausis or decay. Pointing to a piece of decayed wood, Professor Faraday remarked that the result might be considered as the effect of a slow combustion.

As ozone may be considered as an allotropic intermediate condition of oxygen gas, midway between its state of rest and its state of complete activity—so may oxygen in a solid state be made to assume a somewhat parallel intermediate condition. Thus, in the material gun-cotton a large amount of oxygen was stored; inactive to all appearance, but ready to spring into activity so soon as its combining force should be exalted by the contact of fire. (The lecturer, at this stage, showed the effect of burning gun-cotton.) As gun-cotton was prepared, so might he prepare gun-paper and gun-sawdust. A specimen of each was shown by Professor Faraday. "Although in all these substances," the lecturer remarked, "the oxygen appeared strictly quiescent, yet, in point of fact, this was not the case; a decomposition, slow but sure—a sort of modified combustion—was going on." Taking a piece of gun-paper which had been some time prepared, the lecturer showed that it had totally lost its extraordinary combustive power; only burning now like common paper. On examining its texture he found it to be weakened. The paper could now be torn with far greater facility than before; a sort of decay had ensued, not very dissimilar, probably, to the decay which affects woody fibre under ordinary circumstances, and which isso destructive to timber.

The intermediate, half-active, half-quiescent condition of oxygen in solid combination, as evidenced by gun-cotton and its congeners, the lecturer remarked, was most extraordinary. On a former occasion he had pointed out the remarkable quiescence of powers existing in gunpowder; but gunpowder was only a mechanical union of elements—gun-cotton and its congeners, a chemical combination.

Mr. Faraday concluded his lecture by directing the attention of his audience to the enormous amount of oxygen which exists in the material world. This consideration he impressed on his audience by referring to the tables. Not only does oxygen constitute eight-ninths of water and one-fifth of atmospheric air, but it constitutes one-half by weight of silica—the most abundant principle of rock and stone. No one could reflect upon these extraordinary facts without rising from the contemplation impressed with a conviction of the high importance of oxygen in the economy of the physical universe.

HOMŒOPATHY IN SWEDEN.

By Dr. Liedbeck, of Stockholm.

(*Continued from page* 519.)

I give the following extracts from the letters of one of our latest converts to the reformed medicine, Dr. Petesson, of Calmar, who not only "feels himself honoured in presenting himself before the public as a homœopathic physician, but will also, in the next Report to the Medical College of Stockholm, announce himself as an undoubting recipient of the Hahnemannian doctrine." Perhaps, also, the tone of Dr. Petesson will be of more interest to the majority of the readers of the *Homœopathic Times* than my own more sceptical communications in medical matters; sceptical in every respect, excepting as regards the great law for all organic reaction, *simile simili medetur*. Vital reaction is the Archimedean-Hahnemannian fixed point for all that lives and breathes; this is the only true compass in the hand of the physician for steering a right course, and keeping clear of the many hidden or unhidden rocks he has to encounter at every step of his anxious career.

But first allow me only to mention one interesting case which occurred in my own practice not long ago, as it has some reference to the valuable observations about tobacco which I read lately in the *Homœopathic Times*. In the year 1848, I was consulted by a patient, aged between thirty and forty, short, with blue eyes and light hair, meek and weak and tremulous, who complained of being *anaphrodisiac*, but wished to be married. He stooped, was thin, and of a pale and yellowish complexion. On his entering my room I perceived directly a strong smell of snuff, and observed also that the lower part of the nose and the upper lip bore the brownish signal of a snuffer, and the black waistcoat was well brown-powdered. I remembered that Lallemand (vol. ii. p. 14, Paris, 1839,) had observed, "Anaphrodisie par la fumée du tabac." I did not, however, know that snuff only could produce this effect, but I did not hesitate to trace the correspondent effect in the present case. I therefore told the patient that he was the only one who could cure himself, by discontinuing snuff or tobacco in any other form. He willingly agreed to do so, but as he wished besides to have some remedy, I gave him at once *Spir. Phos.*, 2 drops.

After two months the patient visited me again, pretending that the remedy had cured him, adding, however, that he never could believe that taking snuff was so injurious as he had found it since he had left it off. He now looked perfectly well, an image of health, upright, and with an expression of life and spirit in his countenance. The patient now preaches on the injurious effect of snuff amongst the brethren. I think the abstinence from the pernicious but tempting weed in this case did more towards recovery than the single dose of *Phosphorus* I administered, considering that we are all more or less under the influence of *Phosphorus* by the constant use of lucifer-matches, and that the patient thus ought to have been cured before, had *Phosphorus* been the true remedial agent.

But to return to Dr. Petesson. In his letters to me he gives the following account of his conversion to homœopathy:—"Through some of your writings, but principally from reading your pamphlet on 'Small-Pox and its Treatment,'* as well as through one of your former patients, the celebrated Professor Schwartz, my attention has been directed to homœopathy, which previously, from prejudice and ignorance, I had not considered worthy of notice; and I feel at the present moment, to make use of a theological expression, like a suddenly-awakened sinner. I have commenced seriously to study and to prove, and have consequently come to the profound conviction, that the Hahnemannian method of cure is the only true and rational one. The whole of my previous career of nearly twenty years' practice lies before my repentant memory as a great error. In proportion as my knowledge of my newly-adopted science increases, I am resolved to abandon the old routine, though the new *study* requires unceasing labour.

"My first experiments were made with

* Translated in the British Journal of Homœopathy.

Hosted by Google

the remedy (*Vinum Stibiatum*) proposed by you for small-pox, *the almost infallibility of which, when applied in time, I have had an opportunity to observe in more than one hundred patients.* During the autumn I have succeeded in making some cures, which I believe would not have been obtained by allopathic means."

Case 1. — A milliner had for three months suffered from a continued aching and pain of the stomach, with vomiting of everything that she took, either solid or fluid. I diagnosed a commenced *scirrhus ventriculi;* however, after one drop of *Arsen.* 5, repeated for five days, the patient was so perfectly restored, that she can now take whatever food she likes, with impunity.

Case 2.—The wife of a labouring man, suffering from an old crural hernia for three days, presented symptoms of incarceration, and without result had used enemas, *Epsom Salts,* and *Castor Oil,* which were immediately rejected. After two doses of *Nux Vom.,* the incarcerated bowel was spontaneously replaced, during a copious evacuation.

Case 3.—An habitual constipation of ten years' standing was cured in three weeks by *Alumina* 4, one drop daily. The patient, instead of having alvine relief every three days, is now relieved twice a day.

Cases 4 *and* 5.—Two cases of acute rheumatism were cured—one in a week, the other in a fortnight—by *Aconite, Bryonia,* and *Pulsatilla.* Formerly in my allopathic practice, I did not succeed in curing this disease in less than a month or six weeks.

The following case appears to me remarkable as well in a physiological point of view as for the quick effects of the homœopathic treatment.

Case 6.—Miss H. A—, aged nineteen, of a sanguine temperament, of fair complexion, mild temper, and quite regular, had been directed to take *Rust of Iron* in very great quantities for *gastrodynia* of long standing. The disease disappeared after a fortnight's use of the remedy, but the patient was suddenly assailed with delirium of a peculiar character. She became talkative and somewhat odd; she perpetually changed the subject of conversation; was very attentive to everything that took place around her. She exhibited great liveliness, her eyes flashed brilliantly; and her sense of hearing became exceedingly acute. This state of animation, during which she recognised every one she had previously known, and neither spake nor acted altogether irrationally, lasted generally three or four hours at a time; then suddenly the expression of her face became serious and almost suffering, and she began to speak as in her healthy condition. She complained of a burning pain at a spot, about the size of half a crown, on the anterior part of the left side of the head. On being felt, this spot was much hotter than any other part of the head. This lucid interval did not last longer than from five to ten minutes, when her delirium recurred as above. Instead of the headache, she had at times attacks of a violent spasm in the chest, accompanied with violent screaming, and often followed by swooning. These symptoms had lasted four weeks when I was consulted. She was in a delirious state when I arrived, and was at first somewhat shy; but gave a tolerably correct account of her symptoms, and answered my questions without hesitation. After a while, when she returned to what was called her natural state, she bowed to me again, as if she had not before seen me; for though she remembered everything which occurred during her delirium, it was to her as if it had passed long ago or as a memory of other days. I gave her some globules of *Belladonna,* though *Coff.* was perhaps more indicated, as she had not during the whole of her illness slept uninterruptedly for an hour. The patient, however, was quiet during the whole of the night, and spoke rationally, though she did not sleep. The delirium reappeared the following morning, but disappeared for several days after another dose of *Belladonna.* As I have not been able to revisit her, on account of the long distance, I only know of her state from report. Her delirium generally reappeared afterwards only for an hour in the evening, but in the same proportion as these symptoms diminished, reappeared her old gastrodynia, in the same form as before. I have sent her, in succession, *Nux, Chamomilla, Cocculus, Bismuth,* and *Sepia;* but nothing appears as yet to have had a decided effect.

In the beginning of March, five cases of croup occurred in my practice, four of which I treated homœopathically. Two were cured, but were seen soon after the commencement of the attack; the two others succumbed, but I did not see them till the fatal termination was near at hand, as the plastic exudation had taken place before I saw them.

In one of these cases, though yet in my homœopathic noviciate, I opposed the use of leeches and emetics, which were advised by my allopathic *confrère* Dr. F., who was called to meet me in consultation.

Hosted by Google

I gave instead *Aconite, Spong.*, and *Hepar*, of which the first two were used during the first twenty-four hours, and the last during the second and following day.

No fresh attack occurred. My allopathic brother confirmed the accuracy of my diagnosis, confessed it was an undoubted case of croup, but denied the efficacy of the remedies, because, in compliance with the wishes of the parents, I had allowed the application of warm-water compresses to the throat. The hot water did everything, according to him, and the *Aconite, Spongia,* and *Hepar* had done nothing. So seeing is sometimes *not* believing.

I have lately seen a most satisfactory effect of *Calcarea carbonica*, in a case of chronic habitual headache. A maid-servant, aged twenty, with regular periods, but of a scrofulous diathesis, had suffered from a constant headache for upwards of four years. Almost without any hope of curing a disease of so long a standing, I gave her *Calcarea* 5, five drops thrice a day. On the sixth day after the commencement of the treatment she was quite free from her headache, and has continued so ever since.

Two peasants sought my advice some time ago, who suffered from epilepsy, occurring during the night, but preceded by distinct premonitory intimations. I twice gave them *Belladonna* 4, a drop to be taken on the first perception of the premonitory signs; and I have had the satisfaction to hear from them that no regular attacks have since taken place. I cannot, however, hope that their cure is yet accomplished.

If I have met with some failures in my homœopathic practice hitherto, which I do not deny, I put them altogether to the account of my ignorance; and the satisfaction I feel in having commenced this mode of practice repays me manifold for the sneers and sarcasms that ever and anon buzz about me, on account of my having dissented from the *orthodox* medical faith.

(*To be continued.*)

NARRATIVE OF THE INTRODUCTION OF HOMŒOPATHY INTO ENGLAND.

By F. J. Smith, Esq.

(*Continued from page* 573.)

If the state of the public mind, in relation to any given subject, may be gathered, as it is now generally admitted that it may, from the periodical literature of the day, it must be allowed that the medical mind of England was closely sealed against the reception of the doctrines of Hahnemann when Dr. Quin, returning from Italy in the spring of 1827, took up his quarters in this country under the auspices of Prince Leopold.

Two medical periodicals of higher repute and of more extensive circulation did not then exist than the *Edinburgh Medical and Surgical Journal* and the *Medico-Chirurgical Review.* In the 28th volume, and in the 92nd number of the former of these works, published on the 1st July, 1827, we find an article entitled "An Outline of the Homœopathic Doctrine, or the Medical Theory of Hahnemann, by Edward John Spry," in which the writer states—"Many physicians in that country (Italy), but more particularly at Naples and its neighbourhood, have become converts to its theory. In Vienna and Prague it has become quite fashionable. The peculiarities of the proposed maxims appear to have attracted general attention; they were supported by some and ridiculed by others; and as no schemes are too visionary not to procure some proselytes, Hahnemann succeeded in raising a party who publicly espoused his opinions. A long paper-war was the consequence, which has not yet terminated, but which has succeeded in setting the medical men of Germany by the ears, and of forming them into two great sects—the homœopathekers and the antipathekers. It may not be uninteresting to show how such opinions operate in practice; and if we may judge from the opportunities afforded by Hahnemann himself, the conclusion cannot prove satisfactory." The writer then gives the history of two cases treated by Hahnemann, and proceeds: "It is rather singular that these are the only two cases of homœopathical cures reported by Hahnemann, although many are scattered up and down in the writings of his disciples. They are sufficient to show that the system utterly fails when brought to the test of experience; and however ingenious the theory may sound, it appears too ridiculous in its application even to obtain supporters on this side of the Channel. Although this homœopathic party is still numerous in Germany, it is but right to say that its popularity appears to be deservedly on the wane, and it is probable that it will die a natural death in the days of the next generation."

This quotation being solely introduced for the sake of its evidence as to the state of the medical mind in this country, on the subject of homœopathy, in the year 1827, it will not be expected that we should enter upon a criticism of its statements and arguments. We cannot, however, forbear to

Hosted by Google

observe that the insult offered to that great nation—Germany—which has produced such giant minds, reminds us of the grave-digger in Hamlet, and his opinion of the English. We must also draw attention to the admission that the effect of Hahnemann's writings had been to divide Germany into "two great (medical) sects"—an effect surely not to be produced on a body of scientific men by statements and reasonings simply "ridiculous." We have further the implication that there is something extremely "ingenious" in the theory of homœopathy. And we must be allowed to express our sympathy for Dr. Spry, who, if he be still a denizen of earth (which, if we may judge by his style, is more than probable), must have passed a life of the deepest mortification in witnessing the constant increase of the Hahnemannic system, in spite of his prognostication that "it was too ridiculous ever to obtain supporters on this side of the Channel;" and that it was "probable it would die a natural death" on the Continent "in the days of the next generation."

Important as is the foregoing extract as evidence as to the state of the medical mind in 1827, it becomes additionally valuable from the fact that the extract itself is referred to and eulogized by the *Medico-Chirurgical Review* of London, edited by no less a personage than Dr. James Johnson. In the seventh volume of that celebrated work, published 1st of October, 1827, appeared an article with the word "Homœopathy" for its title. Homœopathy is not the only subject, however, upon which the writer expatiates, as our readers will see. We are here admitted to a view of the state of the allopathic profession; and a melancholy picture truly it is! Nor need homœopathists wonder at the insults that have been heaped on their system, when they see with what remorseless hate it is the custom of medical men to pursue one another. "As there is said to be," observes the reviewer, "a time for all things, probably the present time is one when we ought to cry rather than laugh, seeing the profession torn with dissensions and contentions from the South Foreland to the Pentland Frith—the patrons and the professors of Universities at drawn daggers, and, what is worse, at law with one another. Physicians and surgeons at war with and warred on by their respective colleges, and carrying their petitions and litigations into Parliament and courts of justice; one class of the profession endeavouring to supplant another; in short, the contest carried down to individuals, so that in every town, almost in every street, the foot of one man is opposed to that of his neighbour; while the press inflames the ire of contending parties, and ever and anon cries out, 'war even to the knife.' In such a state of things, it is charitable in our venerable cotemporary of the North to place before the public a GERMAN FARCE, which, unlike the apple of discord, must raise one universal and harmonious laugh among all ranks of the profession. Our cotemporary has acted on a celebrated precept of antiquity, laid down by no less a personage than Homer himself, and put on record by the wily Ulysses:—

"'Hear me, my friends, who this good banquet grace,
'Tis sweet to play the fool in time and place.'

"From what has been observed above, we think there cannot be a better time or place to play the fool than the present; and sincerely do we hope that 'grim-visaged war' may smooth his angry front, and 'chain the red dragons of his iron car' while attending to the entertainment which our humorous friend, Mr. Spry, has provided for the occasion. The scene of the homœopathic farce is, as it ought to be, laid in Germany, that huge protuberance of ideality in the brain of Europe, and the *dramatis personæ* are Professor Hahnemann and his disciples. It may not be improper to remind the audience that the principal actor, viz., the said professor, for a long time prepared his own medicines, to *prevent their being known*, and was, eventually, expelled from Leipsic for thus encroaching on the privilege of the apothecaries, and for persisting in keeping his remedies a secret.* Here follows a note which our medical universities will do well to consider. The charters of the German colleges were less favourable to quackery than that which was granted by the amiable (or rather amorous) Henry the Eighth of this country. In Germany, quacks are driven out of society, and regular graduates of regular universities are respected. *Here*, the quack is protected in the exercise of his art; but the physician who has undergone the discipline of the first medical universities in Europe is persecuted and prosecuted to the utmost rigour of the law."

The article proceeds. "The gist of the homœopathic system may be easily and briefly stated. Hippocrates broached the fanciful docrine, that a disease should be

* It is hardly necessary to say that the story of secrecy, in the sense in which it is here employed, is a fabrication. Every man of science knows that to arrive at *certainty* in respect of any experiment, he must be perfectly assured as to the agents he employs. Such a person will therefore regard the fact that Hahnemann "prepared his own medicines," as a very high testimony to his character as a scientific physician.

Hosted by Google

cured by things that induce a state opposite to that of the disease, '*contraria contrariis medentur.*' The German professor strikes out in a diametrically opposite path, and maintains that disordered actions in the human body are to be cured by inducing other disordered actions of the *same kind*, but only much slighter in degree—'*similia similibus curantur.*' The doctrine of anti-pathy had much foundation both in reason and fact. Thus the burning heat of fever naturally suggests cooling drink and cool air; constipation calling for purgatives; diarrhœa for astringents; soporose diseases demand irritation; irritation calls for sedatives, etc. But what shall we say to homœopathy? Do venesection and purgation induce diseases resembling pneumonia, ophthalmia, hepatitis, and other inflammations, when these are cured by the above means? The idea is preposterous. But the effects which he attributes to medicines in the most inconceivably minute doses would stagger the credence of any but a German. Thus *Camomile flowers*, 1481 symptoms; *Elder flowers*, 116; *Iron*, 228; *Bark*, 469; and *Platinum*, 402!!! The thousandth part of a grain of *Arsenic* is the largest dose that should be given, and the hundred-thousandth part is enough in ordinary cases. A drop of the spirituous *Tincture of Sarsaparilla* is said to be a strong dose. The seven-millionth part of a grain of *Cucumis Colocynthis* acts sometimes too powerfully. It is no wonder that the Leipsic apothecaries chased Hahnemann out of their territory. We understand that a certain worshipful company in this country have instituted an action against Mr. Spry for disseminating a doctrine subversive of the best interests of *society*—at least *their* Society. In *this* prosecution we apprehend there will be no lack of alacrity on the part of the plaintiffs."

Observations such as these speak for themselves, and bear with them their own refutation. We must be permitted, however, to observe that there is as distinct and separate a history of every leader of our daily papers, and of every article of our periodical literature, as there is of every kingdom on the face of the earth; and that a knowledge of such history would throw considerable light on the argument employed. We cannot pretend to furnish the precise history of the production under review, but this we do know, that the *Medico-Chirurgical Review* was at the period in question conducted by Dr. James Johnson. Whether he were the author of the article on homœopathy we cannot venture to decide; we can only aver that the style of that article and of his writings in general is very similar. We happen also to know, on undoubted authority, that when Dr. Quin was in England in the autumn of 1824, he mentioned to Dr. Johnson (with whom he was at this time on the most intimate terms) that a new system of medicine, to which he had given some attention, was being practised in Naples, having been imported from Germany, where it was founded by a celebrated physician of Leipsic, of the name of Hahnemann. Dr. Johnson appeared to be much interested, and was certainly not a little amused, with the account given by Dr. Quin, whom he recommended to continue his investigations into the practice, on his return to Naples, adding the request, that he would furnish him (Dr. Johnson) with an article on homœopathy for insertion in his periodical. It would not be correct to say that the recommendation of this celebrated physician was followed by Dr. Quin, because he had previously resolved on resuming his inquiries into the new medical system. However, on again reaching Naples, Dr. Quin renewed his investigations into the Hahnemannic doctrines and practice, as proved by the letter of the distinguished artist dated in April, 1825, and cited by us in a former part of this Narrative. The result of these investigations was of a very different character from that anticipated by the Editor of the *Medico-Chirurgical Review*. Dr. Quin, therefore, with becoming frankness, informed Dr. James Johnson of the decided change his mind had undergone, adding, that if he wrote an article at all, it would be of a nature not likely, he feared, to find favour either with the Editor or his professional readers. To this letter no reply was received. Nevertheless, on his return to England in the spring of 1827, Dr. Quin called on Dr. James Johnson, when the latter inquired if it were true that he had been studying homœopathy in Germany, and had become a convert to the system. Dr. Quin, of course, replied in the affirmative; whereupon—*miserabile dictu!*—a coolness ensued, which ended in a total estrangement, much to the regret of Dr. Quin, who entertained a great respect for the talents of his friend, and held in high esteem the many valuable qualities by which his character was adorned.

What connection the facts just related have with the article on homœopathy in the *Medico-Chirurgical Review* it is impossible for us to say. Each reader will draw a conclusion for himself. But on this, we think, all will be agreed, that the anecdote is illustrative of the state of the medical

Hosted by Google

mind of the country in the year 1827; and that if a man of Dr. James Johnson's character, position, and attainments could indite or insert in his journal such an article as that from which our extracts have been taken, and could so demean himself as our anecdote relates, there must have been a rancour and a virulence in the opposition with which homœopathy had to contend on its first promulgation in England, which, while it rendered caution an indispensable qualification in the herald, must excite our amazement when we reflect on the conquests that have been made, from amongst the ranks of the profession, during so short a period as a quarter of a century.

(*To be continued.*)

CRITICAL ANALYSIS OF DR. ROUTH'S "FALLACIES OF HOMŒOPATHY."

By John Ozanne, M.D.

Entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

IX.

VI. *Influence of Hygienic Discipline.*—It has been shown in the preceding papers that Dr. Routh has brought forward no evidence whatever in his attempt to prove that the superiority of homœopathic results is due to *difference of locality*, to the *constitutional type of prevailing diseases*, or to the *influence of the mind*. Neither does he, in the section which forms the subject of this paper, give any proof of its being due to *diet* or to *hygienic* discipline. We have assertions, it is true; but assertions are not proof. For instance, we have the following at page 36: "If we look at the cases published by their most distinguished writers, and in which the attention to diet is recorded, we are forcibly struck by *the extraordinary manner in which this is enforced*. Coupling this with the admissions made by converts to allopathy, we cannot fail to be convinced that, in most cases, not influenced by mind, *the cure is effected by the dietary rules enforced*, and not by the mere globule."

As this subject is constantly brought forward by the opponents of homœopathy, and as it is found by them to be a short and easy method of denying facts to ascribe all to *the diet*, I have thought it right to inquire if there is, after all, anything so "extraordinary" in it or in the manner in which it is enforced. One circumstance has chiefly induced me to do so. It is that most of our non-medical friends are frequently at a loss what to say when this objection is made, although fully convinced in their own minds of its futility.

In the course of this inquiry we shall have to consider two points: 1st. Whether in homœopathic treatment so extraordinary a degree of attention is paid to diet as is asserted; and whether the dietary is in itself so very peculiar. 2ndly. Whether this objection, so constantly urged by allopathic physicians, is advanced by them in any other light than as a mere argument; whether, in fine, they believe or not that the homœopathic dietary is so good as they choose to say, when it is brought forward as an objection to homœopathic facts.

Upon the first head, the evidence adduced will be taken from Hahnemann's "Organon of Medcine" and from the diet-rules of the Hahnemann Hospital in London; it will also consist of the dietary followed in Dr. Tessier's wards during the time that his researches in pneumonia and cholera, as published in his work (to be referred to frequently in the sequel) were carried on.

Upon the second head, the evidence adduced will be taken from the Reports of the Glasgow Royal Infirmary (mentioned with commendation by Dr. Routh), and will be supported by a few extracts from the expenditure of that establishment.

We should expect from Dr. Routh's statement respecting the "extraordinary manner in which this (the diet) is enforced" by homœopathists, that in Hahnemann's Organon considerable space would be devoted to it. But it is not so. The question of diet and hygienic discipline is mentioned in only five out of 294 sections, and in a book containing 339 pages, less than three are taken up by it.

What is said by Hahnemann, however, in these three short pages is so replete with sound practical sense, that it cannot be out of place here to transcribe it.

"Considering the minuteness of the doses necessary and proper in homœopathic treatment, we may easily understand that, during the treatment, everything must be removed from the *diet and regimen* which can have any medicinal action, in order that the small dose may not be overbalanced and extinguished or disturbed by any foreign medical irritant. Hence the careful investigation into such obstacles to cure is so much the more necessary in the case of patients affected by chronic diseases, as their disease is usually aggravated by such noxious influences and other frequently unnoticed errors in the regimen, which are productive of morbid effects. The most appropriate

Hosted by Google

regimen during the employment in chronic diseases consists in the removal of such obstacles to recovery, and in supplying, where necessary, the reverse; innocent, moral, and intellectual recreation, active exercise in the open air in almost all kinds of weather (daily walks and light manual labour), suitable, unmedicinal food and drink, and so forth." The three sections which I have transcribed (cclix. and following) contain all that is said by Hahnemann of the dietary in *chronic* diseases, with the exception, however, of a note, in which a few articles of diet are named and objected to. Among these we notice: coffee, fine Chinese and other herb-teas; beer prepared with medicinal vegetable substances (hops are medicinal) unsuitable for the patient's state; so-called fine liqueurs made with medicinal spices; spiced chocolate; highly-spiced dishes and sauces; dishes of herbs, roots, and stalks of plants possessing medicinal qualities; old cheese and meats that are in a state of decomposition, or that possess medicinal properties. Then we have a few cautions against "excesses in food and in the use of sugar and salt, as also spirituous drinks;" recommendations to avoid sedentary modes of living; in fact, just what any well-educated person in our day would attempt to inculcate upon the young. The note ends thus: "All these things must be as far as possible avoided or removed, *in order that the cure may not be obstructed or rendered impossible.* Some of my disciples seem needlessly to increase the difficulties of the patient's dietary, by forbidding the use of many more, tolerably indifferent, things, which is not to be commended."

It is clear, therefore, that the broad principle upon which all homœopathic dietary rules are framed is twofold. It consists in the removal or avoidance of everything which may be hurtful to the patient, or which might, being medicinal, arrest the action of the minute doses of homœopathic medicine.

The dietary in *acute* disease, which concerns us most in this inquiry, is equally simple. "In acute diseases, on the other hand, except in cases of mental alienation, the subtile, infallible, internal sense of the awakened life-preserving faculty determines so clearly and precisely, that the physician only requires to counsel the friends and attendants to put no obstacles in the way of the voice of Nature, by a refusal of anything the patient urgently desires in the way of food, or by asking and persuading him to partake of anything injurious. The desire of the patient affected by an acute disease, with regard to food and drink, is certainly chiefly for things that give palliative relief; they are, however, not, strictly speaking, of a medicinal character, and merely supply a sort of want. The slight hindrances that the gratification of this desire, *within moderate bounds*, could oppose to the radical removal of the disease, will be amply counteracted and overcome by the power of the homœopathically-suited medicine, and the vital force set free by it, as also by the refreshment that follows from taking what has been so ardently longed for. In like manner, in acute diseases, the temperature of the room, and the heat or coolness of the evenings, must also be arranged entirely in conformity with the patient's wish" (sec. cclxii. et seq.) That is all that is said by Hahnemann on diet and hygienic discipline.

In the diet rules of the Hahnemann Hospital the same principles are followed, but the articles are specified and classed under two heads—"aliments allowed," and "aliments forbidden." Among the latter are tea, wine, spirits, and porter, to which I shall have to allude presently.

It is singular that Dr. Routh, who can find no objection whatever to the authenticity of the cases recorded by Dr. Tessier, in his work on the homœopathic treatmeut of pneumonia and cholera, should lay so much stress upon the homœopathic dietary rules as the cause of recovery, when he knew that in Dr. Tessier's wards no change whatever had taken place in the dietary of the patients, which remained just the same as when they were under allopathic treatment. I say that *he knew* this, for I have tolerably strong evidence that he must know it; and if he did not, he has shown himself guilty of a degree of negligence, which, in an inquiry such as this, is in the highest degree reprehensible. The evidence is the following: — In the first volume of the *Homœopathic Times*, a series of papers entitled "Homœopathy in Paris" was published. These papers contained a description of the Hôpital St. Marguerite and of Dr. Tessier's wards. In this description the following paragraph is to be found: "At present, Dr. Tessier is not at liberty to make any alteration in the dietary of his patients; they are all submitted as yet to the same rules as those in the allopathic wards. He hopes that in the course of some time he will be in a position to obtain from the General Board of Administration the necessary changes in that respect."—*Homœopathic Times*, vol. i. p. 727.

The evidence that Dr. Routh has seen these papers is *circumstantial*, but nevertheless convincing. It is this: it happened that an interruption took place in

Hosted by Google

the publication of the series of weekly papers; it also happened that a report of Dietl's treatment of pneumonia was given in the very place which would have been occupied by the missing paper, had it appeared. Now, Dr. Routh quotes this report of Dietl (p. 55). Having seen that paper, and being an habitual reader of the *Homœopathic Times*, as we see. in several places in his book, it would be singular that he should have overlooked a series of papers full of statistical details, and bearing most fully upon the subject of his inquiry. This fact is, however, to be noted, for it will be of some interest to us to inquire how these papers have been overlooked in Dr. Routh's statistical inquiry respecting pneumonia, as, independently of the small intrinsic value they possess, some questions are introduced and discussed, which I feel bound to say that, had they been met in a like spirit by Dr. Routh, and fully investigated, his book, instead of being totally sterile as regards the production of good and wholesome results, might have had no small influence upon the fate of the present medical controversy in the British Isles.

We have thus seen that the homœopathic dietary differs from the allopathic in this particular, that we are bound to avoid the use of substances, in the treatment of *chronic* disease, which might annul the action of our delicate preparations. The same rule holds good in *acute* disease likewise, but there is this important difference: that if in acute disease we follow Hahnemann's directions, to be guided by the patient's cravings for food or for drinks, we shall be at variance with allopathic dietaries only upon two points. In the first, when allopathists, through fear of increasing fever when present, or of reproducing it after its disappearance, imperatively *forbid* the use of all kinds of animal food, and insist upon the patient being *kept low*. We differ *in toto* from this principle. We may in many cases forbid the use of animal food, and even of its least nourishing form, light broths, because we know or suppose that it would hurt the patient, but not for the purpose of keeping him low. It may be a matter of necessity to forbid solids, and especially meat, but it is not done as a means of cure; consequently it is only resorted to as a temporary measure, and is carried on to a much smaller extent than under allopathic treatment and discipline. The latter is frequently very severe, and often unnecessarily so. Even in chronic disease, we see numerous articles of diet forbidden by allopathists which we should allow, whereas our restrictions are limited to spirituous drinks and to spices, and other medicinal substances. Several other restrictions, namely, those relating to crude vegetables, pork, and other meats, relate not to the medicines or to the system of treatment, but have reference exclusively to the power the patient has of digesting them.

We now come to the second head of our inquiry, stated at the commencement of this paper: whether allopathists *believe* or not that the homœopathic dietary is so excellent as they choose to say, when they bring it up as an objection to our cures.

I declare that they do not believe in this excellence of the homœopathic dietary, and I moreover deliberately charge every allopathist, who now attributes the superiority of homœopathic results in hospital-practice to the dietary enjoined, with being *dishonest*. It is pre-eminently dishonest to say that the results presented by a system of practical medicine, vastly superior to all those obtained by any other means whatever, are due to the dietary observed as a part of that system, and not to the medicines employed. It is *dishonest* to say so, if it be not believed; and, if believed, it is dishonest—nay, it is *in the highest degree criminal*—not to adopt that dietary.

But what are the facts of the case? In the Infirmary at Glasgow, in the years 1846-47-48-49, the following sums were expended in the purchase of articles which, had the Infirmary been managed on homœopathic principles, would have figured for very small sums: In 1846, the sum expended in the purchase of wine, whiskey, brandy, gin, and London porter, amounted to £369 13*s.* 4*d.* (exclusive of £22 10*s.* for spirits of wine, and £70 13*s.* for tea, etc. etc.) The total number of patients for the year was 4554; the total expenditure £6914 16*s.* 3*d.* At this rate of expenditure, the sum spent in the purchase of wines, spirits, and porter would have maintained at least 250 additional patients. In 1847, the sum expended in the purchase of the same articles was £667 11*s.* 6*d.* (exclusive of £29 4*s.* for spirits of wine, and £90 18*s.* for tea, etc.); the total number of patients being 7607, and the total expenditure for the year £11,232 2*s.*, this sum would have maintained above 400 additional patients. In 1848, these articles cost £302 11*s.* 6*d.* (exclusive of £13 7*s.* for spirits of wine, and £72 7*s.* for tea); the total number of patients for the year being 2669, and the expenditure £6682 8*s.* 6*d.*, this sum would have maintained at least 120 additional patients. In 1849, the expenditure for wines, spirits, and porter was £202 14*s.* 6*d.* (exclusive of £17 3*s.* 6*d.* for

Hosted by Google

spirits of wine, and £56 13*s.* for tea); the number of patients for the year being 2686, and the total expenditure being £5752 16*s.* 5*d.*, this sum would have maintained above 170 additional patients.

There is therefore no excuse upon the score of *economy*, seeing that were the homœopathic dietary adopted so great a portion of expenditure would be saved.

Is there any excuse on the ground of *ignorance* of the homœopathic results? There can be none, for Professor Henderson's "Inquiry into the Homœopathic Practice of Medicine" was published in 1845, and reviewed by Dr. Forbes in the number for January, 1846, of the *British and Foreign Medical Review*, in his well-known article on "Homœopathy, Allopathy, and Young Physic." If, therefore, ignorance of the results of homœopathic practice could be pleaded as an excuse in 1845 and previous years, it cannot be pleaded in 1846 and subsequent years.

This shows therefore that allopathists do not believe that the adoption of the homœopathic dietary would be of any advantage in hospital practice.

But so far from the homœopathic dietary being considered good, as regards the use of stimulants (wine, spirits, porter), the homœopathists using them *rarely*, or only in *small quantities*, I here declare that no physician or surgeon in the United Kingdom, professing the usual allopathic principles, would consent to take the charge of fever or surgical wards, if he were much restricted in the use of those articles (which figure for such large sums in the Glasgow Reports), and much less would he do so, if he were bound to follow the practice of homœopathists in this respect.

With this critical analysis of the preliminary part of Dr. Routh's work, I, strictly speaking, take leave of our author, the continuation of these papers being in point of fact as much an *Essay upon the Homœopathic Statistics in relation to the Allopathic*, as a criticism of Dr. Routh, and will appear under a different title. Dr. Routh's objections to our statistics will be noticed, his statements scrutinized, and his opinions discussed; but we shall proceed in such a manner as to avoid his desultory mode of conducting the inquiry, and whilst omitting to notice none of his objections or criticisms, we shall have to enter into various questions which are of vital importance to all those who seek for truth in medicine and into the development of facts and deductions, which will, I doubt not, be highly interesting and profitable to the readers of the *Homœopathic Times*.

THE
HOMŒOPATHIC TIMES.

SATURDAY, MAY 15TH, 1852.

WE give the report of the Festival in support of the Hahnemann Hospital.

The fact of these Annual Festivals in support of the Homœopathic Hospitals is itself a proof of the hold that homœopathy has taken, and of the progress it has made.

We may well bear the very natural opposition of those belonging to the so-called "Orthodox" medical sect, when we have such proofs of the vitality of our doctrine.

The admirable papers of Dr. Ozanne, in refutation of Dr. Routh's "Fallacies" cannot fail to satisfy the homœopathic public that even elaborate efforts to show that we are weak, only serve to exhibit our strength.

The assertion that some, at least, of our practitioners profess to be able to cure all cases of all diseases is no longer believed.

We have no immunity from death, one of the laws of Nature, either for ourselves, or for our patients, or for those we love.

Coleridge said that "Death" is the most solemn monosyllable in our language,—and so it is, for it signifies the passage from the Visible to the Invisible world—*here* one instant, *there* the next.

> "So passeth in the passing of an hour,
> Of mortal life the leaf, the bud, the flower."

The good, the wise, the gentle, the true-hearted, and the loving is removed, *departed*, separated from the living in the body—and we feel the awful blank in our every-day existence. We wake up as we lie down to our widowed bed; or the child misses the mother; or the mother the child. The sun of our life is in eclipse,—the moon looks sickly, the stars give a feeble glimmering; the song of the birds has no charm, and the outburst of vernal life in the merry month of May has no bloom for us.

On the 10th of May there was the triumph at Paris, the Festival of the sup-

Hosted by Google

porters of the Hahnemann Hospital—and on that day how many were made mourners by the departure of the beloved.

We eat and drink; we marry and are merry, till *the flood comes and takes us away.* But it is not out of place,—it is never out of place—for those who have the hopes of the Christian to point to the World beyond the Grave.

We enter into no religious discussion—we simply state our full belief in the world to come, and in that Divine Revelation which gives us assurance thereof.

For once we may be indulged by our gentle readers with remarks of this tone, which we close by quoting in full the tender and exquisite dirge of Shirley.

"The glories of our blood and state
Are shadows not substantial things;
There is no armour against fate;
Death lays his icy hand on kings;
Sceptre and Crown
Must tumble down,
And in the dust be equal made
With the poor crooked scythe and spade.

Some men with swords may reap the field,
And plant fresh laurels where they kill;
But their strong nerves at last must yield;
They tame but one another still:
Early or late,
They stoop to fate,
And must give up their murmuring breath
When they, pale captives, creep to death.

The garlands wither on your brow,
Then boast no more your mighty deeds;
Upon Death's purple Altar now,
See where the Victor-Victim bleeds!
Your heads must come
To the cold tomb:—
Only the actions of the just
Smell sweet and blossom in the dust."

HAHNEMANN HOSPITAL.

THE anniversary of the establishment of this Hospital, in Bloomsbury-square, for the practice and extension of a knowledge of homœopathy, was celebrated by a very elegant dinner, at the London Tavern, on Monday last.

The Right Hon. the Earl of Wilton took the chair, in the absence of his brother, Lord Robert Grosvenor, M.P., who was unavoidably prevented from attending by his parliamentary duties, and was supported by Lieut.-General Sir C. Pasley, K.C.B.; Lieut.-General Sir T. Hawker; Sir John Kennaway, Bart.; Sir John Hall, Bart.; Brigadier-General G. Frith, H.E.I.C.S.; Mr. C. P. Leslie, M.P.; Mr. J. More Molyneux, Rev. C. Kennaway, Mr. W. Leaf, Mr. C. A. Monck, Mr. Pasley, and about 120 other friends of the charity.

On the removal of the cloth,

The noble CHAIRMAN, in proposing the first toast, "The Health of the Queen," said he was sure that it needed no observations from him to ensure its cordial reception; all must hope that her Majesty's life, either by the practice of allopathy or homœopathy, may be preserved for very many years yet to come. (Cheers.)

The health of His Royal Highness Prince Albert, Albert Prince of Wales, and the rest of the Royal Family having been drunk,

The CHAIRMAN gave the "Army and Navy," combining with it the name of Lieut.-General Sir Charles Pasley.

Lieut.-General Sir CHAS. PASLEY rose and returned thanks, and stated that, in his younger days, he had had some little love for the excitement of the tented field, and as a great deal had of late been said about the national defences, he might be allowed to express an opinion that the army would as ever be found most steadfast and ready in the performance of their duties, though he hardly conceived that the army was efficiently strong. He might also say for the navy, that the spirit which animated them in the days of Nelson still prevailed—though he did not think that most important branch of her Majesty's service was sufficiently strong either in ships, seamen, or marines. He considered the prevailing system of paying off the crews of ships when they came into port most pernicious, and that they ought to form and support a national standing navy, in the same way as they supported a national army. As it now was, they trained men to naval gunnery, and just as they were perfect turned them adrift to look for employment from France, Russia, America, or any other country that chose to avail itself of their services. A militia was a highly valuable body, but in the late war it was found that the privilege of volunteering into it injured enlistment for the army. He also thought that a volunteer force, altogether independent of the army, might prove valuable for national defence, and that its formation ought to be encouraged by the Government.

The CHAIRMAN said that the next toast which he had to propose was one which in that room would be sure to be cordially received—it being "Prosperity to the Hahnemann Hospital." (Loud cheers.) He was quite aware that, in order to do justice to the toast, he ought to have made himself acquainted with the position and statistics of the Hospital; but, unfortunately, only having been unexpectedly called upon to take the chair upon that festive occasion, he had not been enabled to do so. He would, therefore, ask their pardon for any shortcomings in his address. A great many years since, his attention was

Hosted by Google

strongly called to the principles and practice of the homœopathic system, and he could assure them that experience of its results had only strengthened his conviction of the truth of the principles on which it was founded. (Cheers.) He thought he might speak with some authority on the subject, as he had formerly taken a great interest in the practice of surgery, and walked the hospitals of London and Manchester for ten years. (Cheers.) He found that the system was making great progress throughout the country, and an hon. friend of his informed him that, at Manchester, the Dispensary was already self-supporting, there having been last year between 4,000 and 5,000 patients —indeed, he almost regretted that the system was making so much progress in that town, in consequence of the injury it must do to the practitioners of the old system. (Cheers and laughter). He had had great opportunities of seeing the effects of the system amongst the higher classes; but what he most admired in the system was, that it was beneficial to the middle and lower classes. (Cheers.) Formerly, if the rich were afflicted with a disease that was obstinate or deemed incurable, they could go across the seas, to the south of France or the baths of Homburg, for the benefit of their health, but those who had to work for their living could not do so; but now, by the new system they might be relieved at their own homes and have all the advantages enjoyed by the rich. (Cheers.) In promoting a knowledge of homœopathy, as in everything else, much was to be done by individual exertion; and he wished he could stimulate the gentlemen present to greater exertion in favour of the Hospital. (Cheers.) The Hospital owed much to the exertions of a few gentlemen, and he hoped they would excuse him if he mentioned one gentleman, whose example he wished them to follow, he alluded to their friend, Dr. Epps. (Cheers) That gentleman had already procured subscriptions amounting to upwards of £300 for the Hospital, and had promised a donation of £100 annually until the amount he raised was £1,000. (Cheers.) He was sure he need not detain them longer in asking them to drink the toast he had proposed; but he could not sit down without informing them that the committee had received a letter from his Grace the Duke of Hamilton expressing his earnest sympathy with their views (cheers), and his regret that he could not attend that festival. He would not have said anything further in proposing the toast of the Hahnemann Hospital, had he not been aware that some persons objected to it, because there were two hospitals for the practice of homœopathy. Now, he could assure those persons that, though some differences had existed between them, the rivalry was most friendly, and that if they subscribed to either of those hospitals, they would be promoting the interests of the other by aiding in the extension of a knowledge of homœopathy. (Cheers.) He hoped that from day to day the feeling of rivalry or asperity between them would be ameliorated, and that a cordial union would take place between the two institutions; and he could assure them that, so far as he was concerned, no personal efforts should be spared to bring about so desirable a result. (Cheers.) He urged all present to forward the Institution to the utmost of their power, so as to give to the world an opportunity of testing the merits of the system (cheers); as the great object of every society of that description, of every philanthropic mind, must be to ameliorate the sufferings of mankind, no matter whether that was best to be effected by allopathy or homœopathy. He would not detain them longer, but again urging them to use their utmost exertions to support the Institution, he would propose to them, "Prosperity to the Hahnemann Hospital." (Cheers.)

Mr. C. P. LESLIE, M.P., had been intrusted with a toast which he had great pleasure in proposing, though he felt he could not do that justice to it he could wish. He was satisfied of the truth of the principles on which their Hospital was started, and of the value such an Institution must prove to society. In proposing the toast he was about to submit to them, he might mention a fact which the noble earl in the chair had omitted, viz., that the Duke of Hamilton had enclosed in his letter a donation of £10. (Cheers.) He felt assured that homœopathy must progress, though, like all great discoveries, it was for a time opposed; and he, therefore, had great pleasure in proposing to them the health of the Right Hon. the Earl of Wilton, the Chevalier Bunsen, the Earl of Shrewsbury, and the other patrons of the Hospital. (Cheers.)

The Earl of WILTON having briefly returned thanks,

Sir JOHN KENNAWAY rose to propose "Success to Homœopathy." He had, in the absence of their noble President (Lord Robert Grosvenor), a short time since, taken the chair at a meeting of the Society—certainly not of so festive a description as the one they were then enjoying; and when he did so, he expected that he might see some slight notice of their proceedings in the newspapers, but he never expected the result that followed; he did not expect to see their meeting made the subject of an article by the editor of a paper which was feared and respected both at home and abroad—*Punch*. (Hear, hear.) Of this he was quite sure, that homœopathy had withstood and would withstand any test that could be brought against it. (Cheers.) It had often been said that the best test of truth was ridicule; and having stood every other test, was, perhaps, the reason why the article in *Punch* was written, to see whether they could stand the last and greatest test. (Cheers.) Wherever the system had been tried, in whatever part of the country its practitioners had established themselves, homœopathy had made and was continuing to make great and sure progress; and in spite of ridicule, or any other test that could be brought against it, it would continue to do so. It used to be said *Magna est veritas et prævalebit*, but with this system it might be truly said, *Parvo est veritas et prævalebit.* (Cheers and laughter.) They might rely upon it that, within a few years, the truth of homœopathy would be generally acknowledged; and as there were always persons looking out for an opening by which their children might obtain a livelihood, he would advise them to bring up

Hosted by Google

their sons to a knowledge of homœopathy, to be prepared for the time when there would be sure to be a great demand for its professors. (Cheers.) He would conclude by proposing his toast, "Success to Homœopathy." (Cheers.)

The toast having been duly honoured,

Dr. EPPS rose and said—My lords and gentlemen, the sentiment which I have to propose is one to which the heart of every one present must feel a response—it is "the Memory of Hahnemann." If anything has its pleasures it is memory. No mean poet has sung those pleasures, and his song is worthy of the subject. Memory is impression recorded on brain tissue, thence transferred to the mind's tablet, awakable at will, or at least by the appropriate associations of stimulus. To make memory durable requires either intensity or repetition of impression. Memories of certain things and objects are from this latter cause almost lifelong. Who does not at every period of his age remember with intense delight a mother's love? and why is that so impressed but from this, that the impressions made by her love were continual repetitions of affection from childhood's earliest dawn to manhood or womanhood's fullest development? Who does not like to be remembered? Even the lowest, because most degraded, delight in being remembered. What have men done to gain this memory? Men have sought

> "the bubble reputation
> E'en in the cannon's mouth."

To be remembered has cheered thousands in some of the most arduous undertakings; and though it may be the lot of few to have the honour of having their names before a nation's eye, and still fewer to have their memories recorded on a nation's heart, still such memories do exist, and where they do exist, the existence will be found identified with the conjunction of some great deed or some great truth with the names remembered. Hence it is, that though men in all ages have combined to raise the warrior to the highest dignities, and though in the present day titles, and peerages, and pensions are awarded to the successful appliers of physical force, and rarely if ever to the giants of moral and scientific power; yet, in spite of all the efforts to give perpetuity to the memory of the former, it will be found that the names that float uppermost on the stream of human thought are the men whom Time has strung on his beadroll—those who have conjoined themselves with a great truth. The great Napoleon acknowledged that, in a century hence, all that he would occupy would be about ten pages in the world's history. Even our Nelson will depend for the memory of his name more on the sentiment that he put forth on the day of his last battle, "England expects every man to do his duty," than on the battles which he won. Euclid, who discovered the laws of force and proportion, has a memory among mankind far more extensive than Alexander the Great, and the memory of Alexander the Great has most of its permanence dependent upon his occasional recognition of moral truth and virtue. Look at our Newton—the memory of him is tied to the law of gravitation. Look at Galileo—the memory of him is adjoined to the fact of the earth's motion. Look at Harvey—the memory of him is conjoined with the law which regulates the circulation of the blood. Look at Jenner—the memory of him is associated with the law of the vaccine as a protection against small-pox. Look at Davy—the memory of him is inseparably united with the discovery of the elements of the alkaline bodies. Look at Faraday—the memory of him will be for ever made to float in connection with the laws of magnetic power. So with all the great and illustrious. Is there any other name that is associated with a great truth? Is there any other name that is worthy of being remembered in connection with the discovery of a law of the Creator? There is one, and you will recognise it as one that holds a place in your memory—it is the "Memory of Hahnemann." This name is immortal. This name has connected with it a power of impression on the mind's tablet that will augment every day, every year, every century; this has, in its connection with the law *similia similibus curantur*, the power of conjoining itself with every sufferer from disease. On what millions of minds has already this name been engraved by use, experienced in connection with the law discovered on the removal of disease. How many millions have still to have the same recorded in connection with deliverance from sufferings. How many a working-man is to be restored to his toil and to usefulness to his family by the application of this law. Indeed, with the exception of him who

> "In those holy fields,
> Over whose acres walked those blessed feet,
> Which, eighteen hundred years ago, were nailed
> For our advantage on the bitter cross,"

I know no one of all the treaders on the earth's surface who can compare with Hahnemann. He suffered that others might be relieved from suffering; he experimented on himself that others might be saved by the experiments; he endured pains that others might be delivered from pain. Hahnemann, in relation to the diffusion of the law in reference to the action of medicines, could say, at the conclusion of a well-fought struggle, lasting from the age of thirty to eighty-eight years, a fight which he carried on unremittingly and with unflinching honesty of purpose, what the most profound logician of antiquity, the illustrious Paul, said in reference to the struggle in which he engaged in relation to the truth in reference to man's moral and future well-being, "I have fought a good fight, I have finished my course, I have kept the faith;" and similar to the great humility of the apostle of moral salvation, expressed in the glorious language, "By the grace of God I am what I am; and His grace which was was bestowed upon me was not in vain; but I laboured more abundantly than they all: yet not I, but the grace of God, which was with me," was the humble reply of the great apostle of physical deliverance (Hahnemann), who, on his death-bed, thus expressed himself, in reply to his wife, when she said, "Providence owes you a mitigation of your sufferings, since, in your life, you have alleviated the sufferings of so

Hosted by Google

many, and yourself endured so much." "Me," replied the dying sage, "why, then, me? Each man here below works as God gives him strength, and meets with a greater or less reward at the judgment-seat of man, but he can claim no reward at the judgment-seat of God. God owes me nothing, but I owe God much, yea, all." The hon. gentleman having alluded to the fact of a daughter of Hahnemann being present at the meeting, and that the grandson of that learned person was the first pupil to enter their School of Homœopathy in Bloomsbury-square, concluded with proposing "The Memory of Hahnemann."

The toast having been drunk in solemn silence,

The Earl of WILTON apologized for being compelled to leave the meeting, and resign the chair to his friend Sir Charles Pasley; at the same time announcing that the subscriptions of the evening amounted to upwards of £1,000.

Sir Charles Pasley having taken the chair,

Dr. MADDEN rose and said—Gentlemen, it frequently happens that two opposite conditions are productive of similar results, and perhaps never more frequently than in speech-making; for when one has too much to say, he is just as likely to be unable to speak as when he has positively nothing to say at all. If, therefore, I fail in this, my present attempt, to fix the attention of my audience, I hope you will distinctly understand that it is from no lack of materials wherewith to occupy your time, but for the very abundance of my thoughts which so clamorously demand utterance, that my greatest difficulty will consist in reducing them to order and precision. It is, sir, most cheering to think, that we have now got a *native school of homœopathy;* and our hearts swell at the thoughts of the magnitude and importance of the task which the lecturers in that school must undertake, and our hopes beat high at the prospect of the good which they may become instrumental in effecting. Gentlemen, you who have anxiobsly watched the progress of our beloved Cause for many years past, and have seen her outriding the storms which have beat against her little bark—you who have often smiled at the furious but futile efforts of her opponents to put her down, must look with cheerful and hopeful eyes at the budding promises of our new school, and you must feel very desirous that it should make a good impression, and should succeed in all respects. Our present position, sir, is a very interesting and important one; a spirit of inquiry has gone forth, and old Dame Medicine cannot check it. The Esculapian cock has crowed most loudly during the past year, yet the Hahnemannian bantling has not been frightened away. It is an old and familiar saying, that a man seldom cries out unless you hurt him, and if so, let us pity the sorrows of that poor old man Allopathy, for he has really cried out so loudly and bitterly for some time past, that I much fear he has been somewhat roughly dealt with. It is very sad to think that philosophy, knowledge, science, art, wisdom, and wit will not rest content with what our fathers and grandfathers knew. It is a melancholy sight to watch the effects of steam and machinery, and the electric telegraph, and all those new-fangled things, and to think that what took many days to accomplish in our early childhood, can now be done in the twinkling of an eye. I say all this is very melancholy, because it shows such thorough disrespect on the part of the neophytes of the present day for the glorious and time-honoured ways of their seniors. And then, to think that not only people can travel without mail-coaches, and can send messages without special couriers, but that they should now presume to get cured of their diseases without blue pills and black draughts is really past endurance; and yet, when carefully examined, the objections brought against us resolve themselves into nothing more. They cannot deny that persons recover under our care, but they abuse and bully them for having the audacity to do so. They laugh at our medicines, and speak of do-nothing treatment, yet they will not give their own patients the benefit of such *far nientes.* They will unhesitatingly tell a patient that a cure in his case is impossible, and yet, if homœopathy rescue the victim, they will coolly tell him that there was really nothing the matter, and his recovery was just what was to be expected But, gentlemen, I must go to the school, and say something about it. It appears that we have not only learnt something new or valuable ourselves, but we desire to teach others also; and in proposing success to the School of Homœopathy, I would like to say a few words regarding some of the advantages which I hope may result from its establishment. In the first place, I trust it will tend to dissipate the contracted notions current among so many even of our friends respecting our glorious reform. (Cheers.) Gentlemen, I have often felt grieved to find how commonly our friends, and how constantly our enemies, indissolubly associate homœopathy with infinitesimal doses. No doubt, if you look into books of defence and controversy, you will find the disconnection of the two very broadly stated, but in common parlance even our friends persist in speaking of quite a homœopathic quantity of this, that, or the other, while our enemies stigmatize us with the name of *globulist.* (Laughter.) I hope, gentlemen, our lecturers will be very clear upon this point, and that they will rescue us from the imputation of being traitors to our Cause, if we presume to give an appreciable quantity of medicine. This may seem a trifle, but it really is far otherwise, for I have known allopathic prescriptions spoken of as quite homœopathic, because the dose was unusually small, and I have heard some in our profession, who are worthy of the highest respect, stigmatized as very suspicious colleagues because they do not limit their prescriptions to globules and diluted tinctures. (Cheers.) Again, I hope the school will let the profession see that we understand diagnosis, and are not in the habit of misnaming diseases and magnifying trifles for the sake of reaping spurious credit. Gentlemen, I can assure you that for once that I have to tell a patient that their former doctor thought too lightly of their ailments, I have twenty times to assure them of the non-existence of the enlarged livers, affec-

Hosted by Google

tions of the spine, inflammations of the bowels, and other dreadful bugbears by which their allopathic attendants have been terrifying them. (Cheers and laughter.) Again, I hope our lecturers will encourage their students to attend more to the internal development of our science than to the outward spread of our practice. It is all very well to try and extend the knowledge of the advantages of homœopathy, but ir is truer and deeper wisdom to strive to add to these advantages, and thus render them more convincing and self-evident. Once more, I would have it pointed out to our students that, almost without exception, every advancing step which medical treatment has made within the last half century, has been an advance towards homœopathy (cheers); indeed, so much so, that some of the best and most approved methods of treatment in the present day owe their success more or less completely to their approximation to the law of similars. Of this approximation of old physic towards homœopathy I may give one instance out of many, which will be the more interesting, as it relers to no less a person than Sir B. Brodie. I have no doubt that most persons here present are aware that Sir Benjamin is celebrated for his treatment of affections of the joints and spine. Well, during thirty years of his practice, Sir Benjamin recommended bleeding, leeches, cupping, purging, salivation, blisters, setons, and cauterisms; but, in the last edition of his work in 1850, he tells us that "a more enlarged experience has satisfied him that, in the very great majority of instances, this painful and loathsome treatment is not only not useful but actually injurious, and that he has ceased to torment his patients, and is convinced that the change has been attended with the happiest results." (Cheers.) This is certainly a step in the right direction, but will be no small blessing to the community, if our School of Homœopathy shall teach young surgeons to adopt, from the very first, a mode of treatment more mild and still more effectual than that to which Sir Benjamin has brought himself through thirty years of bloodshed and torture, to those who left themselves to his tender mercies. A certain Mr. Alexander Somers, in a highflown rhapsody against the homœopathic delusion, delivered to the inhabitants of Manchester the other day, winds up with the following big and boastful words:—"Theories, if unsustained by reason and unsupported by facts, withered and passed away in the sunlight of truth, like the too luxuriant flowers of tropical climates, while the progress of science resembled the growth of an oak, which, though slow in arriving at maturity, bloomed fresh and beautiful above the mouldering relics of a thousand springs. Such a science was that of medicine, of all sciences the most beautiful and the most ancient. From small beginnings, it had through every age made constant progress, and would, for the benefit of the whole human race, without undergoing fundamental change, progress, with man's progression, to the end of time." Now, sir, a simile, to be a good one, must bear a little carrying out, and I should like Mr. Somers to tell me if this old oak has not become rather rotten at heart, seeing that Sir Benjamin Brodie and numerous other master-minds, who have cut deepest into the very heart of the science, have ended in abjuring the very plans of treatment which have for centuries held the highest place in the esteem of the profession. In one way, certainly, the science of medicine resembles the oak and other deciduous trees; there are very often buds of promise and young leaves, which look very like an approach to some grand improvement, but, alas! for disappointed hopes, in a very short time these new leaves become sere and yellow, and then fall down and leave the poor old trunk bare and exposed to the pitiless wintry blast. Gentlemen, homœopathy is ever green and ever growing, and it is my earnest hope that this young offshoot of ours—this new school of medicine—will prove a vigorous sucker and grow apace, and ere long peer with or overtop the many schools of medicine with which this large metropolis abounds. (Cheers.) I have great pleasure in proposing as a toast, "Success to the Homœopathic School." (Loud cheers.)

The toast was drnnk with great enthusiasm, and acknowledged by Drs. Dudgeon and Curie.

"The Medical Council and Staff," "The Metropolitan and Provincial Practitioners of Great Britain," and a variety of other appropriate toasts having been drunk, including the health of the chairman, the company separated shortly after eleven o'clock, the subscriptions of the evening amounting to £1,016.

Mr. Higgs officiated as toastmaster, and the musical arrangements combined the talents of Miss Williams, Mrs. Endersohn, Messrs. Ransford, W. Ransford, F. Bodda, Holmes, etc.

THE INFANT BEFORE BIRTH AFFECTED IN ITS FORMATION BY IMPRESSIONS MADE ON THE MOTHER.

To the Editor of the Homœopathic Times.

SIR,—The following is an instance of the fact that the fœtus *in utero* may be sometimes considerably influenced by circumstances affecting the mother. A poor woman, whom I delivered yesterday, struck herself a severe blow on the wrist in the fourth month of her pregnancy. She suffered much pain from this accident, and her spirits were much depressed by it for several days. The infant she gave birth to is deficient in the left wrist and hand; the fore-arm terminates about an inch and a half below the elbow-joint, and at the end of the stump five small projections, about the size of pins' heads, represent the fingers. In other respects it is a well-formed and a very healthy child.

Your obedient servant,

Sudbury. JOHN C. LYNCH.

HAHNEMANN'S VIEWS ON COLD WATER AND MOVEMENTS.

Read by Dr. Roth at the Meeting of the Hahnemann Medical Society, the 6th of April, 1852.

I MUST ask your indulgence for the incompleteness of this paper, which I shall read to-day only because our colleague who promised for this evening a highly interesting paper has been obliged to absent himself. We reproach our professional brethren of the old school for condemning homœopathy without examination, and for not considering such an important or rather the most important branch of the healing art worth studying; but, unfortunately, the same reproach applies to the majority of homœopathic practitioners, with regard to the treatment by cold water and movements, notwithstanding they form an essential part of our active means, and even as such come often under the law of like cures like. These reasons induced me to translate the greater part of the following extracts from a little work published by Hahnemann in 1784, under the title of "Directions for curing radically old sores and indolent ulcers; with an Appendix, containing a more appropriate treatment of fistulas, caries, spina ventosa, cancer, white swelling and pulmonary consumption."

Besides these extracts I shall have to quote different passages from Hahnemann's works, in which he mentions cold water and movements, and which may suffice to induce us to study and to improve the present imperfect knowledge of the pathogenetic effects of cold water and movements; the more so, as our great master says—"In consequence of a tolerable experience in medical science, I and many of my colleagues have learned with certainty that the number of necessary remedies is very small, and that, for the most part, with a few drugs everything hitherto considered possible in medicine can be effected, if we know them exactly and if we use them suitably and as simply as possible, in order to know more surely their virtue; just as we dispense with an infinite number of cutting instruments in surgery, if we know how to use properly the few necessary knives. This choice of remedies and the mode of their application distinguish the true physician, who has bound himself to no system, who rejects nothing without examination, or accepts nothing on hearsay, but has the courage to think and to act for himself."*

The passages which I found in Hahnemann's work with regard to cold water and movements, can be arranged in three classes.

First, in such cases where he recommends cold water and movements for making the healthy body hardy.

Secondly, where he shows the pathogenetic effects of these means.

Thirdly, such in which these means are recommended in the cure of diseases, with regard to movements.

"From going barefoot, the feet lose their tendency to get corns, gout, and dropsy; climbing causes less liability to turn giddy. Gleaning corn in August, sheep-washing, crab-catching, tending the cattle in all kinds of weather in the open fields, as well when remaining motionless beside them, as when running after them over the hills, fetching wood from the distant forest in all weathers, the damp schoolroom, the fair that excites disgust at the excesses committed, the three hours' sermon in the cellar-like church—all these are excellent exercises and modes of hardening the body, which would be serviceable to a person in after-life, whatever position he might occupy." (Friend of Health, 238, in the "Lesser Writings of Samuel Hahnemann" translated by Dr. Dudgeon, published in 1792.)

"It is well known that the tailor's trade is not one of the healthiest of occupations. We find in these good folks, if they are diligent workmen, usually emaciated legs, knock-knees, a dragging of the left leg, round shoulders, the head bent forwards, drawn-in abdomen, and so forth; their complexion shows very plainly the unhealthiness of their occupation. Loss of appetite, piles, constipation, weakness of the body, itch, etc., are things quite common among them; and yet there are cases in

* [Our reader will notice that these remarks of Hahnemann were published twelve years before he published his discovery of the homœopathic law.—ED.]

Hosted by Google

which this mode of life has been found favourable to health.

"A young man in England was born with the feet turned inwards. A surgeon whom his mother consulted pronounced the deformity incurable. When he grew up, he could only walk with difficulty upon the outer border of his feet and heels; he always knocked one foot against the other, and frequently fell; the muscles of his thighs and calves were extremely attenuated, and the turned-in feet were so deformed, that shoes of a particular shape and tie had to be made for him. The poor-house authorities bound him apprentice to a tailor, thinking that this was the only trade that his deformity permitted him to follow. In this work, where one usually sits on the shopboard, as is well known, with the legs crossed, he observed a gradual change in his limbs, which, without the slightest employment of external or internal remedies, continued to turn outwards. In the course of three years they attained their natural position, so that he could wear ordinary shoes; they were indeed directed more than usually outwards. The muscles of his legs grew stout, and his body was so well formed that he enlisted in the marines, and thenceforward remained in the service. Probably in this case a peculiar stiffness (rigidity) of the muscles that adduct the foot was the cause why the abductor muscles could not maintain the balance of power, and so allowed the foot to be drawn inwards. The strain upon the former, when the legs were crossed at his work, stretched and relaxed them more, and thus the abductor muscles of the leg and foot were enabled gradually to attain their natural opposing power; indeed the latter gained in this way an excess of power, and his feet were turned outwards more than usual. Joiners and cabinet-makers usually have the right shoulder higher than the left, because they exert the former most during their work. It might be tried whether individuals, whose left shoulder was the highest, would not become straight by following these trades."

In the article on the general principles of the strengthening cure we find the following passage:—"Strengthening diet, fresh air, movement, and recreation of the mind are data whose application and force everybody must acknowledge. Only such food as is convenient to the body, and no more than sufficient, permits a good digestion, and dispels the bad humours from the first channels. Movement produces hunger, increases digestion, carries away, better than all aperients, the abundance of *materia peccans*, through the apertures of the body; every movement of the limbs contributes to a stronger circulation of the blood, and perfects the assimilation of the chyle; no health without movement. *Movement* is the soul of all bodily health; by it the work of the animal machine is wound up. My patients must move themselves. In my so-called strengthening cure of chronic ulcers, which I justly consider as a general one, movement forms the principal part. Driving in easy and by degrees in jolting vehicles, and riding on horseback, serve the rich, and labour and walking the poor. But invariably the intensity of the movement must be considered; even in diseases of the legs, in weakly persons, walking is preferable to strong-arm labour. The movement must never be continued to fatigue, nor, on the contrary, must it be so slight as to allow one to be chilled; in general I increase the movement in proportion to the increase of strength, which is my standard."

Chlorosis.—"Movement is, next to food, the most necessary requisite of the animal organism; by it the work is wound up. We should not compel girls to sit at the work-table or at the toilet, to play at cards, to tiresome visits, to the idle work of reading books, and consequently make them like etiolated plants. Movement and fresh air alone are capable of driving all the humours of our body to their destined places; of forcing all secretory organs to secrete their peculiar humours, of strengthening the muscles, of giving the blood its highest redness, of attenuating the humours, so that they may penetrate the most subtile capillaries with ease, of invigorating the pulsations of the heart, of producing comfortable and good digestion, and, by conducing in the best way to rest, sleep, to the time of recreation, and production of new vital powers. How can an abundance of healthy female blood be originated, and its monthly excretion take place unobstructedly without movement and without the spirit of refreshing air.

"Swollen cervical glands are cured by the lucky hand of some wise woman or midwife, who must, each time that the moon is on the wane, in silence press thrice upon the swollen glands with her thumbs, in a crucial manner. Superstition places much confidence in this semi-magical remedy, which is sometimes actually of great service. Thus much is certain, that glandular swellings in middle-aged individuals of lymphatic constitutions, who have not much general scrofulous disposition, not unfrequently disappear rapidly by rubbing and moderate pressure; thereby are produced an increased circula-

Hosted by Google

tion of the blood and a greater activity of the lymphatic vessels, and even an incipient inflammation, whereby the swelling is removed.

"As movement in general is to the whole machine of the human body, so is friction, principally with woollen cloths, for small parts. The vital force is roused, the circulation of the humours is thereby immensely increased and brought into order, the muscles are strengthened, the skin becomes more sensitive and susceptible of the impression of cold. By these frictions effects are produced, which we may try in vain to produce by other means; with the assistance of friction, the weakest person can make use of the coldest bath. In the cure of chronic diseases, in order to make a cure possible and practicable, the homœopathic physician, in his prescription of diet and mode of living, yields to circumstances; by this method he attains the aim of the cure more certainly, and therefore also more perfectly than by obstinately persisting in strict and, in many cases, impracticable prescriptions. No legislator should order a thing impossible to be done, or to be controlled, or which, if obeyed, produces even greater disadvantages.

"If there is strength, the labourer must continue his manual work, the tradesman his trade, the agriculturist, as far as possible, his field labour, the housewife her household work; only such work is to be forbidden which is injurious to health. Persons not ordinarily occupied with heavy labour but with light work, and leading a sedentary life, must be encouraged to walk in the open air, without entirely neglecting their previous occupations. The rich must also walk more than they usually do, and they may be allowed to dance moderately and properly; too frequent riding in a carriage or on horseback must be restricted. The student also must be induced to take exercise in the open air, and in bad weather to perform some manual labour at home. A pregnant woman had the itch on her hands, and suppressed it in the eighth month of her pregnancy. Three days later she was confined, the lochia disappeared, and she was affected with an inflammatory fever; for seven years since that time she had not been *enceinte*, and suffered from leucorhœa. Afterwards she sunk into poverty, and was obliged to walk a long distance barefoot; the consequence was that the itch reappeared, she also lost the leucorrhœa as well as the rest of the hysterical symptoms, became again *enceinte*, and was successfully confined."

AN ESSAY ON HOMŒOPATHIC STATISTICS;

Together with a Critical Analysis of Dr. Routh's Work, entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

By John Ozanne, M.D.

X.

It is proposed, in the course of this essay, to inquire how far we can avail ourselves of the results, hitherto published, of the application in hospital practice of the system of Hahnemann, in order to form a correct estimation of its *relative* or *absolute* value as a system of therapeutics. It is proposed to take these results, whether published in a numerical form or otherwise, to submit them to a careful analysis, to compare them with the results of allopathic treatment, and, finally, as far as possible, to compare them with the results observed, where patients have been left during the whole or a part of their disease without medical treatment of any kind.

Were we satisfied with taking up these questions, and proceed towards their solution in the way that statistics are generally understood, it would be sufficient to classify the diseases which will form the subject of our inquiry under different heads, in such a manner as to ensure their being really entitled to the name applied to each of them; then to calculate averages or per centages, with the view of exhibiting, in a form alike simple and striking to the eye, the results obtained.

But it is obvious, that by this proceeding we should only obtain averages which, although undoubtedly the expression of truth, would, nevertheless, not be so exempt from error as to be the *fullest* expression of truth. Thus it might happen that although the superiority of the results obtained by the homœopathic system might be established beyond a doubt, nevertheless *the degree* of that superiority might not be exhibited so clearly as to give a correct estimate of its powers, *relative* or *absolute*, as a system of therapeutics.

Were it possible, therefore, to classify a series of observations into groups, the characters of each of which would be so clearly defined as to leave no room for doubt or error, and respecting each of which *some distinct proposition could be affirmed;* were this possible, we should at once attain a degree of precision far more satisfactory to the mind, and more fruitful, in a strictly scientific sense, than

Hosted by Google

the most carefully-calculated averages could by any means give.

However difficult this task may be, we shall not be deterred from undertaking it, in reference to one portion, at least, of the field over which this inquiry will extend. However small the results attained may be, we shall, at all events, have the satisfaction to feel that, as in all scientific investigations a logically and carefully-conducted inquiry can never be totally fruitless, our efforts may not be altogether unavailing in directing the attention of inquirers to a source which, in the end, cannot fail to be productive of results far superior to those obtained by statistics, as generally understood.

One more remark upon this topic before quitting it and passing on to the statement of the division of the subjects of this essay. The remark is this: that this mode of conducting statistical inquiries by the framing of propositions, is not one applicable to every stage of the progress of a science such as medicine. It is only applicable when it is possible to frame propositions which *do not admit of exceptions*, or to which the exceptions are so rare that they may be justly looked upon as mere accidents, not capable of weakening the proposition. This is possible to a great extent under the homœopathic system of treatment. It is not possible under the allopathic; for here the exceptions to the propositions would, in most cases, be so frequent, that, to determine their exact value, it would be necessary to have recourse to the very system of averages which is here denounced as inferior in scientific worth.

It is not intended in this essay to follow Dr. Routh's plan. He commences his statistical "inquiries" with the *General Mortality of Hospitals*, and then proceeds to the *Mortality in Particular Diseases*. It is remarkable that he should have adopted this plan. In an inquiry into *matters of fact, consisting of observations or experiments*, it is logical to proceed by the analytical method, from the simple to the complex. Indeed no other method is possible. Where, on the other hand, the object is to teach that which is already known, the course followed is usually the reverse: it is then usual to proceed from generalities to particulars. This single circumstance would be enough to show that his object was not an inquiry. The object in view was a dogmatic, an authoritative condemnation of homœopathy.

If we would proceed in a course likely to be productive of good fruits, we must commence our inquiry with the study of simple groups of disease; and the effects of treatment being well known in these, we may, with advantage, proceed to inquire into the general mortality of hospitals.

Although vicious in its plan, and faulty in its execution, Dr. Routh's treatise will not be useless to us. Indeed it will be of the greatest service, for it is the production of a skilful, clever, and well-informed—although inaccurate—physician. Moreover, it is the work of an opponent—of one whose efforts have received the warmest eulogies on the part of the allopathic periodicals—of one who has done his utmost to deal a death-blow to homœopathy.

The fact that such a work has been produced, is not only significant that we have reached a new era in the development of our doctrines, but it is useful in a way—considering that our system is founded on truth, and need fear no antagonism, provided it be open and avowed—which I cannot illustrate in a better manner than by quoting the following words of Mr. Stuart Mill, in the preface to his "System of Logic."

"Truth.....is militant, and can only establish itself by means of conflict. The most opposite opinions can make a plausible show of evidence, while each has the statement of its own case; and it is only possible to ascertain which of them is in the right, after hearing and comparing what each can say against the other, and what the other can urge in its defence."

From the above remarks the reader will at once infer that we cannot follow Dr. Routh's arrangement of his subject. Instead, therefore, of commencing our inquiry with the "General Mortality of Hospitals," as he does, we shall at once pass on to his next heading, namely, the "Mortality in Particular Diseases." After a careful study of these, and having obtained data upon which we may rely, we may then with profit proceed to inquire into the general mortality of hospitals, whether homœopathic or allopathic.

Dr. Routh begins this portion of his work with the study of *pneumonia*; he next passes on to *pleuritis, peritonitis, encephalitis*, and *meningitis*, to *dysentery* and *fever*, and ends with *cholera*. There being no objection to this course, we shall simply follow it throughout this part of his work. As we go on, we shall consider, one by one, his objections to our statistics, together with those advanced by Dr. Balfour, in his "Report of the Homœopathic Treatment of Acute Diseases in Dr. Fleischmann's Hospital, Vienna, during the months of May, June, and July, 1846," inserted

Hosted by Google

in the October number for that year of the *British and Foreign Medical Review*. The opinions of a certain Dr. Schulz, quoted by Dr. Routh, will also be brought forward and examined. As these gentlemen appear in the character not only of objectors to homœopathy, but likewise of eye-witnesses to homœopathic facts, it will be a part of our inquiry to enter into a careful scrutiny of their testimony. Moreover, it will become a legitimate and necessary part of our investigations to ascertain their *medical creed*. In ordinary circumstances such a step would not be called for; but in the present case, and as matters stand, we cannot, in our attempt to estimate the testimony of these gentlemen at its real value, avoid entering into the question. We shall therefore have to ascertain, as a necessary part of our inquiry, whether these gentlemen have any belief in medicine at all.

PNEUMONIA.

"This is, perhaps, the disease which, of all others, has made the most perverts to homœopathy. In the table given at length in the Appendix, the following cases are recorded:

"Under homœopathic treatment, male and female, cases 783; deaths 45, mortality 5.7 per cent., or 1 in 17.

"Under allopathic ditto, ditto, cases 1522; deaths 373, mortality 24.5 per cent., or 1 in 4."

"A result most favourable to homœopathic treatment. Unfortunately, however, it is not to be depended on, and much in this difference of mortality is to be explained by the relation to some of the causes before noticed, such as the *variety or type of the disease*, the *selection of cases*, the *comfort of the patient in the hospital*, the *age*, *sex*, etc., having particular reference to the mortality of pneumonia." (Routh, p. 47.)

In meeting these objections, there are different points to be ascertained. In the first place, to what extent may the variety or type of the disease influence the result? This difficulty is removed in this manner: the above 783 cases of pneumonia are collected from different sources, and in the course of several years. The latter fact is of itself a tolerable guarantee that they are not due to any peculiar *epidemical constitution*. It is the more convincing, seeing that the results are not subject to great variations with each year, but tolerably uniform throughout. As to the variety or type, so far as dependent upon *locality*, we shall meet the objection by comparing the homœopathic cases observed at Vienna with the allopathic observed in the same town, quoting our facts as regards the latter only from Drs. Routh and Balfour, and those observed at Paris with the statements to be found in the elaborate work on Pneumonia, by M. Grisolle, of Paris—a work which is, I may here observe, deservedly looked upon by all parties, on account of the completeness of the researches contained in it, and of the candour and impartiality which animate the writer, as a *standard work* upon the subject. The accusation of selection, the superior comforts of homœopathic patients, the question arising from their sex, age, etc., will all be fairly met in the proper time and place.

First. Dr. Routh's first objection to our statistics is given by him in the following words:—"Are the cases occurring in the homœopathic hospitals genuine instances of pneumonia?" (p. 47.) He then takes up the proportion of cases of pneumonia to all cases admitted into the General Hospital at Vienna, and finds it to be 2.1 per cent.; whereas during a period of years, it was 4.5 per cent. at Dr. Fleischmann's hospital. At the General Infirmary of Glasgow, the proportion of pneumonia cases admitted to admissions from all causes was only 1.1 per cent. These facts show, in the first place, if they be correct on all sides, that, first, at the homœopathic hospital at Vienna a larger proportion of pneumonia cases is taken in than either at the General Hospital at Vienna, or the Royal Infirmary at Glasgow. If this turns out to be the case with other serious diseases also, *which it is*, it will establish a presumption that the general mortality at the Vienna Homœopathic Hospital *ought to be greater* than either at the General Hospital at Vienna, or at the Royal Infirmary at Glasgow, which, however, *is not the case*; and second, that at Vienna, pneumonia is a more common disease than at Glasgow; the admissions from that disease being, at Vienna (allopathic), 2.1 per cent., at Glasgow 1.1 per cent., on all admissions.

The point contested here by Dr. Routh is the fact, that the cases put down as pneumonia cases in Dr. Fleischmann's tablets are *genuine* pneumonia cases. How shall we ascertain their true character? Nothing can be easier. It is clear, that if we ascertain the average per annum during a series of years, and take as our test for any particular year not exceeding the average, any testimony, the accuracy of which, *upon that particular point*, we cannot doubt, we at once gain direct and convincing evidence of the truth of the averages.

Now here are the facts: in the period of nine years, beginning with the 1st of Ja-

Hosted by Google

nuary, 1835, and ending on the 31st December, 1843, there were admitted into Dr. Fleischmann's hospital at Vienna 300 cases of pneumonia, being on the average thirty-three per annum. In the subsequent years the number of admissions seems to have increased, as we should expect it to do, seeing the increased reputation of the hospital for curing dangerous diseases. In the five following years, 1844-45-46-47-48, there were 284 admissions, or fifty-six per annum. I have given, a little above, the title of Dr. Balfour's Report, as inserted in the *British and Foreign Medical Review*; it embraces a period of three months. The first case of pneumonia reported by Dr. Balfour was admitted on the 2nd of May, the last on the 24th of July, 1846; his Report on Pneumonia, therefore, as regards pneumonia-admissions, takes in a period of eighty-three days, or eleven weeks and six days, somewhat less than three months. Now it so happens that he reports during that time nineteen cases of pneumonia (one of which, however, *we* do not believe to be genuine); if we take this number and multiply it by four only, which would give a period of less than one year, but which we may put down as one year, the total for the year would be seventy-six, which is considerably above the average number of admissions for each year. The number in Dr. Fleischmann's tables for that year (1846) is sixty-four.

But if it be objected that perhaps there may be more cases of pneumonia admitted in the summer than in the winter months, I have my answer in the "Appendix to the Reports of the Royal Infirmary of Edinburgh for 1842." In Table 10 (p. 13), giving the admissions for each quarter of the year, we find that from October to March, the admissions of pneumonia cases amounted to twenty-eight; in the six summer months they amounted to thirteen only, less than half the number of the admissions for the winter months, if calculated on the same scale. Dr. Fleischmann's admissions, taking Dr. Balfour's Report as our basis, would amouut to 104 pneumonia admissions, the actual number in his tables being only sixty-four.

(*To be continued.*)

REVIEWERS REVIEWED.

By a Progressist.

(*Continued from page* 592.)

But to return to Dr. Routh's "Fallacies." The reviewer goes so far as to say that Mr. Brady's table of cholera cases is "a lie." We conclude, before Mr. Brady published his table of cholera cases treated at Huddersfield, he had sufficient opportunities of ascertaining the facts; that he was not influenced by interest, or that he had any purpose to answer by it calculated to promote his own advantage. We most ardently hope Mr. Brady will "*speak out.*" At the same time the reviewer states this table to be "a lie," on the testimony of Dr. Routh, he admits that Dr. Routh's book is "slovenly written," and that he has an incorrect style of composition; if he is slovenly and incorrect in one way, we may have every reason to expect that he may be slovenly in others, and if he is incorrect in composition, he may be incorrect in figures; but though the reviewer states that Dr. Routh has written a slovenly book, as that book is against homœopathy he has devoted sixteen pages of his number to it. The reviewer is well aware that the progress of science is not confined to the experience of one man, and therefore he opens his Quarterly that he may afford opportunities of enlarging the circle for the reception of truth. The vulgar mind may often be unable to discriminate between the creditable testimony of a man of experience and that of a designing man, who had some interest in calling on his readers for their implicit faith, consequently, it falls into one of the extremes of credulity or scepticism. When the king of Siam was told by a Dutch traveller that, in Holland, at certain seasons of the year, water becomes so solid that an elephant might walk over it, he replied. "I have believed many extraordinary things which you have told me, because I took you for a man of truth and veracity, but now I am convinced you lie." Had the king had a philosopher at his court who had attended to the properties of heat, and he had explained why the water became solid, the king would have judged in a different manner.

In forming an opinion on any subject, we are not to be influenced simply by our own experience. We must extend our views much further than this, and proceed upon the knowledge which we may derive from other sources. To say that this system or that system is incredible because it is opposed to individual experience, is merely to say, it is incredible because it is incredible. A very small portion of our knowledge is obtained through our own experience; the greatest part we get from other men. We must be influenced by the manner and by whom we receive it, and form our opinion as to its correctness as it may accord with facts with which we are already acquainted. Whatever may be

Hosted by Google

the speculative views of other men, homœopathists place confidence in the experience of Hahnemann. He learned to "accumulate facts and discarded all theory." The certainty of a science depends upon the facility with which we trace effects to their true causes, and causes to their true effects. This was Hahnemann's view, when he asked himself the question, "Why does bark cure ague?" It was useless his applying to any medical reviewer—he could not gain the information from such a quarter. "At length he thought, 'A certain quantity of this inert-looking powder will make strong a man who is attacked with a certain sort of weakness, and arrest his periodical shivering and concomitant sufferings, will it make me stronger, I wonder, if I take it?' He began a course of it, and one evening, after having taken a quantity of it for several successive days, he was attacked with shiverings and other symptoms of intermittent fever, attended with much weakness and loss of appetite. He stopped his daily doses; his fever went away, and health returned. He tried it many times, and invariably with the same or similar results."

"Now Sir, observe, if you please, 'Fact the first.' *Cinchona* gives a healthy man an intermittent fever, and *Cinchona* cures intermittent fever in the sick. Do you think the mode of investigation adopted by Hahnemann was unphilosophical, incautious, untruthful? Then, Sir, that is homœopathy; and whenever you give *Quinine* to the weak, you go back to the very elements of the science and adopt that very system which you abuse. And there is not one of you all who does not in this manner every day imitate the very man whose discoveries you ignore while you employ them. You are, one and all of you, homœopathists, and you one and all practise homœopathy, *wherever you can*, and nothing but your ignorance of the properties of those medicines which the law has empowered you to distribute prevents you all from practising pure homœopathy in every instance where you are called in."*

"We are satisfied,"† says the reviewer, "that the profession of medicine will protect its noble art and science from debasement." There has been much difference of opinion among philosophers in regard to the place which medicine is entitled to hold among the sciences, for while one has maintained that it "rests upon an eternal basis, and has within it the power of rising to perfection," it has been distinctly asserted by another, that "almost the only resource of medicine is the art of conjecturing." The following apologue, says D'Alembert, "made by a physician, a man of wit and philosophy, represents very well the state of that science. 'Nature,' says he, 'is fighting with the disease; a blind man armed with a club, that is, the physician, comes to settle the difference. He first tries to make peace; when he cannot accomplish this, he lifts his club and strikes at random, if he strikes the disease, he kills the disease; if he strikes nature, he kills nature.'"

"Another eminent physician," says the same writer, renouncing a practice which he had exercised for thirty years, said, 'I am wearied of guessing.'"

Hahnemann thought for himself, accumulated his own facts, published his experience to the world, and lived through every species of opposition to see his system firmly established. He could calculate on the same phenomena, with the same confidence in which we proceed in other departments of science, without the complicated uncertainty of the old school. With what different feelings does the homœopathist contemplate in its commencement a case of dangerous internal disease, its probable progress and termination, and the effect which our remedies are likely to produce in arresting it, those best can tell who have most experienced them. The light of knowledge, through Hahnemann, which was only dimly perceived by the ancients, which was obscured by the clouds of error and prejudice, has appeared in all its purity and brightness, and whilst improvements of all kinds have been developed, the health of man has not been neglected. It is well worthy of notice, how surely in the order of Providence such men as are wanted are raised up.* By means of his (Hahnemann) experiments a new creation of facts have appeared—of facts, as much superior to mere speculations as things are to words. Such a man is a benefactor, not only to the present generation, but likewise to future ages. "He studied the severe philosophy of Bacon, and from it he learned to accumulate facts, and discard theories; he found the art of cure entangled in all kinds of hypotheses, of which each age saw many rise, become fashionable, and die, to give place to new ones. He found there was no basis of certainty for any theory or opinion, so he rejected the whole useless mass, and determined to have no theory at all."†

Hosted by Google

If we look into the habits of men of science, we find that their whole aim has been to combine, in the highest degree, a depth and extent of knowledge with delicacy and precision in the methods of experimental research. Many scientific persons, both before and after Bacon and Newton, pursued the method of experiment in all its precision. Cavendish, Priestly, Scheele, Davy, Liebig, Faraday, have all applied themselves with intense ardour to experiments. To theory they paid little attention; their writings are copious, distinct, and satisfactory, and principally narrations of facts. Hahnemann offers an extraordinary instance of the power of genius to conquer difficulties, and to create resources of his own. Born in a country town, without friends and without fortune, he seemed, by a disposition which may be called instinctive, to have pursued the course of discovery. He was brought up as a physician, and led by this circumstance to attend to some of the chemical qualities of substances employed in pharmacy; he instituted a train of investigations which gradually led to discoveries of the noblest kind. Amidst the labours of this occupation he found means of exalting and extending the most refined parts of chemistry. "His days were devoted to professional business, his nights to study and translations of books into German." Nothing could repress the ardour of his mind or damp the ardour of his genius; the whole of his life was a career of enterprise which ended in glory. It may be said of him, what perhaps can hardly be said of any other person, that whatever he has done has been perfect at the moment of its production; executed by the hands of a master, it needed no correction.

In general, the most common motives which induce men to study are the love of distinction, of glory, or the desire of power, and we have no right to object to motives of this kind; but it ought to be mentioned, in estimating the character of Hahnemann, that his great stimulus to exertion was evidently the love of truth and knowledge. He disliked notoriety, and he was, as it were, regardless of fame. His labours are recorded with dignity, without parade or apology, and it seemed as if in publication he was performing, not what was a duty to himself but what was a duty to the public. His life was devoted to science. Even to the last he retained all his energy and sagacity of intellect. Since the time of Newton (if I may be permitted to give an opinion), we have sustained no scientific loss so great as that of Hahnemann. Like his great predecessor, he died full of years and glory. His name will be an object of more veneration in future ages than at the present moment. Though it was comparatively unknown in the busy scenes of life, it will remain illustrious in the annals of science, which are as imperishable as that nature to which they belong, and it will be an immortal honour to his house, to his age, and to his country.

I have been led into this eulogium, not merely because it was fully deserved, but because the example of Hahnemann demonstrates what great effects may be produced by small means. How little is required to extend the empire of knowledge, when genius is assisted by industry.

It is unnecessary to pursue our paper to any greater extent; sufficient has, I trust, been said to prove to the public, if not to reviewers, that homœopathy may be of national as well as of individual advantage. It is far from my wish to endeavour to exalt homœopathy to a higher rank than it ought to occupy, or to attempt to raise it unfairly above other branches of useful knowledge, but I should be unjust to my subject were I not to state, that it is a science worthy of the deepest contemplation, and that it is capable of unfolding the most important truths. As the talented Chancellor of the Exchequer said to the House of Commons, so will we say to the profession and the reviewers, "I will sit down now, but the time will come when you will hear me."

THE
HOMŒOPATHIC TIMES.

SATURDAY, MAY 22ND, 1852.

OUR thoughts are solemnized by an event that touches our feelings nearly; and while our heart is full of sympathy we utter the untutored language of an honest spirit.

We advocate homœopathy because we believe it to be true; we hold up Hahnemann to admiration because we believe he was a Genius—a Philanthropist—a *true man*.

We care not a jot for any man's *name*; if there be a true medical reformer, let us see the *fruits of his life*. What has he done? We care for *men*. Show us a Titan, and we acknowledge the Titanic energy.

Hosted by Google

If any man wants the *first* or a *foremost* place in the ranks of our medical reformers, let him show us what *he has done.* If one is to take the first place in science, let him show us his scientific claims.

This matter of homœopathy is too serious a thing to be played with; it is not a toy to amuse one's inanities with. We *know* the vanity of human joys and affections and interests. The *tenth* wave has passed over us.

We want as advocates the tried and the afflicted; those who go heavily all the day long, from the sense of the mighty Cause that engrosses them. No work for any trifler is this.

Mr. Leaf has paid his thousands, perchance his tens of thousands, so we know the value of his adhesion; we know that he believes in homœopathy. What have you *done?* ask we all and each of our supporters, medical or non-medical.

We want honest men and leal. We want for our glorious Reform supporters who can abnegate self; who can rely on the conviction that they are honest; who live in the *inner life,* and striving to do their duty to God and to man, are satisfied to leave the issue to the Will of the Only Wise and Only Good.

This is not a time for party differences. Those who are not against us are for us; but we want true men in their true colours. Every man to his faith; to *the pure all things are pure.* Homœopathy is true or it is false. We must have no *masquing,* no make-believing, no allopathy in disguise.

Whatever be our short-comings, our failures, we have been honest; we have not called bitter sweet, nor sweet bitter: like John Knox, we care not for the face of any man; we throw the gauntlet down—we appeal to the British Nation. We stand on our office; we proclaim homœopathy as propounded by Hahnemann to be a law of Nature. We give and we take: an upright and honourable allopathist is of far greater value to us than any pseudo-homœopathist, any half-and-half professor of our medical faith. We honour Baillie, and Addison, and Alison, and Farre, and Billing. These are all allopathists. We hold in light esteem those who pretend to be with us, and are not of us.

Let every man *work* who professes to be with us. Let him go to bed early, and rise early. Let him not persuade himself that homœopathy is a plaything. We give, in conclusion, a few stanzas from an earnest poem.

TRUTH.

"Seek it late and seek it early,
With the fire and strength of youth,
Massive gates and porters surly
Bar the shrine of living truth.

Craft hath said, let no man enter,
Save the learn'd and chosen few:
Noble hearts, with fearless venture,
Dash the gloomy portal through!

All around—too deep for telling—
Smothered indignation lies,
Till a heart with anguish swelling
Bids a slumbering nation rise.

Fearless truth, their treason branding,
Laughs at Faction's puny ire;
And an honest understanding
Thinks aloud, while men conspire.

Let them tremble, lest a people,
Loving truth, their pride confound;
And from every tower and steeple
Reformation's tocsin sound.

Let them tremble, lest the nation
Trample down their Synod-rules;
Or in mind's last desperation
Turn their Colleges to Schools.

Onward then, though porters surly
Bar the shrine of living Truth,
Seek it late and seek it early,
With the fire and strength of youth;

'Mid the boyhood's dreams of greatness,
In the flow'r of manhood's prime,
'Mid the snows of age's lateness,
In the catacombs of time,—

'Mid the ice of frozen oceans;
Underneath the burning sun;
'Mid life's storms and wild commotions—
Toiling on till Truth is won."

Reviews.

Account of the Reception of Vaccination when discovered by Dr. Jenner.

THIS pamphlet is issued by one who declares that he has "experienced the greatest benefit from homœopathy; having been relieved by it of a disease which there is every reason to believe must have proved fatal, and this without taking a single dose of what is called 'regular medicine.' It is not designed to prove *the truth of* homœopathy, but merely to show to sensible people that similar attacks to these made against the new system of medicine were formerly levelled at what are uow universally acknowledged to be *great truths.*"

"Dr. Squirrell earnestly and publicly supplicated his Majesty George the Third to suppress 'the destructive practice of vaccine inoculation throughout his dominions.' 'It ought,' observed Professor Monro, of Edinburgh, 'to be prohibited by Act of Parliament.' 'The College of Physicians have,' exclaimed Dr. Moseley, 'a duty to perform, and I trust this business will not escape them.' Others appealed to the people themselves. 'It would,' said Dr. Brown, 'undoubtedly be downright madness to imagine *they* will condescend to encourage it.' The *Anti-Vaccinarian Society* called upon the public 'to second their efforts in supporting the cause of humanity against cow-pox injuries,' and besought their aid to suppress 'the cruel despotic tyranny of forcing cow-pox misery on the innocent babes of the poor—a gross violation of religion, morality, law, and humanity.'

"Deaths from cow-pox inoculation were published in the mortality bills of London. 'I have,' alleged Dr Moseley, Physician to the Chelsea Hospital, 'seen children die of the cow-pox without losing the sense of torment even in the article of death.' Dr. Rowley, Physician to the St. Marylebone Infirmary, professed to publish true accounts of fifty-nine deaths from 'cruel vaccination;' and added, 'that when humanity reflects on these and' (to use his own words) 'a great heap of victims diseased for life, and likely to transmit to posterity, for ages, chronic diseases, it is enough to freeze the soul with horror.' And, 'it is,' he exclaims, 'the duty of honourable men in the medical profession to alarm mankind of the impending danger of vaccination.'

"He elsewhere eloquently declaims against 'affectionate parents being robbed of their serenity, and the minds of tender mothers being wrung with eternal suspense;' 'while a few projectors or visionists are pursuing their deleterious projects on human victims, and perpetrating a dangerous innovation which so many fatal facts illustrate.'

"Mr. Lipscomb urgently maintained, that cow-pox, 'the new scourge industriously dispersed to afflict the children of men, is sometimes fatal of itself, and that the diseases introduced or brought into action by it may be also sometimes fatal, and can never be completely guarded against.' One author had seen 'numerous instances' producing coughs, dyspnœa, hectic marasmus, tedious and difficult to eradicate, etc., result from cow-pox. 'Shocking reflection,' he adds, 'to a human mind, that a poison should thus be introduced into the human constitution without the plea of necessity, or the support of reason and experience.' 'Several children,' observes Dr. Moseley, 'have died from diseases bronght on by the cow-pox where no ulcerations had appeared, and others have lost their nails and ends of their fingers, several months after the inoculation.' 'My accounts from the country are,' he continues, 'full of dismal histories of ulcerated arms and mortifications.' 'Blindness,' it was averred, 'lameness, and deformity had been the result of employing the vaccine in innumerable instances, and its fatal venom had removed many an infant untimely from the world.' Nay, it was strenuously maintained and believed, that not only were various old maladies, peculiar to man, thus excited into action by the 'cow-pox poison,' but that different new diseases peculiar to the cow were sometimes communicated to the human constitution by vaccination. 'Various diseases,' writes Dr. Rowley, 'common to cattle, have appeared among the human species since the introduction of cow-pox; as cow-pox mange, cow-pox abscess, cow-pox ulcer, cow-pox gangrene, cow-pox mortification, and enormous hideous swellings of the face, resembling the countenance of an ox, with the eyes distorted, and eyelids forced out of their true situation; diseased joints, etc.' This was published in 1806, eight years after Dr. Jenner's first essay on vaccination appeared. During the year subsequent to the first public announcement of his discovery, Dr. Moseley suggested the possibility of the 'bestial humour' of cow-pox producing a 'brutal fever, exciting incongruous impressions on the brain;' and 'who knows,' says he, 'but that the human character may undergo strange mutations from quadrupedan sympathy, and that some modern Pasiphaë may rival the fables of old?' Some, after vaccination, were actually supposed to 'cough like cows,' and 'bellow like bulls.' And one anti-vaccinist ingeniously suggested, that if cow-pox were known to have existed in a family, this fact might Jebar the members of it from the chances of matrimony, 'for it would,' he remarks, 'be no letter of recommendation.'

"Nor were theological reasons, of course, wanting for calling in question the orthodoxy of vaccination, as of other new discoveries and practices. 'Small-pox,' argues Dr. Rowley, 'is a visitation from God, and originates in man; but the cow-pox is produced by presumptuous, impious man. The former heaven ordained; the latter is perhaps a daring and profane violation of our holy religion.' And he subsequently proposed, 'whether vaccination be agreeable to the will and ordinances of God, as a question worthy of the consideration of the contemplative and learned ministers of the Gospel of

Hosted by Google

Jesus Christ; and whether it be impious and profane thus to wrest out of the hands of the Almighty the divine dispensations of Providence!' 'The projects of these vaccinators seem,' it was affirmed, 'to bid bold defiance to heaven itself, even to the will of God. 'Providence,' reasoned another author, 'never intended that the vaccine disease should affect the human race, else why had it not, before this time, visited the inhabitants of the globe? The law of God,' he continues, 'prohibits the practice; the law of man and the law of nature loudly exclaim against it.'

"In short, vaccination was opposed and denounced on a variety of grounds. It was alleged to be occasionally fatal in its consequences; to be liable to excite various diseased actions and predispositions; to produce diseases new to the human constitution; to be 'impious, unthinking, profane, and irrational;' to be an innovation neither 'established on the basis of reason, nor supported by the foundation of truth.' 'The vaccine,' exclaimed one enemy to cow pox inoculation, 'was the damnedst thing ever proposed; he wished the inventors were all hanged, and he would give his vote for its being done.' And strong pictures were held up to the public eye of the miseries it would infallibly lead to, in case of the recurrence of epidemic small-pox. 'In many families,' writes an author whom I have already quoted, 'there will be none to attend the sick; nurses will quit their patients for their own safety, and servants fly from their masters' houses to shun the pestilence. Then we shall experience a horrid scene of public and private calamity, brought on by a medical experiment, embraced without due consideration; extended by a rash transgression over the bounds of reason; and, after the fullest conviction of its inutility, obstinately continued, by the most degrading relapse of philosophy that ever disgraced the civilized world.'"

This is a very interesting statement, and we thank the worthy compiler for it. Such measure as Jenner met with, has Hahnemann also received. It is singular that Jenner made public his discovery of one homœopathic remedy but a very short time before Hahnemann declared the law for all homœopathic remedies.

With respect to vaccination, it is to be deeply regretted that the prejudices of some of the people have prevented its universal application. The bills of mortality show that small-pox has been lately prevalent; and small-pox might, by this time, have been numbered with the diseases that no longer infect the human race,—at all events, in all civilized countries.

The Moral Evidences of Homœopathy. By STEPHEN YELDHAM, M.R.C.S. London: Baillière. 1852.

Homœopathy; its Principle, Theory, and Practice. By MARMADUKE B. SAMPSON. London: Houlston & Co. 1852.

(From the Atlas.)

THE first of these works consists of two lectures delivered at the London Homœopathic Hospital by Mr. Yeldham, one of the surgeons of the Institution. One lecture was to demonstrate the extent to which the truth of homœopathy is supported by the life of Hahnemann; and the second was to prove that the new system of medicine is based upon a law of nature as indubitable as that of gravitation or any other established operation in the universe. Mr. Yeldham reasons as a well-instructed phrenologist, and shows that Hahnemann, from the various manifestations of his long career, must have possessed, in a powerful degree, all the faculties essential to the character of a discovery. With regard to the law also upon which his system was founded, and which is expressed in the axiom "Like cures like," its simplicity and universality are maintained by a lucid chain of argument. In allusion to the increasing recognition of homœopathy on the part of the public, it is finally remarked:—

"By this test, any discovery, whether it be a question of science or merely a mechanical invention, must stand or fall. When persons have once tasted the benefits of practical reform, whether in the arts or sciences, it would be as difficult to persuade them to return to the old ways, as in the first instance it might have been to persuade them to adopt the new. It is precisely the same with medicine, which although holding a loftier position than the mechanical arts, is not on that account the less a commodity for public consumption upon the effectiveness of which the public, as in other instances, must ultimately decide. But many will exclaim, 'The public is an incompetent judge.' I do not think so. The public, on the first introduction of a novelty, is inexperienced, and may for a time be deceived. But the deception does not last. In the long run, the public, especially in matters concerning its personal interest, is remarkably shrewd, and seldom fails to arrive at a sound verdict. Now it is a thing beyond dispute, that from the first announcement of homœopathy by its lion-hearted discoverer, it has continued to spread in an ever-increasing ratio, till at the present time its limits are the limits only of the habitable globe. In every country where modern civilization has penetrated, homœopathy has followed in its track. Where, a few years ago, its practitioners were numbered by units, they are now counted by hundreds; and yet the supply falls short of the demand. In my own experience I am repeatedly hearing of districts where the cry for homœopathic practitioners is loud and constant. Who are these clamourers after homœopathy? Is it those who are practically

Hosted by Google

strangers to the system; who, having never tested its powers, are impelled only by an idle curiosity, which they have but to indulge to be undeceived? No; these, almost to a man, revile and oppose it. But it is those who are practically acquainted with it; who, having once experienced its gentle and beneficial effects, have a natural repugnance to return to a system whose cure is at times a calamity; those who, having tried it, have found that it does what it professes to do."

The second work is a third edition of Mr. Sampson's well-known exposition of the philosophy of homœopathy. The opening chapters give a picture of the guesswork of the ordinary or orthodox practice of medicine, and of its effects upon those who undergo it, which is wholly unanswerable, because derived entirely from the statements of those who are acknowledged as unquestionable authorities by every member of the profession. All faith being thus shaken in the existing methods of treatment, and the liveliest apprehension of its after-consequences having, in fact, been awakened, the author seeks to establish the scientific and logical character of the new system. This system consists entirely in acting in harmony with the symptoms of the patient. A vast amount of observation is quoted to show that the disturbed actions which indicate the presence of disease are simply efforts of the vital power to throw off the taint that has been contracted, and the question is, shall these be beaten down or assisted? The homœopathist, when he is called upon to deal with any given symptoms, administers a medicine that has the power of producing analogous symptoms. If this be pronounced irrational, he points to the fact that in those cases where the old practitioners possess what they consider to be specifics, they pursue a precisely similar course; that is to say, they employ mercury for diseases of the bones, sulphur for eruptions, ipecacuanha for vomiting, stimulants for delirium-tremens, and hot applications for burns. The homœopathist, therefore, merely pursues consistently, and in accordance, as he believes, with a general law, a course which the old practitioners adopt empirically. Hence it is impossible for the latter to condemn homœopathy without condemning themselves, since they are often homœopathists without knowing it. As regards the infinitesimal doses, Mr. Sampson points out that this question has nothing to do with the principle of the science, and that it is only confounded with it by the ignorant. Homœopathists administer medicines in a state of infinitesimal division because it has been found that in this way they act most potently. A fine body will penetrate where none other would. If it be ridiculous to say that a millionth part of a grain of medicine can produce a greater effect than the crude grain itself, then it must be equally ridiculous that an atom of sand should cause agony to the eye, when the pebble of which it is only a fragment might be applied to that organ without injury. These views and arguments are supported by abundant illustrations, which give an interest to the volume throughout, and cause it to leave an impression not easily to be effaced. It is also characterised by a calm and dignified tone that commands the respect of the reader, whatever may be the conclusions to which he finds himself led, and furnishes, at the same time, the best reproof for those who, without inquiring into the subject, commit themselves to the folly of treating it with levity.

"AN ESSAY UPON AN APOTHECARY.

"By the Author.

"'*He talks like an Apothecary*' (Old Proverb); because, this ingenious artist dealing so much in Nitre, Sulphur, and Mercury, his Constitution is rais'd to a Pitch extreamly volatile, that betrays itself in many irregular Flashes of Thought, and Starts of Expression. The Spirit rises too fast into the Head of his natural Limbeck, and so distils too plentifully from his mouth.

"The Academy *del Cimento* has made some Progress towards the Chymical Analysis of an Apothecary, and have deserv'd very well of the Learned World in that particular. For (as Dr. —— observes in his Travels) it is a Custom in Italy, to prevent the being over-run with them, and to save the Life of the Subject, to allow yearly so many Apothecaries to the several Academies in Italy to be Anatomiz'd, Distill'd, or the like, for the Improvement of natural Knowledge. There being no part of Mankind that affords a greater variety of uncommon Appearances than the Knights of the Pestle.

"We find in the Memoirs of the Learned Society aforesaid, an Operation upon two of them, whose Characters in Life had been very remarkable.

"They signaliz'd themselves by a brisk Humour of curing more Distempers than ever flew from the Box of Pandora, from the Plague to the Tooth Ach. They recover'd several Lords, etc., before they saw them; baffled a Thousand regular Physicians; and travers'd their Prescription; went thro' several Courses of Botany,

Hosted by Google

without being perfect Masters of a Cold Salad; were Chymists meerly by their natural Fire, and Anatomists without being able to carve a Pudding; Scholars without Learning, and Doctors without Education.

"They dress'd all their Discourse in the Language of the Faculty.

"At meals they distributed their Wine with a little Lymphe, dissected a Widgeon, cohobated their Pease-porridge, and amalgamated a Custard. A Morsel of Beef was a bolus; a Grillade was scarify'd; Eating was Mastication and Deglutition; a Dish of Stakes was a Compound of many powerful Ingredients; and a Plate of Soup was a very exalted Preparation.

"In Dress, a Suit of Cloths was a System, a Loophole a Valve, and a Surtout an Integument. Cloth was a Texture of Fibres spread into a Drab or a Kersey; a small Rent in it was Cutaneous; a Thread was a Filement; and the Wastband the Peritoneum.

"The rest of their Conversation had much the same Tincture: After they were bagg'd of the Government, and dispatch'd as usual, they were convey'd to the Public Laboratory and made ready for the Operation.

"The first Part they began upon wes the Head; they found the Skull so very compact, to prevent the Understanding (which is the Spirit of the Brain) from flying off, that they broke three Instruments before they could break the Shell; the Kernal indeed was extreamly moderate, and did not afford them much to examine. The Vessels of the Cerebellum were short, but not mighty Pithy: The Medulla of them was a perfect Alkeli, and opened the Secret, why the Gentleman, when alive, talk'd so much of it, and had so small a seasoning of the true Acid in his Discourse.

"Having thus pass'd the Fortifications of the Head, and a small Avenue of Communication between that and the Tongue, he arriv'd at the Seat of his Soul (according to *Des Cartes*) in the *Glandula Pinealis*; it appear'd to have been only a small Bag of Vapour. In the North Side of the Head, he discover'd some Mercury, and in the South Region, a Quantity of Lead; the Biass lay apparantly on this side; and the Lead effectually disappointed all the little effects, and pent Motions of the Mercury in the opposite Quarter.

"After this Process by way of Anatomy, the next Step was to resolve it by a Chymical Analysis. To draw this into a narrower Compass, since it was a Caput Mortuum already, the little Brain was taken out with a Marrow-Spoon, and the two reigning Principles were found, on the Result, to be Phlegm and Terra Damnata, which last is a sort of Earth, fit for no purpose at all.

"There was neither Sulphur nor Salt in it. The Want of the Former left upon the Mind an *Itch* of being Impertinent; and the defect of Salt caus'd Corruption of Intellects, Salt being the principal Security against Corruption.

"For the rest I refer you to the Treatise publish'd on this Subject, and translated by that Renown'd Furbisher of Foreign Authors, Mr.—— for your own Edification, and the Benefit of the Bookseller.

"I consulted an able Lawyer why we have not an Establishment, like that describ'd above, in England; he answer'd, That Liberty and Property would never be secure, if the nation should be overstock'd with Inhabitants; that therefore Apothecaries were useful to check the Luxuriant Growth of Mankind: That we may not be crowded with too many Competitors, in Business, Wit, Learning, Trade, and the several Faculties, that they are proper sometimes to bleed the Body Politic, when it begins to be Feaverish, by carrying off a firey Whig, or a Tory; and now and then puts a troublesome Relation, a State-Minister, a Rival, etc. out of the way, by a judicious and a well-timed Dose, or the like critical Conveyance. That therefore he deserves much Encouragement; for the Multiplication of Apothecaries is the Downfal of above a hundred Times their Number.

"I thought his answer pretty just: And parted from my sage Instructor, as the Reader doubtless does from myself, with very great Satisfaction." 1723.

A PENDANT TO THE APOTHECARY.

(*From the English Treasury of Wit and Language*, by John Cotgrave, Gent., 1655.)

"Physicks hand
As apt is to destroy, as to preserve,
If heaven make not the medicine."

"I nere took physick yet, nor ever will,
I'l trust none that have Art, and leave to kill."

"Your Physitian is like to your Hawk,
The greater the fowl is that he kills, the greater
Is still both his reward and reputation."

THE PREDOMINATE COMPLECTIONS.

(THOMAS MAY, ESQ., 1667.)

"*Sanguine Complexion.*

There all together flie in companies,
Of different colours, shapes, and qualities,

Hosted by Google

Bright Sanguine Dreams, that seem to cheer the night
With beautious shapes, and rosie wings as bright,
As in the morning, on those Flowers that grace,
In midst of Spring, the painted Flora's face.

"*Cholerick Complexion.*

There Dreams of Choler, in a flame-like hue,
Through th' Air, like little fiery meteors flue,
With swift and angry motion, to and fro,
As if they sought within that place, a foe.
Sometimes up to the Temples roof on high,
They soar, as if they meant to scale the skie;
Or some impossible atchievement sought,
T' allay the thirst of an aspiring thought.

"*Melancholick Complexion.*

But down below, with sad and heavy cheer,
On dead mens Tombs, and every Sepulcher,
The dusky Dreams of melancholy night,
With sable wings, like Bats, or Birds of night,
Fluttering in darkest corners, here and there,
But all alone, and still each other fear:
Courting dead skulls, and seeming to invite
The dismal ghosts, for company by night.

"*Flegmatick Complexion.*

There all along the Temples whited wall,
Phlegmatick lazie Dreams, not wing'd at all,
But slow like slimy Snails, about do crawl,
And evermore, are thence afraid to fall,
And so be drown'd, for on the floor below
They do suppose great pools of water flow."

[The word "complection," or "humour," was formerly used in the sense in which we now apply the word temperament.--ED.]

Correspondence.

PORTRAITS OF EMINENT HOMŒOPATHISTS.

To the Editor of the Homœopathic Times.

SIR,—In the year 1832 the *Lancet* was in about the same position as you are now, a small weekly paper, purposing to enlarge its sheets, and become the Medical Oracle. Now it is retrogressing and yours is progressing; and as of late it has given portraits of eminent men in the profession, in imitation of the French periodicals, and as that work which it began has not been fully carried out, by omitting the Medical Reformers, or those of Young Physic, may I be allowed to suggest that your enlarged edition should accomplish this, and that your homœopathic public may be favoured with portraits of the Medical Luthers. This may appear as a bit of vanity of Young Physic, but it really is nothing more than a bit of justice to our English, Scotch, and Irish reformers, men who have made great sacrifices for the cause of truth and the public good.

Cheltenham, April 14, 1852. A CONVERT.

[We thank our correspondent for the suggestion, but we do not expect that the means will be furnished us to carry it out. Mr. Turner, of Manchester, had, we believe, some purpose of issuing well-done engravings of the Homœopathic Worthies of Britain. Lord Shrewsbury, Mr. Uwins, R.A., Mr. Leaf, the Rev. Mr. Everest, and the Hon. Mr. Moreton—not forgetting M. B. Sampson, Esq., the distinguished and philanthropic lay advocate who has written so lucidly and effectively in behalf of our doctrine—should be among the first, as they were among the earliest patrons of homœopathy in England. Drs. Quin, Belluomini, Uwins, Harris Dunsford, and C. Luther, and Mr. Kingdon, should be the first in the series of the medical men, as we believe they were first in the field, and there are existing portraits of these gentlemen. We will do it, if our correspondent will get us the funds for the engraver.—ED.]

To the Editor of the Homœopathic Times.

SIR,—I perceive in this day's *Homœopathic Times*, in answer to a correspondent, you state that you are not aware of any action having been brought by any homœopathic practitioner for defamation of character, etc. Will you please accept the accompanying *Monthly Journal of Homœopathy*, for April, 1850, by which you may derive some curious and interesting information.

I have the honour to remain, Sir,
Your most obedient servant,
FRANCIS WARR.

[We are obliged to our correspondent for correcting the mistake we made; and thank him for the copy of the *Monthly Journal;* in which, and also in the first volume of the *Homœopathic Times*, the action of Dr. Ozanne against Dr. De Beauvoir De Lisle, is fully recorded. Dr. De Lisle was sentenced to pay £5 damages to the plaintiff, an *écu* (2*s.* 6*d.*) to the Queen, and costs. We believe this is the only action that has been brought in this country by a homœopathic practitioner for defamation of character.—ED.]

HAHNEMANN'S VIEWS ON COLD WATER AND MOVEMENTS.

Read by Dr. Roth at the Meeting of the Hahnemann Medical Society, the 6th of April, 1852.

(*Continued from page* 615.)

"*Rules for the Prescription of Cold Water.*—If we had a panacea (universal remedy), it would be water. I cannot radically cure my patients affected with chronic ulcers without the cold bath. The cold itself appears to act not only as a strengthening and contracting, but also as an antiseptic remedy. The curative power of the cold cannot be used locally so well as by the application of the cold bath; a mode of application capable of the whole scale of the thermometer, without disadvantage and without expense. In the beginning I prescribe, on whatever part of the body the ulcer may be, a water of fifty degrees for a foot-bath up to the ankles, every evening at bedtime, for six minutes, the water to be kept continually in motion.

"This is the lowest degree of the strengthening bath, which is useful and not uncomfortable even to the weakest patient. I increase it from time to time, even when the ulcer is on the foot; thus I increase it in proportion to the augmentation of the strength and the improvement of the sore, and prescribe a full bath for fifteen minutes, gradually up to three times a day; in the morning before breakfast, two hours after dinner, and half an hour before bedtime. The temperature of the water is diminished to forty, thirty, and even twenty degrees, the lowest temperature.

"As we cannot have the same accuracy when using the bath in running water, we must, once for all, state that a uniformity of the temperature of the bath must be preserved by a continual motion of the water; for this purpose, it is necessary that the quantity of water be not too small, if the bath in the room is to have the advantages of the river bath.

"The temperature of the cold bath, and the increasing of the movement of the body, must be in proportion to the increase of the bodily strength. In such a bath-cure so many gradations of increase are applicable, that even the most weakly person is capable of attaining the highest degree without the least shock to his nerves, if the exact prescriptions of the physician are minutely obeyed by the patient. I have hitherto been unable to repress my astonishment at our greatest physicians being so negligent, when recommending the strengthening cure, as to give such indefinite prescriptions as they do for the cold bath.

"Use a half or a full bath in the morning, or also in the evening:" this is their whole prescription. The degrees of the cold, the exact duration of the bath, and the other indispensable rules are not at all mentioned. We need not be astonished at the injury so frequently produced by the cold bath on our health, when we think how bad a use can be made of cold water, in consequence of such a mutilated, negligent, and short prescription.

"*Abuse of Cold Water.*—Many enervated, sickly persons have immersed themselves for hours in snow water, in order to do honour to those great men (their doctors), by the heroic execution of their indefinite prescriptions; but they were taken out of the water fainting, rigid with spasms, or having caught such a violent cold that a putrid fever ensued, frequently even death. Is the beneficial steel to be reprobated because by it the child opened his veins? or is not rather the negligence of his guardians and of the legislators to be blamed? We can never be too punctual and circumstantial in the precision of the rules according to which powerful remedies are to be used, because, notwithstanding this, a negligent execution frequently happens. This want of precision in the prescription has made so many enemies to the cold-water treatment, that we find an immense number of persons who fear the cold bath as the extreme degree of medicinal destruction, and even more than death itself. But the rabble of obsequious physicians have increased to the highest degree, by their senseless application of the prescriptions of some modern Hippocrateses, the disgrace of the cold bath.

"The patient is often forced to enter the cold bath at once, and in most cases to remain therein for an hour. In order to moderate the pangs produced by the cold

Hosted by Google

acting upon him, he feels that there is no other means than to sit motionless; in about a quarter of an hour, much strength being lost in order to bear the cold of such a quantity of water, the water surrounding him becomes tepid. He remains quietly sitting, in order, according to his idea, to restore himself in the now warm water, and to recover the strength which was dissipated for the production of the warmth. This warmed water acts now as a tepid bath, and takes away entirely a part of that strength which the endurance of the immoderate cold of the water in the beginning had left behind. Then he is enveloped in warm clothes, and in this state he is put into a warm bed, a treatment which increases the injury of this senseless application of the cold bath. Perspiration follows, and he loses by this torture of twelve hours at least twenty per cent. of the strength which he had in the beginning, without taking into consideration the subsequent spasms, cold, cough, diarrhœa, or rheumatism, which he patiently endures the following day, as the unavoidable inconveniences of his bath-remedy. It is only a pity that he could not endure this pleasant strengthening bath more than three or four times, otherwise it would have still been of great benefit to him. A very nice, but—which serves much to its recommendation—almost average prescription, powerful enough to enlarge considerably the burial-grounds of the most celebrated watering-places of Europe, and which I feel myself happy in having early abandoned.

"*Pathogenetic Effects of Cold Water.**—If we keep a healthy hand in cold water for some minutes, we experience in it a diminution of temperature; the veins become invisible; the fleshy parts become shrunken, their size is diminished; the skin is paler, duller; motion is more difficult. These are some of the primary effects of cold water on the healthy body. If we now withdraw the hand from the cold water and dry it, no long time will elapse before the opposite state ensues. The hand which has been immersed becomes warmer than the other; we notice considerable turgescence of the soft parts, the veins swell, the skin becomes redder, the movements more free and powerful than in the other; a kind of exalted vitality. This is the secondary or consecutive action of the cold water on the healthy body. This is, moreover, almost the greatest dose in which cold water can be employed, with a permanent good result, as a positive (curative) medicinal agent, in a state of pure debility analogous to its above-described primary effects on the healthy body. I repeat the "greatest dose;" for if the whole body should be exposed to the action of this agent, and if the cold of the water be very considerable, the duration of its application must at least be very much shortened, to a few seconds only, in order to reduce the dose sufficiently. But if the dose of this remedy be in all respects much increased above the normal amount, the morbid symptoms peculiar to the primary action of the cold water increase to a state of actual disease, which the weak part it was intended to cure by its means cannot or can scarcely remove again. If the dose be still further increased, if the water be very cold, if the surface exposed to the water be larger, and the duration of its application much longer than it ought to be for an ordinary curative dose of this agent, there then ensues numbness of the whole limb, cramp of the muscles, often even paralysis; and if the whole body have been immersed in this cold water for an hour or longer, death ensues, or at least the apparent death from freezing in healthy individuals, but much more speedily when it is applied to feeble individuals.

"I mentioned that my patients are induced to take the cold bath by degrees, and in proportion to their increased strength, consequently it happens that, for the most part, when the cure is finished, they are reluctant to abandon the cold treatment. I do not observe, as a consequence of my prescription, any cold; on the contrary, an increased, or at least uninterrupted exhalation; the strength of my patients increases from day to day; for I do not draw by the cold bath more warmth from the body than it is capable of restoring very soon by its own circulation. The impulse of the blood circulating through the body is increased by the contraction of the muscular fibres and vessels, invariably occasioned by the cold; as the force of a spiral spring augments, the more closely it is wound together, so all the organic functions acquire new life.

"In order to effect this strengthening and contracting of the fibres more uniformly, I insist, in whatever degree the bath may be taken, as a thing indispensable, that the water should be kept in continual motion round the body or the immersed limb, and the dimensions of the bath itself being as large as possible, in order to substitute the advantages which the running water-bath has over the room-bath.

"I do not like to use the river-bath before the cure is finished, when a little more or

* Lesser Writings of Hahnemann, translated by Dr. Dudgeon, p. 525.

Hosted by Google

less cold and a negligent supervision is less likely to be injurious; besides, I confine all those to the room-bath who can obey the necessary directions, the more so, as all the advantages of the river-bath are obtained without the danger of its disadvantages.

"The water can be put in motion by the patient himself, when he is able to do so, or it may be done by others. The mode of changing the water in the cooling apparatus in the process of distillation answers very well for all bathing purposes. As much cold water flows down through a tube to the bottom of the bath, as water warmed by the heat of the body flows upwards through a channel, for the warm is lighter, rises to the surface, and hence overflows. But for the sake of poor people, I mention that a somewhat large bath and the movement therein will be sufficient. Poor patients wanting the necessary comforts, and not knowing how to determine exactly the degree of warmth, should act in the following manner. The kind of immersion and its duration are their only standard, according to which the bath is to be increased. The prescription is to immerse themselves in the water of a very deep well, at such and such a depth, so and so often, and for such and such a time, in winter, as well as in summer; from time to time, according to the state of their strength, all this is increased. In this way they can neglect nothing, because the prescription is so simple, and they have the same advantage from it as the rich, who can execute more exact and more precious prescriptions; the coldest water, which even rich people have in summer at their disposal, is but that from the wells, which are thirty and more feet deep, and have a temperature rarely under 52°, unless they are able to procure the luxury of increasing the cold of the bath by ice from ice-cellars; but the coldest water from the wells is sufficient for everybody, if the treatment is to be undergone during the summer, because less cold can be substituted by a more frequent and longer bath, as well as by the kind of immersion."

(*To be continued.*)

AN ESSAY ON HOMŒOPATHIC STATISTICS;

Together with a Critical Analysis of Dr. Routh's Work, entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

By John Ozanne, M.D.

XI.

The examination of the number of cases of pneumonia admitted into Fleischmann's hospital, in relation to all admissions, led Dr. Routh to the following conclusion: "the review of these facts admits but of one of two inferences; the cases are either *picked out* or *selected*, or the *diagnosis is wrong*." This is, certainly, a most serious charge. It is one in which the fault imputed implies both *dishonesty* and *ignorance*. It is one, therefore, which ought to be supported by undeniable evidence, in default of which it ought to redound upon the accuser.

We have seen, however, that so far from the number of pneumonia cases being too great, and if we take Dr. Balfour's Report, published in the *British and Foreign Medical Review* for 1846, as the basis of our calculation, the number recorded in Dr. Fleischmann's tables for the year (assuming Dr. Balfour's report, the report of an adversary, to be correct) would be rather too small. This fact should of itself be proof sufficient that this system of accusing persons of dishonesty upon simple conjecture is deserving of the most marked censure.

But this is not the only instance in which such accusations are brought forward. I shall have, in the course of this and the following paper, to bring forward other instances of the same kind. In doing so my object will be twofold:—1, to meet the imputations and to refute them; 2, to show what we are to think of the accusers themselves. But to proceed.

"The above conclusions seem to point out that the principal reason of the homœopathic success is to be found in the incorrect diagnosis or selection of cases. Diseases are not called by their proper names. Thus in the Leipsic returns (1841-42) we have 7 cases of pleuritis *muscularis*; in 1840-1, 1 case of peritonitis muscularis, another of pleuritis muscularis (Stat-Klinik) again the same year, 3 cases of muscular peritonitis and muscular pleuritis, etc.; *in their cases of pneumonia, instances of pneumonia hypostatica are recorded.* This improper nomenclature, it is clear, as including diseases perfectly different *and in no way fatal*, must materially affect the cipher of mortality when a comparison is made for special diseases." (p. 47).

I have given the whole paragraph, as I have done in many other cases, not because it bears very closely upon the question at present under consideration, but in order to avoid the common accusation of giving "garbled extracts," the usual resource of those who are supporting a bad cause. In this case, as well as in all others, I have

Hosted by Google

given either full paragraphs or sentences, or, at least, exactly as much as would give a fair and full statement of Dr. Routh's objections.

With the cases of pleuritis and peritonitis *muscularis* I have nothing to do at present. They will be considered under their respective headings. But I will proceed to inquire at once whether the inclusion of cases of *pneumonia hypostatica* in the homœopathic statistics of pneumonia is likely to lessen or not the per-centage of mortality in that disease. Were this the only object of my inquiry it might be answered in a few lines; but there is an additional one, which is this, namely, to ascertain whether Dr. Routh knows what he is talking about when he mentions pneumonia hypostatica as a *disease in no way fatal.*

In the investigation of this point I will avoid giving opinions of my own, and will adhere as much as possible to the plan hitherto followed in the course of this "analysis," although perhaps rather a tedious one for the reader, as it involves the necessity of frequently giving long extracts, namely, to quote the opinions of the authorities brought forward in the *very words* to be found in their works.

"There is a peculiar form of pneumonia to which the term *hypostatic* has been given by Piorry, and which is developed from the passive stasis which occurs in the most dependent parts of the lung, and to which the term *hypostatic pneumonia* has been assigned. It presents *the thorough stamp of asthenic inflammation.*" (Rokitansky, Path. Anat., Syd. Soc. ed., vol. iv. p. 85.)

"*Hypostatic pneumonia,* first pointed out by Piorry, chiefly befalls aged persons, and is characterised by the peculiarity of its development and diffusion, as also by the irregular and insidious nature of its course.... This *senile* pneumonia has been far more carefully investigated by Hourmann and Dechambre than by Piorry, so that, in pointing out the distinctive features of this form, I shall chiefly adhere to their description. The differences are mainly dependent upon the peculiarity of structure of the lungs in old age, for an acquaintance with which we are indebted to the aforesaid pathologists." (Hasse, Path. Anat., Syd. Soc. ed., p 220.) Hasse next describes its varieties, and, alluding to a form of hepatization which he has noticed, he says:—"I must, however, remark that the smooth hepatization above mentioned has occurred to me not only in the aged, but likewise in persons who have been long bedridden from some disease involving great prostration of nervous energy (as apoplexy, palsy, and the like), *and at length die* under symptoms *apparently* catarrhal, but perhaps really due to inflammatory irritation resulting from genuine hypostasis of blood in the lungs."

Louis, in his work on Typhoid Fever, devotes some pages to the consideration of the lesions of the lungs in persons who *have died* in consequence of that disease. But he has not studied these lesions so carefully as Messrs. Piorry, Haurmann, and Dechambre. One singular result, however, of his investigations is that these lesions were found in nearly the same proportion among those dying of acute diseases in general, as among those dying of typhoid fever. (Fièvre typhoide, tome i. p. 336.)

I mention this, in order to show that I am alive to an objection which may be made, namely, that Dr. Routh perhaps understands under the term *hypostatic pneumonia* the mere stagnation—the so-called *hypostasis* of the blood—which is met with in the dependent parts of the lungs in typhus and typhoid fevers. That a certain amount of dullness on percussion is frequently met with at the base of the lungs and in their posterior parts, in the course of these fevers, and that this dullness may be due to the stagnation of blood in these portions of the pulmonary tissues I readily grant; that this condition is generally curable, more particularly under homœopathic treatment, I also admit, but this *is not* hypostatic pneumonia.

"We must guard against confounding hypostatic peripneumony (a term synonymous of pneumonia) with that condition frequently encountered in the lungs of persons who die of typhus. There the lung is likewise of increased gravity, and mostly softened. On careful examination, however, it will be seen that these changes are the results of stagnation of, for the most part, diseased blood.... By careful ablution the stain cannot indeed be removed, but the substance may, in some measure, be restored to its natural state, whilst in the texture so altered *no vestige is ever seen of any inflammatory product.*" (Hasse, Path. Anat., p. 222.) The latter characteristic constitutes an essential distinction between the condition of the lungs dependent upon "subsidence" of the blood, which is "met with in all diseases wherein the primary or secondary cause of death is, as it is commonly said, in the brain, and its extent is proportionate to the duration of the agony—in plain English, proportionate to the duration of the death-*struggle* (ibid.)—and hypostatic pneumonia."

Hosted by Google

Now it so happens that this pneumonia hypostatica, or asthenic pneumonia—chiefly met with in old people, and "developed from the passive stasis of the blood, which occurs in the most dependent parts of the lungs," and yet differing from this stasis, inasmuch as in the latter there are no vestiges of inflammatory products after ablution—is *one of the most dangerous forms of pneumonia that can be met with;* therefore homœopathists, in including cases of pneumonia hypostatica in their tables, only add to instead of diminishing their mortality in pneumonia.

Whilst examining the objections founded upon the presumed inaccuracy of the diagnosis, or the *possibility* of its being intentionally falsified, I think it is proper to notice the other instances given, in the course of Dr. Routh's remarks upon pneumonia, of the manner in which the returns might be so tampered with as to show results more favourable than those really obtained.

He says, that "the cipher of mortality may be diminished," in a manner "not likely to be detected, if the fatal cases are carried under a generally-admitted fatal complication; *phthisis*, for instance, or *œdema of the lungs*, of which disease twelve out of thirteen died in Fleischmann's hospital, between 1835 and 1843" (p. 50).

I cannot avoid pausing here for a moment, to express my admiration of the ingenuity displayed by our author in his discoveries respecting the means by which facts may be so distorted as to present a favourable appearance, whereas if exposed in their bare reality, their appearance would be the reverse of favourable. I confess that this extreme subtlety of intellect is itself suspicious; it reminds one of the skill of the adept in the art of using coloured water, and of persuading others that it is "a deadly poison." But it will bring upon itself its own chastisement; for he who is so lavish of suspicion with regard to others cannot expect that his own statements should pass current without a glance of suspicion being cast upon them.

In meeting these objections, it is not my intention at present to meet the charge of falsification of returns indirectly made against Dr. Fleischmann; it is not my intention, in this place, to defend the physician, than whom, if I may express the universal opinion of those who have been honoured with his acquaintance, none can be more straightforward and honest. This will be done more appropriately, when I shall have to notice the general character of the Report sent from Vienna to the *British and Foreign Medical Review*, by Dr. Balfour.

It is proposed in this place to meet these objections, together with all those advanced by Dr. Routh, with the *internal evidence* alone which they afford. And here I must remind the general reader that scientific facts, unlike facts in the political or social world, rest upon a species of evidence which I here style *internal*, the foundation of which is the uniformity of Nature in all her operations, these operations being governed by *general laws*.

With regard to the possibility asserted by Dr. Routh, of classing unsuccessful pneumonia cases as cases of phthisis, it requires but little acquaintance with medical facts to perceive that with two diseases such as these, which in general present such marked differences, not only in their symptoms but likewise in their march and duration, there is no possibility of any malpractice, such as that suggested, in an hospital in which there is a reasonable amount of government supervision, excepting in a very limited number of cases—too limited to affect materially the per centage of mortality. I do not think it necessary to dwell here at greater length upon the question, which is, I will allow, one of considerable interest. As a great deal is said upon it with reference to the complications of pneumonia in Dr. Routh's work, it will be necessary to go into it more fully. This will be the more desirable, as the suspicions expressed by the champion of allopathy naturally lead us to suspect that these circumstances, the complications of pneumonia, are made a loophole by which the allopathists are to escape out of a very unpleasant dilemma indeed.

Dr. Routh seems to think that thirteen cases of *œdema of the lungs*, admitted in the course of nine years into Dr. Fleischmann's hospital, is too large a number not to admit of the explanation he has given, namely, that unsuccessful pneumonia cases may be returned as cases of œdema, which is usually, or almost invariably fatal.

His objection is, no doubt, founded upon the fact that with us œdema of the lungs is not considered to be a frequent disease. This point, therefore, must be investigated. Regarding its frequency at the allopathic hospital at Vienna I have no means of judging, exeepting from the statements made by Rokitansky, in his work on Pathological Anatomy, already quoted. These statements we may take as an accurate expression of the facts, for Professor Rokitansky has for years had the direction of the post-mortem examinations at the Vienna General Hospital. We are told, for instance, in the preface to his second volume, that the dissections are all made

Hosted by Google

under his directions, and records of all that is observed taken down at his dictation. We are also told that from four to six bodies are opened every day. But Rokitansky does not give any statement in *figures*. However, although we cannot get the necessary information in a direct manner, we may get it indirectly.

In the first place, what is meant by a frequent disease? Chomel says of pneumonia, that it is "in the first rank with reference to *frequency*, in our clinical records." (Dict. de Méd., tom. xxv. p. 160) This is as true in London as it is in Paris; for in the Registrar-General's Report of the deaths occurring in the metropolis during the eight years ending in December, 1847, pneumonia is the disease which, next to phthisis, presents the greatest mortality. Its frequency at Glasgow, in relation to admissions for other diseases, is not quite so great as the London mortality would lead us to expect; nevertheless, at Glasgow, pneumonia is one of the most frequent diseases to be met with in the General Hospital. But Dr. Routh tells us that the admissions at the Vienna General Hospital are exactly double those at Glasgow; therefore we may look upon pneumonia as being a *frequent disease* at Vienna as well as in London or Paris.

Now, if we turn to Rokitansky for evidence as to the frequency of pulmonary œdema, we find, in the section headed *œdema of the lungs*, this statement—"pulmonary œdema is a *very frequent* and extremely important disease" (vol. iv. p. 69).

Since pneumonia is admitted to be a frequent, and œdema of the lungs a very frequent disease, we should expect, if Dr. Routh's insinuation were founded, to find the proportion of admission of cases of pulmonary œdema into Fleischmann's hospital to be at least twenty-one per thousand, the proportion of pneumonia cases at the General Hospital.

But what are the facts? 6524 patients were admitted into Fleischmann's hospital in the course of nine years. In the same period of time, fourteen cases (not thirteen, as stated by Dr. Routh) of pulmonary œdema were admitted. These cases give a proportion of two per thousand of œdema at the Homœopathic, against twenty-one per thousand of inflammation of the lungs at the General Hospital! In other words, if Dr. Fleischmann had returned ten times as many cases of œdema as he has done, his return would still be in accordance with the usual frequency of œdema of the lungs at Vienna.

(To be continued.)

NARRATIVE OF THE INTRODUCTION OF HOMŒOPATHY INTO ENGLAND.

By F. J. Smith, Esq.

(Continued from page 604.)

Important as it is to obtain a correct impression as to the state of the medical mind of England with reference to homœopathy, on its introduction into this country, it is of far greater importance, if we would rightly estimate the force with which our science had to contend, in the early days of its English existence, to ascertain the state of the public mind in relation to this subject.

And it will be in vain to search for such evidence amid the records of our periodical literature, for society was, as yet, ignorant even of the existence of such a science as homœopathy: the press, therefore, had no feeling to evince or represent. And even now, when homœopathy reckons 100,000 converts in Great Britain, it can scarcely be said to have assumed a position of sufficient importance to call forth any general notice from the press, though of late years—to their honour be it recorded—the *Morning Post* has occasionally mentioned the subject, and always with respect; and some of the weekly newspapers have demanded for it a fair and impartial investigation. Nor must we omit to add, that that universal genius and ubiquitous being—*Punch*—has occasionally condescended to bestow upon homœopathy a passing, though by no means a flattering notice.

But although debarred, by the necessity of the case, from evidence of this conclusive character, we are not without the means of arriving at a tolerably correct estimate of the force we are concerned to ascertain. Taking the fact we have established, viz., the violent spirit of animosity towards homœopathy evinced by the profession, and certain acknowledged principles of human nature, as our guides, we need not be far out in our calculation. The subject is one of deep importance, and should we be led into a discussion of some length, we must beg the reader to bear with us, on account of its importance.

Now, the profession must have been actuated, in their hostility to homœopathy, by—either a desire to expose and extirpate error, or by a desire to suppress and exterminate the truth. They cannot be acquitted of most unphilosophical conduct in condemning without investigating the subject; but there is no occasion to assume that their motive was corrupt. And it matters not which of these hypotheses we take, either will bring us to this point—that they were

Hosted by Google

interested in employing their influence with society to prevent the spread of homœopathy. We will therefore assume that they were laudably desirous of protecting society from the inroad of error. In estimating human conduct, however, while giving due prominency to primary motives, we must not omit such as are secondary; and in this latter class we cannot fail to recognise self-interest, since the spread of homœopathy must have endangered the occupation of allopathists. And it is not too much to take for granted, that what men were thus instigated to do by motives so powerful, they accomplished to the extent of their ability.

And this leads us to investigate into the facilities afforded to medical men to influence society. Now, the influence of the clergy—by which is meant ministers of religion in general—in social affairs is proverbial. If, then, we can show that there is an influence even greater than that of the clergy, we shall have gone far to prove that that influence must be coextensive with the limits of society. And we think we shall be able to demonstrate that such is the influence exercised by the medical profession.

Our proposition, then, is, that the influence of the medical profession, in social affairs, is greater than that of the clergy.

And our first argument is based on the admission, and oft-repeated lamentation, of the clergy themselves, that mankind are far more prone to be affected by what concerns the physical, than that which relates to the spiritual; that they will forthwith attend to some trifling—and, *à fortiori*, to any serious—derangement of their physical health; they will allow, unheeded, the spiritual health to decline, even to decay; and that while, in the ratio of declining physical health, is there usually a felt anxiety for medical direction; in the ratio of declining spiritual health is usually a manifested indifference to religious direction. Accordingly we find that there is hardly a family without its medical adviser, while there are very many without their spiritual counsellor.

If we inquire a little further into this subject, we shall discover that there is a bond of union between medical adviser and patient, which no other profession admits of being established; nor, indeed, scarcely any other circumstances in life. There is nothing we do with greater hesitation than impart our entire confidence to another; there is nothing which, when done, induces us to look with so much reliance on another as the fact that he possesses that confidence. But in the very necessity of things, the patient must make a confidante of his doctor; the doctor must be made acquainted with every disturbing cause, be it physical, mental, moral, or spiritual, otherwise he cannot prescribe. The medical men of every country therefore become, so to speak, a bank, in which the entire confidence of its people is deposited. They can no more help receiving, than the people can help making such deposits; but, nevertheless, they thereby acquire a hold on the affections, and an immense influence over the minds of the depositors.

Again, the prostration of the intellect is the source of enormous power in him before whom it is made. And a very near approximation to this state of things takes place between the patient and doctor. So far as relates to the generality of invalids, the medical man is the oracle of an occult science. The patient may have exhausted his brain with theory after theory as to the cause of his suffering, its mode of treatment, and its probable termination. The doctor enters, and the invalid is inspired with a mingled feeling of awe and faith; he resigns into his adviser's hands the province of thinking for him, and he reposes in him as one who possesses the keys of life and death. There is nothing approaching to either of the foregoing sources of influence—and they are amongst the most powerful by which human beings can be actuated—in the relation between the minister of religion and the *generality* of mankind.

But thus far we have regarded the subject of influence as springing from a motive of selfishness—a very general motive it is true, but not the only one, we are happy to believe, by which mortals—especially the fairer portion of them—are actuated. Gratitude is a noble sentiment, and enters largely into the considerations by which society is bound together. Let us, then, try the question at issue by this test. Mitigation of suffering, restoration to health, salvation from death, are usually ascribed by the patient to the doctor, and call forth, not from himself alone, but from every member of his family, the most intense emotions. And even if the doctor be regarded merely as the instrument of a higher power, the heart must be callous that feels not unbounded gratitude for the services rendered, accompanied as they usually are by the liveliest manifestations of solicitude. Now, the wisest of men has undoubtedly declared, that "he who converteth a sinner from the error of his ways, shall save a soul alive;" and beyond all question, when such an instance occurs, the gratitude should, and can scarcely fail to be greater than in those cases we have been considering. But does any one believe that such instances are

Hosted by Google

anything like so common an occurrence as those which arise in medical practice? And it must be remembered that we are now concerned with *number*, and not with *intensity*. Tried, therefore, by the test of gratitude, the balance of influence appears to be in favour of the medical profession.

The clergy have certainly one great advantage, viz., that of the pulpit; but this has to do with the *subject*, not with the individual; and only so far as their position gives them access to the domestic circle has it a bearing on our argument; and in spite of this position, we have seen, "that while there is scarcely a family without its medical adviser, there are very many without their spiritual counsellor."

We would not willingly omit any consideration that has a bearing on the discussion; and therefore we freely concede that spiritual things are of far higher moment than things temporal. And we readily allow that it follows from this concession, that where people are really in earnest on the subject of—what is generally understood by the term—religion, the former must be preferred to the latter; that, consequently, the intercourse between the truly spiritual teacher, and the earnest, spiritually-minded disciple, is of a character so transcendently sublime, that between it and the association between medical man and patient there is nothing in common; and that, consequently, in such cases, the influence of the clergy must be paramount to all others. But that this is but a very small class of the community, we have the testimony of all ages for our authority.

On the whole, then, we conclude that the influence of the medical profession is more general than that of the clerical. But the influence of the clergy is, as we have seen, proverbial. We may therefore fairly conclude that the influence of medical men must be almost coextensive with the limits of society. Again, it has been demonstrated that medical men had, in 1827, the strongest motives for exerting such influence as they possessed, to prevent the spread of homœopathy; and it has just been shown that that influence was almost coextensive with the limits of society: hence it may fairly be concluded that homœopathy had to contend with an influence exerted to prevent its spread, almost coextensive with the limits of society.

As a corollary from the preceding investigation, we may look for the earliest converts to homœopathy from amongst those portions of society which were least under the influence of the medical profession. And beyond a doubt, that portion of society with which medical men possess the greatest influence is the middle class. From this class they emanate; with this class are their most intimate associations; amongst this class are their kinsmen after the flesh. On a par with the clergy in respect of general attainments, and elevated somewhat above the middle class by education, they possess, in common with their clerical brethren, the influence which arises from superiority in certain departments of literary knowledge. In maintaining the position of the medical profession, moreover, the middle classes, being associated by the ties of relationship, have a direct interest. The case is altogether different in the highest and lowest class of society; with both the connection of the medical man is for the most part limited by his professional duties. With the private views and feelings of the one he is not permitted to intermeddle; with those of the other he has no time to interfere. The higher classes, too, from their abundant leisure, their habit of travelling abroad, and their intimate acquaintance with modern languages, possess opportunities of informing themselves on subjects of novel character beyond that of any other class; and where their "class-feelings" are not concerned, are usually in advance, as they should be, of general society. We may therefore fairly conclude that those portions of the community which are the least under the influence of the medical profession are the highest and the lowest; and it is amongst these, as our corollary would teach us, that we are to look for the earliest converts to homœopathy. And here, as we shall presently see, are these converts to be found. Our corollary being thus vindicated, bears its testimony to the truth of our proposition, that the medical profession did its utmost to prevent the spread of homœopathy; nor should we perhaps be going too far, were we to assert that homœopathy commenced its career in England amidst the anathemas of the medical profession; and that, as it advanced, almost every house became a fortress arrayed against the system.

In a former part of this Narrative we have shown that homœopathy was introduced into England in the year 1827, and that its blessings were first made known in London, at Claremont, Esher, and Hampton. We then glanced at Dr. Quin's subsequent continental career. Returning to the main design of these papers, we exhibited the state of the medical mind of the country in relation to the Hahnemannic system, in the year 1827; and in this article we have demonstrated the state of public feeling, which supervened on the introduction of homœopathy.

Hosted by Google

We propose now to lay before our readers a brief sketch of the progress of homœopathy in England since the spring of 1827. Dr. Quin was at that period the only physician in this country who practised according to the Hahnemannic system. The intolerance of the profession rendered caution absolutely necessary, and this attribute was displayed in an eminent degree by Dr. Quin. Employing the remedies only in non-dangerous cases at first, he never incurred the risk of bringing the system into discredit with his patients, or of affording his adversaries an opportunity of ascribing failure to this novel mode of practice, when it would have been due to the fatality of the disease. In other cases, where its efficacy could be contrasted with allopathic treatment, to the obvious conviction of the sufferer, he exhibited the remedial powers of homœopathy. Thus he continued to practise, gradually enlarging the sphere of his operations at home, and visiting annually the Continent, as we have seen, during the ex-London season, and in the course of these excursions, renewing his acquaintance with his old associates, forming new connections, and on two occasions confirming his faith, and enlarging his knowledge at the well-spring of homœopathy itself. In this way things continued till the autumn of 1830, when an event occurred calculated to excite the liveliest emotions amongst those who were interested in the progress of our great medical reform.

It may be thought by some, that we are passing too rapidly over a period so important as the first three years and six months of homœopathy in England. But it must be remembered that it is our province to deal with historical facts, not with thoughts, plans, or intentions. It is scarcely possible to doubt that he who had jeopardized so much, and had voluntarily incurred such odium for the Cause, should not have devoted much time to considerations of this nature. There was, however, no homœopathic public at this time to be addressed; we cannot, therefore, look for any printed records; and the poor being seen as gratuitous patients, we shall search in vain for any public dispensary.

The important event to which we have just alluded as having taken place in the autumn of 1830, was the return of the Earl and Countess of Shrewsbury to this country, with two distinguished homœopathic physicians in their suite. The name of one was Dr. Francesco Romani; that of the other Dr. Taglianini. The former, a practitioner of Naples, was a very learned man, and possessed of a profound knowledge of his profession, but withal timid in the exercise of the medical art, which was probably due to constitutional causes. The latter was a native of Ascoli, in the March of Ancona; and it is no great disparagement to him to say that his attainments were not equal to those of his companion. It was to be expected that these distinguished guests would accompany the noble Earl and Countess to their ancestral hall of Alton Towers; nor was any disappointment felt in hearing that they were occupied there in disseminating a practical knowledge of homœopathy, by curing the sick and diseased of the surrounding neighbourhood. It was probably thought that a wider sphere of usefulness might have been found in the metropolis, but this, it was confidently expected, they would fill when the season commenced.

But, alas! for the idiosyncrasy of poor human nature, the courage that had braved the derision of Italian allopaths, fell prostrate before the inclemency of an English winter. Confining themselves almost entirely during that trying season, to the genial atmosphere of the inner-walls of Alton Towers; they availed themselves of the earliest opportunity the following spring to quit the shores of Great Britain, resolving never more to expose their southern susceptibilities to the ice and snow of our northern latitude.

The feeling of intense disappointment and regret to which the report of their return to Italy gave rise amongst the small body of English homœopaths, may readily be conceived, when it is remembered, that by this act two out of three practitioners of that medical system, in which this little band had learned to place the most implicit confidence—and in learning which they had ceased to place any reliance whatever in the medical doctrines in general use—had quitted this country for ever, leaving behind but one, respecting whom—whatever their opinion of his talents, and however content they might have been to repose in him implicitly before their expectations had been raised—they must have felt, that associated with other kindred minds, whose aid in consultation he might thus have commanded, that greatest of all earthly bessings—their health—would have been abundantly more secure. Nor was this, by any means, the sole ground of their despondency. Every true disciple of the illustrirous Hahnemann is a genuine philanthropist; and the English homœopath must have felt, when he heard of the departure of these physicians, that a mighty engine for extending that system, with which, as he conceives, the well-being

Hosted by Google

of his country is bound up, had quitted our shores for ever. A rude shock was thus given to his noblest aspirations; and he may well be pardoned for not anticipating, amid the obloquy which then surrounded the doctrines of homœopathy, those glorious days which have since arisen upon the land of his birth.

The brief visit* of these Italian physicians is not, however, without its moral. The power to endure much they must have possessed, otherwise they could not have been homœopaths in the year 1830. But victory is seldom achieved save by those who are capable of "enduring *all things*"—men possessed of the nerves of a Hahnemann or a Wellington. In this great quality they appear to have been deficient: a little more, and their names would have been handed down to posterity in honourable association with that of Quin; as it is, England, at least, has no laurels for the brows of Romani and Taglianini.

(To be continued.)

STRAY NOTES.

By an Old Practitioner.

1. *The Terms Homœopathy and Allopathy.*

It is a very common complaint among those who have been converted to homœopathy after practising allopathy for a long time, that Hahnemann should have marked his doctrine by a separate, strange-sounding name. They assert, that by thus indirectly cutting off his followers from their former professional habits and generally from their professional friends and associates, and stigmatizing them in reality as a medical sect, he has seriously impeded the progress and open profession of his system among medical men of the ordinary school, and unnecessarily increased the difficulties with which those who wish to join his standard have to contend with on all sides.

Yet there is scarcely a point of his doctrine itself upon which he insisted, particularly in his latter years, so forcibly and so pertinaciously as upon the necessity of designating his system by a separate name. With his intuitive knowledge of human nature, and taught, besides, by bitter experience, he clearly foresaw that had he not severed his system, *toto cœlo*, from the old school, even by a new and odd-sounding term, ere long there would have sprung up all sorts of fanciful, arbitrary, mischievous, hybrid alliances between the two, which would have led to endless confusion, and the gradual destruction and absorption of his doctrine; that everybody, in fact, would have had an opportunity of fashioning his own cloak to hide, shelter, and disguise his ignorance, laziness, and presumption, and that the worst description of easy latitudinarianism would have usurped the place of close application, persevering industry, and all progress in the right direction.

Certainly, if one considers the extraordinary longing which a great number of converted allopaths, even now, evince to graft homœopathy upon allopathy, wherever they possibly can—if one bears in mind the almost irresistible power of early impressions, preconceived ideas, and long-standing habits—if one looks at the present state of homœopathic practice (at least, what passes current under that name), one cannot sufficiently admire Hahnemann's sagacity and wisdom, even in this particular; and instead of blaming him for inventing a new name for his doctrine, and thereby establishing for ever a broad gulf between his system and allopathy, those who value his doctrine in its purity ought to feel exceedingly grateful. More than once have I talked to him on the subject, and he invariably declared that his object in calling his system Homœopathy was the one which has just been mentioned; that he did not attach much importance to the name itself, no more indeed than he attached to his individual view of the *modus operandi* of homœopathic medicines and doses, and that any other name of a similar meaning might have been adopted. It is true the name Homœopathy does not express much of the doctrine itself, and perhaps a term like *Homœotherapia*, which is, grammatically, equally correct, would have embraced the subject more fully and significantly; but as the term homœopathy is now universally adopted, and we all know, or at least ought to know, what it stands for, it would be folly to attempt to alter it. As it is, we have, at least, a distinct standard from which to start, and round which to rally, and which in no manner whatever interferes with true progress and improvement.

Even less felicitous than in adopting the name of homœopathy has Hahnemann been in calling the ordinary medical practice Allopathy; although medical men of that school frequently resort to the ἀλλοιον in the treatment of diseases, yet this is far from being the leading feature of their proceedings: indeed, it would be difficult to say what is *the* leading or even *a* leading feature in their mode of treating disease;

* Six months only; vide Elogio di Lady Guandalina Talbot, Principessa Borghese, da Francesca Romani, p. 15. Napoli, 1840.

Hosted by Google

for however scientific and philosophical allopathy *seems* to be in books and lecture-rooms, it sinks into the most variegated and unprincipled routine at the bedside of the patient. Allopaths have neither a law of nature to guide them, nor a well-defined broad principle, nor even generally-acknowledged rules for their proceedings, and it is this total absence of any principle of sufficient importance and universality which makes it difficult to designate the ordinary practice under a comprehensive term. The most significative term I could coin is VETULISM, from *vetula*, an old woman—old woman's practice; the correctness of which term I hope to prove in the next number.

INFINITESIMAL MIASMS.

(*Extracted from a Faggot of French Sticks*, vol. ii. p. 12.)

AND then completing my arrangements by placing before the table a comfortable arm-chair, like Robinson Crusoe, I looked around me with an inward satisfaction it would be difficult to describe; and I was standing very much in the attitude of a young artist, joyously admiring the painting he has concluded, when, with great velocity, there shot past my nose—to tell the truth, it actually hit it—an arrow of air about a foot long, but no thicker than a piece of packthread, that did not smell as it ought to do. "It is the breath of envy," said I to myself, "mortified at my happiness!" and, discarding the green-eyed monster from my thoughts, and again admiring my location, I bade it a short adieu, and descended into the street. At about six o'clock I returned to my apartment, and, like a young lover, was again admiring its clearness, when another little arrow, from an unpleasant quiver, flew by me. "It's all fancy," said I to myself, "it can't come from my kind landlady, nor from my chest of drawers. I'm two stories above the drains and two below the gutters of this world; Paris outside my window, and a passage outside my door; the thing," I did not exactly know what to call it, "is impossible."

I had a most amusing dinner. I had left it entirely to my landlady to decide what was good for me; and as I sat alone, sometimes I could scarcely help laughing aloud at her prescription, and from the end of a silver fork I was placing between my lips a small portion of one of the unknown ingredients, for the purpose of analysing its composition, when, as nearly as I could guess, about an inch and a half from me, there whizzed by another little arrow. In less than the twinkllng of an eye it had completely passed, and where it had come from, or where it had gone to, I was alike utterly ignorant. After dinner I rambled about the streets until it was time to go to my bed, which proved clean and comfortable. In the morning—quite contrary to my habit—I awoke with a slight headache, and I was lying on my back conscientiously recapitulating the nameless items of my dinner, when there rushed past the uppermost feature of my face, not an arrow but a javelin. During the day, on being half a dozen times similarly assailed, I became slightly dispirited for a few moments, until, rallying my forces,—I mean looking at my chest of drawers, secretaire, and other comforts that surrounded me, and muttering the words "home, *sweet* home!" I determined during the day not to notice the contemptible little demon that was assailing me, but at night to remove my bedding from its alcove to the floor near the window. I did so; but again awaking with rather a worse headache, I felt it was in vain to endeavour to hold out, and that I had, therefore, better at once sound a retreat. Accordingly, ringing my bell, I requested the *garçon* to ascertain whether Madame would be visible to me. In a few minutes she entered my room, with the same placid smile which had adorned her countenance when it last left me. What, she kindly inquired, could she do to serve me. It required the whole of my resolution, and, indeed, almost more than I possessed, to answer her friendly query by telling her, in broken sentences and in faltering accents, that the room was in every respect all I could desire, "But that....it....had ...at times... a very unpleasant smell." "Non, monsieur!" she replied, with great gentleness. I assured her it was the case. "Non, monsieur!!" she replied, with greater gentleness. "Madame," said I, "it has twice over given me a headache, from whieh," laying my right hand flat on my forehead, "I am suffering at this moment." "Non, monsieur!!!" she replied, so gently and so faintly, that I could hardly hear it. "But, madame," I added, "I have no desire to leave you. Would you be kind enough to allow me to remove to the apartment at the top of the house which I first saw, for which I should wish to pay the same as for this one?" "Certainement, monsieur!" she replied, gently bowing her head, and looking as placid, as kind, and as anxious to oblige me as ever, and, accordingly, in less than a quarter of an hour the migration was

Hosted by Google

effected. From the above anecdote, trifling as it may sound, Mr. Chadwick and the Board of Health would, no doubt, be able to draw a most important moral. I leave them, however, two stories below me, to trace to its secret source a tiny cause, which, in a region high above cesspools and drains, had created a stratum of impure air, the past, the ever present, and the still future source and nourisher of fever,* which, had it been inodorous, I should most certainly have remained in.

THE
HOMŒOPATHIC TIMES.

SATURDAY, MAY 29TH, 1852.

THE whole world is now in a state of transition. The old empires of Japan and China are feeling the throbs of an unborn life; ancient Asia palpitates with the burden of the future; the depths of isolated Africa are penetrated by the subtle influence of coming Change; young and mighty America, the vigorous North and the glowing South alike, reverberates the prophetic intimation; and Europe, the Step-dame of Civilization, trembles to its centre.

Voices of the Future startle the magnetic minds which sympathise with the Invisible. It is in this state of things that a Medical Reform has been proposed that has shocked the occupants of Academical Chairs, and occasioned the angry growls of corporate Medical Bodies.

What change want they? They do not wish to feel any new life under their dry bones,—they are satisfied with things as they are. They will not see that the wonderful changes that have marked the progress of the Nations during the last half century must affect the profession of Medicine.

What need of earnest purpose—of vigorous resolution—of undaunted moral courage—of direct integrity—have they who profess to be the pioneers and champions of this Medical Reform! Such men as Fletcher of Edinburgh was, are those we want—energetic and downright men.

"From drugs intended to impart
Relief to sickness, care, and pain,
The doctor, with pernicious art,
Extracts a *poison* and a *bane*."

That is, misapplied drugs, given in gross quantity, act as poisons; used according to the law of Harmony, the law propounded by Hahnemann, they are *curative*.

Medicine is subject to mutations as well as kingdoms and empires; but though it has undergone innumerable changes, yet the humour of its professors is much the same.

"Many a truth is like a wolf—which we hold by the ears; afraid to let it escape, and yet scarcely able to retain it. It was a saying of the selfish Fontenelle, that if he held the most important truth, like a bird, in his hand, he would rather crush it than let it go forth. Lessing, the German, on the contrary, found such a delight in the investigation of truth, that he professed his readiness to make over all claim as its discoverer, provided he might still be allowed to pursue it. Nor can we wonder at his holy ardour, for to follow truth to its source is to stand at the footstool of God."

Hahnemann *did not crush the bird he held in his hand, but let it go forth;* and thence the enmity of sciolists to him.

If there is a *local* sympathy, to be without which is to want a faculty, and if, as is so forcibly expressed in the noble language of Dr. Johnson, "that man is little to be envied whose patriotism would not gain force upon the plain of Marathon, or whose piety would not grow warmer among the ruins of Iona," how much more to be deplored is the want of sympathy for the progress of an Immortal and Indestructible Truth; and how little indeed is that man to be envied who cannot sympathise with Howard during his mission of benevolence, with Gardiner during his mission of Christian love, and with Hahnemann during his of medical philanthropy.

Each of these men, in his degree, showed in his life and sacrifices and sufferings how well he understood philanthropy as defined by Cicero:—*Ad tuendos conservandosque homines hominem natum esse. Homines hominum causâ sunt genera ti, ut ipsi inter se alii aliis prodesse possint. Hominem naturæ obedientem, homini nocere non posse.* "For the de-

* Paris is infinitely less healthy than London. And it is probably owing to inferior sanitary arrangements, and especially to defective drainage, that while the comparative mortality of the population of London, exceeding two millions, is 2.5 per cent., the mortality of the population of Paris, rather less than one million, is 3.3 per cent. In other words, there die annually in clear bright Paris, about 7,000 persons more than, out of the same amount of population, die in smoky London.

fence and preservation of men was man born; the very end of the being of men is that they should help one another as much as possible. The man who is true to nature cannot injure any of his fellow-beings."

Correspondence.

METROPOLITAN HOMŒOPATHIC HOSPITAL.

To the Editor of the Homœopathic Times.

SIR,—The reports recently published in your columns of the festive meetings held by the supporters of the homœopathic hospitals in this metropolis, afford no inapt opportunity of considering the present position and future prospects of these Institutions, especially in their bearing upon the true interests of the great medical reform which now commands the attention of all classes of society. It has long been an undetermined question among the friends of homœopathy how far that science is benefited by the establishment of hospitals for its practice. For myself, I certainly was at first of opinion that, independently of the boon conferred upon the poor, a very great amount of benefit would ensue to the Cause, and the truth become more widely disseminated by the foundation of hospitals. But recent experience of the faulty principles upon which these establishments were founded, and the manner in which they are conducted, have induced me to change that opinion, and I now look upon the existing homœopathic hospitals as one cause of the little progress (little when compared with its mighty value) made by the science of homœopathy in this country. To render this clear, it is only necessary to glance at the history of these medical charities. The first of those now existing was established in Golden Square, under the title of "The London Homœopathic Hospital." The aim of its promoters was excellent; they sought, by the gradual introduction of homœopathic treatment amongst the poor of this great city, to procure well-authenticated statistics as to its efficacy in the cure of disease, while they would afford to old-school practitioners ocular demonstration of what they refused to acquire by reading, and upon the strength of which they would no doubt have been successful in their application to Government for a charter to form a college or school of homœopathy. Of course, no statistics could be of any value unless *true* homœopathy were practised; it was therefore essential that the medical men connected with it should not be mere experimentalists, but steady followers of the principles of the homœopathic law, and practising it according to the rules laid down and proved by Hahnemann, its great discoverer. To ensure this, as well as that its medical officers should be gentlemen, *sans reproche*, it would only have been necessary to have formed a council of half a dozen of the leading members of the medical profession, by whom the appointments should have been made. In place, however, of this rational mode, a fundamental rule was adopted, that the medical officers of the London Homœopathic Hospital should be selected *only* from the members of the British Homœopathic Society. Now the rules of this private society were not agreeable to many; the charge of several guineas annually was disagreeable to some, and for numerous reasons many highly-qualified members of the profession had not only seceded from this Society, but others would not, or could not, become members, and were consequently excluded from candidateship to an hospital hampered with such rules as those which govern the medical department of the London Homœopathic. To obviate the effects of this rule, and to endeavour to obtain statistics on a more extended basis, and to afford scope for talent and energy, *said* to exist, but which had hitherto been, as was supposed, oppressed and persecuted, a few gentlemen, themselves members of the British Homœopathic Society, urged by lay-friends, determined to try the experiment of establishing another hospital upon more comprehensive principles, and in April, 1850, the Hahnemann Hospital, in Bloomsbury Square, was founded. The promoters were determined that the utmost liberality should prevail; that no exclusiveness should militate against the success of the undertaking. They gave Scylla a wide berth, but, as a natural consequence, only to fall into Charybdis. The doors of the new hospital were thrown open to all medical practitioners desirous of joining it, and all who joined were to be on the footing of a perfect equality. No test of homœopathic fitness,* beyond the production of an allopathic diploma or degree, was adopted. No questions were asked. No breath against professional reputation, no whisper of unprofessional conduct was allowed [illegible] a candidate for admission—all were received with open arms, in the supposition that party interest should have no sway, and that merit alone would find its level; but, alas! Mr. Editor, your pages have too truthfully recorded the unhappy results. Thus we have in London, at present, two homœopathic hospitals, both, though from different causes, equally inefficient as far as the promulgation of the truth of the science is concerned;—the one, by an obstinate adherence to an exclusive rule, circumscribing its own usefulness, the other, by the inconsiderate adoption of a baneful principle, nullifying its own labours. The one crushing into insignificance the statistics it was formed to magnify, the other rendering its statistics useless, as flowing from an adulterated source. Could the funds of these two medical charities be thrown together, and one establishment be formed, under the guidance of a council of ten or twelve of the leading men of the country, I have no doubt, Sir, but that a great and permanent hospital, school, and college, worthy of Great Britain and homœopathy, would spring from the auspicious union; but the consent of the parties, so necessary in all alliances, is here wanting, and I much fear they must be left to struggle on through their present unhealthy existence as best they may. But there is no disease

* This remark of our correspondent applies equally to the other Hospital.—ED.

Hosted by Google

without its remedy, and I have lately seen what appears to be one for this crying evil in your own columns. I allude to a letter from the Hon. Augustus Moreton, a gentleman well known as an excellent and scientific homœopathist, suggesting the formation of a children's hospital, under the guidance of a competent medical council and medical staff. It seems to me that the establishment of such a charity, in the manner prescribed, would at once afford the widest scope for the practice of the science and the attainment of satisfactory statistics, as well as the enormous amount of benefit to the poor *and to the country*, in evil prevented to the next generation. Surely, Sir, this scheme has not had the attention it deserves, and you could hardly do better for homœopathy, in my humble opinion, than press your readers to support the wide-spreading and genial philanthropy of its proposer. If my remarks should find a place in your columns, I shall do myself the pleasure to address you a few lines on the same subject at some future period.

I remain, Sir, your obedient servant,

LIBRA.

To the Editor of the Homœopathic Times.

112, Gloucester Place.

SIR,—It is with great regret that we appear again before the homœopathic public. But two extraordinary papers printed and circulated among the subscribers to the Hahnemann Hospital, by order of the present Board of Management, leave us no option. The first of these papers purports to be a report of the last general meeting of subscribers. It commences by giving the annual report of the Board of Management. This report was not passed unanimously, the four seceding members being dissentient; so that, as far as regards any difference of opinion between these and the majority, it is an *ex-parte* statement. The statement made by the seceding members of the Board of Management of their reasons for retiring is *wholly suppressed;* but Lord Robert Grosvenor's speech, which was favourable to the majority, is given at length.

It is also stated, that it was moved by the Honourable A. H. M. Moreton, "that the formal appointment of clinical lecturers by the Board of Management be not approved." The resolution actually moved by him being, that the formal appointment of clinical lecturers by the Board of Management be not approved, *but that, in accordance with the written opinions of the majority of the Medical Council, clinical instruction and lectures be given by the physicians and surgeons of the Hospital, without title of any sort.* The first version making him apparently move a resolution against clinical lectures, while the resolution that was actually moved was, *that clinical instruction and lectures should be given.*

In the second paper we find the words "it has been asserted." Here follow the assertions. If these are intended to represent the statements of the retiring members of the Board of Management, we think that, in common fairness, they ought to have been the statements actually made,* or words substantially representing their meaning.

The remainder of the paper is chiefly taken up in justifying the *majority* of the Board of Management in advocating *compulsory* delivery of clinical lectures, from which the reader would naturally infer that the minority was opposed to compulsory clinical lectures. The fact, however, being, that the four seceding members of the Board were of opinion that it should be *compulsory* on the Medical Officersof the in-patients to give clinical lectures or instruction, but without any medical title or precedence. The question, however, of voluntary or compulsory lectures was never at any time before the Board of Management. The real question was, whether Dr. Curie should be appointed by the Board of Management lecturer on clinical medicine to the Hahnemann Hospital, there having been no recommendation from the Medical Council for that appointment.

One word more. In the Report of the Board of Management for the last year, it is stated that they "accepted the offers of Drs. Curie and Henriques to deliver clinical lectures." This is hardly consistent with the fact. These gentlemen offered themselves, in answer to a public advertisement, as candidates for the clinical lectureships; their offers to lecture as the appointed clinical lecturers to the Hospital were accepted. It was stated at the time by the minority, that if these gentlemen would lecture as simple medical officers, and not as *the appointed lecturers of the Hospital*, our opposition was at an end, for it was the title of *clinical lecturer to the Hospital* that was offensive to the other medical officers, as conferring a medical superiority. I have mentioned this, as the wording of the passage in the Report might mislead a casual reader into the idea that no medical men had been appointed to the office of clinical lecturers to the Hahnemann Hospital.

Although we have at present retired from all connection with the Hospital, we hope, with a view to its future success, that the new Board of Management will take advantage of the experience of the past, and, by strict impartiality in the management of its medical affairs, show its disposition to be advised by its Medical Council, and thus by degrees recover that public confidence which has been so unwisely tampered with, and for a time lost, and that they will in future abstain from circulating such partial and inaccurate documents at the expense of the funds of the charity.

We remain, your obedient servants,

A. H. MACDONALD MORETON.

HOMŒOPATHY IN SWEDEN.

By Dr. Liedbeck, of Stockholm.

(*Continued from page* 601.)

I give now a few cases of another of our colleagues, Dr. Mörth, who having been cured by me of an obstinate diarrhœa by a few globules of *Rhus* 3, and who, from having read the Organon, now recognises the superiority of the doctrine of Hahnemann. He writes to me thus: "I have commenced seriously the contemplation and study of Hahnemann's Organon, which I have had since your translation first appeared. The more I read and compare, the more I am delighted with the homœopathic explanation Hahnemann gives of cures performed in the olden times; nay, it is infinitely more satisfactory than the hypothetic blind-man's game of the old allopathic system. Homœopathy gives us something definite and decisive—an absolute natural law, indisputable and everlasting; and the time cannot be far distant when its great originator will be acknowledged as the Linnæus of medicine. I have succeeded beyond expectation in some cases I have treated according to the homœopathic indications, though not with such small doses as Hahnemann recommends. An immediate beneficial effect was produced in the case of a young lady, who suffered much from constipation and headaches, from one-eighth grain doses of *Extract of Opium*. I have also found, during the prevailing epidemic of scarlet fever, that the vaunted remedy of *Carbonate of Ammonia* was superseded and happily displaced by remedies chosen from individualising each case, according to the Hahnemannian prescript.

"I am still, however, in doubt about the theory of potency and of the small doses; but this is a matter of experience."

In practice Dr. Mörth has not yet in all cases thrown away the antiquated medicine à la Molière: "*Venam secare, ensuite purgare, repurgare, mixturare,*" etc. But if these opposite principles still keep place in his peaceful mind, perhaps in some measure from the old maxim, "*Volenti nulla injuria fit,*" his letters record several cures with the recognised direction of the cardinal rule of the Hahnemannian doctrine, *similia similibus curentur.*

I begin with his relation of a catarrhal affection, with which he was himself affected.

"After having taken a violent cold, on a damp night in the month of June last summer, through travelling against the wind, I commenced coughing, and felt at the same time a soreness in the throat, without any pain when swallowing. The principal symptoms were, severe cold in the head, with copious secretion of a thick matter, sometimes mixed with blood, and at times bleeding from the nose; the eyes were red and running, and my hearing very much impaired; hoarseness amounting almost to *dysphonia*, and a burning sensation in the posterior part of the throat. The cough was incessant and most violent, and the expectoration very abundant; the rattle from the lungs could be heard at a distance of several feet. The expectoration was sometimes thick, greenish, sometimes thin, but always mixed with a number of air-vesicles. My appetite was fair, but my bowels acted only every other day. Having tried in vain *Euphr.* and *Mercur. viv.*, as well as *Sulphur*, and as I was obliged to see my patients during the whole time, I expected serious consequences from this protracted illness. I was getting thinner, and felt weak and exhausted on the slightest effort. The violent effort of coughing at last produced such strains in the left groin, that I began to fear I should be ruptured. But this symptom gave me indication for *Nux Vom.* Now the scene changed at once. After the first day the cough began to diminish, and the pressure in the groin became so much better, that I was no longer obliged to press my hand on it when the cough came on. From that moment my recovery progressed; I was completely restored by the repetition of a few doses of *Nux Vom.*

"*Case* 2.—Miss G—, aged thirty-eight, has suffered during many years from gastralgia, and latterly her abdomen had become much expanded and enlarged, as if she was *enceinte*, probably in consequence of visceral obstruction and consequent intumescence (Sauvages, the *hyposarque* of Linnæus). Her face was pale and some-

Hosted by Google

what sallow; the appetite in general good, though at times indifferent. The periods were regular; so also the evacuations of the bowels; the abdomen distended and hard, at times uneasy, and the size has neither decreased nor increased since I first measured her. She complains principally of difficulty in moving the body, and the stomach is somewhat tender to the touch. Indurations cannot be detected by manual examination. The urine, which is thick, is diminished in quantity; no thirst; pain when in a horizontal position; the lower extremities not swollen, but generally stiff after walking.

"*China* relieved here all the pain and tenderness, and though the stomach is still as much enlarged as before, in some measure from ascites, the patient is very satisfied in being without any of the suffering she endured before. She is still under my care.

"In a case of delirium tremens, with tremor of the hands, I have seen relief from *Digitalis Tinct.*, a few drops in four ounces of water, a teaspoonful for a dose every second day. The patient is now completely restored. What strikes me most in this case is that the patient has entirely lost his passion for strong liquors. Of *Ant. crudum* I have seen good results in a case of cephalalgia; so also of *Ignatia* in cases of cardialgia, complicated with a sinking feeling in the pit of the stomach. In two cases of amblyopia I have restored the sight only through the adherence to the homœopathic principle.

"*Case* 3.—A woman, married sixteen years, and the mother of six children, after having become aware of the unexpected but certain fact of her husband's infidelity to her, suffered from all the symptoms of unrequited love—crying, despair, pain in the epigastric region, restlessness, losing her appetite, and suddenly becoming thin, etc. I prescribed two grains of *Extract. Hyoscyam.*, with *Sacch. Lact.*, divided into fourteen parts, and told her to take one powder two or three times a day when she periodically became worse. She felt better immediately after the first powder, and her improvement gradually progressed every day. After some time she used to take only one or half a powder occasionally, when her symptoms, though in a less degree, reappeared. She was well before all the powders were finished, though the cause of her illness still continued.

"I will only, *en passant*, mention an observation I have made, which I translate in the following way: the action of a remedy, for the application of which there is full indication, is considerably assisted when it is at the same time externally applied. For instance, if we have to treat an ophthalmia, in which the patient complains of a sensation as if there were sand in his eyes, and also in other respects, *Nux Vom.* is indicated for internal use; he will feel immediate relief by a collyrium of from ten, twelve, to fifteen drops of the *Tincture of Nux Vom.*, in three or four ounces of water. I have in several cases ascertained this fact."

What has already been related proves sufficiently that there are more homœopathic physicians than one in Sweden. The list of names of those who have been or are still active in the cause of homœopathy, and which I give in the subjoined note,* will not be without interest, when once the history of the new medical reform is to be written. Besides, at the present moment, several allopathic physicians are in correspondence with me, having commenced inquiries and studies of the principles of our doctrine; amongst whom I may mention the celebrated Uncle Adam, the Eugene Sue of Sweden, his attention having more particularly been drawn to the subject since his wife, after having in vain tried the resources of the antiquated medicine for a uterine hemorrhage, was cured by a few globules of *Belladonna.*

We need not pause to inquire whether or no Dr. Hamberg is right in his allegation, that there is no homœopathic chemist in Sweden, for in fact there *are two*, both well conducted and honourably sustained. I do not contend for myself, but only for full liberty in dispensing my medicines, as well as in thought and action, according to my *conscience and understanding*, in harmony with my oath as physician, to which I will be true till death.

"Mr. Asker, proprietor of the apothecary's shop "Lion," in Norrköping, has, during the last autumn, of his own accord and out of professional interest, provided himself with an account of Dr. Grüner's preparation, containing medicines, mostly in the billionth, and several in much higher attenuations, either in globules or in tinctures. Besides, there is also a complete collection of the necessary, but generally more scarce animal medicines, viz., *Anthrax, Hydrophobicum, Lachesis trigonocephalus, Psoricum, Sepia*, etc. Of the *mother tinctures*, there are several in great quantities, viz., *Rhus, Arnica, Nux Vom.*,

* George Wahlenberg, M.D., Professor at Upsala, deceased; P. Liedbeck, M.D., Stockholm; C. Söderberg, M.D., Sigtuna, deceased; S. N. Selldén, M.D., Wexió; C. Bergman, M.D., Halmstad, deceased; D. Petersson, M.D., Calmar; F. Noréus, M.D., Norrköping; N. Mörth, M.D., Linköping; and C. U. Sondén, M.D., Stockholm (relapsed to allopathy.)

Symphytum, etc. There are other remedies, either foreign to the Swedish Pharmacopœia, or out of common use, viz., *Euphrasia*, *Pulsatilla nigricans*, etc. Everything is well secured in glass bottles with stoppers; the whole laboratory is nicely fitted up, and is kept in a separate building, in which no drugs in the gross form are kept, and there are, besides, a very good balance, with scales of platina, with measure-tubes for 100 or 200 drops, etc.

"P. SCHIERMAN, M.D.
"L. P. HANSEEN, M.D.
"T. NOREUS, M.D., Homœopathic Practitioner.
"C. F. ASKER, Apothecary, Proprietor of the Apothecary's Shop "Lion," Norrköping.
"F. BERGSTRÖM, J. BARCK, Pharmaceutic Candidates.

"Norrköping, 26th April, 1852."

The following document has been kindly forwarded to me by our colleague in Calmar, and is signed by him in his capacity of town-physician.*

"I beg to state that there is a separate department in the apothecary's shop, in Calmar, for homœopathic medicines, partly prepared there according to the Pharmacopœia of Grüner, partly imported direct from Dresden.

"D. G. PETERSSON, M.D.

"Calmar, 26th April, 1852."

If love of truth is the test of the true philosopher, our Swedish allopathic brethren have proved themselves to be possessed of very unphilosophical minds. It may be that Sweden is behind in the new medical reform, as well as in many other improvements, viz., railroads, electric telegraphs, etc., resulting from the more inquiring and progressive spirit of our age; indeed, I think Sweden, next to the Celestial Empire, is the most stationary country in the world. But it remains for us to hope that the small phalanx of men now engaged in the question of liberty in thought and action in medical matters, will not fail to do their duty in a country which was once the foremost in the defence of the civil and religious liberty of mankind.

As I may not again soon have an occasion to appear in the columns of your valuable journal, I take the opportunity of making a few observations on a case of mine already recorded in the *Homœopathic Times*, March 2, 1850, p. 456. I there stated, in the case of Mrs. B—g, that *Arsen.* 3 did not yield any good effect in her *typhlitis*, but that *Ignatia* gave relief, and was curative. It occurred to me during the following year, in 1851, that as the patient used to sleep in a room papered with green colours, they might contain *Arsenicum*—in fact, by a chemical test this was found to be the case. The key to the riddle was now found. Mrs. B. used to be mostly affected during the winter season, and towards the spring, until the windows could be kept more open. I advised her to procure new *papering*, altogether free from *Arsenic*, and since she adopted my advice, the repeated attacks of *typhlitis* have ceased. The reason why *Arsenicum* did not give any relief is here perceived. *Ginseng*, on the contrary, cured her last attack much more strikingly and speedily than *Ignatia* previously used to do. There is also no remedy with such a special action on the cœcum as *Ginseng* (see *Noack and Trinks' Arzneimittelehre*, and *Allg. Zeitung für Homœopathie, Sympt.* 86, 89, 105, etc., but principally 121, 124, 125, 128, 129). I have also in typhus abdominalis, with affection of the cœcum, found in *Ginseng* 2 and 3, a specific remedy. I think, therefore, that this remedy deserves the more general attention of our continental colleagues; more perhaps on account of its pharmaco-dynamic character than from the few cases which have occurred in my practice, since my attention was first drawn to the subject in the above case.

* By town-physician is meant the medical officer appointed to perform post-mortem examinations, and to exercise many of the functions of a health officer.

HAHNEMANN'S VIEWS ON COLD WATER AND MOVEMENTS.

Read by Dr. Roth at the Meeting of the Hahnemann Medical Society, the 6th of April, 1852.

(*Continued from page* 629.)

"*Exercise and Bath.*—The weakness of the patient, sometimes also bad weather, make it indispensable to take moderate exercise before and after the cold bath; an incomparable remedy to keep up the circulation. The increased warmth of the blood produced by movement is then capable of more easily resisting the cold of the bath, and the muscular fibres and vessels contract more uniformly. Even by these means we have the advantage that the cold bath does not produce cold, and that we are enabled to increase the degree of the cold more quickly, than we could if the patient were obliged, unprepared and suddenly, to undergo the influence of the cold water. The exercise before the bath must be moderate, so as not to produce perspiration, because it would be very injurious to

Hosted by Google

expose the body in this state to the cold of the bath. The exercise after the bath may be somewhat increased, but even then neither perspiration nor fatigue must follow it; under similar restrictions we may anticipate immense advantages, which cannot be obtained by any other means.

"If during the after-treatment, the bath is augmented to the full bath, and the cold as well as the duration of the bath are daily to be increased, I prescribe to my patients one or two glasses of wine and water. I have frequently had an opportunity of observing the manifestly good effect of this prescription, which will be easily understood by those who reflect upon it. I add to the rules of the application of cold water another very essential circumstance, exactly connected with the previously-described manipulations.

"From the first slight immersion to the coldest full bath, those parts of the patient which are in the water, as well as those adjacent, are rubbed with woollen cloths, and the strength of the friction is greatest when the patient is about to leave the bath. The friction can be done either by the patient or an attendant. Immediately after the bath, the same parts are rubbed for one or two minutes, either with dry cloths only, or with others impregnated with the vapours of spices and resins, and generally the friction after the bath is much stronger; then the parts are covered, and, according to the state of the strength, a walk from a quarter of an hour to an hour is prescribed.

"If we wish to increase the cold of the bath more speedily, the friction must also be used before the bath, on the parts to be immersed, which manipulation has advantages not to be procured by any other treatment. With the assistance of friction, the weakest person can make use of the coldest bath.

"The friction is to be extended to the parts surrounding the sores, which are the principal places to be strengthened, and where obstructions of the vessels are to be removed. Care must be taken that the friction be executed lightly and cautiously at first, and with proper regard to the scared places.

"My recommendation of the cold bath and suitable diet as the principal means of a strengthening cure of chronic ulcers is based on the most striking and numerous experiments, for which reason I claim in this respect unlimited confidence. A great advantage of this excellent remedy is, that even the poorest may readily make use of it without any circumstantial prescriptions, except those already mentioned; like the rich, they can walk before and after the bath, rub themselves, keep the water around the immersed part in constant motion, enjoy the fresh air, and for wine they can substitute good beer.

"*Curative Effects of Cold Water.*—During many years, when I was ignorant of any specific remedies for old chronic diseases, I frequently combated them successfully solely with cold washing, cold foot-baths, and also with immersion for one minute at a time in water of from fifty to sixty degrees Fahrenheit. One case, however, among many others, is so remarkable, that I cannot refrain from detailing it. A man, somewhat advanced in years, but still possessing considerable strength, had had for five years, from an unknown cause, a paralytic affection of his left arm. The movements he could perform with it were very weak and few, and the sensibility of it also was much diminished. On one occasion, when he was on a visit to a relative, and there was no one to fetch the fish for the supper, out of a frozen tank, he got up quietly, broke the ice, leant over it, and passed nearly an hour with both arms in the ice-cold-water, before he could get out the required number of fish. He brought them, to the great delight of his host, but immediately complained of pains in the affected arm, which in the course of a few hours inflamed. The following day, the pain and inflammation were gone, and his arm had acquired its healthy sensibility, and all its power of movement. The arm was cured and remained so.

"*Internal Strengthening Cure.*—All internal strengthening remedies, as well as the external treatment, must be increased by degrees, in proportion to the increase of the strength of the patient, which rule should be applied even to the daily portion of wine prescribed.

"In general I am unable to give, with respect to wine, a fixed and certain prescription. A man accustomed to wine can take a considerable quantity without injury, while the same amount would make a boy ill. To poor persons, who cannot forego the use of brandy, I do not forbid it, but I diminish its quantity. I have observed irreparable loss of strength in persons accustomed to wine and brandy, if I had forbidden these liquors; notwithstanding this practice, contrary to the rules, I still radically cured many persons. But when both these strong liquors, from having been taken to excess, were the sole cause of the corruption of the humours, and when this intemperance threatened the total ruin of their health, or had already affected it, then I pursued another course, if there was one. In the

Hosted by Google

beginning I positively refused to cure their ulcers; if by my refusal they became the more desirous and resolved to do and to permit all to be done which I thought proper, then I pointed out to them the danger in which they were, either of remaining uncured, or even of soon dying miserably, if their manner of living was not entirely changed. I showed them the only course to be followed, and if they exhibited perfect firmness and resolution, I treated them in the following manner.

"I permitted the poor, accustomed to brandy alone, for several weeks to drink their usual quantity of this terrible liquor, on condition that they drank, after each small glass of brandy, a large tumbler of water. Afterwards I diminished by degrees the quantity of brandy, while I increased the cold water, till I attained the point at which they drank much water and little brandy. If they still continued to have full confidence in being cured, and to be obedient, notwithstanding my strictness, I then allowed them to follow the last course for a certain time, so that at least six months should pass under this general and thorough penance. If their health was in fact still capable of some improvement, it was by this treatment; nutritious food and exercise were good accessories, and finally, the strengthening remedy and a suitable treatment of the sore, completed for the most part the cure. Every one knows as well as myself that such patients are the most difficult to cure; therefore they will believe me when I assure them that many remain uncured. The tyranny of habit, poverty, and prejudice, with frequently irreparable dryness of the fibres and debility of the nerves, were often sufficiently potent to produce death.

"No treatment has been more effectual in curing wine-drunkards than the water-cure, the gradual change of their previous mode of living, exercise, exhilarating occupations, and wholesome food; finally, external and internal strengthening treatment, as well as the proper dressing of the ulcer.

"*Local Treatment.*—Cold water is the only means which I use in the inflamed swelling around the ulcer; the cold water prevents, without any additional means, the inflammation and swelling, and besides, if the sore is cleaned, keeps its humours in good order.

"If the old sore is on the leg, this part ought to be immersed in cold water daily, two or three times before the bandage is changed. The sore is covered with a slight bandage; the suffering part must not on any account be exempted from the cold bath, its greatest remedy.

"*Reopening of the Ulcers.*—Generally in all these cases, the strengthening treatment of the body is either neglected or not sufficiently increased, therefore we must use the cold bath twice instead of once a day, or thrice instead of twice; the temperature of the water should be increased several degrees. The patient ought to remain in the bath some minutes longer than before; he must be more deeply immersed; the friction ought to be extended over the whole body. He should wear woollen shirts, and if the friction had been done hitherto after the bath, it ought now to be done also before the bath, and in the water itself. The bodily exercise is to be increased a little; the meals must be rendered more nutritious, principally by meat and a little spice.

"If the patient is bandaged with a firm bandage, when suffering from chronic ulcers of the legs, he is prevented from taking exercise, which is most tedious for poor persons, who, when deprived of the use of their legs, have not the means of being driven in a carriage; and *strengthening the body without movement is not to be thought of.*

"*After-treatment.*—I generally endeavour to render the cure of my patients as agreeable to them as possible, because diseases are already sufficient evils in themselves. My principal aim is to make a simple and radical cure; and for those patients suffering from chronic ulcers in the feet, how light is the burden which is imposed upon them during the treatment. I endeavour to obtain this ease of cure chiefly by the simplicity of the prescribed rules and remedies; but then I exact the most implicit obedience, the more so, as this virtue is in the power of every one from whom I claim it. Without this we can do as little as to attempt to construct a watch with the most exactly-worked wheels, which are not properly put together.

"As I substitute for the infinite mingle-mangle and hodge-podge of contradictory prescriptions, and for the burden of debilitating, improper curative methods following each other, with the view of restoring the strength and health of the patient, a simple energetic treatment, universally applicable and easily carried out, so for their own good, I impress upon my patients, after their sores are healed, that they should persevere in this wholesome mode of living, and continue the internal and external strengthening cure only for a certain time, longer and shorter, as I may determine, according to the importance of the disease cured. I proceed as follows. The duration, the temperature, and the number of the cold baths I recommend to be continued for a

Hosted by Google

certain time *i. e.* a fortnight, or from four to six weeks uninterruptedly, then they are diminished for a time, from about one to two months. For instance, I prescribe, instead of bathing thrice, for a time only twice, and finally, only once; instead of 35, 40, 45—50 to 55 degrees; instead of the full bath the shallow, and finally, the footbath; instead of the strong friction before, in, and after the bath, over the whole body, gentle friction by degrees only in and after the bath; finally, only in it over half the body, and only around the scared parts; the duration of twenty minutes decreased by degrees to ten and six minutes. These gradual changes are not at all inconvenient to the former patient; the body becomes progressively less accustomed to the high degree of the strengthening cure, and still preserves the firmness of its fibres."

[We have already remarked that these views of Hahnemann, which so remarkably indicate his decided preference for what has been called "simple treatment," in comparison of the drugging system, were published before he arrived at the happy inspiration of the homœopathic law. We will take an early opportunity to show what were his views on the subjects Dr. Roth has illustrated, from his earlier as well as his lesser writings, *after* he propounded homœopathy. —Ed.]

STRAY NOTES.

By an Old Practitioner.

(*Continued from page* 637.)

II. *Vitalism and Vetulism.*

These two terms perhaps read, look, and sound as well in juxtaposition, and convey at least as clear and distinct ideas, as the names homœopathy and allopathy. The word vitalism, of course, needs no explanation, its meaning in relation to our system is at once perceived by whosoever has rightly understood Hahnemann's doctrine. Of vetulism I said, in a previous article, that it appeared to me the most appropriate term by which to designate the ordinary mode of treating disease, and I promised to justify so uncomplimentary a title forthwith.

When we speak of medical art in the ordinary sense of the word, we simply mean the therapeutic branch of medicine; and speaking of therapeutics, we mean, in the same sense, almost exclusively, the application of those dynamic agents generally called medicines. It is, of course, essential that a medical man, before he makes use of medicines for the eure of disease, should know what the therapeutic properties of these agents are. In homœopathy the trial of the medicines on persons in health is the principle which reveals to the practitioner their therapeutic virtues; but allopathy has no such principle. It has endeavoured to find it in chemical investigation and has failed; it has scrutinized the smell, taste, form, colour, and the physical properties of medicinal substances, and has been disappointed; it has tried its medicines upon animals, and has tortured the poor creatures in vain; it has thought that certain plants and minerals would exhibit their medicinal properties according to their position in the modern system of botany and mineralogy, and has found itself mistaken. Finally, in depair, it has thrown itself into the arms of conjecture and empiricism. The latter, however (*usus in morbis*, the use or rather abuse in disease), is the sheet-anchor of the ordinary therapeutics: a medicine is given in a case of disease, *because it has produced, or is said to have produced, beneficial effects in similar cases.* Now this same sheet-anchor of the principal portion of the ordinary allopathic art is also the sheet-anchor in the ordinary "old woman's" practice. An "old woman" (*vetula*) recommends and gives her medicines exactly upon the same meagre principle as the allopath, *ab usu in morbis*; therefore, as far as principle is concerned (aye, and practice too), there is hardly a difference between allopathy and vetulism; and if there is, it is rather in favour of the "old woman" than of the allopath. For her "system" is as old as mankind itself; she generally gives simples, and does not mix half a dozen powerful medicines together; she thereby does infinitely less harm, and can follow the effects of such simples with much greater clearness and precision than the allopath can the effects of his mixtures. Moreover, she seldom or never bleeds, leeches, salivates, cuts, and burns, as the allopath does; and last, though not least, she never tries to deck out her simple experience in tawdry rags of subtle theory and clumsy speculation. I need not pursue the subject further, and shall only add, that taking these various facts into consideration, one arrives, through an easy *sorites*, at the inevitable and strictly syllogistic conclusion, not only that allopathy does not essentially differ from "old woman's" practice (vetulism), but also, what on the whole experience confirms, that it is safer to intrust the treatment of disease to a cautious "old woman" than to a drugging, drenching, bleeding, leeching, salivating, blistering, cutting, and burning allopath, with his raw and coarse notions of the therapeutic properties of medicines, and of the susceptibility of the organism in a state of disease.

THE
HOMŒOPATHIC TIMES.

SATURDAY, JUNE 5TH, 1852.

IF to the illustrious BACON we are indebted for the method of dissipating false philosophy, and of investigating and discovering the truths of Science, and to LUTHER we owe our freedom from the incrusted usages of hoar Antiquity, it is to HAHNEMANN that we must ascribe the praise of being at once the BACON and the LUTHER of Medicine. He first, in the large sense, applied the inductive method to Therapeutics; and he is the father of the Medical Reformation, as the first who resisted the authority of Centuries and of Names, and broke through the cobwebs of academical and traditional learning.

He opposed the spirit of mere dogmatic systems. He was an observer of Nature, and a collector of facts; and he rejected the hypothetical and gratuitous assumptions of medical theorists.

He cared not a jot for the chemical or alchemical, the mechanical or the mediæval barbarisms. He knew that the human body was not a stock nor a stone.

Dr. WILLIAM HUNTER, one of his contemporaries, was of his mind in respect to all delusive hypotheses; and, like HAHNEMANN, ridiculed the theorists who run themselves perpetually on the shallows. With respect to the stomach, that great physician and physiologist thus delivered himself to his wondering class. "Some physiologists, gentlemen, will have it that the stomach is a mill; others that it is a fermenting vat; others again, that it is a stew-pan; but, in my view of the matter, it is neither a mill, a fermenting vat, nor a stew-pan; but a stomach, gentlemen, a stomach."

So our HAHNEMANN rejects all theories concerning the *this* and the *that* of the human economy: his is a law of healing, whose object is the restoration of the equipoise of disturbed forces, the re-nutrition of parts that languish, the reparation of disordered functions, and the sustentation of the vital powers.

HAHNEMANN, therefore, like HIPPOCRATES, required that his patients should not be starved, but that the amount of aliment should be in just proportion to the demands for it. He knew better than to starve an old person or a child for instance. He starved none.

One of the great requirements is a digest, in one volume, of his medical aphorisms. His teaching is peculiarly aphoristical. Such a book, in *readable* English, would be invaluable to the Anglo-Saxon race. Who so fit to undertake it as CONSTANTINE HERING? Will he do it? We incite him to the task. It would be with him a labour of love, as he, certainly, was a favourite pupil of HAHNEMANN. We require a readable digest of the doctrines and practice of the Saxon Sage for the Saxon race.

ST. JAMES' (HOMŒOPATHIC) HOSPITAL, DONCASTER.

ON Wednesday, the 26th May, Dr. DUNN laid the foundation stone of St. James's Hospital, Doncaster, and made a brief and pointed address to the masons and others who had collected to witness the ceremony. The foundation stone was cut to receive a bottle containing a brief history of the rise and progress of the Hospital; a list of names of its early friends; a copy of the first circular issued; the 145th number of the *Homœopathic Times;* the *Doncaster Chronicle and Gazette; the Tourist's Guide to Doncaster and the Environs,* by G. V. T. Brook; and a "Great Exhibition Card." Dr. DUNN desiring, as far as possible, to discountenance the use of intoxicating drinks, asked the contractor, Mr. ELSWORTH, to provide a substantial supper for his workmen to celebrate the day.

The building is to be delivered to Dr. DUNN, complete, on the 1st of September next.

We have not found that any attention has been paid to the appeal made in behalf of Dr. DUNN and his enterprise, so merito-

Hosted by Google

rious on his part, and which implies so much devotion to the Cause. We do not understand this indifference on the part of homœopathists, whether medical or non-medical, to the undertaking of one so deeply pledged to our Medical Reform.

There are three constituted Medical Homœopathic Societies in England; not one of these has come to Dr. DUNN's help. We consider the homœopathic public (*pace* our esteemed historian) not at a hundred thousand, but a million, including England, Ireland, and Scotland.

"*C'est l'union qui fait la force*, in union is strength." Our medical men have to learn this principle of power. We state distinctly, that it is the duty of every medical homœopathist to assist Dr. DUNN, by getting donations and subscriptions for his Hospital. He has taken the sole responsibility on himself, and will spend his last shilling to accomplish his object; and it is precisely because he is a man of that character and spirit (we wish we had many like him), that the rest of us should come to his rescue.

We cannot conceive a worse sign than a cold and selfish and self-seeking and miserable indifference on such a subject as this.

The Manchester Hospital is the work of many, and so is the London Homœopathic Hospital, and so is the Hahnemann Hospital, and so is the proposed homœopathic hospital at Edinburgh; but at Doncaster an individual, Dr. GEORGE DUNN, has initiated, *at his own risk*, such an Institution.

We believe that, out of his own connection and neighbourhood, up to this time, only *one* person has really tried to do anything for him. *This is too bad.*

LAYING THE FOUNDATION STONE OF ST. JAMES'S HOSPITAL.—On Wednesday, May 26, the foundation stone of St. James's Hospital was laid by its philanthropic projector, Dr Dunn. The building, as we announced several weeks back, is to be erected on the west side of the town, on the slip of land between Cleveland Street and St. Sepulchre Gate, and is principally designed for the treatment of accidents and acute diseases. The apartments will be lofty and spacious, and well warmed and ventilated, the fresh air being suitably tempered on its admission by being passed over pipes heated with hot water. There will be sufficient accommodation for a considerable number of beds, which will be introduced from time to time as circumstances may warrant. The principal apartments will be the casualty ward and the fever ward—besides which there will be the surgeon's and the matron's rooms, bath-room, kitchen, washhouse, pantry, etc. The bath-room will be an excellent feature in this Institution, inasmuch as it will comprise hot, cold, tepid, vapour, and shower baths, which will be open to the inhabitants generally at a very moderate price. There is, indeed, every reason to believe that this building altogether will be a model of its kind, and that it will in a great number of ways be highly advantageous to the town at large. It is needless for us to advert to the credit which so obviously and justly belongs to Dr. Dunn for the arduous and benevolent undertaking in which he has thus engaged, and we sincerely wish that his most sanguine views with regard to its usefulness may be fully realized. The Institution being one of a private character, it was determined that the laying of the foundation stone should be accomplished as quietly as possible. Accordingly, about two o'clock on Wednesday afternoon, Dr. Dunn and two or three friends repaired to the site of the building, which had been previously excavated in a suitable manner, and after the usual preparations he proceeded to lay the first stone. In doing this he addressed a few observations to those around. He began by invoking the blessing of Almighty God on the work then about to be commenced, as without such blessing nothing could prosper, and said he hoped that this Institution might produce all the benefits that he anticipated from it. He could assure them that in this undertaking he had had no interested motives, but had been actuated by a sincere desire to provide a building where accidents and acute diseases might be properly treated. Without the assistance of many kind friends, he could not have hoped to rear a building so well adapted to the purpose as that of which he was about to lay the foundation stone. First he must mention the name of his friend Mr. Fisher, of Westfield, who had kindly given him the land; next, the liberality of Earl Fitzwilliam, Viscount Milton, Sir Joseph Copley, Mr. W. B. Wrightson, Mr. Edmund Denison, Mr. Brown, Mr. Walker, Mr. Blagden, and several others of the resident and neighbouring gentry. He ought to mention that the building had been designed, much to his satisfaction, by Mr. Haughton, of this town, and he had no doubt it would prove a great ornament to that locality. He hoped and trusted the contractors and builders would do their best to carry out the design efficiently, and then the work would be a credit to them all. He knew it was customary on these occasions to provide intoxicating drink for the workmen employed, but he had preferred to put into the hands of the contractor a sufficient sum to provide them with a supper (hear, hear). With these observations he would now proceed to lay the first stone of St. James's Hospital. Dr. Dunn accordingly took the trowel from the contractor,

Hosted by Google

and having spread the mortar "in a workmanlike manner," the stone was lowered to its bed, and the ceremony was completed. We ought to add that the contractor for the building is Mr. Elsworth, and it is to be completed in about four months.—*Doncaster Chronicle.*

Correspondence.

THE BARK OF THE ALNUS.

To the Editor of the Homœopathic Times.

SIR,—A patient, who has lately come under my care, tells me that a friend, once similarly affected, had been cured by a decoction of the *bark* of a tree, which I find is the Alnus, whether *A. glutinosa* or *incisa* I cannot exactly determine from the specimen sent to me.

The affection is an anomalous one of the skin, of some standing, sometimes, but by no means constantly, presenting appearances of purpura hæmorrhagica; there is generally an excited state of the system, which readily yields to *Belladonna*, this, however, does not *cure* the disease.

My object in writing is to inquire if any of your readers are acquainted with the properties of the Alnus (alder tree), and if these are yielded best by an aqueous or alcoholic infusion. If known to be safe, I would institute provings; but I do not wish to administer it upon the report of an unprofessional man, and he not a botanist, it being possible that he may not have selected the plant of which he had in reality taken, some years having elapsed.

I shall only further add, that I am familiar with the *external* use of the Alnus. When in allopathic practice, I was accustomed to prescribe an ointment made of the *leaves* as an useful application to excoriated nipples. It was brought under my notice by Messrs. Duncan and Flockhart, of Edinburgh. I should not have recourse to it *now* in similar circumstances. An answer from any one interested in the discovery and proving of new remedies will much oblige,

Sir, yours faithfully,
CHARLES RANSFORD.

22, Boothan, York, May 29, 1852.

LING'S EXERCISES.

To the Editor of the Homœopathic Times.

SIR,—In your journal of the 13th of March last, appeared a review of my work on the Swedish treatment, entitled "Medicina Mechanica;" but unfortunately the number containing it only came into my hands about the middle of April,—a circumstance that will account for my not replying thereto before. In this review certain grave charges are brought against my predecessor and instructor, Mr. De Betou, as well as myself; and he being then, as now, resident in Sweden, and my own share of the allegations depending on his testimony, I lost no time in forwarding a copy of the journal, with a request that he would give me such account of his education and experience in the science as would enable me to set your reviewer right on points, respecting which he has obviously been misinformed.

In the first place, it is stated in the review that Mr. De Betou "was not a pupil of the Swedish Institution." To this he replies as follows: "Ling was for many years my teacher. I frequented his lectures on the theory and practice of the treatment. I took notes therefrom; and it was during one summer, I think that of 1836, I received instruction from Professor Georgii himself in the hygienic or pedagogical department." Now, this not only refutes the former statement, but that which succeeds it; namely, that "he (Mr. De Betou) acquired the knowledge of Ling's method through his partnership with Mr. Ehrenhoff, etc."

As regards Professor Branting's formulæ having been supplied him by Mr. Ehrenhoff in "strict confidence," Mr. De Betou says, "they were lent me to copy by Mr. Ehrenhoff, and *never in confidence;* and they were publicly taught by Professor Branting, who was and is paid by Government" for the purpose. On my own part, I received the "formulæ" as a portion of the available matter with which to inform the profession and the public on the subject, and should have been ready enough to acknowledge to whom I was specially indebted for them, had I known, as I now do, the facts of the case. But after all, this disturbance about the "formulæ," together with remarks of a like nature, are surely unworthy of those who desire to spread a knowledge, so much needed in this country, of this valuable adjunct to the resources of medicine. It would have been a work of supererogation to enumerate all the authorities I consulted on the several divisions of my book; yet I believe I have done so in a fair and open manner, wherever such could by possibility be needed. To keep either "formulæ" or other kinds of information *secret* is certainly to degrade any branch of science connected with medicine. If either Professors Georgii or Branting deem themselves aggrieved by their domain being invaded by others, perhaps they will show good cause why they have permitted so many years to elapse without giving to the world some practical account of the science they practise and teach. I should have been too glad to have followed in their wake, but no alternative was left me. From whatever source your reviewer obtained his information, it is now clear, if Mr. De Betou's own statement is received—which in fairness it ought to be—that his faith in the few quarters where such could be elicited has been abused; whilst I can only add my readiness and earnest desire to afford every facility to a knowledge of the truth being arrived at.

Fearing that I may already have trespassed on your valuable space, I have therefore only to request that you will support the impartial character of your journal by inserting this letter, in justice to Mr. De Betou, if not to my own feeble efforts in the cause of medical science.

I am, Sir, your obedient servant,
J. W. F. BLUNDELL, M.D.

32, Finsbury Circus, May 27, 1852.

[The reviewer of Dr. Blundell's book of course

Hosted by Google

put down as facts what he had received as such. Did Mr. De Betou go through a regular study, with long-continued dissections, of anatomy and physiology? Did he attend the Institution at Stockholm, with a view to *practise* the exercises of Ling?

We have been informed that most, if not all, of the cases recorded in Dr. Blundell's book were in fact the cases of persons who had been under Mr. De Betou's treatment.

We have no interest in the subject beyond a wish to do justice, and we willingly publish Dr. Blundell's letter. We think that Professors Branting and Georgii should long since have published a satisfactory statement of the doctrine and practice of Ling, with full instructions as to the mode of using these exercises. The publications of Drs. Roth and Blundell will probably spur them on to the accomplishment of the duty they owe to Ling and to themselves. —Ed]

To the Editor of the Homœopathic Times.

Sir,—Dr. Ozanne has written for the learned on Dr. Routh's "Fallacies," allow me to say a word to the unlearned on the same subject. A friend paid me a visit, fresh from London and the allopathic predictions that Dr. Routh had tricked homœopathy, and Dr. Ozanne had floored himself in trying to answer his "Fallacies!" As you may suppose, my friend was no homœopathist. I asked him if he had read the book or the answer. He said that he had seen neither; but the unanswerable argument in favour of Dr. Routh was, that many, and of those many some of the first allopathic doctors ("all honourable men!"), spoke in the highest terms of his book. I forthwith bought Dr. Routh's "Fallacies" (an unlucky choice the Doctor made of a title), and read it over with my friend, pointing out the Doctor's fallacies and contradictions at every page. It was an easy task, and filled my friend with astonishment, particularly when I proved to him that the globules had nothing to do with the truth of the homœopathic system, and that many homœopathic practitioners seldom, some never, used them at all; that Hahnemann found out homœopathy, or as the learned call it, "the law of *similia similibus curantur*," long before he made or used his globules; that only the violent action of the common doses of medicine, when given homœopathically, induced him to lower and lower each dose as he found it act too powerfully on the system, till at length he invented his globules; that Hahnemann was a celebrated chemist long before he was a homœopathist. My friend was so much struck and interested on learning these truths, that he observed it was a great pity that the medicine and system should be confounded together. He suggested that the globules used by homœopathists should be called "Hahnemann's medicines," and not homœopathic medicines. Mr. Editor, if you think my friend's suggestion a good one, pray recommend its introduction into the hospitals and homœopathic chemists' shops, so that, by introducing the globules as Hahnemann's medicines, they could no longer be used by the allopaths to blind the eyes of the unlearned readers of their "Fallacies." If Dr. Routh does not understand what homœopathy is, he had better not write about it. If he does understand that globules are not essential to the system, I can only add, he is "an honourable man, so are they all, all honourable men!"

I remain, yours truly,
H. C.

May 24th, 1852.

HOMŒOPATHY.

To the Editor of the Northampton Mercury.

Sir,—You have opened your columns to the discussion of a subject of the highest temporal interest to your fellow-men,—the resources available by them when suffering from bodily disease; a trial which few, if any, at all times escape. Among the many important "topics of the day," none having reference to this life only can possess higher claims to calm inquiry and earnest attention. As I occasionally visit patients in Northampton, I hope it will not be considered impertinent or intrusive if I request a hearing upon the matter now in dispute among you. I will offer my remarks as briefly as possible.

1. Homœopathy *is not quackery*. The essence of quackery is secrecy. The individual practising it pretends to the possession of some valuable remedy—a nostrum—which he sells for his own private gain, but which he will not disclose for the public good. Homœopathy has no secrets—no nostrum—it courts inquiry, it entreats medical men to investigate it. This is not quackery.

Homœopathy, in its present form, was discovered by a regular physician, and was first published in the leading medical journal of Europe (Hufeland's) in 1796. It has been studied and adopted by many (I believe at least 3,000) regularly educated and qualified practitioners, who urgently call upon their colleagues to follow their example. They offer every facility in the way of instruction, by hospitals and dispensaries, and by private information, which it is in their power to give. This is not quackery.

2. Homœopathy *is not a novelty*. The principle was admirably announced, though not fully adhered to, because its importance was not fully recognised, by the fathers of medicine, the writers of the works bearing the name of Hippocrates, written some three and twenty centuries ago. In the treatise "On the Places in Man," we read the following prescription for mania:—"Give the patient a draught made from the root of mandrake in a smaller dose than will induce mania," if taken in health. Again; "Per similia morbus fit et per similia adhibita ex morbo sanantur. Velut urina stillicidium idem facit si non sit, et si sit idem sedat. Et tussis eodem modo velut urinæ stillicidium ab iisdem fit et sedatur. Febris....

Hosted by Google

aliquando quidem ab iisdem fit et sedatur, aliquando autem a contrariis." "It thus appears," observes the learned Dr. Francis Adams, in his translation of the works of Hippocrates, published by the Sydenham Society, "that the principles both of *allopathy* and *homœopathy* are recognised by the author of this treatise."

3. Homœopathy *is not an uncertainty.* In the letter signed "Faust," in your paper of May 8, it is remarked "that the two disciples of Hahnemann (A. M'P. and Mr. Pearce in their letters the week before, May 1) themselves differ on a most essential point, to wit, the proper meaning of the dogma "*similia similibus curantur.*" The one affirms that M.R.C.S. (the writer of the first letter on the subject) has well defined its meaning to be "that a medicine which will produce a disease will also cure *it.*" While the other (Mr. Pearce) maintains that in this definition a "blunder" has been committed, and that neither Hahnemann nor his followers ever meant any such thing. I should suppose that A. M'P. is a non-professional man; one, probably, who, having derived benefit from the new treatment, is anxious to promote its adoption, and I thank him for the tone of his letter; but it is certainly true that he admitted too much when he allowed M.R.C.S.'s definition to be correct. "A medicine which will produce a disease will cure *it*" cannot be a definition of homœopathy—it is the same curing the same—not like curing like. *Similia* is not *idem.* For the cure of mania, says the Hippocratic writer, give a draught of mandragora in a smaller dose than will cause mania. Here we have two cases of mania which resemble each other; the symptoms are similar, but the causes are different, and the cases are not absolutely identical. *Belladonna*, in like manner, when swallowed as a poison, produces a scarlet rash, a sore throat, fever, headache, etc., all which symptoms appear in scarlet fever. *Belladonna* not only generally cures, but often preserves from scarlet fever, as was first discovered by Hahnemann. It does not produce or cause scarlet fever, but it does produce symptoms similar to those of scarlet fever. There is no sufficient ground for the remark of Faust on this point. The principle is thus received and taught in every work on homœopathy. In fact, if any one rejects this principle of *similia*, it is clear that, in reality, he is no homœopathist. The meaning of the word is sufficient to decide this. But it was easier for Faust to point out the absurdity of the error inadvertently admitted by A. M'P. than of the truth as explained by Mr. Pearce.

4. Homœopathy is *a practical fact.* It is not a speculative theory to be reasoned upon in the closet, but a fact to be observed at the bedside; it is no metaphysical subtlety, to be logically shown by *a priori* reasoning to be absurd; it is no piece of presumption and impudence, to be put down "by authority," as the Council of our Royal College of Surgeons happily acknowledge; it is a fact to be examined, like the statement of any other fact, *upon evidence.* We are not called upon to sit down and imagine its possibility or its impossibility, but we are urgently pressed to observe whether it be true or not. Hundreds of credible witnesses tell us that all curable diseases are for the most part readily cured by the new method. This is asserted as a fact; is it true? This is the question. Try the medicines—why should you not? The interests of humanity require it. If they succeed, it is a great blessing; if they fail, publish the failures. This is the only fair and honest way to oppose homœopathy, and in no other way is it likely to be opposed with success.

5. Homœopathy, like all other methods of treating diseases, *must stand upon its comparative merits.* There is no absolute preservation from suffering in a sinful world, nor any deliverance from death. "There is no discharge in that war." And as all generations have died under the old method, so, should the new one prevail, all generations will continue to die under it. This consideration should render the disputants on both sides sober-minded. Medical men are engaged in an unequal contest; the great enemy will always conquer at last; but the question is a fair and a rational one, from which class of means do we actually obtain the greatest amount of relief from bodily suffering, and by which is the apparent approach of death most frequently warded off? This reduces the whole matter to what, in my opinion, is its proper shape—a practical question—what will do me most good when I am ill?

6. *The old method is unsatisfactory.* This is admitted by almost all medical authorities. It would occupy too much of your space were I to bring forward quotations in support of this statement. They might be had in abundance; but the fact is so notorious, that the differing of doctors has become a proverb. In short, there is no opposition of sentiment or of practice too great not to be frequently met with. The old medicine is in the condition that astronomy was in before Newton, and in a worse condition than chemistry was in before Dalton. Many valuable isolated facts known, but no law of nature discovered by which a host of conflicting conjectures might be dissipated, and facts reduced to an intelligible order.

7. Homœopathy *is simple and intelligible.* However absurd the rule may appear to some, it is practically a plain one, and becomes, to those who follow it, more easy and more satisfactory every day. It is not pretended that it can be carried out without serious labour. The law of gravity is abundantly plain and simple, but there are plenty of difficulties, notwithstanding, in working out by it the lunar inequalities.

8. Homœopathy *gains by comparison.* It is more successful than the old system. This comparison can be instituted in two ways—by the statistics of public institutions, and by those converts from the old practice who have tried it long enough to be able to compare with each other the results in their own hands of the two methods. As an illustration of the former mode of comparison, the following abstract, drawn from Dr. Routh's statistics in the "Fal-

Hosted by Google

lacies of Homœopathy" (one of the two books recommended to your readers in the first letter in your paper by M.R.C.S.), is given by his reviewer, "by which the relative success of the new and the old modes of treatment can be seen at a glance.

Hom. Treatment.		*Allop. Treatment.*
Deaths per cent.		Deaths per cent.
Pneumonia 5.7	....	24.
Pleuritis .....3.	....	13.
Peritonitis ....4.	....	13.
Dysentery.....3.	....	22.
All diseases 4.4	....	8.5

I will ask for space for one additional fact only on this point. When, in 1836, the Asiatic cholera attacked, as an awful scourge, the city of Vienna, all the hospitals were filled up to receive cases indiscriminately, as they occurred; one was a homœopathic hospital, but under the inspection of two allopathic physicians. The authorized report, when the epidemic had done its work of death, was this:—Mortality in the Homœopathic Hospital, 33 per cent.; mortality in the Allopathic Hospital, 66 per cent. Two-thirds recovered in the one, and two-thirds died in the other. See "Austria and its Institutions," by Mr. W. R. Wilde, M.R.I.A.

The second mode of comparison rests in the bosom of each private practitioner. Thus much, however, may be stated, so far as I am at present informed, every practitioner who has, with sufficient care and perseverance, tried homœopathy has embraced it, and I have not yet heard of one who has deserted its ranks. For myself, I may be permitted to say that, after having practised the old method for many years with success, and having now devoted myself for some time to the new mode, while I at once acknowledge that the study is laborious, and not without its difficulties, I am persuaded that it is a change for the better, and I venture to engage that if my medical brethren will try such plants as the following, prepared as we use them, in the cases for which they are indicated by the law of *similia*, they will be greatly surprised and gratified by their beneficial effects. Aconitum Napellus, Bryonia Alba, Matricaria Chamomilla, Ipecacuanha, Atropa Belladonna, Arnica Montana, Pulsatilla Pratensis, Nux Vomica, etc., etc.

9. Homœopathy is *medical treatment*. It is not the do-nothing system which it is represented to be by opponents who thus only betray their ignorance. When fever and dysentery were desolating many parts of Ireland in 1847, one of the places which suffered most was Buntry, near Skibbereen, in the county of Cork. During ten weeks 192 cases were treated homœopathically at their own homes, amid all the wretchedness of famine; the mortality from fever was $1\frac{4}{5}$ per cent., and from dysentery 14 per cent. During the same period many were treated on the old method in the Bantry Union Hospital, with the advantages of proper ventilation, attendance, nourishment, etc., and from the report of Dr. Tuckey, the physician, the mortality from fever was $13\frac{1}{3}$ per cent., and from dysentery 36 per cent.

At the same time another Fever Hospital was opened for similar cases occurring among the emigrants from Ireland to this country, in which the medical man tells us he abstained from all interference, and remained passively watching the cases, ordering them free ventilation, cleanliness, and confinement to bed; water or milk and water being given as drinks. He congratulates himself upon the success attendant upon thus allowing the cases to take their natural course undisturbed by medicine; but the deaths from fever in this hospital were 10 per cent. It has been stated that the deaths from fever under the new treatment were $1\frac{4}{5}$ per cent., a sufficient proof that *that* treatment is doing something and gaining by it, while, by the same comparison, giving the large doses of the old medicines is doing something indeed, but losing by it. The figures are $13\frac{1}{3}$, $10\frac{4}{5}$.

10. I think your readers will agree that Mr. Faircloth's letter reflects discredit upon himself. He is much mistaken if he thinks he can shut us all up in the "genus" of quacks. He is also much mistaken if he thinks that his abstaining from continuing the controversy will summarily conclude the inquiry. He treads upon dangerous ground when he ventures to assign ill motives to the conduct of his neighbours. I know nothing of the case alluded to by himself and Mr. Pearce, but I may remark that while he denies that they met in consultation, which Mr. Pearce does not assert, but rather implies the contrary, he does *not* deny what Mr. Pearce did assert, and which is the only thing the public is interested about, namely, that the case was one of pneumonia, and in great danger. But I allude to Mr. Faircloth's letter only to deprecate the tone and spirit with which the subject is often assailed, and also, as I acknowledge with regret, sometimes defended. It is a subject of sufficient gravity and importance to demand that, during its investigation, prejudices and personal interests be laid aside. I must further observe, that I by no means undertake to defend all the efforts to explain and illustrate homœopathy made, as I think, very injudiciously by its advocates. Our business, in the first instance, is not to explain, but to test—to ascertain facts, and if they be true, whether we can explain them or not, it is our duty to let our patients have the benefit of them. The farmer does not refuse to reap his harvest until he can explain how the seed he, a few months before, put in the ground has become ready for his sickle; so, in a matter of at least equal importance, true wisdom would seem to suggest that we should be thankful if some improvement has at length been effected in an art which all confess to have been nearly stationary for thousands of years, and that we should gladly avail ourselves of it.

My letter is too long, or there are other interesting points which might be noticed.

With many thanks for your love of fair play in this matter,

I am, Mr. Editor, your obedient servant,

WILLIAM SHARP, F.R.S.,

Late Senior Surgeon of the Bradford General Infirmary.

Rugby, May 11, 1852.

HOMŒOPATHY VERSUS ALLOPATHY; OR, "YOUNG PHYSIC" VERSUS OLD PHYSIC.

To the Editor of the Cheltenham Examiner.

SIR,—It has been asserted that the Cheltenham waters never have nor ever will induce, in a healthy person, either dyspepsia or indigestion, or any other disease analogous to it. I could easily produce several persons, in whom "analogous" diseases to those in which Cheltenham waters are useful were caused by the injudicious use of them. But to settle this point, I challenge any gainsayer to the proof of it personally, by placing himself under my care, to take the waters for three months; at the end of which time I will guarantee, premising that he be in good health when he commences them, that he will have a disease "analogous" to one of those for the cure of which the waters are administered.

I beg to say, that it was by repeatedly witnessing last summer this homœopathic property in the Cheltenham water which induced me to investigate the doctrine of homœopathy, and which led to my adoption of it, as a scientific mode of cure. I refer any one for information on this homœopathic property of saline waters to Doctors Mead and Rutty on Mineral Waters, wherein he will find instances of the internal use of them bringing on scorbutic symptoms, and many other mischiefs.

Homœopathists administer, as Hahnemann says, "one *simple* medicinal substance at a time," not *many* medicinal substances jumbled together in pills and mixtures, thus forming a hodge-podge compound, of whose effect on the system the allopaths know scarcely anything. Homœopathists, on the contrary, give "one known medicine at a time," whose effects upon the system they have previously ascertained by repeated experiments on the healthy man, and therefore they can calculate with certainty, both as regards its dose and effects. But the school of compounds can neither agree about the dose of their remedies nor the effects of them; look at their Materia Medicas and Pharmacopœias, published by the sanction of the *savans* of the colleges, and not one of them agree in their prescribed doses.

I cannot resist quoting the following fact, related by Dr. Hering, who whilst travelling in Germany saw an old gentleman who had suffered much under many doctors, who all treated him differently. He at last, however, determined to take no more medicine until he should find "three doctors who would all agree upon his case;" and for this purpose he was travelling, and had, when Dr. Hering saw him, consulted 477 physicians, who wrote for him 832 recipes, containing 1097 different remedies. He requested Dr. Hering to prescribe, but he declined it, and asked him if Hahnemann were not among the number whom he consulted. "With a smile, he turned to No. 301, name of disease O, remedy prescribed O. 'That was the wisest man of the lot,' said he, 'for he said that the name of the remedy did not concern me, but that the cure was the essential point.' 'But why,' I inquired, 'did you not allow him to treat you?' 'Because,' said he, 'he is but two, and I must have three who agree.'" Dr. Hering said, if he were willing to sacrifice some hundred francs in the experiment, he would find not *three* but *thirty-three* physicians who would agree in his case, to which he acceded. A description of his disease was then made out and sent to thirty-three homœopathic physicians. He shortly after wrote to Dr. Hering, saying, "I send you wine of the year 1822, because twenty-two physicians agree respecting my case. I thereby perceive that there is certainly such a thing in this world as twenty-two physicians who have fixed upon the same remedy." He took the remedy and got cured.

I now proceed to prove that homœopathists occasionally give "simple medicinal substances" which contain as many component ingredients as mineral waters, and in as sensible portions.

Take, for instance, the *Mother Tincture of Aconite*, which is made by mixing together equal parts of the *Extract of Aconite* and alcohol. In this preparation there is contained far more of the material substance than is to be found in the same quantity of mineral waters, and though called a simple substance, it nevertheless contains, upon analysis, many different ingredients. "M. Peschier found that *Aconite* contains an acid which forms an insoluble compound with baryta, a small quantity of waxy matter, phosphate, malate, and carbonate of lime."

I have formerly shown that we do sometimes administer medicine in appreciable doses, viz., mother tinctures. But as the allopathic school continually seize upon our doses as a theme for ridicule, it may not be amiss to bestow upon it a few more remarks, although it has been *unanswerably* answered, by appealing to the effects of their results in disease. I am not, however, astonished that this school, which is accustomed to administer in disease the most *gross* and *nauseous* compounds, cannot comprehend how a tiny globule can accomplish even more than their stereotyped half-pint mixture, and just because they can neither *see, measure, nor test* the acting agent in the globule, they at once reject the idea of its being possessed of any efficacy. Well, this may be bigotry and prejudice, but it certainly is not philosophy, as upon the same principle they must, *a priori*, reject the power and efficacy of electricity, galvanism, magnetism, attraction, gravitation, miasm, mind, air, wind, and a thousand other physical agents; for I defy them to prove the effects of these agents by either "the microscope, chemical tests, etc.," without which they think they can only be believed in "through the most superstitious faith." Now, how do we know the existence, power, and efficacy of any or all of these agents, but by their *results?* and to this homœopathists appeal as the convincing proof of the power of their tiny globules in the cure of diseases.

However painful to allopaths this subject may be, when the health of the public is concerned

Hosted by Google

truth must be told. In one of the most violent and acute diseases—Asiatic cholera—it is found from statistics, that the allopathic school can only cure about *one-half* of their patients; whereas the *results* of the homœopathic treatment in Europe, in 1831, show a total of 2,753 *cured* out of 3,017 cases, being a mortality of only 8¾ per cent.! Again, in the homœopathic hospital at Vienna, the deaths in inflammation of the lungs are only about 6 per cent., while under the old system they are 23 per cent.! In pleurisy, under homœopathic treatment, the deaths were only 1¼ per cent., while under the old system they were 12½ per cent. In inflammation of the bowels, 4¾ per cent.; under old system 27½ per cent. In the devastating epidemic of dysentery which occurred at Bantry, in Ireland, in 1847, the deaths under homœopathic treatment were only 14 per cent., while under the old system they were 36 per cent. The Vicar of Bantry attests the efficacy of the homœopathic treatment in this epidemic.

Philosophers are not able to explain fully how the electric telegraph conveys our thoughts with the rapidity of lightning, nor are homœopathists capable of explaining to a certainty how globules, etc. cure; still the results in the one and the results in the other prove the fact of their action, and *experience* has attested and established it.

Formerly, it was the custom to administer *Cinchona Bark* by the ounce, but of late science has been brought to act upon it, and has extracted from the crude bark its active principle, *Quinine*, and now *one grain* of *Quinine* is found to be as efficacious as a whole spoonful of *Bark*, and why? Because it has gone through a process which has developed its real curative properties in an infinitesimal quantity! A similar instance may be found in *Morphia* extracted from *Opium*.

It is known that a man may swallow ounces of crude *Mercury* without much inconvenience; but when *one grain* is *triturated* with a little conserve of roses, behold the mighty transformation which takes place. Instead of now being the innoxious *Mercury*, it becomes the favourite and the universally-prescribed blue pill of the allopathic school.

Hahnemann commenced a glorious work, and was even permitted to bring it to considerable perfection, but surely he did not perfect it. There is a little for his successors to accomplish. Did the alchemists perfect chemistry? surely they left a little work for Davy and Faraday. Did Aristotle, Hippocrates, Galen, etc., perfect medicine? surely, they left something for Hahnemann to do. And so have we homœopathists something to do in perfecting homœopathy.

Homœopathy is not "a system without drugs," as it uses between 300 and 400 different drugs; *but it is not a drugging system.* It uses medicine to cure disease, but not *to swell a chemist's bill.* Nor are its cures performed by diet, as I am not one whit more particular now' as regards the rigid diet of my patients, than I was when I practised on the old system. On the contrary, I can now allow patients a far more nourishing diet than I formerly could. Homœopathy, Sir, having truth and science for its foundation, has progressed, and is continuing to progress every day, notwithstanding the combinations which have leagued themselves against it; and at the present moment it numbers among its professors and followers many of the most eminent physicians and philosophers of the day, both in Europe and England. Numbering such men as it does in its ranks, it may well be considered as presenting a formidable front, and the *Lancet* may well become half crazy, knowing that its craft is in danger.

Steam-engines did not put down stage-coaches at once, but they have now effectually accomplished it; and in fifty years hence, large pill-boxes, chemist's bottles, etc., will be lying in old-store lofts, or, perhaps, placed in a museum, as a curiosity to show our successors what *gross ideas* their forefathers had of medicine.

I am, Sir,

Your obedient servant,

HUGH HASTINGS, M.D.

[We have considerably abridged this letter.—ED. H. T.]

MISCARRIAGE.

(*From the Practical Advantages of Homœopathy, by the late* HARRIS DUNSFORD, M.D.)

A MISCARRIAGE may generally be prevented by the remedies employed in homœopathic practice. When this distressing event therefore is apprehended, either from a previous occurrence, or from particular indications, precautionary measures should at once be taken to effect the desired object. This, by the usual practice, is often merely temporarily attained, but by homœopathic agents may in general be permanently secured. A lady, in the fourth month of pregnancy, was suddenly seized during the night with slight pain, attended with flooding to an alarming extent; the blood was of a dark colour. I administered *Crocus*, which arrested without altogether stopping the discharge; *Belladonna* restrained it still more, and in less than an hour entirely subdued it. It recurred, however, on the following night to a considerable extent, but was completely stopped by the same remedies. Three distinguished accoucheurs expressed their opinion that from so severe a hemorrhage miscarriage would result, but the lady went her full time, and gave birth to a healthy infant.

ON THE USE OF HIGH ATTENUATIONS IN HOMŒOPATHIC PRACTICE.

By Dr. C. Von Bönninghausen, of Munster, Westphalia.

The great medicinal virtue and curative efficacy of the high and highest attenuations, or, more correctly speaking, dynamizations of conscientiously-prepared homœopathic remedies have been so thoroughly and convincingly tried and proved by some of the most experienced and honourable practitioners, that one really cannot help feeling some surprise at the strange obstinacy with which so many professed homœopathists not only refuse to employ high attenuations in their practice, but even pronounce them *à priori* as totally inefficient, and endeavour to ridicule the notion that would ascribe to them the slightest medicinal action or virtue. And yet no one who has impartially put the question to the only reliable test, that of experience, will deny that the discovery of the high dynamizations is one of the most marvellous progresses of the homœopathic science, and that no other improvement in homœopathic technics can compete with it. The immortal Hahnemann, whose talent really looks sometimes like an inspiration from above, had, in the last years of his life, arrived at a profound conviction of the efficacy of high attenuations, and had accordingly for some time followed, in the preparation of his remedies and in his doses, a method different from that which he had recommended to the public in his former works; the modifications then introduced he intended to publish to the world in the last edition of his "Organon." This edition has, unfortunately, never appeared, although I know, from several letters of Hahnemann, to a certainty that he had completed the work, and that the MS. was ready for the printer, when death struck him. The world knows well by whose means the publication of that most important work has been prevented.

But from the same letters of the great master, with which he honoured and rejoiced me during a period of more than fourteen years, and of which the last was dictated scarce two months before his death, and signed with already trembling hand, I know pretty well what he thought of high dynamizations, and that he unreservedly approved of the notions and proceedings in this matter of myself and of my friends (Stapf and Grösss). It was, therefore, by no means a mere inconsiderate desire of innovation that prompted me first to call the attention of homœopathic practitioners to this important subject, in an article which appeared in the "New Archives for Homœopathic Medicine" (vol. i. No. ii. p. 36), and to which my friend Stapf appended some remarks relative to several cases of Grösss and his own, fully confirmatory of my views and experience.

I should think that homœopathists, at all events, those who profess to have long used with the greatest success our remedial agents, up to the 30th attenuation, have no right to reject *à priori* the higher attenuations. Assuredly no one will venture to affirm that a *material* medicinal substance continues still to be present in the 30th attenuation; the homœopathic practitioner knows that no perceptible difference can be discerned between the action of the 18th and the 24th, or between that of the 24th and the 30th attenuation, although *materially* the differences are great enough in all conscience. This fact alone should suffice to prove convincingly, or at all events raise a strong presumption, that the medicinal virtue of a remedial agent, though (if we may be permitted to use the expression) *in-dwelling* in the matter, is by no means *identical with* or *inherent in* that matter, and that this mysterious principle, which eludes the grasp of the chemist, must not be measured by the rule applied to ponderable substances, but is in its evolution and propagation rather akin to the imponderable principles (light, heat, electricity, magnetism). I have this very year commenced a series of comparative experiments on the influence on vegetation which matters, indifferent in themselves, may acquire by being strongly rubbed or shaken together with substances exercising a certain action upon vegetation; these experiments, which I intend to continue, even now already

Hosted by Google

give the most positive and conclusive results, showing that vegetable life is highly susceptible of being acted upon by high attenuations. I intend shortly to publish my experiments on this subject, and the results to which they have led. I have a sanguine hope that these results may finally lead to the deduction of a new hitherto unknown law for animated nature, as startling as the "*similia similibus.*" All experiments of this kind, intelligently and accurately conducted, are questions asked of Nature, and to which "the honest inquirer" is sure to receive an answer; they are of infinitely higher value than all the "opinions" and theoretical views in the world; which, if the truth must be confessed, are worth mostly the one as much as the other—*i. e.* nothing.

Mindful of the motto of our great master, "Audete sapere," every homœopathist, sincerely desirous of furthering the progress of our subl me science, ought therefore at least to condescend to subject to the test of experiment the statements and suggestions of his professional brethren, instead of rejecting them *à priori*, and for no other reason than that they do not happen to accord with what he may be pleased to call "common sense," and of combating them with weapons such as the ultra-allopathists of former days used to wield against homœopathy, and which surely are not fair, and often even scarcely honourable or decent. We have never dreamt of exacting or demanding a blind faith in the truth and correctness of our statements and allegations; all we ask of our professional brethren is, that they will consent to put these statements and allegations to the only reliable test, that of experience; and we appeal to them, and request them, in the words of the immortal Hahnemann, to repeat our experiments, but to repeat them accurately, and exactly in the manner in which they are laid before you; and you will speedily discern with your own eyes whether our statements rest upon the basis of truth or upon that of error.

It must, however, also be admitted, that a correct and accurate repetition of homœopathic experiments is by no means without its difficulties, and yet these difficulties must be thoroughly overcome ere the results obtained can be considered trustworthy and conclusive. The homœopathic experimenter should possess a *thorough* knowledge of the homœopathic science, more *particularly* of the *Materia Medica, and should strictly and scrupulously adhere to the instructions of the great founder of the homœopathic doctrine.* The most important point is, of course, always the selection of the proper remedy; but it is almost of equal importance to guard carefully against inconsiderate repetition of the doses of the remedy administered, or hasty substitution of other agents instead, or rapid alternation between different medicinal substances. The higher dynamizations of homœopathic remedies require more particular caution in this respect, since experience has proved that they are slower and more continuous and lasting in their action than the lower attenuations, and that they can the least bear repetitions without appropriate intervening medicines. Accordingly, if a homœopathic practitioner is not in the position to select with exactitude the proper remedy, or does not deem himself possessed of moral strength sufficient to let him calmly await the action of the remedy administered, though some time should elapse before that action becomes manifest, let him not expect safe and reliable results from his experiments, nor ascribe his failure to the method or agent recommended by others, but frankly and honestly attribute it to the obstacles, subjective or objective, that have opposed the success of his experiment. But every homœopathic practitioner of any experience and practice will find plenty of cases where he may satisfy every requirement to a successful trial, and to such cases he may, without the slightest prejudice to his patients or to his reputation, at first limit his experiments.

As this is the first time that I have had the honour to address myself directly to my esteemed British colleagues, I must crave permission to offer a few explanatory remarks before I proceed to the narration of my cases.

I have made it an inviolable rule, in accordance with the example and precepts of Hahnemann, to keep a register of every case. Now, as my practice happens to be very extensive, it will be readily perceived that, as I can scarcely have time to note down minutely every fact, symptom, or indication, I am therefore obliged to confine myself to those symptoms and characteristic indications which bear more immediately upon the choice of the remedy, and which can only be acquired after a lengthened and constant study of the homœopathic Materia Medica Pura. My pathological descriptions and delineations are therefore always rather brief, yet, I trust, sufficiently clear and pointed, and affording all the indications requisite to explain the reason why the remedy administered was selected. Now, as I do not like to make any addition from memory, which is mostly treacherous, I hope no one will blame me

Hosted by Google

for confining myself to a literal reproduction of the respective cases as they are extracted from my case-books. I add volume and page, simply for the reason that any one who may choose to call my statements in question, and who may feel inclined to honour me with a personal visit, may convince himself from the original case-book of the perfect correctness of my statement. My case-books already number eighty volumes quarto, and I have therefore, for the sake of reference, made an accurate alphabetical index to them, which enables me to put my hand readily upon any case which I may happen to search for. With respect to the long and minutely detailed description of cases, which occupy several pages, I cannot help remarking that they look but too frequently like some historical romance, based on fact in the main, but vastly embellished in the accessories. But in homœopathic practice, the selection of the proper remedy from amongst a group of medicines, seemingly equally indicated against the main features of these accessories, depends, in a great measure, upon the occasions and their proper estimation; it will, therefore, readily be granted that poetic additions to them, or reminiscences that smack but too often of the generalizing pathologies of the old school, can only tend to confuse and confound.

Having premised this much, by way of introduction, I will now proceed to give a few cases from my books, in compliance with the request of my excellent colleague and friend, Mr. Wilson, of London—a request to which I the more readily respond, as I am firmly convinced that it is from Great Britain principally that our noble science will spread and diffuse its blessings over a considerable portion of the civilized world. I am perfectly aware that the young doctrine has in Great Britain also had to pass, and will still have to pass, through many struggles and persecutions, particularly on the part of some of the Universities, which sounds rather odd, considering the boasted freedom of teaching. But I entertain no doubt of its ultimate triumph there, relying as I do on the all-conquering power of truth, and on the generous ardour of Englishmen to aid and advance everything good and useful. Germany has indeed been from old the cradle of most inventions, but they have all been somehow compelled to seek beyond its boundaries—and more particularly in England—a soil in which to develope themselves, to ripen, and to spread. Therefore, my dear British colleagues, I tender you, from the distance that separates us, the hand of a brother, and address once more to you the motto of our departed teacher and master—"Audete sapere!"

(*To be continued.*)

HAHNEMANN'S VIEWS OF THE ACTION OF HEAT AND COLD, AIR OR WATER, ON THE HUMAN BODY.

We have lately had presented to us by our very pains-taking contributor, Dr. Roth, Hahnemann's "Views on Cold Water and on Movements," before he arrived at the therapeutic law, *let likes be treated by likes*. We now give his views of the agency of heat and cold, *after* he had propounded homœopathy.

It will be seen that Hahnemann considered heat and cold, whether of air or water, in their agencies as merely hygienic, and not as exerting any medical or curative power, *per se*.

A person subject to ague, or marsh fever, in the fens of Essex, goes to Malvern, or to North Wales, or the Highlands of Scotland, and throws off the disorder. This is a result of a strictly hygienic precept. A person has been a slave to pleasure or business, to the senate, or the bar, or the merchant's office, or the honest clergyman's unceasing drudgery, and is broken down; he goes away, leaves his work, goes to bed early, rises early, attends to hygienic rules—and gets well. This is hygiene, not *medical* treatment.

These illustrations may assist our readers in arriving at Hahnemann's ultimate and well-considered views.

Physiology and hygiene should be made a necessary part of education. It is far more important to the welfare of the human race, in all its aspects, to study in this manner than to be engaged in the investigation of *roots* and *cosines*. We speak of the mass.

We take our quotation from Dr. Dudgeon's translation of Hahnemann's edition of the Organon, 1835. It is known that he left *complete* a new revision. His widow has thought proper to *burke* it: we once again call on her to publish it. Hahneman observes (Organon of Medicine, Dudgeon's translation, 1849), "in recent cases of frost-bitten limbs, frozen sour-crout is applied, or frictions of snow are used," to which he appends as a note the following remarks.

"It is on such examples of domestic practice that Mr. M. Lux founds his so-called mode of cure by *identicals* and *idem*, which he calls *Isopathy*, which some

Hosted by Google

eccentric-minded persons have already adopted as the *ne plus ultra* of a healing art, without knowing how they can carry it out in practice.

"But if we examine these instances attentively, we find that they do not bear out these views.

"The purely physical powers differ in the nature of their action on the living organism, from those of a dynamic medicinal kind.

"Heat or cold of the air that surrounds us, or of the water, or of our food and drink, occasion (*as heat and cold*) *of themselves* no absolute injury to a healthy body; heat and cold are in their alternations essential to the maintenance of healthy life, consequently they are not of themselves medicine. Heat and cold, therefore, act as curative agents in affections of the body, not by virtue of their essential nature (not, therefore, as heat and cold *per se*, not as things hurtful in themselves, as are the drugs, *Rhubarb, China*, etc., even in the smallest doses), but *only* by virtue of their greater or smaller *quantity*, that is, according to their degrees of temperature, just as (to take an example from mere physical powers) a great weight of lead will bruise my hand painfully, not by virtue of its essential nature as lead, for a thin plate of lead would not bruise me, but in consequence of its quantity and massive weight.

"If, then, cold or heat be serviceable in bodily ailments like frost-bites or burns, they are so solely on account of their degree of temperature, just as they only inflict injury on the healthy body by their extreme degrees of temperature.

"Thus we find in these examples of successful domestic practice, that it is not the prolonged application of the degree of cold in which the limb was frozen that restores it *isopathically* (it would thereby be rendered quite lifeless and dead), but a degree of cold that only approximates to that (*homœopathy*), and which gradually rises to a comfortable temperature, as frozen sour-crout laid upon the frost-bitten hand, in the temperature of the room, soon melts, gradually growing warmer from 32° or 33° (Fahr.) to the temperature of the room, supposing that to be only 55°, and thus the limb is recovered by physical homœopathy. In like manner, a hand scalded with boiling water would not be *isopathically* cured by the application of boiling water, but only by a somewhat lower temperature, as, for example, by holding it in a vessel containing a fluid heated to 160°, which becomes every minute less hot, and finally descends to the temperature of the room, whereupon the scalded part is restored by *homœopathy*. Water in the act of freezing cannot *isopathically* draw out the frost from potatoes and apples, but this is effected by water only near the freezing-point.

"So, to give another example from physical action, the injury resulting from a blow on the forehead with a hard substance (a painful tumour) is soon diminished in pain and swelling by pressing on the spot for a considerable time with the ball of the thumb, strongly at first, and then gradually less forcibly, homœopathically, but not by an equally hard blow with an equally hard body, which would increase the evil isopathically.

"The examples of cures by isopathy given in the book alluded to—muscular contractions in human beings, and spinal paralysis in a dog, which had been caused by a chill, being rapidly cured by cold bathing—these events are falsely explained by isopathy. What are called sufferings from a chill, are only nominally connected with cold, and often arise, in the bodies of those predisposed to them, even from a draught of wind which was not at all cold. Moreover, the manifold effects of a cold bath on the living organism, in health and in disease, cannot be reduced to such a simple formula as to warrant the construction of a system of such pretensions! That serpents' bites, as is there stated, are most certainly cured by portions of the serpents, must remain a mere fable of a former age, until such an improbable assertion is authenticated by indubitable observation and experience, which it certainly never will be. That, in fine, the saliva of a mad dog given to a patient labouring under hydrophobia (in Russia), *is said* to have cured him—that "*is said*" would not seduce any conscientious physician to imitate such a hazardous experiment, to construct a so-called isopathic system, so dangerous, and so highly improbable in its extended application, as has been done (not by the modest author of the pamphlet entitled '*The Isopathy of Contagions:* Leipzic, Kollmann,' but) by its eccentric supporters, especially Dr. Gröss (v. *Allg. hom. Ztg.*, ii. p. 72), who vaunts this isopathy (*æqualia æqualibus*) as the only proper therapeutic rule, and sees nothing in the *similia similibus* but an indifferent substitute for it; ungratefully enough, as he is entirely indebted to the *similia similibus* for all his fame and fortune."—*Hahnemann's Organon*, pp. 100-103.

AN ESSAY ON HOMŒOPATHIC STATISTICS;

Together with a Critical Analysis of Dr. Routh's Work, entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

By John Ozanne, M.D.

(*Continued from page* 632.)

XII.

Another possible source of error in the diagnosis of pneumonia is thus stated: "Dr. Peacock, one of the gentlemen who kindly communicated to me his cases, has suggested to me that probably many of the cases called pneumonia are in reality cases of *capillary bronchitis*; the former being a mild disease, the latter one of very serious import. These diseases are rarely distinguished, and even by some good auscultators" (Routh, p. 56).

Although this source of error is not brought forward as an objection against homœopathic statistics, but merely as a sort of palliative of the decided inferiority of the allopathic statistics of pneumonia as compared with the homœopathic, I nevertheless think it necessary to enter at some length into the consideration of the facts, respecting which these statements are made, in order to ascertain how far they are founded. For it is obvious that, if the diagnosis of pneumonia were open, in general, and even in the hands of "good auscultators," to such serious sources of fallacy, as it is here affirmed that it is, it would be useless to proceed with our inquiry, as it would only lead us to uncertain or fallacious results. Fortunately, however, some of the assertions of Drs. Peacock and Routh are without foundation, or at least have not the value which they choose to assign to them. Therefore, we may still, with the majority of physicians ever since Laënnec's admirable discovery of auscultation as a means of diagnosing chest-disease, select pneumonia as the disease which, from its gravity, the regularity of its march, and the certainty with which it may be diagnosed, has deserved and deserves still to be looked upon as the touchstone by which every new system of therapeutics is to be tested.

We shall have to consider Dr. Peacock's statements as reported by Dr. Routh, under the following heads: 1. The differential diagnosis of pneumonia and capillary bronchitis. 2. Their relative gravity. 3. Their relative frequency. 4. The influence which an error in diagnosis might have upon the per-centage mortality of pneumonia.

1. *The differential diagnosis.*—It is here stated, upon the authority of Dr. Peacock, that "these diseases are rarely distinguished, and *even by some good auscultators.*"

There is evidently some misapprehension here, either of the signs of capillary bronchitis or of those of pneumonia. The words quoted above give us the clue to this misapprehension. I may at once anticipate upon what I shall have to say in the sequel, and state it to arise from the error under which both of these gentlemen appear to be labouring, namely, that the first stage of pneumonia is to be diagnosed by *auscultation alone.*

It is clear, in the first place, that the only form of bronchitis to which Dr. Routh alludes is that general capillary bronchitis, which, from the great dyspnœa attending it, has been also called *suffocative catarrh.* I know of no other form of bronchitis of which it could be said that it is a *very serious*, whereas, compared with it, pneumonia is a *mild* disease. If a disease which in allopathic hospitals gives a mortality of twenty-four per cent. can be called *mild*, that form of bronchitis which, compared with it, deserves to be called *very severe*, can be no other than the *suffocative catarrh* or *suffocative bronchitis.*

Now, there are many features in both maladies which, independently of *auscultation*, establish a marked difference between them. The aspect of the countenance, the colour of the lips and of the skin generally, the urgency of the dyspnœa in the suffocative bronchitis, the state of the pulse, the character of the expectoration, when there is any, would alone, in the absence of the signs to be obtained by percussion and auscultation of the chest, give a tolerably correct idea of the nature of the complaint. But this is not all. The age of the patient would be of much assistance also, for capillary bronchitis of this degree of gravity is chiefly met with in children and adolescents. In them, it is true, it is frequently complicated with lobular* or partial pneumonia, but the degree of gravity of the attack does not arise from the presence of a few pneumonic nodules. The gravity of the disease arises from the

* I use the term *lobular pneumonia* in the sense in which it is used by Barthez and Rilliet, in their excellent work on the diseases of children. It is much to be regretted that the same signification is not attached by all authors to the term *lobular*, as applied to pneumonia. Thus Hasse's description (Path. Anat., p. 218), and his statement of the disease, as described by Cruveilhier and Douce, do not coincide with the description of it given by Dr. Craigie (Path. Anat., p. 989); neither do either of them coincide with the disease described under that name by Barthez and Rilliet.

Hosted by Google

circumstance that the chief portion of the bronchial apparatus is clogged up with a peculiar secretion, which impedes both the egress and the ingress of the atmospherical air.

If, now, we attempt to ascertain what are the *characteristic* signs by means of which we may diagnose with certainty the presence of pneumonia, we find that the *appearance of the sputa* is one of the principal. Without the rusty or brownish-red, or the various intermediate shades of colour arising from the admixture of blood-globules in various proportions with the viscid, adhesive, semi-transparent substance of the sputa, no one can venture to diagnose with *certainty* the first stage of pneumonia. The auscultatory signs are scarcely sufficient to distinguish it from capillary bronchitis. But if, in the absence of expectoration, we might feel justified, under certain circumstances—which I doubt—to diagnose the first stage of pneumonia, we cannot do so when *there is* expectoration, and when that expectoration *is characteristic of bronchitis* and not of pneumonia.

These remarks are made with reference to Dr. Peacock's opinions regarding the differential diagnosis of these diseases, and more particularly with reference to some of the cases reported as pneumonia—cases in his treatise on the Influenza in 1847-48. Now, I believe one or two of these cases to be not pneumonia but bronchitis; or at least I do not feel at all satisfied that they are examples of partial pneumonia complicated with bronchitis.

It should not be forgotten that in the absence of the sputa characteristic of pneumonia, and indeed in the presence of those characterising bronchitis, the auscultatory signs should be of the most decided description, to allow us to diagnose the presence of pneumonia. Thus when, as in one or two of Dr. Peacock's cases, we meet with mucous, sub-crepitant, and sibilant rhonchi, mixed or following upon *crepitant* rattle—when we are not told whether they are audible during the inspiration alone—when, in addition to this, we meet with the general features of capillary bronchitis and sputa characteristic of the latter disease only, it seems to me that we are not justified in calling such a case pneumonia. It may be that the *crepitus* consists of numerous *bullæ*, closely packed together, of equal dimensions, very fine, and giving rise as they break to a sharp crackling sound; this may be, and yet it may not be pneumonia. Lately I have met with such a case, in which the expectoration was thin, serous, and slightly frothy. The sub-crepitant rhonchus was as similar as possible to the crepitus of pneumonia, being heard moreover only during the inspiratory movement, and yet there was no other feature of pneumonia.

In some of Dr. Peacock's cases there is noted some dullness of percussion. This again is not sufficient, unless well marked; for we know that in *serious* capillary bronchitis some parts of the chest are *unduly resonant*, thus causing other parts to appear by contrast insufficiently so. In this manner, a slight degree of dullness on percussion, together even with a slight bronchial resonance of the voice, or *souffle*, are not sufficient to denote hepatization of the lung with certainty, particularly if at the base; for in the serious forms of this disease, especially on the approach of death, a certain amount of passive stasis of the blood takes place in the dependent portions of the lungs; now this stasis may, as declared by Fournet (Auscultation et Phthisie, p. 293), give rise to "un peu de caractère bronchique, qui tient à un commencement de splénisation."

It may be objected that in certain cases we cannot avail ourselves of the characteristic sputa as a sign of pneumonia, because there are *no sputa*. It is true, that occasionally there are no sputa in pneumonia; but this is rare, and seldom occurs in any but in infants, cachectic or old people (the usual cause of the so-called *latent* pneumonia, in which there may be an absence not only of sputa but likewise of cough). In capillary bronchitis it is much more common to meet with cases in which there is no expectoration, or if any, only once or twice during the whole course of the disease.

Dr. Peacock reports such a case, calling it pneumonia. It is the case of W. Brooks (p. 160). The absence of expectoration is mentioned, together with a remark, which, if he reported the cases himself, does not tend to raise his character for acuteness of observation. This patient, a "porter at a coalshed," and probably a strong lad when taken ill, is reported, six days after the outset of the influenza, thus: "he *coughs severely*, but does *not expectorate, apparently from want of power*;" at the same time, "the respirations are easy and regular, twenty-four in the minute," the "pulse ninety-six, quiet and soft." It is evident that here the absence of expectoration cannot be ascribed to want of power, for the patient coughed "severely."

If now we turn our attention to the capillary bronchitis of young children, we find it more difficult to apply our test, for here there is usually no expectoration. It

Hosted by Google

must be confessed that in early infancy it is scarcely possible to discriminate between simple acute suffocative bronchitis, and the same disease complicated with partial pneumonia. For if in certain cases we may meet with real *crepitus*, it is generally mixed with subcrepitant râles which modify it; for which reason and for those given above, we must remain in doubt. Add to which the fact, that with real partial pneumonia, the *rhonchus* heard may be subcrepitant.

The frequency, however, of lobular or partial pneumonia in young children, establishes in such cases a presumption that we have to deal with that disease, complicated with bronchitis.

To sum up what has been said, we may take it for granted, that if in infants we are not able to diagnose pneumonia with certainty, it is not so in adolescents or adults. Now it so happens that our statistics, at least those we intend to study, deal only with adolescents or adults; therefore we need not pursue the question further.

2. *Their relative gravity.*—In little children the gravity of the suffocative catarrh is exceedingly great. Barthez and Rilliet speak of it thus:—"When the inflammation has from the first invaded the whole extent of the bronchial apparatus, and that it is accompanied by a copious purulent or pseudo-membranous secretion, it is at all ages a very serious disease. *All our patients, as well as all those whose cases were recorded by Dr. Fauvel, have died*" (tome i. p. 46).

In persons past the period of infancy the danger is less great. Thus Dr. Peacock says:—"Of nineteen cases of capillary bronchitis, constituting the whole of those seen by me during two years in my hospital practice, eight proved fatal, or deducting seven, complicated with tuberculous disease of the lungs or with cardiac affections, four of which died, the disease proved fatal in four out of twelve uncomplicated cases. M. Fauvel informs us that of nineteen adults attacked with acute capillary bronchitis, ten died" (Peacock on Influenza, p. 50).

This difference in the gravity of the disease in childhood and in subsequent periods of life is deserving of attention, with reference to the mortality of pneumonia; for, as already stated in our statistics, the subjects dealt with are not children but grown-up persons.

I cannot dismiss this question of the gravity of capillary bronchitis without remarking that, under homœopathic treatment, it is in adults rarely fatal. Recently I have observed an epidemic of this disease, in which persons of all ages were affected; although three of these were advanced in years, and there were amongst the number some young children and infants, I have not met with a single death.* In fact, capillary bronchitis is not by any means so very serious as stated above, excepting, of course, that occurring in infancy. Indeed, generally, its extent is not great, and I believe, it is on the whole, especially under homœopathic treatment, far less serious than pneumonia.

That it is not always so very serious a disease as the statements of Dr. Peacock would lead us to suppose, I bring forward in proof some of his own cases. Out of twenty cases of epidemic catarrhal fever, consisting of cases of capillary bronchitis and of pneumonia, I select five of capillary bronchitis, which are not of so very severe a character as we should expect from these statements. Cases 1 and 2 are slight. Case 3 tolerably severe, but the age of the patient good. Case 7 not very severe. Case 8 slight. These cases confirm my remark, that in adults the gravity of the disease is not so great as stated, and therefore Dr. Peacock's patients would probably have fared far better under homœopathic treatment.

What is the homœopathic mortality in acute suffocative catarrh in infancy? The only published cases that I know of, are three cases recorded by Professor Henderson, in the *British Journal of Homœopathy*, for 1850 (p. 364). The patients were aged respectively twenty-one, thirteen, and four months. Two recovered, and one died. This is a more favourable result by far than that of Barthez and Rilliet, all whose patients died.

3. *Their relative frequency.*—Pneumonia is a frequent disease, but the acute suffocative catarrh of children is a very rare disease. The six cases recorded by Barthez and Rilliet, at the Hôpital des Enfants, Paris, were the only cases observed by them in a very large number of children.

I think it may be stated with truth, that, excepting when it occurs epidemically, capillary bronchitis, of a sufficient degree of gravity to render it capable of being mistaken for pneumonia, is decidedly a rare disease in grown-up persons.

4. *The influence which an error in diagnosis might have upon the per-centage mortality of pneumonia.*—We have seen

* Some weeks after the cessation of this epidemic, I lost a little patient with capillary bronchitis or pneumonia, complicated, I believe, with tuberculosis of the lungs.

Hosted by Google

that it is difficult, in children, to distinguish between simple acute capillary bronchitis, and that form which is complicated with lobular pneumonia. But we have also seen that an error of this kind would not increase the mortality of pneumonia, for the disease would be classed as bronchitis, and should the patient die, the error might be corrected.

We have also seen, that, by attending not only to the signs derived from auscultation, but also to all the other symptoms, and more particularly to the character of the sputa, an error of diagnosis in the adolescent or the adult is almost impossible. Now, as our statistics comprise only persons passed the period of childhood, they cannot by any means be rendered fallacious by any error of diagnosis of this kind. We may, therefore, dismiss Dr. Peacock's "suggestion," and conclude that as the allopathic mortality of pneumonia is not increased in the adolescent or the adult, by comprising under this head cases of capillary bronchitis, we may fairly compare our tables of pneumonia with theirs.

Another suggestion is offered by Dr. Peacock, in these words: "Again, a very careful and minute observer may *often discover pneumonia one day, and because it might be absent on the morrow, another observer would have overlooked this, and called it bronchitis.* Statistically, such a case ought to be included in the returns of pneumonia. The minute observer may thus have many cases of pneumonia which have recovered; the other but few" (Routh, p. 56).

It will be proper to bear in mind Dr. Peacock's suggestion. Perhaps he, too, is "*a minute observer!*" I need not remark at any length upon this statement. It is obvious that such a suggestion could only emanate from one whose diagnosis of pneumonia is based upon the presence of a mere rhonchus. If it be coarse, the case is one of bronchitis; if fine, it is one of pneumonia! But more of this hereafter.

(*To be continued.*)

THE
HOMŒOPATHIC TIMES.

SATURDAY, JUNE 12TH, 1852.

IT was the custom of the Greeks, when lamps were brought in at night, to exclaim, "Hail, friendly light!" Not so has the medical profession of Britain hailed the introduction of the Hahnemannian light in the midst of *their* night: they prefer to regard it as a pestilent innovation—they care not for the intellectual light of the Saxon Sage.

Take them as a class, they are satisfied with the knowledge of words and of technicalities—of the outside shows instead of the deeper realities of things. They have not learned the most difficult of all lessons —that *of unlearning.* None like to confess that their opinions are erroneous; and in proportion to the bigotry of the school in which men have been educated, is the sluggishness of their intellect with respect to any *new truth.* They have worked hard in their way, and what they have painfully acquired they cling to with an obstinate predilection. HARVEY and JENNER could find no physician turned of forty who would admit the circulation of the blood, and agree to adopt vaccination. There are only too many of these forty-year old gentlemen now opposed to homœopathy.

Oh, that they were wise, and would consider the immense opening for inquiry into the real art of healing that is proffered by homœopathy! It is not a thing for to-day, but for all time, so far as the inhabitants of this planet are concerned.

"Touch not," cry out these old-world worthies, "that noble system of medicine, which has been consecrated by several thousand years." They think the old coach better than any newer method of travelling.

The ordinary medical practice has been well defined by one of the allopathic body, the "guessing at Nature's intentions, and then endeavouring to substitute man's."

Those who practise in this way are guided by the opinions of their teachers and the transmitted lore of the schools. They think not for themselves. "There cannot," says LOCKE, "be a more dangerous thing to rely on than the opinion of others, nor more likely to mislead one; since there is much more falsehood and error among men than truth and knowledge; and if the opinions and persuasions of others, whom we think well of, be

Hosted by Google

a ground of assent, men have reason to be heathen in Japan, Mahometans in Turkey, Papists in Spain, Protestants in England, and Lutherans in Sweden."

Were the whole profession to enter on a new career of medical inquiry, with minds free from prejudice and prepossession, how much would they unlearn of what they now so stubbornly cherish! The name of HAHNEMANN would then be uttered with respect and admiration in our Schools, Colleges, and Universities, and his doctrine and practice would at least be allowed fair play, and be submitted to an honest examination by actual experiment.

It is a melancholy fact that the ordinary medicine has plenty of *drugs*, but few *remedies*. It is afflicting enough to be ill; it is quite unnecessary that we should be poisoned by our physician. We do not undervalue this noble profession: we only wish to stimulate its members to an honest inquiry into the truth of our doctrine and practice. There is no more noble citizen of any country—no worthier inhabitant of this earth than the successful practitioner. "*Neque enim ullâ aliâ re homines propius ad deos accedunt, quam salutem hominibus dando.*—There is nothing wherein men approach nearer to blessed spirits, than in contributing to the health and well-being of their fellow-creatures." It is because we wish to increase the number of successful practitioners, that we press the subject of homœopathy on the attention of our allopathic brethren.

WE feel ourselves highly honoured in being the medium of BÖNNINGHAUSEN'S first direct communications to his British colleagues.

The submarine telegraph now connects England and France, and England and Ireland. The mind of man exerts an infinitely more subtle ageney. The Sage of Münster now speaks in the Anglo-Saxon tongue, through us as his interpreters, to all who speak the language of Earth's dominant race.

His papers will be reproduced wherever English is spoken; and though but a few of the present generation of his colleagues may adopt his views, the next may, if the experience of other experimenters is found to confirm his.

BÖNNINGHAUSEN and CONSTANTINE HERING are, assuredly, the most distinguished of the pupils of HAHNEMANN. They have done more, and have exercised a more independent action, have thought more, reasoned more, suggested more, advanced more, and proved more than any of the rest of their co-disciples.

Each of these truly illustrious men has, by unwearied discipline, achieved the conquest of mind over body. The discipline has been sustained during many years, and is now habitual; and many an excellent fruit of that powerful discipline has been added to the homœopathic stock.

We leave entirely open the question of dilution, attenuation, dynamization, call it what you will. It must be admitted, however, that the smallest dose, that will act effectually, is that which should be chosen for each particular case. This is a matter for repeated experimentation and of sustained experience.

It is but just, however, to BÖNNINGHAUSEN that his experiments should be repeated by others, and that too in his way, and according to his directions.

It is known that HAHNEMANN at one time drew the limit at the thirtieth dynamization, and seemed to discourage any trial of medicines beyond that limit. We are now authoritatively informed (see first column of VON BÖNNINGHAUSEN'S communication in our present number) by BÖNNINGHAUSEN that, during his latter years, he used himself preparations dynamized far beyond that point; and that he left us as a legacy the sum of his experience in the revised edition of the Organon, which was ready for the press before his death, but which has not been allowed to see the light—as yet.

Review.

Homœopathy and the Homœopathists. By J. STEVENSON BUSHNAN, M.D. London, John Churchill, Princes Street, Soho.

WE have not leisure, at present, to enter

Hosted by Google

into a critical review of this singular production.

The first noticeable point is that the author, who is a Fellow of the College of Physicians of Edinburgh, and Physician to the Metropolitan Free Hospital, dedicates his book to the noble Dr. John Forbes,—an eclectic in medicine, if ever there was one.

Next, in his introduction, the author speaks of Dr. A. Wood's "Homœopathy Unmasked" as the only book on the subject with which he is acquainted. We call his attention to the "Confessions of a Homœopathist," where he will find strange matter, perilously handled, a spice of *diablerie*, and no end of malice.

"A faithful analysis of Hahnemann's doctrines," Dr. Bushnan maintains his abortion to be. He an exposer of quacks, and of the chief of quacks, Samuel Hahnemann!

His very first sentence is an insult to the Germans—the art of printing is something, and that the Germans claim; the liberty of thought is something, and that the Germans claim; the magnetic needle is something, and that the Germans claim; literature is something, and the Germans are the fifth of mankind, the Greeks, Romans, Italians, and English being their precedents.

Who more noble than the Germans in anatomy and physiology and pathology? Yet the author sneers at them. The truth is, *that people* have the elements of the highest inventive faculty. Dr. Bushnan knows this very well; and when it suits his purpose, he can be *Germano Germanior*. He can out-germanise Germany.

We have spoken respectfully of Dr. Routh, though he is being severely handled by Dr. Ozanne, who is a master in dialectics. Dr. Bushnan's book is simply discreditable to himself. We know him to be a scholar, and as such his scholarly *instinct* should have led him to a worthier course. We know that some time ago he wished to see homœopathic practice, and we presume with an honest purpose.

Dr. Bushnan knows very well—none better—that his volume is a mere *claptrap*. He knows very well that, as a scholar, he ought to be ashamed of it. We had augured better things of him.

Dr. Forbes, to whom he dedicates his volume, has not pronounced—*sub judice lis est*. That enlightened physician and honest man ventured to attend one of our homœopathic hospitals. He had not a FEAR on his pillow, like that which haunts Dr. Bushnan. He is a sturdy man. Let him pronounce against us, and we will listen with respect to him.

We wish our readers to read Dr. Bushnan's scandalous book—so little do we fear him; we promise him *a dressing*. He ought to be ashamed of himself, for he knows better—as nurses say of naughty little boys.

Correspondence.

THE MOVEMENT-CURE.

To the Editor of the Homœopathic Times.

SIR,—In consequence of a letter in your last number from Dr. Blundell, wherein he attempts to vindicate for his "predecessor and instructor" the title of a pupil at the Institution of Stockholm, and also to excuse himself for having made use of Professor Branting's formulæ and practical rules (occupying five or six pages of Dr. Blundell's book), without acknowledging the sources whence they were obtained, I beg to offer a few observations.

Whether Mr. De Betou acquired his knowledge of Ling's system from hearing a *few* lectures by Ling himself, or from his partnership with Mr. Ehrenhoff, or from my own instruction "in the pedagogic and hygienic department," or from these conjoint means of information, namely, a few lectures by Ling, a partnership with Mr. Ehrenhoff, and some instruction from myself, he has shown, by several successful cases published by Dr. Blundell, that he well applied the degree of knowledge he possessed. Had he been better informed on the subject, he would have been more able to advance the science in this country. The facts recorded in medical literature, which testify the great therapeutical power of frictions, corporeal exercises, and other mechanical appliances, Ling submitted to general laws, and he established a science containing a definite prescription for every movement of the human body, whether *voluntary* or *inducted*. To be a pupil of Ling, implies a knowledge how to act in accordance with these principles, theoretically as well as practically. Just as little can the mere listener to a Beethoven or a Haydn be fairly called the pupil of either of those masters, aa Mr. De Betou or anybody else can claim to be a disciple of Ling, by hearing merely, without having pondered, and studied, and practically applied under due superintendence, the science, such as it is, and still only taught at the Institution which Ling himself founded at Stockholm, where, as far as I know, Dr. Blundell's instructor neither studied nor attended any course of lectures. I believe that Mr. De Betou never attended any courses of anatomy and physiology in Sweden; what he did in England I cannot say.

As to Dr. Blundell's curious explanation respecting the publication of Professor Branting's formulæ—*undoubtedly not public property*—I confess I am utterly at a loss what to say The fact still remains that they appear in Dr.

Hosted by Google

Blundell's book as the result of his own experience and observations. It is possible that, in the course of years, when Dr. Blundell is better enabled to understand and appreciate the long observation and the acute research contained in those formulæ, he will arrive at the conclusion that the original discoverer should be allowed the merit of the discovery.

As to the claims of those interested in the progress and true practice of the system to an authoritative work, I can only say that they have reason to look for such an exposition of Ling's doctrines and practice. I do not, however, deem it necessary to apologize for Professor Branting or myself. The actual daily investigations and experimentations we have each been engaged in making, since the decease of Ling, with a view to test the actions of the various movements, together with the urgent duties of lecturers, and the attendance on a numerous *clientelle*, have rendered it impossible for the present to set forth a complete treatise. Our performances, brief and unsatisfactory as they may be, at least contain what is not discoverable in the more ponderous works of recent publication in this country—a true and accurate representation of the science. The larger and more comprehensive treatise I hope to accomplish; but that must be a book of principles and practical rules, with some practical illustrations; for Ling's science, as a living and practical art, can be no more traced out, in all its practical bearings, in a book, than can be the science of sounds and harmonies.

Your obedient servant,

102, Piccadilly. A. GEORGII.

To the Editor of the Homœopathic Times.

SIR,—Permit me to suggest that you have, in your last number, condemned somewhat too hastily the conduct of the homœopathic body, for not giving their support to the funds of the hospital now erecting at Doncaster under the auspices of Dr. Dunn.

I confess to have felt that a faith so triumphant as that of Dr. Dunn's, self-sacrifice so remarkable, and personal effort so inexhaustible, called for my humble support. But with the conviction on my mind that a Homœopathic Hospital is not *necessarily* a great good, that it may, on the contrary, become, if not founded on right principles and rigidly conducted on the same, a very great evil, I felt it to be my duty to wait till you, Mr. Editor, or Dr. Dunn, in the columns of the *Homœopathic Times*, made known to us of the public, the principles on which the Doncaster Hospital is founded, and the guarantee provided against any departure from those principles.

When the establishment of hospitals came to be regarded in homœopathic circles as a thing no longer to be delayed, the *Homœopathic Times* distinguished itself by the zeal and ability with which it discussed the fundamental principles on which such institutions should be established. About this period two hospitals started into existence—the London Homœopathic, and the Hahnemann—the former representing one class of principles, the latter another. The *Homœopathic Times* approved of the principles on which the Hahnemann Hospital was founded, but has since had occasion to denounce with severity a departure from those principles on the part of the managers. The *Homœopathic Times* has, therefore, taught us two very important lessons—first, that hospitals should be based on certain principles; secondly, that some guarantee should be provided against a departure from those principles.

Now, Sir, no information on these vital points has yet been given, in respect of Dr. Dunn's Hospital, by the *Homœopathic Times;* and it would have been to show ourselves unworthy the labour you have bestowed on the education of the homœopathic mind, had we, until supplied with such evidence, forwarded our subscriptions to the Doncaster Hospital.

These observations apply likewise to the proposition made a short time since, by the Honourable A. H. Moreton, in reference to the establishment of a "Child's Hospital." A design more benevolent than this cannot well be conceived, nor one better calculated to exhibit the powers of homœopathy, which, in the treatment of adults, has almost invariably to contend not only with disease, but with a state of the system far more difficult to deal with than the disease itself, induced by the allopathic remedies taken for years.

But, Sir, before we of the public subscribe to this, or any other institution we must be made acquainted with the principles on which it is to be conducted, and must have some guarantee that those principles will not be departed from. Information of this kind we have a right to look for from your journal as the organ of public opinion; and until it is vouchsafed, I submit that we stand acquitted of indifference to the great cause of homœopathy. Should this information be supplied, and be unquestionably satisfactory, then will you have a right to denounce, with all the withering eloquence you can command, a heartless homœopathic public. But, Sir, I entertain a very different opinion as to the result. I have very little doubt that all those who refused to belong to either of the metropolitan hospitals on account of the disputings to which their formation gave rise, and all those who left the Hahnemann Hospital because of its departure from the principles on which it was founded—as incontestably demonstrated by Mr. Wilson*—will be too happy to find institutions of which they can approve, that they may be enabled to devote to the spread of homœopathy that annual amount which they are now retaining, but which they had resolved on dedicating to this glorious cause.

I am, Sir, your obedient servant,

F. J. SMITH.

74, Old Broad Street,
June 7th, 1852.

P.S.—On the eve of leaving England for some weeks, I have been too much occupied to collect and arrange any materials for my Narrative.

* A Letter to the Governors and Subscribers to the Hahnemann Hospital, by D. Wilson. Bailliere, 1852.

Hosted by Google

To the Editor of the Northampton Mercury.

SIR,—To combat all the abuse of homœopathy by writers who evidently know nothing about the system they are attacking, would occupy too much of your space and my time without doing the slightest good. It is, however, rather curious that your correspondent, Common Sense, should, by way of proving the absurdity of the homœopathic principle, give us an illustration that supports it. He says, "With burns, unfortunate experience in my own family has taught me that *cooling* things are best, and not turpentine, etc. A mixture of lime-water and oil is so cooling and soothing, that I am sure no one who has ever tried it will ever use anything else." Now both lime-water and oil are extremely inflammable substances; they are both full of caloric or heat, and, consequently, the admission that your correspondent makes is an affirmation of Dr. Hahnemann's great principle *similia similibus*. Both your correspondents confound the *effect* of the application of certain substances with the substances themselves. A bottle of boiling water placed in a linen bag, and hung up in the sun, and kept constantly wet with the strongest spirits, will become cold sooner than by any other means. Here we have the heat of the sun and the heat of the spirits extracting the heat from the water; that it is the extreme degree of cold, produced by the more rapid evaporation of spirits than of any other fluid, that extracts the heat from the boiling water does not interfere with the principle *similia similibus*. As to Common Sense's remarks in reference to snow being the best application to frozen limbs, it reminds me of the Brahmin who, upon being shown the impurity of the Ganges water by some being placed in a microscope, exclaimed, "You mistake the matter; it is not your glass that shows the impurity of the sacred Ganges, but the purity of that sacred water which shows the impurity in your glass!" Everybody knows that to restore vitality to a frozen limb you must produce warmth in it. The question is, what is the best method of producing that warmth, and universal experience teaches us that it must be produced by the application of snow, and not by any warm substance. Your correspondent will not, I presume, affirm that friction with spirits or oil, or warm water would have the same beneficial effect as friction with snow. Really, Sir, it is melancholy to see *prejudice* carrying men to such an extent as to try to write down a system of which they evidently know nothing, by using arguments and illustrations which, not having well considered, only confirm the system they wish to crush.

But we will leave such writers to themselves, and, with your permission, I will state the opinions of those who have followed the *far more dignified* course of testing the truth of Dr. Hahnemann's great principle of the healing art *before* writing upon the subject. Dr. Henderson, Professor of Pathology in the University of Edinburgh, in a letter which he addressed to Dr. Forbes, in reply to an article of his in the *British and Foreign Medical Review*, and which letter is published, together with some more valuable papers by Dr. Russell, in his work entitled "Homœopathy in 1851," makes the following statement:—"'The members of the Homœopathic Society of Vienna have begun to subject the Materia Medica of Hahnemann to a rigid experimental scrutiny, and as their mode of proceeding is worthy of being followed as an example, I transcribe this short account of it, and its bearings on the credibility of Hahnemann. 'The members meet, and to each is given a portion of the medicine to be experimented with, without telling him what that medicine is. At home they take this medicine in various doses, and write down all the effects they have produced; they then meet again, and each reads over the symptoms it has produced on him. Thus there is obtained a series of testimonies from well-qualified and independent observers. They have found that the general result of Hahnemann's provings are perfectly accurate, and have expressed their admiration of his skill as an experimental and faithful describer of his experiments.' (Exposition de la Doctrine Médicale Homœopathique, 2nd edition, Paris, 1834.)" * Your correspondents who so ridicule the homœopathic principle, *similia similibus curantur* (like cures like), are not, I presume, aware that, although Dr. Hahnemann determined the method by which the principle might be carried out with practical effect, he does not lay claim to the merit of being the discoverer of it, but quotes it from the works of Dr. Stahl, an eminent physician of the old school, who practised at Hallè in 1694, and who thus writes:—"The rule admitted in medicine, to treat diseases by remedies contrary or opposite to the effects which they produce, is completely false and absurd. I am persuaded, on the contrary, that diseases yield to agents which produce a similar disorder (*similia similibus*)." This passage from Stahl is quoted by Dr. Hahnemann in his great work, "Organon." Here we find an eminent physician of the allopathic school, who was in 1687 physician to the Duke of Weimar, in 1694 was appointed to the professorship of medicine, anatomy, and chemistry, in the University of Halle, and in 1716 became physician to the King of Prussia, asserting the *absurdity* of the system of medicine so earnstly contended for by M.R.C.S., Faust, Common Sense, and many others, and asserting the soundness of the homœopathic principle, so ridiculed by these writers, upwards of eighty years before Hahnemann thought of them. I could bring forward much more in support of homœopathy, and I shall, with your permission, return to the subject again, because, I repeat it, the cause of homœopathy is the cause of humanity, but I must for the present conclude. Your correspondents will, I hope, pardon me for saying that true wisdom never indulges in abuse and ridicule of a science which attracted the attention of such men as Stahl and Hahnemann, and many other equally eminent men of later date; and although they may differ in opinion with them—and discussion is the best method of finding out truth—yet, in the language of Dr. Henderson, "the contest may be

Hosted by Google

conducted as it becometh gentlemen to contend, without rash imputation of unworthy motives—without appealing to the prejudices and passions of the ignorant—without wilful unfairness, and without discourtesy." (Russell's Homœopathy in 1851, p. 82.)

I am, Sir, your obedient servant,

A. M'P.

THE CLAIMS OF HOMŒOPATHY TO THE CONSIDERATION OF ITS OPPONENTS.

(To the Editor of the Medical Times and Gazette.)

SIR,—In requesting the favour of the insertion in your periodical of the following remarks, I rely upon that spirit of fair, open, and honest inquiry which has always characterised it, and which has gained for it the admiration of so many members of my profession.

When medical men are asked by the public what they think of homœopathy, their universal reply is, "Humbug!" and this, too, when they have never taken the pains to study its principles or observe its practice. Does not this imply that they are satisfied with the old system,—that it has in their opinion reached something like perfection, and is not, like other systems of old, susceptible of improvement? And yet, if we watch the bedside practice of these men, what is the result? Let any candid student, in quest of a rational system of physic, attend carefully to the practice of our great hospital physicians, and he cannot fail to be convinced, by their various and opposite methods of treating the same diseases, that they are inwardly conscious of the defective state of therapeutics, and of a sad want in this respect of something like a fixed, guiding principle. In proof of this I might adduce many cases; but let it suffice, that I have myself seen cases of pleurisy, pneumonia, and acute rheumatism, under the care of the most eminent physicians in London, treated by lemon-juice, which cases, by other eminent physicians, or by themselves at other times, would be treated by bleeding, cupping, calomel, opium, and tartar emetic. I have also seen all the cases in a clinical ward indiscriminately treated for weeks by a quack medicine called "Warburg's Tincture," the composition and properties of which were totally unknown to those prescribing it. I say, then, that when we see the leading men in our profession deserting the old and more generally received methods of treatment, for others which are new, or opposite, or unknown, it is fair to conclude, that they are either guilty of wanton cruelty to their patients, or, as I believe, that they are conscious of the defects of the present system of therapeutics, and anxious to discover a better. Adopting, then, the latter supposition, I shall proceed to show that they are bound to consider the system of homœopathy, and put it to the test of practice.

There are but two kinds of truths,—(*a*) those which may be discovered by *à priori* reasoning, which are implied in what we already know, are elicited by reasoning alone, and not by observation or testimony; and (*b*) those which ars commonly called "matters of fact," which, before they were discovered, were absolutely unknown, and not implied by anything we previously knew; these we could never possibly arrive at by the internal workings of our own mind; we gain them by observation, experiment, and testimony; and if the observations and experiments have been carefully conducted, and the testimony respectable, we assent to the truths. To the former class belong the truths of mathematics and metaphysics, which a man may reason out in his arm-chair. To the latter belong most of the truths in medicine, which can only be arrived at by experience and observation. These two classes of truths are well illustrated in the well-known and often-quoted words of Sir. J. Herschel :—"A clever man, shut up alone, and allowed unlimited time, might reason out for himself all the truths of mathematics, by proceeding from those simple notions of space and number, of which he cannot divest himself without ceasing to think; but he would never tell, by any effort of reasoning, what would become of a lump of sugar if immersed in water, or what impression would be produced in his eye by mixing the colours yellow and blue—results which can be learnt only by experience." Now, it requires no argument to prove that homœopathy belongs to the class which we call "matters of fact." No *à priori* reasoning, therefore, can possibly decide whether or not globules produce the effects attributed to them. A long series of experiments, carefully conducted by men of intelligence and good character, alone can decide this point; in short, in order to pronounce upon homœopathy, we must put it into practice. I am consequently at a loss to conceive what has become of the philosophy, the logic, and even the common honesty, of those members of our profession, who boldly pronounce upon a "matter of fact" without consenting to fulfil those conditions which are essential to the settlement of all such questions. In this particular the public are their superiors in intelligence. They well know, and feel, that there is no force or conclusiveness in the reasonings of a man upon a "matter of fact." Their plain question is, "Have you tried it?" or "Have you seen it tried?" and if the reply is "No," then all their subsequent arguments have not the slightest weight. To all this it may be objected that, upon precisely the same grounds, medical men are bound to try "Holloway's Pills," or, indeed, any and every other quack remedy. To this I would reply that, in the case of "Holloway's Pills," the conditions (viz. respectable testimony and carefully-conducted experiments) essential to the settlement of questions of "matter of fact" are wanting; whereas, in the case of homœopathy, we see a large hospital devoted to its practice, supported by some of the most logical, intelligent, and honest among the public, and superintended by medical men of eminence, intelligence, and respectability. *We have, then, in homœopathy, a question of a "matter of fact," with all the conditions necessary for its determination; and I say fearlessly, that the physician who re-*

Hosted by Google

*fuses to apply himself to the subject, and put the system into practice, or watch the practice of others, is not a worthy member of his profession, because he omits a duty which he owes to himself, to the public, and to his Maker!**

I have been, and am still, strongly opposed to and prejudiced against homœopathy; but I see clearly, that I committed a great mistake in endeavouring to settle the matter off-hand, by *à priori* reasoning; and I would now approach the subject in the true spirit of Lord Bacon, who says: "All idols must be abjured and renounced, with a firm and solemn resolution, and the understanding must be completely freed and cleared of them, so that the access to the kingdom of man, which is founded on the sciences, may resemble that to the kingdom of heaven, where no admission is conceded, except to children."

Trusting you will oblige me by an early insertion of these remarks, I enclose my card, and remain, etc.

London. ALLOPATH.

[We publish this letter because it has been sent to us by a regular practitioner; but we do so with some scruple, as it is evident that the writer is not conversant with the subject. No one ever pretended that homœopathy is to be refuted by *à priori* reasoning; it has been refuted by direct experiment, as in the Paris hospitals many years ago, and by analysis of the dogmas on which it is based. Our correspondent appears to us peculiarly unfortunate in his illustration of the different kinds of method of investigation. Mathematics and metaphysics are, equally with medicine, founded on experience and experiment.

As to ordinary therapeutics, no one ever pretended that the subject is perfect. Medicine, like all sciences, is to be advanced by experiment and observation. We treat rheumatism now with a certain degree of success; there is no reason why we should not endeavour to find out a better method.

If medical men are so little conversant as is our correspondent with the true foundation of therapeutics, and with the true method of advancing the art of healing, we do not wonder that they find themselves beaten in argument by the homœopaths. "Allopath" is even apparently ignorant of the derivation of the signature he adopts; otherwise, we think, so close a reasoner would scarcely have employed it.—ED. *Medical Times and Gazette.*]

[We have extracted the paper of "Allopath," and the remarks of the Editor of the *Medical Times and Gazette*, from that journal. We trust that "Allopath" is only one of many of the allopathic body who see the necessity of a fair inquiry into the claims of homœopathy, in a spirit very different from that which Dr. Bushnan, the well-known Editor of the *Medical Times and Gazette*, has displayed in his book, "Homœopathy and the Homœopathists."

The Editor of the *Medical Times* calls his correspondent "Allopath" a close reasoner, but at the same time charges him with not being conversant with the subject on which he writes.

*[We have italicised this honest paragraph.—ED. H. T.]

We deny entirely that homœopathy was refuted by direct experiments in the hospitals of Paris; and we ask our adversary for his proofs. We refer the reader to the "Introduction to the Study of Homœopathy," by the Editors of the *British Journal of Homœopathy*, for the disproof. At this very moment, as that Editor very well knows, homœopathy is being practised with great success in one of the hospitals of Paris. We think he has heard of the name of Tessier, and that he is aware of the existence of the hospital of *St. Marguerite*, and that Tessier practises homœopathy there. As he has expressed a wish to see the practice of homœopathy, he may go over to Paris and see Tessier's practice, *sub rosâ*.

We beg to inform this erudite gentleman that there are some things in mathematics, and some in metaphysics, which are not founded on, but are altogether independent of experience and experiment. We should be glad of his *proof*, for instance, of any of the axioms of Euclid, or of any of those which are called "self-evident truths."

"I think, *therefore*, I am," was all that Descartes could give as a reason for believing in his own actual being. Dr. Johnson thought he refuted Berkeley by plunging his foot against a large stone, and saying, "*I know that is matter, for I feel it.*'

The wonderful discoveries that are now being made with respect to the imponderables—light electricity, magnetism, etc.—are showing *philosophers* that there is a mighty force in powers existing in nature, but not reduced under mechanical or chemical laws, as these are yet known.

Faraday laughed last year at the doctrine of magnetoid currents; this year he believes in them. Faraday laughs this year at homœopathy; next year he may believe in it.

Nobody indeed pretends that therapeutics is a perfect art—nor are we aware that any one pretends that any art or science known to man is *perfected* by him, or is perfect as he knows it. It is only the Creator who can say "be healed," and the sufferer is healed.

The body of man is prepared for dissolution under the operation of laws as certain as those by which it is built up. But man knows little or nothing of the laws of *increments* or *decrements*. We certainly expect to find no such knowledge exhibited by the Editor of the *Medical Times and Gazette*. We do not suspect he has had much practice in therapeutics. We are thankful to him, however, for publishing the letter of "Allopath;" and we wish he would undertake to publish our *statistics*.

Let him do what Dr. Forbes has done, attend the practice of one of our hospitals, openly as that honest man did; or secretly, if he pleases, at Vienna, or in Paris.

"There is nothing like leather," has been the rule of conduct of our opponents. They have supposed their readers would swallow anything, however tough.

We shall probably return to this subject.—ED. *Homœopathic Times.*]

ON THE USE OF HIGH ATTENUATIONS IN HOMŒOPATHIC PRACTICE.

By Dr. C. Von Bönninghausen, of Munster, Westphalia.

(*Continued from page* 657.)

CASES.

1 (Vol. 78, page 116). W. Soh. W—, farmer, aged thirty-seven years, suffered since three or four months from stitches in the left side, which grow worse when the patient moves much about, works hard, or gets excited; rest produces a beneficial influence; palpitation of the heart, particularly on awakening. In the morning, cough, with putrid, yellowish expectoration, (formerly streaked black); oppressed respiration in a warm room. (*About eighteen months ago the patient got wet through in the fields,* which was the original cause of his illness; subsequently, last summer, he had a fever, after which he felt tolerably well for a few months.) Feels worse in the evening; feeling of uneasiness in the limbs in the evening. Cold makes him feel worse. Itching on the shoulder-blades and on the chest.

The patient can give no account of the allopathic preparations which he had taken previous to his applying to me.

March 10th, 1851.—1, *Rhus Toxicodendron*; 2, *Bryonia*; 3, *Rhus Toxicodendron*, 200 (*i. e.* of each remedy two globules, moistened with the 200th dynamization of the centesimal scale). One dose to be taken every fifth evening.

March 30th. Amelioration in all symptoms, but without complete removal of any. 1. *Calc. carb.* 2000 (Jen.); 2 to 4 § (*Sacch. Lact.*—the symbol § was the one which Hahnemann used to employ for this substance). One dose to be taken every fifth evening.

April 18th. Considerably better. 1 to 4 §. One dose every fifth evening.

May 8th. No further improvement. Anxiety and oppression when lying down after meals. Sleeplessness in the early part of the night. 1. *Lycopodium* 2000 (Jen.); 2 to 4 §. One dose every fifth evening.

May 30th. A few boils on the arms; in other respects quite well. 1 to 4 §. One dose every fifth evening.

Perfectly cured.

2 (vol. 78, page 120). L. G—, housekeeper, thirty-nine years of age, spinster, resident in Munster. Has been suffering for the last fifteen months from *gastric fever* (so called by the allopathic school), accompanied by copious perspirations (termed, also on that account, *sweating fever*). In the morning, at rising, vomiting of phlegm. All fat food disagrees with her. Obstinate constipation; is compelled to have recourse to pills to obtain alvine evacuations. Pains in the small of the back, both when walking about, and when sitting or lying. Heaviness in the forehead. Perspirations in bed in the middle of the night, and early in the morning; perspiration when sitting down, after the least exercise, most copious in the back, under the armpits, and about the sexual parts. No thirst. Sensation of lassitude early in the morning. Headache after meals. Melancholy disposition. She despairs of her recovery.

Since the commencement of her illness up to the time of her applying to me, the patient has been under allopathic treatment, and has been literally drenched with all sorts of medicine, which, however, have only had the effect to make her go on from bad to worse. The prescriptions showed a most liberal use more particularly of the following preparations. *Potio Riveri, Spir. Mindereri, Rheum, Spirit. Salis dulcis, Ammonium muriat., Acidum muriaticum, Senna, Colchicum autumnale, Kali aceticum,* and *Sulphur, Valeriana,* etc.

March 12, 1851. 1. *Sepia* 2000 (Jen.); 2 to 4 §. The powder to be dissolved in three teaspoonfuls of water; one teaspoonful to be taken every night.

March 29th. Considerably better in every respect. 1, *Sepia* 4000 (Jen.); 2 to 4 §. To be taken as before.

April 16th. Still some pain in the small of the back, and headache after any exertion; for the last four days, perspiration during sleep. 1, *Sulphur* 4000 (Jen.); 2 to 4 §. To be taken as before.

Hosted by Google

May 5th. The fever which she had last year, at the beginning of her illness, returned yesterday, with thirst at night, and headache; she is, however, better to-day. 1, *Sepia* 6000; 2 to 4 §. To be taken as before.

Perfect recovery. She feels better than ever before in her life.

3 (vol. 78, page 126). B. B—, a boy, thirteen years of age, suffered since three months from an enormous swelling of the parotid gland, not accompanied, however, by severe pain. He has been hitherto under allopathic treatment, but has not derived the slightest benefit from it; has forgotten to bring the prescriptions with him.

March 15th, 1851. 1, *Sulphur* 2000; 2, *Psor.* 200; 3, *Sulphur* 2000; 4, § One powder to be taken every fifth evening.

April 5th. No change. Brought with him some of the allopathic prescriptions, showing that he had taken, among others, *Tart. stib.*, *Mercurius*, *Sulphur*, and *Camphor*. 1, *Calc.* 2000 (Jen.); 2 to 4 §. One powder to be taken every fifth evening.

April 28th. The swelling of the gland much reduced. 1 to 4 §. One powder to be taken every fifth evening.

May 17th. There remains hardly any swelling. 1, *Calc.* 3000; 2 to 4 §. One powder to be taken every fifth evening.

Perfectly cured.

4 (vol. 78, page 127). B. B—, a girl, sixteen years of age, resident in Munster; affected since three years with a running from the left ears of a fetid sanguino-purulent matter; the running is unattended with pain. Cutting pain in the forehead. Chronic inflammation of the eyes, though less severe than formerly. Diarrhœa, with protrusion of the rectum. Monthly period regular, but of too long duration; preceded by violent abdominal pains. (The mother had a protracted attack of nervous fever during her pregnancy with this child.)

The patient had been treated for some time by a homœopathic practitioner of this place, who is now deceased, but she had experienced only trifling benefit from the treatment, some slight amelioration having been effected in the diarrhœa and ophthalmia.

March 18th, 1851. 1, *Sulphur* 2000; 2, §; 3, *Sulphur* 2000; 4, §. To be taken, one powder every fifth evening.

April 13th. Considerable amelioration in all the symptoms. The running from the ear diminished, though not yet altogether removed. 1, *Calc.* 2000; 2 to 4 §. One powder to be taken every fifth day.

Perfectly cured.

5th (vol. 80, page 131). T. B—, spinster, thirty-five years of age; affected since several years with pains in the spleen resembling stitches, and spreading from the spleen to the left side of the chest; the pains are more severe in the evening, and after any exertion. Swelling of the feet, in the evening. Trembling of the limbs. Perspires readily and copiously, particularly at night, and when sitting down after any exertion. Fat food disagrees with her. Costiveness.

The patient had been in the hands of several allopathic physicians, who had given a great quantity of medicine, but without achieving any better result than making the patient go on from bad to worse. *Ferrum* and *Valerian* seemed to have been the favourite nostrums.

March 15th, 1851. 1, *Sepia* 200; 2, *Ignatia amara*, 200; 3, *Sepia* 200; 4, §. One powder to be taken every fifth evening.

April 21st. Considerable improvement, though not yet perfectly restored to health. Diarrhœa after partaking of oily substances. 1, *Sep.* 2000 (Jen.); 2 to 4 §. One powder to be taken every fifth evening.

Perfectly cured.

6 (vol. 80, page 138). H. L—, of H—, painter and glazier, twenty years of age; suffered since last summer from stitches in the right side of the chest, accompanied by traction in the limbs, and beating in the forehead, particularly over the left eye; the symptoms are worse during wet stormy weather, snow, hoar-frost, and in the evening when retiring to rest, and also when the patient takes a walk, or exerts himself in any other way. Cannot sleep before midnight, on account of a distressing cough, with spasms and difficult expectoration of saline mucus; after this expectoration, the patient feels his chest somewhat relieved. He can lie only on the left side (Phthisis tuberculosa!) Bread, soups, pancakes, pork and all fat food disagree with him. He feels very cold, and is always worse in the cold. Little thirst. His strength is completely gone; he can no longer work.

The patient had been for nine months under allopathic treatment, and had been made to cultivate an extensive acquaintance with the preparations of the Pharmacopœia. *Ammon. mur.* and *Tart. stib.* seemed to have been the principal favourites. His case had, however, grown worse and worse, until at length his physician left him to the curative virtues of copious draughts of tea of *Lichen Island.*, but with the same bad success.

March 16th, 1851. 1, *Kali carbon.* 200; 2, *Sulphur* 200; 3, *Kali carbon.* 200; 4, §. One powder to be taken every fifth evening.

Hosted by Google

April 7th. Considerable improvement in all the symptoms, although not one of them has yet completely disappeared. The expectoration has lost its saline taste, and is now perfectly tasteless. In the evening, oppression of the chest, when sitting. 1, *Phosphorus* 2000; 2 to 4 §. One powder to be taken every fifth day.

April 30th. The *Phosphorus* has not made a favourable impression upon the system; the oppression of the chest in the evening is worse than before. 1, *Nux Vomica* 200; 2, *Kali carbon.* 2000; 4, §. One powder to be taken every fifth evening.

After these remedies the patient recovered his health completely. This is one of the serious cases witnessed by Dr. Dunham, of New York, during his stay here.

7 (vol. 78, page 137). H. H—, a boy, eight years of age, was affected at the age of six months with a fever (pectoral fever), and has been suffering ever since. Cough, with pain in the chest; the cough is dry in the evening, but in the morning it is accompanied by expectoration of a sweetish matter, tasting like milk, or like nuts. Strong appetite; eat as much as he may, the patient hardly ever feels satisfied. Perspiration as soon as he falls asleep. Brown urine in the morning. Great desire to drink milk. Constant rheum.

The patient had been hitherto under allopathic treatment, but without deriving any benefit from the same. The prescriptions could not be got.

March 18th, 1851. 1, *Sulphur* 200; 2, §; 3, *Calc. carb.* 200; 4, §. One powder to be taken every eighth day.

April 12th. Considerable improvement in all the symptoms, 4 §. One powder to be taken every eighth day.

No further remedy or treatment was required to restore the boy to perfect health, which he has continued to enjoy up to the present moment.

8 (vol. 78, page 142). B. H—, a student, twenty-four years of age resident at Munster; has been labouring for about a year under a peculiar kind of difficulty of breathing; he feels as if there were a valve in the throat, intercepting the breath; this grows worse in the evening in bed, when the patient often feels as if he were on the point of suffocation. Cough unattended with pain; scanty expectoration, brought up with difficulty. Sensation of lassitude in the chest. When drawing in the breath, the patient has a sensation as if his chest were too narrow. In the early part of the morning he feels better.

The patient has been under allopathi- treatment. The last remedy recommended by his physician was *Lichen Island.*, but he has not derived the slightest benefit from this or from any of the other medicines administered to him.

March 19th, 1851. 1, *Spongia* 200; 2, *Hep. sulph. calc.* 200; 3, *Spongia* 200, 4, §. One powder to be taken every eighth day.

April 16th. The sensation of the presence of a valve in the throat is completely gone. The difficulty of breathing is considerably less, and confined entirely to the morning. Cough when drawing a deep breath. Headache in the morning, Sensation of cold in the stomach. 1, *Phosphorus* 2000; 2 to 4 §. One powder to be taken every eighth day.

May 14th. Improvement in all the symptoms. 1, *Kali carb.* 2000; 2 to 4 §. One powder to be taken every eighth day.

June 18th. The *Kali carb.* seemed to have been badly chosen; perhaps its administration was premature. The patient feels very cold and chilly, particularly in the morning; the sensation of a valve in the throat has come back, and is more strongly felt now in the act of exhaling. Palpitation of the heart has come on. 1, *Spongia* 2000; 2 to 4 §. One powder to be taken every eighth day.

Perfect recovery took place after these remedies.

I beg to call the particular attention of my homœopathic colleagues to the consequence of the ill-advised administration of the *Kali* in this case, as in Case 6 of that of the *Phosphorus*. The injurious consequences of these two doses clearly prove the powerful action of high dynamizations upon the system.

(To be continued.)

THE HOMŒOPATHIC AND ALLOPATHIC PRACTICE IN ACUTE PNEUMONIA CONTRASTED.

By George Dunn, M.D.

On Thursday, March 13, at noon, I was requested to visit Miss S. L., aged eight years and eight months; of a lymphatic temperament, stout, robust frame, mild and amiable disposition. I found her in bed, breathing hurriedly and noisily, very feverish, pulse 130, coated tongue, offensive breath, and dry, hot skin. There was acute pain to the slightest touch under and around the right clavicle and upper third of the right side of the chest, increased by the movement of the body or of the right arm. On closer examination, the upper half of the right lung was found to be con-

Hosted by Google

gested, and on percussion (which was painful) yielded a dull sound; the crepitant rhonchus, so constant in the first stage of pneumonia, could be distinctly heard without the aid of the stethoscope, which I had not at the time with me. These symptoms accurately pointed out the nature and seat of the complaint, which could be no other than a very severe and sudden attack of inflammation of the lung; there was no complication. On inquiry it was found that the patient had had rigors about five o'clock in the morning, which her elder sister, who slept in the same bed, attributed to play, and told her "not to shake the bed so;" this was clearly the onslaught of the disease, and reminds one more of the sudden attacks of soldiers and others exposed to the inclemency of the weather, than the usual modes of attack on those who are surrounded by every care and comfort. The respirations at this early period were from fifty to sixty in the minute; this symptom, with the noise and distress which it occasioned, was very alarming to all around, and no time was lost in applying the proper remedies. *Aconite* was immediately administered, and as I was going a short journey into the country, expecting to be absent about two hours, I desired the dose to be repeated every hour until I returned. This was faithfully attended to; and on my return, though the breathing was as noisy and hurried as before, yet the pain and uneasiness were a little abated, and *Aconite* was continued every two hours. At bedtime considerable relief was experienced, and though the patient got only about two hours' sleep, she was not restless, and early in the morning she was more quiet, the sputum was more easily expectorated; it was rusty, and later in the day tinged with blood. I saw the patient four times before five, p.m., on Friday, and the symptoms were already much less urgent. *Phosphorus* 3 had been substituted for the *Aconite* with marked benefit; after each dose her attendant noticed that on administering it the respirations fell ten in a few minutes. At five p.m., after my fourth visit, I had again occasion to see a patient in the country, and during my absence there was a slight spasm in the affected lung, for which, had I been present, a dose of *Hyoscyamus* would have been given; this very naturally alarmed her attendant, who sent for the medical man I had named, should any emergency arise; he not being at home, the nearest medical man was sent for, who did not either proceed to the sick-room to administer to the necessities of the case, or to allay the fears of her anxious attendant. The first gentleman sent for coming in, and at once proceeding to the bedside of the patient, the parley was stopped, and when they both appeared at the bedside the spasm was gone; and they told the attendant that though the case was one of doubt, there was nothing alarming in the patient's case. On my return I hastened to see the case, and met the medical gentlemen in the drawing-room, after they had seen the patient, and I said there can be no doubt about the disease, much as we may differ about the treatment, and they both agreed (or appeared to do so) that the disease was acute inflammation of the right lung; for which one gentleman told me he would deplete, and the other told me he would not. After this they took their departure, and I visited my patient, and finding no trace of spasm left, I again administered *Phosphorus*, and it was truly delightful to see how beneficially each dose told; the respirations, which had been sixty, falling to thirty at midnight. When I left my patient, I called on my way home at her grandfather's, who lives in the town, to say that I considered my patient out of danger, and this I could do most conscientiously and truthfully, seeing that the pulse had fallen to a hundred, and the respirations, from sixty, had fallen to thirty in as many hours. I was then aware that I had the disease under control, and the *Phosphorus* was ordered to be continued every four hours.

On Saturday morning the temperature of the atmosphere had fallen considerably; there was a sharp frost, and a keen north-east wind blowing. I found my patient easy, lying on the side affected; but the pulse had risen to 106, the respirations to forty in the minute; no pain. I had to approach quite close to the patient to count the respirations, which the day previous were readily heard on the landing, and even down to the drawing-room on a lower floor; expectoration scanty, and without tinge of blood. As the bowels had not acted since Wednesday evening, I administered an enema of gruel and castor oil, which was not long retained. I must here confess that I did this, not thinking it particularly requisite, but because such stress is laid upon purging by the generality of people, who seem to agree with Messrs. Morison, Holloway, and Co., that violent purging can cure all diseases that flesh is heir to; the enema had very little effect, and I intended after a while to administer a second.

The anxious parents arriving from a distance (having been summoned by the friends at my request) put a stop to my further progress, which, I will say, had been eminently satisfactory during the forty-six hours that I had attended; the pulse, from

Hosted by Google

130, had fallen to 100; the respirations, from sixty, had fallen to thirty; but owing to a keen frost and a north-east wind, the latter had risen to forty, the former to 106, but this was unattended by distress. After an interview with the parents, and after I had introduced the mother to her daughter, I took my leave, promising to return in an hour; this, however, was not permitted me. A family consultation was held, the result of which was that my patient, though progressing rapidly towards cure, was taken out of my hands without my being summoned to hear the reasons for such a step.

I do not blame the parents, to whom, medically, I was a stranger, and for whom every allowance, under the painful circumstances, ought to be made. For what I here advance I have a competent witness to bear me out, one who had had inflammation of the lung, and had been cured by my treatment, and one who has had much experience in sickness and of medical men, and one also whose veracity will not be doubted.

Forty-six hours had I anxiously watched this truly terrific onslaught of disease, and amendment had followed every dose administered; I have nothing to regret, nothing to reproach myself with. Had I been favoured by Providence with a milder temperature and more genial weather, the progress would probably have been more rapid; but under every disadvantage in this respect, I will defy any candid man to say that under any treatment the progress would have been greater.

Let us now change the scene, and give a truthful diary of what was called "active treatment," and if the old school of medicine has nothing better to oppose to acute inflammation of the lung the sooner it ceases its operations the better; for it has been demonstrated by Dietl, who collected the statistics (these statistics are from his own practice) of three methods of cure, viz., blood-letting, *Tartar Emetic*, and diet only, that the latter was by far the most successful; for whilst the mortality was 20 per cent. by bleeding and *Tartar Emetic*, it was only 7 per cent. by the treatment by diet only. But to our case: the first dose of drugs that was administered was a *Calomel* powder, then immediately followed TWO LEECHES ON THE PIT OF THE STOMACH. This latter application, I confess, astonished me very much, because the inflammation was raging in the right lung, and not in the stomach; true it is there was tenderness to pressure on the whole precordial region, but in a general inflammatory state there would be tenderness to pressure nearly throughout the entire body, particularly when this inflammatory state arises from cold. These measures naturally irritated the patient very much, and both pulse and respirations rose, the former to 130, the latter to sixty in the minute. After four hours, the *Calomel* powder not acting, it was followed by a second; and in four hours more, no action being produced on the bowels by the two, a third was given, which succeeded in purging all good and bad matter from the stomach and bowels, and this concluded the first twelve hours' work, which we may as well review.

In the morning, at ten a.m., the patient's pulse was 106; respirations had risen to forty, owing to a cold north-east wind and keen frost; the expectoration was free from blood, and easily coughed up; the patient was quiet, easy, and free from pain, *lying on the side affected.* Twelve hours later a marked change had been effected by what was called (and as far as the bowels were concerned, most truly) "active treatment;" the pulse had risen to 130, the respirations to sixty in the minute; the patient prostrate, irritated, and much, very much worse in every respect. Two more leeches were ordered, and applied a little to the right side, but only one took; a dose of fever mixture, ordered to be taken every four hours. The patient passed a most restless night, weak, and complaining—not of pain in the lung, but from sheer fatigue of purgings, leechings, and nauseous drugs. Morning arrived, and with it the medical men (of whom I will say none could have been more attentive), when the treatment was continued. Another leech was applied, the mixture continued every four hours, and in the evening a blister was applied, and this, with much examining, and consequently disturbing the patient, closed the second day's proceedings. A marked change for the worse was again apparent, and the medical men, as well as the friends, despaired of her life; her strength was wasted by the varied means of depletion, whilst the disease had been allowed undisturbed possession of the lung, and the distress of the poor patient, weak, restless, and breathing sixty times in a minute, may be imagined, but cannot be described.

Monday and Tuesday the proceedings were little varied; only one purge was given, and one more blister applied. The weakness was too alarming even for the depleting school; all hope by such treatment was gone.

On Wednesday, chancing to meet one of the medical men, who verified the above account of the treatment, I told him plainly that such measures would kill the patient, and unless some specific treatment was applied to the lung, the only diseased

Hosted by Google

part, the patient would soon die. I pointed out the means by which he might save his friend's child; I appealed to him in the most earnest manner; I entreated him to alter the treatment and save his patient—*there was yet time.* I offered him the remedy; I desired him to use it not as a suggestion of mine, but his own; I begged him to keep both the fame and the emolument; I showed him statistics of the large homœopathic hospitals, where the mortality from pneumonia is astonishingly low, about 3 per cent.; I told him of the uniform success of the treatment on the lower animals; I referred him to a gentleman in the town, whose son was on the point of death from double pneumonia, which case appeared in the *Homœopathic Times* last year; I also told him what disgrace would await him and his colleague, if, after taking my patient away *who was doing well,* they dosed her to death. He appeared impressed with the truth of what I advanced, acknowledged that the patient was beyond their means of cure (or at least so I understood), but I heard no more from him for several days.

A great change in the temperature coming on during the same afternoon that this conversation took place, and the drugs being discontinued, a little wine being substituted to bring back (vain hope!) the strength they had so needlessly wasted, a lull in this frightful storm took place; the patient became less distressed, she took more notice, the respirations fell to fifty, and during Friday night they reached their lowest point under the depleting method, which was forty-five, never to recede so low again. Providence was extremely kind to these gentlemen, and granted them two days of south-west wind and a mild temperature. Here was a golden opportunity, but how was it employed? in giving wine and barley water to woo back a portion of the strength so recklessly thrown away; and with Saturday's change in the temperature the respirations speedily rose to sixty and upwards; another mercurial purge, which acted four times, and a composing powder at bedtime, closed Saturday's treatment, and the patient was a wreck pitiable to behold.

Can we wonder at the colossal fortunes made by the Morisons, Holloways, Worsdells, and the great and increasing tribe of drastic drenchers, when we see two respectable medical men, of long standing in the town, employing a whole week, during which time there is a raging inflammation going on in one lung, in violently purging the bowels of a poor little girl who had taken little or no food for ten days, and who, moreover, was neither labouring under obstruction or even slight constipation.

Sunday. Just nine days after I had been superseded, a third blister ushered in the day's proceedings, and *Tartar Emetic,* with wine and barley-water, made up the treatment; the respirations rose above seventy; patient exhausted and less tractable.

Monday. Change of wind to westward; temperature mild, even warm; respirations reduced a little below sixty; more nourishment taken, less wine, but disease in the lung still untouched. Fever mixture every four hours, wine every two, and a composing dose at bedtime, which procured a quiet night, after which the medical men were astonished that there was no amendment; respirations (that true barometer in acute inflammation of the lung) sixty; patient weak and hectic; medicine and wine continued; a composing dose at bedtime. Another quiet night; respirations higher in the morning, above sixty; patient evidently sinking; mixture every four hours; a blister to the back, making the fourth; and all hope gone. The little patient struggles bravely against the combined attacks of disease and doctors, but is evidently sinking under such fearful odds.

Thursday. Allowed to have anything she asks for; ate roast beef, whilst a blister was gnawing at her back. But why pursue the painful details further: the *Prussic Acid,* the *Mercury* and *Chalk,* the *Rhubarb,* and other matters equally appropriate, may be left without comment. Let us await the end, which cannot be far off, to make a few remarks upon the different modes and the different results of the homœopathic and allopathic treatment of inflammatory attacks in general, of inflammation of the lungs in particular.

Friday morning. Great pain, restlessness, and irritability; sinking fast; a few brief hours, and all will be over.

Saturday, 29th. The poor little patient still lives, but the end is now very near. For fifteen days and nights has the fond mother watched with the greatest anxiety to witness some change in the little sufferer's condition, but has watched only to see life ebbing out. Oh, that medical men would ponder on the awful responsibility that devolves upon them in such cases, and study the better method of healing! If art can do no more than has been done in this case, better, far better, leave it entirely to Nature, because it has been clearly demonstrated that such cases get well under diet only; and I am firmly of opinion that, had this little patient been continued under the homœopathic treatment, which had already done so much for

Hosted by Google

her, she would now have been convalescent. The little patient expired at a quarter past two on Sunday morning, and sank calmly to everlasting rest.

(*To be continued.*)

[We are sorry we are obliged to divide this paper—but we cannot, in general, afford more than five or six columns for any one article.—ED.]

AN ESSAY ON HOMŒOPATHIC STATISTICS;

Together with a Critical Analysis of Dr. Routh's Work, entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

BY JOHN OZANNE, M.D.

(*Continued from page* 662.)

XIII.

The complication of pneumonia.—"The majority of cases of pneumonia recorded by homœopaths," says Dr. Routh, "are *idiopathic* or *simple*, not *complicated* or *secondary*. The mortality in these varieties must necessarily be very different" (p. 50).

The statement that the complicated or secondary forms of pneumonia are more serious, and present a much larger mortality than the simple or idiopathic, is perfectly correct. Dr. Routh may be right also in stating that "the majority of cases" recorded by homœopaths are uncomplicated. I do not intend to contest either of these positions; but what I do intend to contest is the conclusion which he draws from his facts,—namely, that the superiority of the homœopathic results at Paris or Vienna, as compared with the allopathic in the same towns, is to be explained by the fact that in the London hospital practical complications are very frequent!

Were it my present purpose merely to answer the objections brought forward against homœopathic statistics by Dr. Routh, it would be sufficient to show that the patients admitted into the homœopathic wards of the Hôpital St. Marguerite of Paris, or into the Hospital of the Sisters of Charity of Vienna, are precisely the same as those admitted into the allopathic hospitals of either town. For under whatever variety of form a disease may manifest itself, whether this variety be due to causes in constant operation, or merely to epidemic or accidental influences, it is obvious that by taking a very large number of cases, collected in the course of several years, every variety and every complication of the disease must necessarily be included. No legitimate objection can be made upon this score to the statistics of the Vienna Homœopathic Hospital, for we have tables giving us a summary of *all* the cases treated in that Institution for many years past.

The cases of pneumonia treated at Paris by Dr. Tessier, and analysed by Dr. Routh, are neither so numerous, nor are they the result of so long a period of homœopathic practice. These cases, as published in Dr. Tessier's work on Pneumonia and Cholera, were collected in a period of somewhat less than three years. But if Dr. Tessier's cases are less numerous, and do not present a summary of the homœopathic treatment of pneumonia during many years, as Dr. Fleischmann's do, they have this advantage, that being fully recorded, we may make them the subject of a careful analysis. This will be done in the course of this essay.

It is, then, my intention to enter fully into the question of the complications of pneumonia, to endeavour to ascertain to what extent they influence the per-centage mortality of that disease, and, as an immediate result, to discover how far the homœopathic statistics are rendered more or less favourable by the number of complicated cases which they embrace. Although this course may appear at first sight to be both long and tedious, it will not, I feel convinced, be thought so upon further reflection. The question at issue is one of which the importance cannot be denied; nothing therefore could do it more real damage than a superficial or imperfect inquiry. Nothing short of the tedious but necessary process of testing the statistics by every objection which has been or can be possibly raised against them, can be deemed satisfactory by the thoughtful inquirer.

I may here anticipate upon the results of this inquiry so far as to state that, after various calculations, taking every one of Dr. Routh's objections as the basis of each of them, I have found homœopathy to be superior to allopathy in very nearly the same proportions stated in the series of papers published in the first volume of this periodical, in which the statistics of pneumonia were discussed.*

* The mortality under judicious allopathic treatment, as stated by Grisolle, was found to stand in relation to Tessier's in the proportion of 2.776 to 1.000, and in relation to Fleischmann's, as 2.714 is to 1.000. The close approximation of the figures, obtained by calculating the homœopathic mortality at Vienna and at Paris, is truly remarkable.

Hosted by Google

Before we proceed one step further with our inquiry, it is necessary to understand clearly what is meant by the term *complication*, as applied to pneumonia.

With the strictest propriety we might say that *any other disease* co-existing with pneumonia is a complication of it, but it is evident that in practice such a definition would be found thoroughly useless as a guide to our prognosis; for if we took the term in such a wide sense, we might say that toothache, simple neuralgia, cataract, nasal catarrh, slight bronchitis, etc., are complications of pneumonia. They would be, it is true, real complications, but not of such a character as to guide us in forming our prognosis.

Our definition therefore will be, that a complication is that disease or morbid condition of the system which, either by its very nature or the circumstances under which it occurs, may influence the course of pneumonia, so as to lessen in a marked manner the chances of recovery. This definition is necessary; for in the sequel we shall find that the word *complication* is understood by allopathic physicians in a very vague sense, so vague indeed, that under this appellation morbid conditions, which can scarcely be said to be capable of influencing unfavourably the course of pneumonia, are comprised. It will therefore be a part of my task to consider what are and what are not *legitimate complications*.

By the side of this definition we shall also have to keep in view one very important circumstance, connected with the very nature of the remedial measures adopted by the allopathic school. This circumstance is, that whilst the injurious influence of the complications of pneumonia consists, for the most part, in a depression or exhaustion of the vital power, the chief remedial measures adopted by that school exhaust the vital power, by withdrawing a portion of the vital fluids. So that, either they are used and tend to depress still further the patient's strength, or they are not used, and then the disease gains ground, and finally proves fatal!

In his attack upon the homœopathic statistics of pneumonia, Dr. Routh places his chief reliance upon a series of cases not yet published, but the details of which were privately given to him. He speaks of these cases in the following words:—"In 140 cases occurring in the practice of Drs. Taylor, Walshe, and Peacock, furnished to me by the kindness of these gentlemen, fifty-five per cent. were complicated; Dr. Hughes obtained fifty-two per cent. The proportion of complicated to uncomplicated may be thus fairly assumed as equal" (p. 50).

The mortality was very great. "There were 140 cases, forty-three deaths—mortality, one in three, or thirty per cent." (p. 52).

In the absence of details of these cases, it is totally impossible to form a correct idea of their character. It is impossible, moreover, to feel sure that the complications would answer to our definition as given above. We may, however, obtain some tolerably satisfactory notion of them, by taking into consideration that the proportion of complications is very nearly that obtained by Dr. Hughes. Now, as all these gentlemen collected these cases in London, their complications must have been nearly alike; therefore, we may make some use of the analysis given by Dr. Hughes, in the "Guy's Hospital Reports," of his own cases, in order to ascertain the character of the complications in those of Drs. Taylor, Walshe, and Peacock. This will be done in the sequel. At present, I may dismiss this portion of the subject with the statement, that many of Dr. Hughes's complications do not correspond with our definition of what we are to understand by complications.

Since, then, we have no details of the symptoms in the 140 cases of Drs. Taylor, Walshe, and Peacock, we are compelled to take the various complications enumerated one by one, with the view of ascertaining whether they are of such a nature as to account for the wide difference in the results of treatment under the two medical systems, namely, a mortality of thirty per cent. under allopathic, against five or six per cent. under homœopathic treatment.

We are told that in these 140 cases the complications were, in order of frequency, as follows:—"Phthisis, severe bronchitis, Bright's disease of the kidney and dropsy, endocarditis and pericarditis, meningitis, erysipelas" (Routh, p. 53). We shall follow the same order in our inquiry.

I. *Phthisis.* In the consideration of phthisis as a complication of pneumonia, we shall have to solve the following questions.

1st. *Is phthisis a dangerous complication?*

The danger arising from this complication is chiefly dependent upon the *form* or the *stage* of the tubercular disease of the lungs.

A. *Limited tuberculosis in the earlier stage of its development.* I will quote upon this point the opinion of Louis, the greatest authority on the pathology of phthisis.

Hosted by Google

"When pneumonia occurred at an advanced period of the disease, while the patients were still able to pursue their ordinary avocations, and while their strength and flesh had not as yet materially failed, it displayed itself with the series of symptoms ordinarily accompanying it, when developed in persons in perfect health. *But these symptoms were generally of slight severity, even when tuberculous cavities had already formed at the apices of the lungs.* . . . .

"The slight seriousness in pneumonia, arising in the course of phthisis, when the disease is unadvanced, has also been noticed by M. Andral. This observer mentions too (as I have myself sometimes seen) that it is not rare to meet with phthisical individuals who have experienced well-marked symptoms of pneumonia twelve or fifteen times in the course of their malady. And M. Grisolle, in his admirable treatise upon Pneumonia, concludes, from the facts before him, that that affection, when occurring in the course of phthisis, only accelerates the progress of the latter in a small number of cases; that limited, most commonly, to a small surface and to the neighbourhood of the tubercles, it is not accompanied with very severe symptoms; that it follows a regular course, of an average duration of from twelve to fifteen days, *is almost constantly followed by recovery, and does not appear to aggravate* the primary disease.

"No doubt the last-stated proposition ill accords with generally received opinion; it clashes directly with the statements of M. Andral, who, a few lines below the admission above cited, assures his readers that intercurrent pneumonia, too often neglected, or altogether escaping detection, causes the premature death of a great number of patients; and that in cases where it does not immediately entail their destruction, it is always detrimental, inasmuch as it promotes the development of new crops of tubercles, and hastens the period of their softening.

"Nevertheless I believe the proposition of M. Grisolle to be true, applied as it has been by him to intercurrent pneumonia, developed when the tuberculous disease is not far advanced; at least it is comformable to what I have myself observed" (Louis on Phthisis, Syd. Soc. ed., p. 274).

B. *In the advanced stages of phthisis*, pneumonia is more serious. "That arising in the closing periods of the disease is almost necessarily fatal" (Louis, p. 276).

But the question arises here, is this a pneumonia case complicating phthisis, or is it not phthisis complicated with pneumonia? undoubtedly the latter. It would be a manifest abuse of classification to class such a case as one of pneumonia.

It is a different thing in the early period of phthisis, complicating or complicated by pneumonia. Here, in most instances, the seat of the pneumonia is around the tubercular depositions; during the progress of the pneumonia, if the patient's chest have not been previously examined, the presence of the tubercles, although suspected, may perhaps not be recognised. If, as it happens in most cases under homœopathic treatment, the patient recovers, and if he be not repeatedly stethoscoped, after his recovery, the complication will not be discovered; but if he die under allopathic treatment, the case is put down as complicated, which is, of course, to account for its fatal result.

C. *Tubercular infiltration* of a whole lobe, or even of a whole lung, may exist and be the cause of pulmonary inflammation, giving rise to hepatization of the tissue of the lung. It gives rise to a form of phthisis which is tumultuous and acute, is accompanied with repeated attacks of pneumonia, and is attended with much pain and distress" (Rokitansky, loc. cit., p. 104).

A deposition of *miliary tubercles*, scattered throughout a large portion of one lung, may exist and be surrounded by patches of hepatized pulmonary tissue; such a form may be as speedily fatal as pneumonia itself.

II. *What influence does phthisis exercise upon the relative mortality of pneumonia, under homœopathic and allopathic treatment?* This question will be best answered under the following heads.

A. *What is the comparative frequency of phthisis in different climates or localities?*

If it could be shown that phthisis was more frequent in England than at Vienna, or at Paris, we might infer, from the difference of frequency, that statistics made up at the latter places might perhaps gain, though not in the degree stated by Dr. Routh, by the less frequent complication of pneumonia with phthisis. But it is not so, and it is a singular fact that climate has no perceptible influence upon the production of phthisis. The reports of the army surgeons, extending over a period of seven years, and gathered by Major Tulloch, gave the unexpected information that amongst the troops the mortality from phthisis was greatest in the West Indies, and least in Canada and Nova Scotia. That at the Mediterranean stations, the proportion is almost exactly the

Hosted by Google

same as in Great Britain; being at Gibraltar as 1000 is to 8.2; to 6.7 at Malta; to 5.3 in the Ionian Islands; and to 6.6 in the United Kingdom. The same reports show the mortality amongst the Maltese inhabittants to be almost identical with what it is in Sweden, namely, at Malta, $5\frac{3}{8}$ to 1000 inhabitants; in Sweden, $5\frac{3}{5}$ to 1000 inhabitants. It it clear therefore that the proportion of cases of phthisis complicating pneumonia must be nearly alike in London, Paris, and Vienna. Hence the statistics at the two latter places are placed upon the same footing, with regard to this complication, as the London statistics.

B. *What is the influence of the form of the tubercular disease of the lung?*

We have seen that limited tuberculosis, in the early periods of its development, exercises little or no influence upon the result of the pneumonia; not so, however, with the *infiltrated* tubercle, or *scattered miliary* tubercles, when occupying a large portion of the pulmonary tissue. But these forms are rare. In Dr. Hughes's 54 cadaveric inspections, there was only one case of this kind. It was met with but once in the seventeen post-mortem examinations of persons who had died of pneumonia at the Royal Infirmary of Edinburgh, in 1842. It is therefore evident that, being so rare, it can add but very little to the mortality of pneumonia.

C. *What is the influence of the allopathic and homœopathic treatment*, respectively, upon pneumonia complicated with tubercular disease of the lungs?

This is a vital question in our inquiry, but it will be best answered when, in the next paper, we calculate upon the bases given in Dr. Routh's book itself—the relative mortality in complicated pneumonia.

(*To be continued.*)

ELOGE OF HAHNEMANN.

By an Hahnemannian.

It matters not where Hahnemann was born, and where he died; it matters not that his widow had his body embalmed, but not the less kept back the revised edition of his works he had finished for the press. She is false to his memory if she does not publish his revised works.

In his life he was pleasant, useful, a benefactor to his species. In his customary mode of life he united the simplicity with the dignity of the philosopher. The chief expression of his countenance was an irrepressible benignity As Tacitus says of Agricola, "bonum virum facilè crederes, magnum libenter. In looking at him you would see at once he was a good man, and you would rapidly and willingly come to the conclusion he was a great one."

So far as his own glory was concerned, he lived out the full term of humanity. He was a man that made no fortune by his painful profession. In fact he died rather poor than otherwise.

He left a wife his literary executor, who withholds the last fruits of his mind. We must leave that to her conscience.

He left as *sons* Bönninghausen and Constantine Hering, and each of them has done justice to his memory.

He was of Napoleon's age—and to be Somebody in comparison with Napoleon is something. In the very year that the great Conqueror made his first magical campaign of Italy, Hahnemann published his Organon. The one went forth to vanquish Austrians, the other to vanquish diseases; which was the greater conqueror?

Our Hahnemann had enough to contend with—open enemies and false disciples. He lived in an age when to be a medical reformer was to be an infamy. Happy was our Hahnemann in his life, not less happy in his end.

The whole world was at his funeral. He left us his doctrine and example as a bequest. He that professes to be homœopathist, should be Hahnemannian.

No tears for him—no lilies scattered over his tomb—but the flowers that are typical of immortality—and are called *immortal*, as in the way of mockery.

That august face of Hahnemann, and that magnificent head, are still, we believe, to be seen by the grace of his widow, but his last revised writings are withheld by that widow. What are we to think of this?

If there be any place for the shades of the benefactors of their race—if, even as the civilized heathen believed, spirits are not extinguished with the last breath of this mortal life, our Hahnemann is in that Paradise of the Loving and of the Faithful.

Worthy of all praise and of all just rivalry is he!

His true wife and his real progeny are *what he did*; you find this stamped in his writings.

His face and his head have often been reproduced; but it is not brass, nor stone, nor marble, nor the painter's art, nor the engraver's, that can preserve to us the august Image of Hahnemann.

We again take up the language of the admirable Tacitus, and what he said of Agricola we say of Hahnemann.

"*Quidquid ex Hahnemanno amavimus*

Hosted by Google

quidquid mirati sumus, manet mansurumque est in animis hominum, in æternitate temporum, famâ rerum. Nam multos veterum, velut inglorios et ignobiles, oblivio obruet, Hahnemannus, posteritati narratus et traditus, superstes erit. Hahnemann's memory will live for ever. Other physicians, great in a transitory reputation, will be forgotten, but Hahnemann will survive the wrecks of Time, and future generations will cherish the memory of the Sage, the Physician, and the Philanthropist."

THE HOMŒOPATHIC TIMES.

SATURDAY, JUNE 19TH, 1852.

EARNESTNESS is a pearl of price; to be in downright earnest is to show that one is somebody. In this peddling, huckstering age, who are in earnest?

Louis Napoleon and the Czar? Who else are in earnest? It is a painful question. We hate tyranny and *Sclavism*, so we are no advocates for despots. But who else, except despots, are in earnest?

The gold of California and Australia, this wretched pelf, engrosses the thoughts of men.

The *Caucasus* of D'Israeli is thus brought into close affinity with the *Caucus* of the United States.

Touching the physical well-being of man, nothing has been propounded that approaches in importance to homœopathy. How has it been received? how is it prosecuted? what are the views, and the desires, and the objects of its upholders? Let them come forward and declare their faith.

If it be to extract as much as can be extracted from the public, in the way of remuneration, we despise the motive. How many true believers are in our ranks? We hope very many.

Men are in the habit of making strange distinctions between speech and action, but where truth is concerned there should be no distinction. The real upholders of homœopathy are not afraid of investigation, of a searching inquiry. The best of us are poor creatures, and we should be willing to make the best case out for others.

We are not, therefore, bigoted adherents of homœopathy. We don't say that Sir Benjamin Brodie knows nothing of the diseases of joints because he may, perhaps, now and then fret a simple wart on the cheek into an irritable sore, by the application of *Potassa fusa.*

We do not say that the same distinguished surgeon and Mr. Hodgson are not, in their way, excellent surgeons, because they see, in the first instance, soon after its occurrence, a fungoid disease of the breast; say nothing can be done; prescribe *hydriodate of potash*, and six months after recommend the removal of the disease by the knife.

These are the inconsistencies of surgeons and physicians.

But we do look for truth, and we expect fair play, as we are prepared to render it. We are no upholders of any party; we have abundantly shown that we are sufficiently *eclectic* in medicine. We have given the water treatment its due; we have acknowledged zoo-magnetism as a real power; we have argued that the true movement-cure is founded on just physiological principles.

Let those who maintain the doctrine and practice of Hahnemann be *in earnest.* That is all we require of them.

The fashion of this world soon passes away, but truth is for ever. We know right well that our own earnestness and directness of thought and langnage have offended not a few; but we stand on the ground of our integrity, and knowing that we are right, we believe we shall receive justice.

We are reproduced in the United States, but we have scant support from our colleagues at home.

If we did not create, we at least have the merit of having demonstrated that there is a homœopathic public. We thrive by that public—it is for them we labour. The Rector of Wickwar is not wrong in his judgment. He, we believe, appreciates

Hosted by Google

us; so does Constantine Hering; so does Bönninghausen. Time is the umpire, and to Time we leave the arbitrement.

THE COLLEGE OF PHYSICIANS.

It is known that this venerable body attempted to degrade Harvey; it refused its fellowship to Armstrong; and refused its license to Jenner.

New discoveries, for the improvement of the practice of physic, do not seem to come within the scope of this College. One of the most able physicians that ever adorned this metropolis is still without the fellowship of the College—the successor of Baillie—the skilled diagnostician and excellent pathologist, Dr. Farre, but two of his sons, who were educated at Cambridge, are fellows of that College. Each of these gentlemen would at once admit his inferiority to his father; but each of them is a fellow of the College of Physicians—and *the* Farre is not a fellow.

Let any one read good Baron's life of Jenner, and he will see how the originator of vaccination was treated by the College. The book is very interesting. Some of these medical biographies are very valuable, and this is one of them.

There are in Britain not a few of those practising homœopathy who are entitled to the fellowship of the College of Physicians, and whom they should feel a pride in numbering among their fellows. They prefer to *ignore* homœopathy, as they ignored the circulation of the blood, as taught by Harvey, and as they ignored vaccination, as propounded by Jenner, though he was a graduate of Oxford. It would be invidious to particularise the individuals in our body who are fairly entitled to the consideration of the College.

Where will all this end? necessarily in the overthrow of an effete and useless Institution. There are some good names on the list of the fellows of the College. But what is the standing of the majority? what is the College good for? what does it propose for the health of the lieges of the realm? But we give a specimen of the practice of one of the most admired of its members—the victim being the father of our Queen—who would himself have been king, had his life not been cut short by the heroic practice. The Duke of Kent had not his mortal life preserved by excessive bleeding. Was he killed by it? His brother, George IV., had also pneumonia the same year. He too was bled, but not largely, and probably ate freely and drank *maraschino*. Dr. Gregory, of Edinburgh, proposed to him to go the "whole hog" of the Sangrado system; but George the Magnificent laughed at him, and lived ten years longer. Would any allopath now treat pneumonia in this way?

"On Thursday se'nnight His Royal Highness the Duke of Kent took a long walk, with Captain Conroy, in the environs of Sidmouth, and returned to the cottage with his boots thoroughly soaked.

"Captain Conroy, on reaching home, urged the Duke to change his boots and stockings; but the suggestion was unheeded until he dressed for dinner, being attracted by the smiles of his infant Princess, with whom he sat for a considerable time in fond parental endearment. Before night, however, he felt a sensation of cold and hoarseness, when Dr. Wilson prescribed a dose composed of calomel and Dr. James's powder. This His Royal Highness, confiding in his strength, and from an aversion to medicine, declined taking, remarking that he had little doubt but a night's rest would carry off every uneasy symptom. The event proved the contrary. In the morning the symptoms of fever were increased, and *though* [BECAUSE?] His Royal Highness lost ONE HUNDRED AND TWENTY ounces of blood from the arms, and by cupping, he died on Sunday forenoon.

"Dr. Maton was summoned from London, unavailingly, in consultation. I well remember to have heard, at his house in Spring Gardens, that able physician and accomplished man talk over with my father the particulars of the Duke's case, and to have listened to Dr. Maton's bitter regret at its fatal issue. One of his remarks was, 'Perhaps all was done that could be done. Indeed, *that* is the view which *must now be taken;* but if I had been in attendance on him in the early stage of his disorder, I think I should have BLED HIM MORE FREELY [!] His stamina was so great, his constitution so unimpaired by excess, that he would have borne more depletion; at all events, I would have risked it. The result might have been the same, but I should have hazarded extreme depletion.'"—*Life of the Duke of Kent, by the Rev. Erskine Neale.*

THE MEDICAL TIMES AND GAZETTE AND "ALLOPATH."

We extract another letter from "Allopath" to the Editor of the *Medical Times and Gazette.* The correspondent is obviously honest, and should push his inquiries; and see the actual practice of homœopathy in London, Paris, or Vienna, each of which cities has homœopathic hospitals,—those in Vienna sanctioned by the Government.

We peremptorily deny the hardy assertion of the Editor, that the question has been settled by experience and observation—against homœopathy; we assert that it has been settled by experience and observation—in favour of homœopathy. Our assertion is worth quite as much as his.

Hosted by Google

We ask him for his proofs that "the so-called facts of the homœopaths have been shown over and over again to be no facts; and that they have been convicted of statistical falsehoods *usque ad nauseam*." Till he produces his *proofs* he must lie under the imputation of making assertions at variance with truth and the facts.

In his review of Dr. Holland's "Chapters on Mental Physiology," the Editor of the *Medical Times and Gazette* writes:—

"Mesmerism and homœopathy are touched on frequently, in the course of his work, by Dr. Holland; and the sound sense displayed in discussing these subjects, and the philosophical tone of his remarks on them, cannot fail to undeceive some of those men of learning and position who have been beguiled into lending the weight of their name for the spread of the dogmata of these *pseudo*-sciences."

Let "Allopath" be comforted with the knowledge, that in proposing a fair inquiry into homœopathy, he recommends the investigation of a doctrine received by men of learning and position.

"SIR,—Your remarks appended to my communication of last week, on the subject of homœopathy, were certainly sufficiently severe, and also, as it seems to me, quite uncalled for. If I was unfortunate in my illustration of the different kinds of truths, so also was Sir J. Herschel, in the quotation which I gave, and so is Archbishop Whately equally unfortunate, since they both bear me out in my assertion, that the truths of mathematics and metaphysics may be elicited by *à priori* reasoning, and are not, equally with medicine, founded on experience and experimeet. I quite agree with you that "medicine is to be advanced by experiment and observation," and "that there is no reason why we should not find out a better method of treating rheumatism; and consequently you cannot, prior to and independent of experiment, affirm that this "better method" is not to be found in homœopathy. As to my ignorance of the foundation of therapeutics, I believe it to be founded on carefully-conducted experiments and observations; and that, being thus founded, homœopathy has a stronger claim upon our attention than those unknown nostrums which find their way into the wards of our hospitals. Lastly, as to my signature, I need hardly say that I am fully aware of its derivation, and I employed it simply because I am what is called an allopath. Why you should find fault with it I do not know. Requesting the favour of the insertion of these few lines (to which I think I am entitled, by way of self-defence),

"I am, etc.,

"London. "ALLOPATH.

"[The question has been settled by experience and observation. The so-called facts of the homœopaths have been shown over and over again to be no facts. They have been convicted of statistical falsehoods *usque ad nauseam*.—ED. *Medical Times and Gazette*.]

Correspondence.

ST. JAMES'S HOMŒOPATHIC HOSPITAL, DONCASTER.

To the Editor of the Homœopathic Times.

SIR,—A letter from your earnest and intelligent correspondent, Mr. F. J. Smith, in your last number, gives me an opportunity of stating, through the medium of your columns, that the management of the St. James's Hospital will be under my sole care, and for this very good reason, that there is not another homœopathic practitioner nearer than Sheffield, distant eighteen miles, Leeds twenty-eight, and York thirty. I shall, however, be too happy to avail myself of the assistance and co-operation of any homœopath, when I have the pleasure of having one for a colleague, and making him or them (if more than one) equal in every respect with myself, if he or they will take equal labour and equal risk. I shall take care (if doomed to toil alone) that while I live it is not perverted—but no man can say what may take place when the grave closes over him—and I shall do my best to prove, by the cases there treated, the immense superiority of the homœopathic treatment; and it cannot fail to furnish valuable statistics, as an immense number of patients will avail themselves of the consultations, which will be given daily. I cannot imagine what your correspondent means by saying that the establishment of a "homœopathic hospital is not necessarily a great good;" if founded on charity and good-will to men, and conducted entirely and strictly according to the Hahnemannian doctrine, it *must* prove a great good, and I trust we shall not be long ere we see one established in every town where there is a true brother of the faith. How an isolated homœopath, however, is to guarantee the management of such hospital after his short span is ended, I am at a loss to conjecture, and shall be glad if your correspondent can point out any means whereby such a desirable end may be obtained. My son Hahnemann (now only two years and a half old) I may not be spared to see dubbed doctor by a more enlightened faculty than that which lately refused Dr. A. Pope his degree, but I have a firm faith that his *name* will be no barrier to his success eighteen years hence, if he be spared, nor do I think that I shall toil and struggle much longer without one or more homœopathic colleagues; but I can assure your correspondent, to whom I feel deeply indebted for the interest which he takes in this matter, that while I live the St. James's Hospital shall be devoted to the spread of homœopathy, which I consider the greatest temporal blessing ever vouchsafed by a merciful Creator to suffering man, and which I will spare no labour or sacrifice to diffuse amongst my fellow-men.

I am Sir, your obedient servant,

GEORGE DUNN.

[We presume that by a deed of trust any

Hosted by Google

hospital may be perpetuated for any specialty, and *à fortiori* for the practice of homœopathy, which is for the treatment of all curable disorders and diseases.—ED.]

CHILDREN'S HOSPITAL.

(*Communicated.*)

ON the 7th inst., at 112, Gloucester Place, Portman Square, the Hon. A. H. Macdonald Moreton, in the chair, a meeting of gentlemen, interested in the extension of homœopathy, was held to consider what steps were best calculated to advance their object.

It was resolved, to effect the purpose they had at heart, to found a hospital for the treatment of children; and it was further resolved to take immediate measures for carrying this resolution into execution.

It was resolved that the hospital be conducted upon the principles laid down and practised by Samuel Hahnemann.

That case-books be kept at the hospital, in which shall be stated the fullest history and the existing symptoms of the patient on entering the hospital, the medicines given, the subsequent symptoms, and the subsequent medicines given, which books shall be, at all reasonable times, open to all subscribers.

That the medical officers of the hospital shall give clinical instruction or lectures, and afford every facility to medical practitioners and students, to become acquainted with the homœopathic system of practice.

That the medical officers shall publish periodically a collection of cases from their hospital practice, in illustration of results, be they favourable or otherwise.

That the hospital be managed by a committee of laymen, who recognise the Organon of Hahnemann as the only sound basis by which his system of medical practice can be tested.

That the payment of five shillings annually shall constitute a subscriber, but that donations be received to any amount.

That whenever the funds of the hospital shall admit of it, some provision shall be made for attending poor women in their confinements.

It is highly important that the principles upon which the medical practice is to be conducted should be strictly defined, to guard against a routine system of spurious practice, which is unfortunately too prevalent at present, and totally at variance with Hahnemann's precepts. The principles of Hahnemann were, to take down carefully all the symptoms of the patient, to compare them with the recorded symptoms of the medicines whose effects are known, and to select the medicine that shall appear to be most homœopathic to the most minute totality of the collected symptoms (objective and subjective) of the patient, or, in other words, to find a medicine that shall be, as nearly as possible, analogous, in its ascertained and recorded effects, to the symptoms of the complaint.

All the so-called specifics in the old system of medicine (which operate curatively) are, in fact, homœopathic to the diseases against which they are given successfully. Such as *Bark* against certain forms of intermittent fever, *Opium*, against delirium tremens, *Sulphur* in itch, *Camphor* for strangury from blisters, etc., etc.

What we have taken the liberty of calling the spurious routine system, is the selecting a medicine that shall relieve only one or two of the most prominent symptoms of the complaint, and then going on to another; giving one medicine for one symptom, another for another, without due examination. This requires far less labour, far less ability than the system propounded by the founder of homœopathy, and it is far less happy in its results to the patient.

With regard to the teaching the system of homœopathy to pupils; let them at least learn by the more laborious and more successful mode of practice.

It is with the view to ensure this laborious and difficult yet simple practice its full complement of study, that the case-books are to be rigorously and exactly kept, and open to inspection. The periodical publication of cases will, it is hoped, show the public that in the Child's Hospital some effort at least will be made to practise and teach homœopathy as propounded by its founder.

The sum of five shillings constituting a subscriber, it is expected that vast numbers, of limited means, will be stimulated to become contributors and participators in this noble undertaking.

It is trusted that a sufficient amount will be raised by an extended list of subscribers, and that many who know nothing about homœopathy will give the small amount of five shillings to an establishment where everything is so open and so public; that they may be fairly assured whether there may not be truth in a system that tells the fond mother that croup need no longer sound a death knell in her ear, but that it is a curable complaint; that scarlet fever is no longer a dangerous complaint; that bronchitis and inflammation of the lungs are deprived of more than half their terrors.

At least we trust that we may calculate that each mother, who believes that her child's life has been saved by homœopathy, will give five shillings to help to save the lives of her poorer fellow-creatures.

A list of lady patronesses and other philanthropic supporters will shortly be published. Meantime subscriptions, etc., will be received by Mr. Baillière, bookseller, 219, Regent Street, and by the following homœopathic chemists:—Mr. Headland, 15, Princes Street, Hanover Square; Mr. Leath, Vere Street, Oxford Street; Mr. Lane, Sloane Street; Mr. Storer, Foster Lane; Mr. Walker, Conduit Street.

LONDON: Printed by THOMAS HARRILD, of Albany Cottage, Sydenham, in the County of Kent, at his Printing Office, 1, and 1½, Dudley Court, in the Parish of St. Olave, Silver Street, in the City of London; and Published by HENRY RENSHAW, at the Office, 356 Strand, in the County of Middlesex.—*Saturday, June* 19, 1852.

Communications.

ON THE USE OF HIGH ATTENUATIONS IN HOMŒOPATHIC PRACTICE.

By Dr. C. Von Bönninghausen, of Munster, Westphalia.

(*Continued from page* 671.)

9 (Vol. 78, page 145). Sophia S—, an infant, six months old, was suddenly seized with an attack of quinsy, which speedily gained ground, threatening the life of the child. When I was called in, the case exhibited every sign of gravity and danger, which was the more serious, as two hours had already elapsed since it had taken this turn.

I found all the usual symptoms, such as heat and redness of the face, hoarseness, cough sounding like croup, rattling in the throat when the child falls asleep.

March 21, 1851. 1, *Acon.* 200; 2, *Hep. sulph. calc.* 200; 3, *Spongia* 200; 4, *Hep. sulph. calc.* 200. One powder to be taken every five hours.

After the second powder, the infant was already perfectly cured, and there was accordingly no need to administer 3 and 4. I mention this case here to show that high dynamizations are quite in their place in acute diseases. For several years I have invariably used, in croup and other acute diseases, the 200th attenuation, and this without ever failing once in my object.

10 (vol. 78, page 151). H. S—, goldsmith, aged thirty-four years; has since three years been affected with a severe cough, attended with retching, and often with vomiting, which gives some relief; the expectoration is scanty and insipid. The cough comes on every morning, immediately after the patient has partaken of food or drink; also after smoking, but most severely after drinking wine. He ascribes the origin of the cough to the sudden ingestion of very hot coffee. At a former period he had the itch, which was treated with *Sulphur* and *Soap*; and also gonorrhœa, which was suppressed by *Copaiva* and *Merc.* (the latter in doses of six grains).

I could not ascertain from the patient what medicines he had taken up to the time of his application to me. He could inform me only that *Oleum Crotonis* and *Pimpinella* were of the number, but that he had never derived the slightest benefit from any of the preparations prescribed for him.

March 22, 1851. 1, *Nux Vomica* 200; 2, *Ipecacuanha* 200; 3, *Nux Vomica* 200; 4, §. One powder to be taken every third evening.

April 14. Twenty-four hours after the administration of the first powder, a considerable improvement manifested itself, and continued up to the present time. The morbid symptoms now make their appearance only after drinking, and no longer after eating. The patient feels a kind of narrowing or contraction in the urethra when urinating. 1, *Ars.* 3000; 2 to 4, §. One powder to be taken every fifth evening.

Three weeks after he felt perfectly cured; and as I have neither seen him nor heard from him since, although he could come to me by rail in about an hour's time, I think I may assume that he continues to enjoy good health.

11. (vol. 78, page 153). A. C—, a boy, aged thirteen, has been affected since two years with tinea favosa, on the hairy scalp, and with herpes farin. (pityriasis), spread in small isolated spots all over the body. In other respects the boy is well.

In this case various ointments, oils, and soaps had been used, and also *Mercury*, but all without the desired effect.

March 23, 1851. 1, *Sulphur* 2000; 2, *Sulphur* 4000; 3, §. One powder to be taken every eighth day.

April 19. Considerable improvement. 1, *Sulphur* 6000; 2 to 4, §. One powder to be taken every eighth day.

May 26. Improvement, but less marked than the last time. 1, *Calc. carb.* 2000; 2 to 4, §. One powder to be taken every eighth day.

July 7. Further considerable improvement. Most of the spots are completely healed. 1, *Silicea* 4000; 2 to 4, §. One powder to be taken every eight days.

After this the eruption vanished completely. The skin assumed the natural healthy colour, and up to this day the boy continues in good health.

Hosted by Google

12 (vol. 78, page 174). A. A—, an infant about twelve months old, son of a teacher; about six months ago reddish spots appeared about the ears, and afterwards on his face, hands, and arms. The allopathic medicines which were administered to the child only had the effect of causing the eruption to spread over the rest of the body. The way in which the eruption proceeds and runs its course is as follows. At first the skin gets red, and a little discharge makes its appearance; afterwards a yellow crust forms, with purulent matter underneath it; in the course of a few days the crust turns to a dark brown or blackish colour, and finally scales off, but is speedily replaced by another red spot, which then goes through the same course, and so on. The father, mother, and grandmother of the child had, in their time, suffered from similar eruptions.

I could not ascertain from the parents what were the allopathic medicines hitherto administered to the infant. They could only inform me that the poor little patient had been made to drink copiously of tea of *Viola tricolor* (Jacea).

March 29, 1851. 1, *Sulph.* 2000; 2, *Psor.* 2000; 3, *Sulph.* 4000; 4, §. One powder to be taken every fifth day.

April 26. Considerable improvement in all the symptoms. 1, *Calc. carb.* 2000; 2 to 4, §. One powder every fifth day.

After this the eruption disappeared altogether, and the child continues well up to this day.

13. (vol. 78, page 209). P. R—, a girl, aged eighteen years; has been subject since five years to epileptic attacks, which appeared formerly at longer intervals, but latterly they have become much more frequent, often five or six times in a day. During the attacks there is yellowness of the face, bluish colour around the eyes, and entire loss of consciousness; the attacks last at least five minutes; the menses come too soon and too strong; before and during the accession the patient suffers from spasms in the abdomen, sometimes also headache; anxiety at the appearance of the attacks; without pains or other sensations; black spots only under the eyes, with blue lips; much coldness; no thirst; she is better in the morning; oppressed in the warm room; formerly suffered much from ascarides; temper irritable; uneasy by strong motion, palpitation of the heart; without anxiety.

Although the allopath knows that such cases are incurable, she has, nevertheless, taken a variety of drugs.

April 8, 1851. 1, ♀ 2000; 2 to 4, §. A powder every third evening.

April 29. The attacks very much diminished, and only before and after the period; a few attacks; none in the interval; also better in other respects, and looks better. In the beginning of the menses, cramps in the abdomen. 1, *Cuprum met.* 2000; 2 to 4, §. Like the former, every third evening.

May 19. After some time strong epileptic attacks, during and before the menses, with much coldness and pains in the hips; she is very melancholy and irritable before the monthly indisposition. 1, *Calc. carb.* 200; 2 to 4, §. As before.

June 3. Has had no fresh attack. 1 to 4, §. As before.

June 23. A strong epileptic attack at the appearance of the menses, which were copious. 1, *Calc. carb.* 3000; 2 to 4, §. As before.

July 9. No attack the last fourteen days, although she was exposed at times to much mental excitement. 1 to 4, §. As before, every third evening.

July 24. Many strong attacks during the time of the monthly illness, with soreness and burning in the parts. I suspect masturbation. 1, *Phosphor.* 2000; 2 to 4, §. As the former.

September 18. She remained well until the last eight days, when she again suffered from an attack at the time of the monthly appearance. 1, *Nux Vomica* 200; 2 to 4, §; 3, *Natrum mur.* 2000. A powder every fifth evening.

October 25. Soon after (3, *Natrum mur.*) she had, at the time of the menses, a strong attack, but has remained free since that time.

Time will show if this be a cure, and permanent.

14. (vol. 78, page 217). C. S—, a girl, thirteen years of age, of a delicate constitution; was first attacked with diarrhœa, which had been checked by allopathic means; this was followed by a severe, hard, dry cough, which has continued more than four months; it is worse in the evening and in the fresh air; the child is very much reduced; pain in the chest when coughing, and strong perspiration in the evening while in bed. The child feels much better when in a warm room; stitches in the temples when coughing; aversion to fat and vegetables; had a humid eruption around the chin, and there are still to be seen a few red spots; humid eruptions on the head. The mother had, during pregnancy with this child, an eruption over the whole body.

The allopathic remedies produced no effect, amongst which were particularly *Ammon. muriat., Columbo, Opium, Rheum., Cascar.*, and *Spirit. Mindereri.* As the

Hosted by Google

last resource, refuge was taken in homœopathy.

April 10, 1851. 1 to 3, *Hep. sulph. calc.*; 2, *Spongia*, of each 200; 4, §. A dose every fifth evening.

May 3. Something better; dry cough in the evening, particularly affected by tobacco-smoke. 1, *Petrol.* 200; 2 to 4, §. As the former.

May 26. Better in every respect. 1, *Petrol.* 2000; 2 to 4, §. After which perfect restoration to health.

15. (vol. 78, page 220). T. P—, an unmarried lady, aged fifty years; has suffered since youth from headache. Having consulted many physicians without receiving the least benefit, she submitted to her fate, and took no more medicine. She was advised by her friends to consult me; she called, but was incredulous in the highest degree. The headache before mentioned still exists; pressure on the top of the head, generally worse before noon, but often increasing towards evening, also during motion; worse in a warm room; vomiting of everything except animal food; shortness of breath in walking; sleep good; the menses, which have now ceased, were formerly scanty; much overpowering heat; violent and irritable temper, and during the headache much crying. She has been subject to fits of vomiting from her youth.

April 12, 1851. 1, *Nux Vomica* 1000; 2 to 4, §. Every fifth evening.

May 12. She remained free from headache until the end of the last week, to her great astonishment; it again appeared with violent shooting (not pressing) on the top of the head, accompanied with sour and bitter vomiting; eruption on the right eyebrow. 1, *Sepia* 200; 2 to 4, §. Of each powder, dissolved in water, during three consecutive evenings a spoonful; nothing the two following evenings.

May 29. She had a very severe attack, which lasted but one day; some headache; but in the morning, in bed, a creeping, crawling sensation in the hands. 1, *Sepia* 2000; 2 to 4, §. Like the former.

June 20. No headache, and is now quite well. 1, *Sepia* 4000; 2 to 4, §. Like the former.

Nothing more was necessary; all the sufferings she has had for so many years have entirely ceased. She has now full confidence in our mode of practice.

16. (vol. 78, page 225). C. W—, a girl, fourteen years of age, from the country. She is confined to bed, and has been in bad health for a year; she formerly suffered from an eruption on the top of the head, which has been suppressed allopathically by ointments; since that time constant headache, with sickness, worse in the evening, and when moving; pain in the hips, worse in the evening and during motion; sickness after every meal; chilliness; no perspiration while in bed; a desire for salt; an aversion to milk; great weakness, so that she can scarcely bear being out of bed for a few moments. She has been treated allopathically for a long time without the least benefit.

April 14, 1851. 1, *Sulphur* 2000; 2, *Sulphur* 4000; 3 and 4, §. A powder every fifth evening.

May 12. Considerably better. 1, *Sulphur* 6000; 2 to 4, §. Like the former.

This long-suffering young person is now in excellent health. *Sulphur*, in a high dynamization, was the only remedy used.

17. (vol. 78, page 230). N. L—, a boy, aged eight years, has been sickly for four years; but has become worse the last two months, from the effects of hooping-cough; violent cough, with sweetish expectoration, which is worse when beginning to move in the room, and after walking in the open air; much vomiting in the evening and at night, mostly mucus, but once lately, blood; aversion to fat; feels chilly; no thirst; frequent bleeding of the nose at night; very bashful and timid. He was attacked in the winter with the measles, after which he had hooping-cough.

He has for a long time been treated allopathically, and has taken a variety of drugs; latterly, much *Ferr. acet.* and *Ammon. muriat.*

April 17, 1851. 1 to 3, *Pulsatilla*; 2, *Sulphur*, of each 200; 4, §. A dose every fifth evening.

May 9. Considerably better; the boy is scarcely to be recognised. 1, *Sulphur* 2000; 2 to 4, §; 3, *Pulsatilla* 200.

These remedies were sufficient to remove all diseased symptoms, and his health is now better than it has ever been.

18. (vol. 78, page 275). H. H., aged twenty-two years; suffered for ten years from caries and enlargement of the bone of the whole right leg, with its toes; the leg is considerably swelled, which aches and burns; and from six holes there runs constantly a watery, sometimes bloody, and very ichorous discharge. During the winter the pain in the leg ceases, when he suffers from a severe cough. At the approach of spring the pains in the leg increase, and the cough ceases. He is compelled to walk with crutches. He has been under allopathic treatment ten years without receiving any benefit.

April 27, 1851. 1 to 3, *Silicea*; 2, *Hep. sulph. calc.*, of each 200; 4, §. A powder

Hosted by Google

every fifth evening; and to cover the suppurating holes with tallow and lint.

May 25. Much improved. 1, *Hep. sulph. calc.* 2000; 2 to 4, §. To be taken like the former.

June 15. Continued improvement; suppuration continues. 1, *Silicea* 4000; 2 to 4, §. Like the former.

July 6. Great improvement, as expected; several holes closed; the pains have entirely ceased. He has put aside the crutches. 1 to 4, §. Like the former.

August 3. Continued improvement. 1, *Silicea* 6000; 2 to 4, §. As before.

August 31. Again considerable progress. He does not only go without crutches, but has walked to-day a distance of six miles, and will walk the same distance in the afternoon. 1 to 4, §. As before.

September 28. Much improved in health; but two holes still suppurate, particularly that of the great toe; all the others are closed, and the foot which was so much swollen has now assumed its usual size. 1 to 4, §. As the former.

October 19. Since eight days there seems to be a check in the improvement; there is still a hole which suppurates; the pain has entirely ceased; he takes much exercise throughout the day. 1, *Hep. sulph. calc.* 3000; 2 to 4, §. To use like the others.

Although the cure is not completed, yet we have no doubt that the result will be favourable. My object in communicating this case is to show that even in similar complaints the high potencies exert their action.

19. (vol. 78, page 279). H. B—, a young man, aged eighteen years, suffered since two years (after the death of his brother, who died from consumption, he had slept in his bed until the last moment) from shortness of breath, as if the chest were tightened by a bandage; expectorating in the morning some sweetish, putrid matter; great hunger, with a general decline; after a meal he is a little better for half an hour, otherwise he is worse from nine o'clock in the morning until seven o'clock in the evening, when he rests.

He has taken much medicine for two years, but I could not ascertain of what kind.

April 28. 1, *Phosphorus* 2000; 2 to 4, §. Each powder to be dissolved in three teaspoonfuls of water, and to take one the forthree evenings consecutively, and then to stop two evenings.

May 15. Was much better, however, and took coffee after the use of the four powders, and now he complains of shooting pains in the chest, and a sensation as if something had been torn away; worse in the morning and at noon; better after a meal. 1, *Nux Vomica* 2000; 2 to 4, §; 3, *Phosphorus* 4000. Like the former; after which he was entirely well.

20. I conclude with the cure of a bird. The professor of languages to my children called eight days ago to tell me that two of his canary birds had died, and the third was about to die, apparently of the same complaint. The bird ate constantly in the cage, but everything passed from him undigested. *Pulsatilla* 2000, cured him completely, to the great astonishment of the professor.

AN ESSAY ON HOMŒOPATHIC STATISTICS;

Together with a Critical Analysis of Dr. Routh's Work, entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

By John Ozanne, M.D.

(*Continued from page* 678.)

XIV.

Before we proceed to consider the complication standing next in order of frequency, it will be proper to recapitulate the conclusions to which we have been led in our last paper, in reference to the influence of phthisis, as a complication of pneumonia, upon the value of the statistics of the latter disease.

It was found, by references to the best authorities in the allopathic school, that—

1st. If limited and not in an advanced stage, phthisis is not by any means a serious complication of pneumonia.

2nd. That so far from occurring in a more serious form when tubercles are present in the lungs, pneumonia seems to be less severe than that occurring in persons in perfect health, if the tubercular patients, of course, "are still able to pursue their ordinary avocations, and while their strength and flesh have not as yet materially failed" (Louis, loc. cit.)

3rd. That at a more advanced period of phthisis, the occurrence of pneumonia usually hastens the progress of the disease; but then the case is no longer one of pneumonia complicated with phthisis, but one of phthisis complicated with pneumonia: a distinction not of a speculative kind, but essentially practical, seeing that, in the former case, the presence of tubercles does not constitute the principal disease; whereas, in the latter, the case is one of fully-developed phthisis.

Hosted by Google

4th. That the second proposition is not to be understood of two forms of phthisis mentioned in the last paper, namely, tubercular infiltration of a large portion of a lung, or extensive deposition of miliary tubercles—two forms of tuberculosis which may give rise to acute phthisis, and which, if pneumonia should supervene, may speedily end in death.

But that these two forms being very rare, their influence on the per-centage mortality of pneumonia is small.

5th. That, on the other hand, tubercular disease of the lungs being remarkably equal in its *general* distribution, in climates and localities differing from each other in the highest possible degree, the proportion of cases of pneumonia complicated with tubercular disease of the lungs must be tolerably equal in homœopathic or allopathic hospitals, whether our places of observation be London, Paris, Vienna, or Linz.

But whilst all these points were fully and carefully investigated in the last paper, the important question, what is the relative influence of the allopathic and homœopathic modes of treatment upon the course and termination of pneumonia complicated with phthisis, was left for future consideration, the space allowed by the Editor of the *Homœopathic Times* having been already exceeded.

For the complete solution of this question we have not as yet the necessary materials. Had Dr. Routh given us detailed observations of the cases of pneumonia complicated with phthisis, which, he says, were so numerous in the practice of Drs. Taylor, Walshe, and Peacock, instead of leaving us quite in the dark as to their real character, we might at the present moment be prepared to make a greater step in advance than we are now able to do. But if unable to obtain the solution of our question in a direct and complete manner, we shall obtain indirectly quite sufficient to show that the influence of this as well as of the subsequent complications upon the mortality of pneumonia has been greatly overrated.

Dr. Routh alludes, with reference to the number of complications met with in the practice of Drs. Taylor, Walshe, and Peacock, to the investigations of Dr. Hughes in regard of several points connected with the pathology and treatment of pneumonia. He tells us (page 50) that in the practice of the three first-named gentlemen, the proportion of complicated to uncomplicated cases was fifty-five per cent.; whereas "Dr. Hughes obtained fifty-two per cent." The close approximation of the two proportions, together with the fact that all the cases were observed by these gentlemen in the same town, justify us in taking the published results of Dr. Hughes, in order to ascertain how far we may rely upon the statements of Dr. Routh respecting the great frequency of phthisis, and its great influence in increasing the mortality of pneumonia.

The facts which will serve as our basis are contained in Dr. Hughes's paper in the "Guy's Hospital Reports" for October, 1848. In this paper, the "analysis of fifty-four cadaveric inspections of fatal pneumonia," consisting of the *larger number* of the cases of pneumonia which terminated fatally in the hospital during a period of four years, is given in a tabular form.

I do not take the facts embodied in previous papers of Dr. Hughes in the "Reports;" but by so doing, be it observed, I only pay a greater tribute of respect to the high scientific character of this observer, for he tells us himself that, "in the former paper, a large proportion of the cases were collected from the manuscript books of the hospital, and were recorded by *a great variety of observers*," whereas in this paper they were all collected by himself (loc. cit., p. 3).

In this paper, however, the object of which, moreover, is not to inquire into the relative number of complicated to uncomplicated cases, or of one kind of complication to another kind, we cannot be sure that we get the exact proportion of phthisis cases; for, from the following words, and from one or two other observations in the course of the paper, it would appear, that many other cases, in which pneumonia existed to a certain extent, and which, according to Dr. Peacock's observations (Routh, p. 56), ought to be included in the statistics of pneumonia, were not included in Dr. Hughes's *analysis*.

"Many more cases affected with *a certain amount or degree of pneumonia* have, of course, been inspected at the hospital during that time; and a few (but the author believes they must be indeed a very few) serious, extensive, and even fatal cases may have been inspected which he has not witnessed, and which, therefore, are not included in the table. He feels, however, assured that no case of a serious, much less of a fatal character, which he has himself seen, has been omitted; while, at the same time, he *acknowledges that many instances of a slight extent, or of a doubtful nature, have been passed over*, from the conviction that they may not be properly included among cases of 'fatal pneumonia'"

Hosted by Google

(Hughes, loc. cit., p. 3). The reader should be informed that Dr. Hughes, when speaking of cases "of a slight extent, or of a doubtful nature," alludes not to the cases as observed during life, but as observed on dissection of the diseased parts, after death.

I have quoted these passages in order to show that, in taking Dr. Hughes's fifty-four cases as my standard of comparison, I am acting not only in *all fairness*, but that, from the fact that many cases of pneumonia of slight extent, or of doubtful character, when examined after death, have been omitted in Dr. Hughes's tables, I am actually taking as my standard a collection of cases in which the more serious forms of the disease are stated to exist in a larger proportion. Therefore, as regards the question at issue, we should expect to find, from this very circumstance, a larger proportion of cases of those forms of phthisis, which we have shown to be the most serious as complications of pneumonia. In other words, we should expect the number of such cases to be *greater*, than if the whole of the cases of pneumonia terminating fatally in the hospital during the four years had been included in the tables.

The question is of so much importance, that I give here a description of these cases, as entered in the tables.

Case 12. "Acute phthisis; grey hepatization existed in the upper lobe." These terms lead us to the belief that the whole of the disease was limited to one lobe. If not so, the case is not described in the same manner as other cases.

Case 13. "Acute phthisis; red hepatization, occurring at the base of a lung, tubercular and disorganized above." The whole disease is here limited to one lung.

Case 14. "Acute and gangrenous phthisis; a large gangrenous mass, succeeding to consolidation, existed in the base of the right lung, and some scattered patches of gangrene in the left lung; there were also a few tubercles." The complications were here of small importance; the real gravity of the case was due to the gangrenous character which the pneumonia assumed.

Case 21. "Acute phthisis; a tubercular cavity in the right upper lobe; firm, whitish consolidation in other parts." The complication here, a single cavity, is not of a serious character.

Case 30. "Gangrenous diseased heart, liver, and bronchi; phthisis; an old tubercular cavity with chronic tubercles, surrounded with gangrenous pneumonia of the upper lobe; other lung tubercular, with some pneumonic consolidation." In this case the tuberculosis is more extensive; most probably, if observed during life, this case would not have been classed by Dr. Hughes as one of pneumonia. However, the death was due less to the presence of tubercles, than to the gangrenous character of the pneumonia which supervened.

Case 52. (Already alluded to.) "Diffused tubercles; both lungs generally affected with acute pneumonia, almost airless and nearly consolidated, with miliary tubercles distributed throughout every part, and on the pleuræ."

Case 54. "Tubercles in apex; diseased kidneys; base of right lung solid, firm, red and fawn-coloured; sinking in water. Tubercles in the apex, left lung quite healthy, and without tubercles. There is one very striking feature in the cases reported by Dr. Hughes in this paper, it is the frequency of gangrene of the lung, as a termination of pneumonia. This, it must be remembered, if a complication at all, is one which springs from the imperfection of the mode of treatment adopted; it is not a *necessary* consequence of pneumonia, even in cases in which the inflammation of the tissue of the lung takes place around tubercular depositions on the cavities which are the consequences of the tubercular disease. Dr. Hughes accounts for this circumstance in these words: "The very large proportion of cases of gangrene of the lung (18 cases out of 54, exactly one-third) may be, the author believes, partially accounted for by the *generally low type of disease*, which existed over a considerable part of the time during which the cases were collected, and particularly over the period at which the late influenza was so remarkably prevalent" (loc. cit., p. 15).

This mode of accounting for the frequency of gangrene in these cases of pneumonia may satisfy an allopathist, but it certainly cannot satisfy the disciple of the new school, who is aware of the curative powers of the homœopathic remedies. Indeed, the fact itself, namely, the frequency of gangrene, is a proof of the want of power of allopathic measures to cure pneumonia in any but the simple uncomplicated cases. We might even raise the question whether, in complicated cases, the depleting and other depressing measures do not add to the mischief, with perfect propriety. But what we have to deal with at present is the frequency of tubercular disease of the lung, as a complication of pneumonia, and the extent to which this complication may influence the results of homœopathic treatment.

We find, as stated above, that the proportion of cases in which tubercular disease co-existed with pneumonia was 7

Hosted by Google

to 54. If we take the mortality of Drs. Taylor, Walshe, and Peacock, as stated by Dr. Routh, namely, 30 per cent., as the basis of our calculation, and this is perfectly fair, seeing that the proportion of complicated cases, as observed by them and by Dr. Hughes, was nearly equal, we find that these 54 deaths represent 179 or 180 patients, the proportion of tubercular cases is therefore *one death with tubercular disease* to 25 cases under treatment, or three per cent.

If, instead of taking the London mortality of 30 per cent., we were to take that of Edinburgh, which is 24 per cent., or that of Glasgow, 27 per cent., say, on an average, 25 per cent., the proportion of deaths with tubercular disease would be only one to 30 cases under treatment, or 3.33 per cent. But we may, in order not to overstate our case, take the former number, four per cent.

Now, upon looking at the description given of these seven cases, we cannot but conclude that one only, or at the most two (Cases 52 and 30), would have terminated fatally, if under homœopathic treatment. Yet if both had died, it would only give a mortality from this cause of a little more than one per cent., and if we suppose that in a third case (Case 54, for instance) death had also taken place under homœopathic treatment, which, however, we cannot concede, the mortality would be still less than two per cent. from this cause. It is evident, therefore, that the influence of phthisis is greatly exaggerated.

II. *Severe Bronchitis.*—The next complication in order of frequency is bronchitis. That bronchitis is frequent as a complication no one can doubt, but its influence on the mortality of pneumonia cannot be great; certainly under good homœopathic treatment it could not give rise to a fatal issue in so many instances as tubercular disease, if extensive, would do. For there is this essential difference between the two, that the former is, except in very rare instances, curable; whereas the latter, if extensive or advanced, must necessarily cause the death of the pneumonic patient. It is probable, therefore, that the deaths arising in Fleischmann's Hospital from this complication of pneumonia are exceedingly rare. We may, then, put these down at somewhat less than those arising from tubercular disease; say one per cent. Thus both complications—the two at the head of the list—would give rise to a mortality of only three per cent!

(*To be continued.*)

THE HOMŒOPATHIC AND ALLOPATHIC PRACTICE IN ACUTE PNEUMONIA CONTRASTED.

By George Dunn, M.D.

(*Concluded from page* 629.)

After dropping a tear on this little child's grave, let us in all sincerity and truth pass in rapid review the principal points worthy of notice, and endeavour to profit by them for our future guidance. A very sudden attack of inflammation, in whatever part of the body it occurs, is sure to awaken the attention of the patient and friends; and as the attack is sudden, so must the treatment be prompt, or the patient either dies suddenly or some organic change takes place in the part of the body inflamed. But when any such change takes place by total neglect or ineffectual treatment, the victims often only escape sudden death to linger out a painful and weary existence. It will be advisable to state the different modes of treatment pursued by the old school of medicine, and that which has been found so sure and efficacious in the new or homœopathic, and then draw our conclusions as to the best.

I may here observe that I most firmly believe in the honour, the worthiness, and benevolence of the medical profession. I believe that most of its members are anxious to heal the patients that apply to them as speedily, as easily, and with as little inconvenience and expense as is compatible with efficiency; and this is as true of allopaths as homœopaths. I do not credit the tales of sordid avarice that are so frequently and so unscrupulously circulated about medical men. At the same time I am ready to admit that the medical body has unworthy members belonging to it; and to these and to all I would humbly but earnestly say, "Yours is an honourable and a mighty trust; to you the lives of parents, brothers, sisters, and dear children are readily and in the most unbounded confidence committed; take care not to abuse the high confidence reposed in you. You have the power, and I mistake your character very much, if you lack the will to serve honestly, to the best of your abilities, those confided to your care." We must also bear in mind that very great responsibility attaches to all the acts, as well as to the words, of a medical man. If his acts are reprehensible—if his words are characterised by levity and insincerity—if he merely visits his patient to send a pill or a potion, his mission is abused, and he only fulfils the worst parts of it. If he shrouds himself and his language in mystery—if he does not open his entire con-

Hosted by Google

fidence to the patient, the latter cannot view him otherwise than as a necessary evil, and will be glad when he is able to dispense with his services. It is not thus that medical men ought to be viewed, nor are they, when they fulfil their mission aright. A patient, however poor, who confides his secrets to a medical man, reposes a confidence which ought never to be abused, and deserves to be treated with the utmost kindness and consideration. The twin evils, poverty and sickness, that such a patient labours under, it may not be in the power of the medical man to remove, but he may alleviate the pangs caused by them; and if he cannot do this even, he can pour words of sympathy and kindness into the wounds, and these never fail to have a soothing and happy effect; and when death cannot be baffled longer, a "word in season" may be spoken, which may touch a chord that will vibrate beyond this earthly dwelling.

The profession that can count among its members a Hahnemann, a Hope, and an Abercromby, and a long list of living worthies imbued with like feelings, may well feel proud. These are the beacons that ought to guide us on our path, which is frequently a rugged one; the lights we must be guided by, if we would attain that eminence which should be the ambition of all. I think I can discern a yet higher eminence for the medical profession than it has ever yet aspired to; but it is only perhaps a pleasing dream, and I need not name it here.

Having said that I give credit to medical men for truth and benevolence, for probity and a desire to use the best means to cure, I yet must confess that, knowing how defective their means are to combat acute inflammations—seeing that, when young and inexperienced, they bleed and purge, and when older and more experienced, they abstain from these often destructive and always harsh means—I say I must confess that I am grieved to see them shut their eyes to the great law of Nature revealed to them by the immortal Hahnemann. I know not by what means they are to be convinced of the truth and beauty of that law, but of this I feel persuaded, that their refusal to study that law will, sooner or later, bring upon them the contempt of the public, and go far to deprive them of that share of remuneration they would be entitled to, if they used the best method of cure. We do, however, bear in mind that it is the fate of all great reforms in science, as well as other subjects, to be ridiculed by the very men who ought to be the first to study and to test them. In regard to homœopathy, this is easy enough, as any man, not wilfully closing his eyes, may see at any moment; but if medical men persist in ignoring homœopathy, a day is not very distant when they will find themselves ignored by the public.

I have been led to these remarks from a sincere desire to see the members of the profession improve their position; for it cannot be doubted that the uncertainty of physic, as practised by a great majority of the profession in England, is rapidly sinking the character of medical men to the level of the druggist, or, still worse, to the patent-medicine vendor. Inflammations are treated generally by allopathic practitioners by bleedings, blisterings, purgings, vomitings, *Antimony*, and *Mercury:* and this is practised, more or less, with little variation, wherever the seat of the inflammation may be. Is it in the brain, to bleed, blister, and give *Calomel* and *Antimony* is common; is it in the throat, the same treatment is applied; is it in the lungs, we have seen how our little patient fared from day to day; and wherever the seat of the inflammation, the same destructive, often dangerous, and always weakening means are used. The uselessness of such means is attested by the selfsame practitioners, faithfully represented, as we must suppose, by the Editor of the *Medical Times*, who, in an abusive article against us poor homœopaths, made use of these remarkable words: "It must, however, be admitted that bleedings, blisterings, and purgings, used to allay acute inflammations, involving a tedious illness and a slow convalescence, contrast unfavourably with the no-treatment by homœopathy, *and a* CONSEQUENT SPEEDY RECOVERY."

We have seen that, whatever be the seat of the inflammation, some or all of these methods of depletion are made use of to allay it; but the plainest and simplest mind must be aware that, if a patient contracts a pleurisy, he can have no more blood in his body than he had an hour previous to the attack, and if the blood concentrated unduly on one organ can be made to leave that organ—in other words, if the equilibrium can be restored—there can be no occasion or excuse for reducing the whole quantity of blood in the body, thereby "*involving tedious illness and slow convalescence.*" Now, have we a remedy that will restore the equilibrium without depletion of any kind? Do *we* possess a prompt and specific remedy? I answer, without hesitation, we do; but it is not, as it is in allopathic practice, always the same

Hosted by Google

remedy. In pleurisy, for example, we have *Aconite* or *Bryonia;* in the lung, though *Aconite* is useful to begin with, yet it would not do all that is needed, and here we use *Phosphorus* or *Bryonia* when the pleuræ are involved; in the brain, *Belladonna;* in the liver, *Mercury, Nux Vomica*, etc.

Here is a wide difference between the two treatments: in the one, depletion for all; in the other, remedies harmonic to each. The results are still more striking. Pleurisy I have known to be cured in twenty-four hours; double pneumonia in two or three days; and a cure by homœopathic remedies does not mean a long convalescence, and a host of tonics, bitter beer, wine, and a residence at the sea-side, but health, rosy health, in a comparatively short time.

If such be the results of the different treatments, if, after recovery from inflammatory diseases by the depleting or allopathic method, there is a slow convalescence, frequent relapses, and such expensive means of recovery, sometimes, alas! leading to habitual inebriation—whilst recovery by homœopathic remedies is speedy, and needing no such delusive and often seducing means—how long, it may be asked—start not, allopath (if any such read these pages), start not when I ask how long such dangerous and destructive means are to be allowed? The rack, the torture, the whip, the mild stocks even, have been swept away by a more philosophic and humane treatment of criminals. Are medical men to be longer allowed to be the only scourges of their race, when all other capital punishments are about to be abolished? Do I invoke the power of the legislature on *your* heads? Do I wish to imitate the Wakleys, old and young, who would gladly consign a benevolent man to Newgate? Do I wish the same measure to be meted out to *you* that the Toogoods, Inglises, and Co. would mete out to *us?* Far from it; but it is time that public opinion raised its voice against such useless, barbarous, and destructive measures. It is time that the public insist on your reasons for still goading them to death with your lancets, your blisters, your burnings, and your poisonous drugs. The public have insisted on a keen supervision of lunatic asylums, where the manacle, the dark cell, the galling chain, have given way to sympathy and kindness, light and air. Shall you be longer allowed to hold despotic sway over the liberty, the limbs, the lives of the people? You, forsooth, affect to be greatly shocked when your imitators, the Morisons, Coffins, and Co., drug an ignorant dupe to death. You kill in a similar manner, aye, and with like means, but you are authorized—you hold a diploma. No jealous Wakley can touch you; the diploma is your license, and you fear no tribunal.

Are all who practise the old method to be thus condemned? By no means: it is only the men who persist, like their prototype Sangrado, in still using the means that are known to be so destructive. Is the practice of Chambers, of Locock, of Clarke, and many learned and experienced physicians, deserving the censure I only wish to pass on the officious Sangrados and drug-dealers? Send a patient to such an one as these, and see with what care he avoids drugs in hopeless cases, and how homœopathically he treats epidemics, not only for the cure, but for prevention. Is he ignorant of the homœopathic law? It is only the Toogoods and Co. who abuse it, without knowing anything of it; and this class bring ridicule upon themselves, and not on us.

Can that practice be guided by *true* medical science, which allows each member to give a different guess as to the ailment, and a different remedy for its cure? Has God given to dogs and wild animals remedies for their ailments, and instinct when to use them and where to find them? and has He given to man, who wears His image, the animal, the vegetable, and the mineral kingdoms in vain? Has He endowed man with sense to read the stars, and denied him the powers of mind sufficient to select a remedy for his ailments? 'Twere blasphemy to think so. Nature's laws are simple, but never varying. They cannot be altered or twisted to suit our interests; and the immortal Hahnemann has discovered the law of healing as surely as Newton discovered the laws of attraction and gravitation. In true science all is certainty, uniformity, simplicity, and beauty; in pretended science, such as the old school of drugging, all is guess, doubt, and complication. Consult a hundred medical men of the old school, and each will make a different guess at the ailment, and each will certainly give a different remedy. Consult again a hundred homœopaths, and if they will study the case, they each arrive at the same remedy, without pretending to guess about the ailment at all. Which is more worthy the name of science?

I admit that the kindred sciences have advanced with rapid strides to perfection—anatomy, physiology (which, aided by the microscope, leaves little more to be known), chemistry, botany, etc.; but the homœopath avails himself of this increased knowledge as much if not more than the allo-

Hosted by Google

path. Can the same advance be claimed for the practice of medicine? It can; but not for the old school, which has rather retrograded than advanced.

There is a fashion too in medicines, as well as in coats. I remember well when *Iodine* was first introduced; it was a rarity to see a prescription without it in some shape or other, and a great many were half-poisoned by its continued and inappropriate use. Now *Cod-liver Oil* is in fashion, and in many cases is very valuable, but its indiscriminate use is sure to end by its being discarded altogether. In short, there is nothing more uncertain and less amenable to rule than the modern allopathic practice of physic; contrasted with the homœopathic, it is as darkness opposed to light. The latter is a science, a law of Nature, a divine gift, which cannot be too highly praised or too highly prized; the former, a chance, always hurtful in some degree, even when it cures. The one is health-giving; the other life-destroying. It is time to desist. I had only intended to give a short history of this unfortunate case, and I have been *surprised* into writing a pamphlet. Let it pass, I could do no less; and if it awaken one of my colleagues to seek further information on this all-important subject, I shall be repaid for the pain I have undergone.

Let no man, however, practise homœopathy who looks more for emolument than the good of mankind; still less let him practise it, if he wishes to sail down life's stream in a pleasure-boat wafted by a gentle and fair breeze. He must be prepared to be buffeted about on the rough sea of life, looked upon more as a pirate than a regular trader. He must be prepared to see all laws of courtesy and honour set aside where he is concerned; nay more, his friends of yesterday will be his foes to-day; the man who would sit at his table and break bread with him to-day, to-morrow, hearing that he is a homœopath, is ready to break his head or his heart, and use every spiteful means to do him wrong. I have felt this acutely—I still feel it keenly; but I feel also that I possess something more valuable than the fragile friendship which can be broken by a difference of opinion. I possess a divine truth; and no pecuniary sacrifice, no loss of friendship, no contumely, no ridicule that may be heaped upon me can make me for one moment waver as to the course I shall continue to pursue. I certainly do prefer the open foe to the false friend: I prefer the rapier in my breast to the muck-fork in my back. On the platform, in the press, in a congress of medical men, I am ready to defend the law that I have studied, the practice that I follow. I have poured out my feelings on paper, *currente calamo*, whilst death hovered round the bed of my amiable patient. I will desist and say, *requiescat in pace!*

STRICTURES UPON JAHR'S MANUAL.

(*Communicated.*)

Having an entire morning free from interruptions, the writer determined, once for all, to examine thoroughly Jahr's Manual of Homœopathic Medicine, at least the second volume, long and most favourably known as the "Repertory;" it has been repeatedly noticed in the *British Journal of Homœopathy*. A very meritorious part of its pretensions consists in this having been, we believe, the first Manual, on its being translated into English, which enabled practitioners in this country to avail themselves of the remedial resources discovered and perfected by the immortal Hahnemann. For homœopathy could not be expected to take root in England, far less to produce fair flowers and fruit, until it had become duly naturalized to the soil and acclimated by a regular process.

This is the work so largely used by amateurs, who are guided by the index to the remedies most appropriate to each supposed malady, and they, as well as the professionals who have been fortunate enough in the present critical times to obtain a *diploma*, soon get by heart from its pages a small list of specifics—*exempli gratiâ*, *Aconite* for fever; *Arsenic* for colds; *Belladonna* for sore throat; *Bryonia* for pain of the side; *Nux* and *Opium* for constipation; down to *Zincum* and *Zingiber*, the final letters of the pharmacopœial alphabet.

Some sages there are, however, who not diving very deep below the surface, conclude that the labours of all provers and homœopathists together must result, and have resulted, in the discovery of a panacea, an universal remedy for diseases of whatever kind and degree; and this opinion is strongly fortified by the a b c arrangement, not alone of diseases or of symptoms, which prevails throughout the work, but of the remedies as well. Thus the too eager dilettante finding *Aconite* named first for *prosopalgia*, or pains of the face, exhibits that drug first, and if not soon successful in affording relief, he tries *Belladonna*, which stands next, and that failing, he proceeds to *Causticum* and *Colocynth.* But if his luck have lain

Hosted by Google

chiefly with the first-mentioned remedy, he becomes (to coin a word) a confirmed mono-pharmacist. This view of Jahr, however absurd it may appear, was amusingly evinced in the columns of the *Homœopathic Times*, some months ago, in an effusion by a Brighton "Touchstone:"

> "*Hail! ever-precious Aconite,*
> *How shall we thy virtues write?*
> *If your bile's disordered quite,*
> *If your eyes can't bear the light,*
> *There is no cure like Aconite.*
> *Should you sleepless lie at night,*
> *Take a dose of Aconite.*"

And so on for an entire page. But the ground plan of Jahr's Repertory is anything but systematic; no literary or scientific martinet is he. Chapter I. treats of internal general affections; Chapter II. of the skin and external organs; Chapter III. of sleep; Chapter IV. of febrile affections; Chapter V. moral affections. It would have been natural, methinks, to have adopted the masterly anatomical order laid down by Hahnemann for the proving of remedies,* but he has not done so. However, while we notice this trivial blemish in the construction of his Manual, perhaps it is more than compensated in other details by a freedom and even occasional wildness, significative (in these latitudes at least) of one who has not been regularly educated in the trammels of the medical profession. Thus (page 409): "*Helminthiasis.*—For tape-worm or tænia, the treatment may commence in most cases by administering a single dose of *Sulph.* when the moon is waning, then a single dose of *Merc.* at the full moon following." It is but just to add, that Noack and Trinks, and certain other accredited writers, attach much importance to the various lunar periods. That anomalous portion of the letter-press entitled "Sections," is sufficiently puzzling to warrant the assertion that it is unmeaning and defective, and that it might be very advantageously re-cast in another form. Some of the practical observations ("clinical remarks") are objectionable, and the student should be upon his guard against them; far otherwise is the paragraph upon "Inflammations." "The best *antiphlogistic* that homœopathy possesses is undoubtedly *Aconite*, and in many cases of acute inflammation this medicine will subdue the disease; but it must not be supposed that it can be administered in all cases as an *infallible specific*, on the contrary, if *Aconitum* is to do good, it must be indicated by the totality of symptoms, as well as every other medicine. There are, in fact, many inflammatory diseases (and principally those in which the old school also forbids phlebotomy) in which the use of *Aconite* would only be a loss of time. But, on the other hand, the cases in which this medicine is almost indispensable are inflammation of the *serous membranes* with violent febrile heat, hard and quick pulse, etc."

Such instructions are highly valuable in the actual transition stage of a great medical reform, but being addressed chiefly to converts from the old school, who are supposed to be irrecoverably imbued with the "traditions of the elders," they are calculated to mislead others, and did mislead, in a notable instance still fresh in our recollection.

A lady, about sixty years of age, of a collected, serene disposition, was the subject of cancerous tumours and tubercles in the left mamma. On the 25th of November, 1851, the progress of this complaint appeared to be suddenly arrested; the pain, the discharge, the hemorrhage, ceased entirely; she fancied she had taken cold; she was confined to her bed; the bowels above the umbilicus exquisitely tender to the touch, and she hardly dared to breathe; abdomen somewhat tumified; tongue white; much thirst; pulse about 120; no sleep; great heat of body; bowels much confined; urine scanty; she had previously manifested œdema of both feet. *Aconite 3rd dilution, a dose every two hours.* This treatment was continued for two days, with some little relief to the extreme pain, but the bowels remained costive. The lady was not again visited by the writer until the 22nd of December, when there was much ascites, with excessive tenderness of abdomen, and increased œdema of knees and back. An intermitting pulse now pointed to *Digitalis*, and afterwards *Merc. sol.*, *Bryonia*, *Puls.*, *Sulph.*, and particularly *Aconite*, in different dilutions, were again and again exhibited, with scarcely any advantage, the natural evacuations, both liquid and solid, being almost entirely suspended for weeks together, with alarming exacerbations from time to time. At length, on the 5th February, *Nux Vom.* was given in the 6th dilution. On the 9th the patient was much more free from pain, and had passed water freely.

On the 17th the epigastrium was almost free from tenderness, the dropsy had much lessened, and the bowels, to the close of her career, which was prolonged between two and three months after this date, continued to act every day with surprising regularity.

* Vide Preface to the Materia Medica Pura, vol. i.

Hosted by Google

The treatment of this case was directed against the peritoneal inflammation, which undoubtedly existed in a pretty acute form at first. *Aconite* caused no very marked benefit, although it may have limited the further progress of the inflammation. But a candid review of the circumstances of the case, and particularly of the importance which was then attached to the above passage in infallible Jahr, leads to the inference that had *Nux Vom.* been resorted to from the very first period of the invasion, much suffering would have been avoided, and the patient's days have been somewhat prolonged. Again, in numberless cases of pleurisy, *Bryonia* will be found to be better suited than Jahr's grand antiphlogistic.

Lest the writer should appear to be unaccountably hostile to that well-tried and most useful drug *Aconite*, let him rather endeavour to fix the odium of any spleen that may have been manifested in the course of these remarks upon the fact of the very extensive circulation of this Manual. "Opinions generally received," says Sir Joshua Reynolds, "and floating in the world, whether true or false, we naturally adopt and make our own: they may be considered as a kind of inheritance to which we succeed and are tenants for life, and which we leave to our posterity very near in the condition in which we received it, not much being in any man's power either to impair or improve it. The greatest part of these opinions, like current coin in its circulation, we are obliged to take without weighing or examining; but by this inevitable inattention many adulterated pieces are received, which, when we seriously estimate our wealth, we must throw away."

What this great artist has so truly and elegantly said of painting, is equally true and yet more important as regards the employment of medicines. In pneumonia, another highly inflammatory and phlebotomable disease, the greatest reliance may be placed upon *Aconite*, during the first stage, that of congestion or splenization; but Jahr is, we imagine, somewhat in the rear of the advance of our therapeutics, in urging upon his readers the claims of *Sulphur* to our confidence, in preference to *Phosphorus*. The following is the objectionable passage. "In cases in which the pneumonia has already reached the secood stage, the red hepatization, the principal medicine is *Sulph.*, administered in a dose of from 3 to 6 globules, dissolved in eight ounces of water, and of this solution, a spoonful is to be taken every three hours" (page 567). To the exclusive followers of Jahr, if such there be, we beg to commend an able article on Pneumonia, in No. xxxv. of the *British Journal of Homœopathy*. The writer says: "The adaptation of *Phosphorus* to pneumonia can be established both by the proving of the medicine and its extensive and most successful application; it is by the steady persevering use of this remedy, and of this alone, that Dr. Fleischmann has acquired such celebrity in the treatment of pneumonia. Up to the year 1844, he and his pupil, Dr. Reiss, of Linz, had treated in all 379 cases, and had lost only 19, or 1 in 20; the last 44 of Fleischmann, and 34 of Reiss, having all recovered. Dr. Fleischmann is frequently blamed for what is called routine practice; but we must recollect that pneumonia is a routine disease, running a definite course, depending, as we have shown, upon certain simple and constant structural changes, and we see no reason why there may not be a specific for all cases of simple pneumonia occurring in healthy persons. And for our own part, we greatly prefer an undeviating adherence to a remedy, which on the whole suits the disease, than a striving after something which seems to correspond to every little symptom of the individual case. We shall conclude our notice of *Phosphorus* by quoting Dr. Fleischmann's words.

"I used formerly to employ the ordinary remedies, *Aconite, Bryonia, Cannabis*, etc., in pneumonia, and that with considerable success, but each of those remedies is adapted only to particular cases, or rather to particular shapes of the disease. Thus it happened that, besides the difficulty I experienced in discovering the medicine adapted to the particular case, which is no easy matter, I was frequently left in a state of disagreeable uncertainty as to the remedy which had effected the cure. Now, however, I have attained much greater certainty, since for the last year and a half I have administered no other substance than *Phosphorus*, in every case of pneumonia, under what form soever it might present itself; and I think I may, with perfect confidence, pronounce it to be a true specific. I have seen the most violent cases of pneumonia, in every variety of constitution and season, come to a happy issue by the sole employment of this remedy; cases in which almost two-thirds of one lung were hepatized."

In the exanthema called measles, or rubeola, household terms, for which you will in vain search the index (*Morbill* or *Morbilli* is the uncouth and obsolete cognomen here bestowed upon it), there is no hint or most distant suspicion that *Aconite*

Hosted by Google

may be considered its true specific. The experience, however, of Dr. Ozanne, of Dr. Madden, and of the writer, in several distinct and distant epidemics of measles, is entirely favourable to the great superiority of *Aconite* to *Pulsatilla*, *Belladonna*, *Bryonia*, or indeed to any other medicine enumerated in Jahr. It appears to maintain its superiority, in every stage of that highly inflammatory complaint.

The last chapter, on Poisons, is of deep and of almost penal interest to the practitioner, on account of the legal investigation which not unfrequently waits upon the ultimate issue. Liquid ammonia may be an excellent antidote to poisoning by prussic acid; but the writer ventures to suggest that in those few cases occurring in actual practice, where any remedy against this rapidly life-exhausting agent is capable of being applied, none will be found to be more ready at hand, or more efficacious, than the cold douche, applied at short intervals to the nape of the neck and the upper part of the dorsal vertebra. In conjunction with the late Dr. Hope, of St. George's Hospital, he instituted many years ago, extensive experiments upon the lower animals with the cold douche; and its great success in restoring animation, and a cessation of the convulsive opisthotonos, after respiration was wholly suspended, and even the pulsations of the heart—that *ultimo moriens* of the Mammalia—could scarcely be detected, seemed almost miraculous.

THE
HOMŒOPATHIC TIMES.

SATURDAY, JUNE 26TH, 1852.

THE rule of precedent and the authority of the past ages are not to be too strictly maintained; for they are in truth opposed to Nature. Nothing on the earth or under the earth remains always the same.

The some sixty thousand volumes that make up what is called English law should be reduced to one full-typed quarto volume, or at least to a dozen. An encyclopædia of medicine of a dozen volumes might be made to contain all that is worth retaining of the allopathic writings from Hippocrates to Hahnemann.

A writer of the last century (1744) observes: "Mankind may properly be divided into two classes—the credulous, who swallow everything without proof, and the more ignorant incredulous, who, having neither understanding to discern nor abilities to judge, shut their eyes against proof."

The mere substitution of the dogmatic decision or ephemeral opinion of a school or a college or a teacher for a principle or a truth, is the sure way of perpetuating error; and so we make, it may be, the folly of those, whose opinions we profess, the rule of our conduct and the gauge of our wisdom. Had this vicious rule been always acted on we should still have alchemy instead of chemistry; and in civic life we should never have emerged from barbarism.

In truth, medical practice has so often veered about, from the multitude of theories on which it has been based, that the uncertainty of medicine may have passed into a proverb, as well as that of law. "*Equidem beatos puto*," says PLINY, "*quibus deorum munere datum est, aut facere scribenda, aut legenda scribere; beatissimos verè quibus utrumque.* I hold those, to whom has been given the power, either to do things worthy of historical record, or to write things worthy of being read, to be happy; but those to be happiest to whom both these powers have been given." And this is the praise we claim for our HAHNEMANN. He did things worthy of being recorded (where are his *tomes* of carefully kept and admirably treated cases?), and he wrote things worthy of being read.

It is recorded of a king of the old world in the olden times, that he suppressed a book which treated of the virtues of plants, for fear it should be abused, and engender maladies. Many medical men of eminence, as has been shown by our historian, Mr. FREDERICK SMITH, have declared their utter disbelief in the efficacy of their drugs, and their belief in the certain mischief done by them; and therefore our allopathic brethren need not quarrel with the decision of the king.

What the English public requires is to be taught the general principles of physio-

Hosted by Google

logy, and to be instructed in the laws of health and disease; then few would be found guilty of the absurd folly of turning their stomachs into apothecaries' shops. The barbarous jargon in which prescriptions are written should be made to give way for plain English; then people would know what they are taking, and in what measure.

Public opinion has been aptly compared to a river which digs its own bed. We think that public opinion is decidedly setting in, in favour of homœopathy. At all events, it demands a full and fair inquiry into the merits of our medical reform. It demands for us a patient hearing—and will enforce it; and it will secure for us what we ask,—"a clear stage and no favour."

As journalists we have endeavoured to stimulate the public in this direction, and we believe our endeavours have not been altogether fruitless. We fully believe that the success of the internal development of homœopathy, we mean its cultivation by medical men in the right direction, depends very much on the external development; that is, of the knowledge diffused among the public of what homœopathy really is. Let those to be practised on know what the practitioners ought to be, and they would endeavour to come up to the mark.

Correspondence.

THE HOMŒOPATHIC CONGRESS.

To the Editor of the Homœopathic Times.

SIR,—The meeting of the Homœopathic Congress was, I believe, fixed to take place in Edinburgh this year, mainly in consequence of the very strong demonstrations made against homœopathy by certain parties there; but the moral effect of the meeting will be in a great measure lost if it takes place, as at present fixed, in September, since at that time Edinburgh is half empty and the College closed. We shall, indeed, run some risk of being accused of waiting till our chief adversaries were absent, before we dared to show our faces there. September was chosen, under the idea that some of the London men would not be able to get away earlier; but we must recollect that the London season will, in all probability, be over unusually early this year, in fact, before the end of July; but even if it were not so, the absence of some three or four men would be of the two the lesser evil.

From these considerations, I would propose that the secretaries should ascertain whether the day of graduation will this year be the 31st of July, or the 2nd of August (the 1st being Sunday), and that if it is to be the 31st, that the Congress should be summoned for the 29th and 30th, and that invitations to the dinner of the 30th should be given to such of the expected graduates as are understood not to be hostile to homœopathy, and, as a matter of courtesy, to the different professors; the Congress to be the host of any who may accept the invitation. If the graduation is to take place on the 2nd of August, then the Congress should be summoned for the 30th and 31st of July.

I am, Sir, your obedient servant,

GEORGE FEARON.

Birmingham,
June 12, 1852.

Miscellaneous.

ON THE CHANGES PRODUCED IN THE PROPERTIES OF BODIES BY PULVERIZATION.

[M. Dorvault, a French allopath, has discovered that the properties of bodies are IN SOME RESPECTS changed by pulverization. Now that this fact is coming up from a legitimate quarter, we trust our allopathic friends will continue the investigation a little further. —ED. *North American Homœopathic Journal.*]

To the present time, pharmacologists have always considered pulverization as a mere change in the form of bodies—each particle of the divided body being regarded as a diminutive, without change of property, of the entire mass. While admitting that, in most cases, this is a mere expression of the fact, M. Dorvault believes that there is a greater number of substances than is suspected, in which the operation induces a modification of their chemical characters *and medicinal properties.* At present, he can only adduce two or three decided examples in justification of this opinion. Every one knows that sugar, on being powdered, loses a portion of its solubility and sweetening power. Is this referrible to an altered electrical condition of the sugar, as the phosphorescence which is developed during pulverization in the dark might lead us to suspect? Again, gum arabic, when powdered, possesses neither the same taste nor solubility as when entire; and pulverization so diminishes the solubility of arsenious acid, that while a kilogramme of water will dissolve forty grammes in the vitreous state, it will only dissolve fourteen of the powder. In the above examples, the modification is exhibited by diminution of solubility, but in other cases it may manifest itself in other directions.—*Brit. and For. Rev., April,* from *L'Union Médicale,* No. 150.

STRAY NOTES.

By an Old Practitioner.

(*Continued from page* 646.)

III. *Is Allopathy a System?*

Science, in a philosophical sense, consists in carefully-ascertained data, and the laws, principles, and rules derived from them through cautious induction. Science becomes a *system* when these isolated laws, principles, and rules are intimately connected with, depend upon, and verify each other, and thus severally contribute, like the different parts of a healthy organism, to form a symmetrical whole. The most perfect form of a system is that which has, as a centre, some comprehensive law of nature, or some supreme principle from which all the other parts depend, and round which they harmoniously gravitate.

To this most perfect form of a system homœopathy has a right to lay claim. In the homœopathic system of therapeutics, as taught by Hahnemann, the law *similia similibus* is the great centre; the principle of trying the medicines on the healthy body emanates from and is vitally connected with it; the principle of homœopathic doses and their preparation is derived and cannot be legitimately separated from the former; so also that of giving only one medicine at a time. Again, the homœopathic regimen is the necessary consequence of the other principles. Thus in this beautifully-constructed system all the different parts are closely connected with, vitally depending upon, and so indispensably necessary to each other, that none could be taken away without essentially injuring the whole edifice.

Let us compare with this the so-called *allopathic system*. Where is the great central principle of allopathic therapeutics? Where are the laws, principles, and rules which are admitted as such by all, or which even deserve any such name? Echo answers, Where? It is true, the history of medicine tells us that attempts without number have been made, from time to time, to give to medicine the form of a system. But what has become of them? has any of them survived? No; they were simply hot-house plants, which wanted the essential conditions of a healthy continuance of life, and bore at their very birth the germs of early decay and death within themselves. And why? Simply because they were either speculative systems spun *à priori* from the framer's brain without any or sufficient experimental foundation, or because undue and hasty inferences were drawn from loosely-observed and imperfectly-authenticated facts. How different and truly philosophical the method which Hahnemann followed in the construction of his system! It was only after the most careful and discriminating collection of facts for many years, and only when he found that such facts always led to the same inference, and always found their complete explanation in that inference, that he finally enunciated the great fundamental law of his doctrine. Thus in the course of years, and always guided by the strict rules of scientific investigation, he at last produced his astonishingly complete system of therapeutics, the true spirit of which is fully understood, as yet, by only a small number of his professional followers, but will, let us hope, be fully appreciated by subsequent generations. In comparison with this structure, as solid and sure as laws of nature can make it, in what a pitiable light does that wretched allopathic farrago appear, which has hitherto been honoured with the noble name of a therapeutic *system*, whilst in reality it is nothing else but a compound of silly speculations and crude, unscientific routine, which not only can never be called (except, perhaps, ironically) a system, but which is even unworthy to be termed a science in the proper sense of the word. Therefore, instead of calling it the allopathic *system*, or any other name which implies order, unity, and method, call it the *ordinary therapeutics*, the *ordinary mode of treating* disease; not even allopathy in juxtaposition with homœopathy; and if you must have a concise and expressive term, call it vetulism.

AN ESSAY ON HOMŒOPATHIC STATISTICS;

Together with a Critical Analysis of Dr. Routh's Work, entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

By John Ozanne, M.D.

(*Continued from page* 689.)

XV.

III. *Bright's disease of the kidney* stands next in order, as a complication of pneumonia. The proportion of cases in which it occurred is, however, not stated. The omission of this statement is no exception to Dr. Routh's usual mode of proceeding in the course of his work. But as with us the object in view is a *bonâ fide* inquiry into the truth of the homœopathic statistics, it is necessary that we should have no quantity undetermined.

With *indeterminates* of any kind our mind is ill at ease, for we have no foundation of a sure kind upon which to base our judgments. In such a case, if we could not assign a value for the indeterminate, it would be but to abstain altogether from forming a judgment. Fortunately, however, although Dr. Routh has left us entirely in the dark upon this point, he has said enough to enable us, by means of collateral evidence, to clear up the obscurity which hangs about these cases of Drs. Taylor, Walshe, and Peacock, to such an extent as to show that their experience cannot be made the grounds of an objection against homœopathic statistics.

Dr. Routh, with the view of accounting for the enormous mortality of 51 per cent., in their complicated cases, tells us, that "the mortality in these cases appears to be greater among males, owing to the greater number of cases affected with Bright's disease among the former, a disease which, it will be remembered, is very rare in Vienna, and very common here" (p. 53).

In a preceding paper (*Homœopathic Times*, No. 144, p. 576) facts have been brought forward to prove, in direct contradiction of Dr. Routh's assertion, that Bright's disease of the kidney is less frequent in Great Britain than he states it to be at Vienna. For we have found that, whereas he states the latter to be present in at most 5 per cent. of the cases of persons examined after death at Vienna, he seems to look upon this proportion as far below that which is met with in Lombardy, other parts of Italy, and elsewhere. From facts taken from the Glasgow Infirmary and the Edinburgh Infirmary Reports, we have found the proportion of deaths from, *or with*, Bright's disease of the kidney to be, with reference to deaths from other causes, as 1 is to 66, in the former Institution, (and even if all the deaths classed under the headings *anasarca*, *ascites*, and *general dropsy—probably all due to other causes*—be added to those classed under the headings *renal dropsy* and *diseased kidney*, the proportion is only 1 death from kidney disease and from dropsy, due to various other causes, to 31 deaths from all causes!) and as 1 is to 44 in the latter.

We may therefore fairly conclude, that Bright's disease of the kidney, and its difference of frequency at Glasgow and at Vienna, cannot account for the more favourable results obtained in the homœopathic treatment of pneumonia at the latter place. Indeed, the fact that in Dr. Routh's appendix, pneumonia, treated allopathically, presents a ratio of mortality higher by 1 per cent. at Vienna than at Glasgow (the ratio of mortality being 27 per cent. at Glasgow, against 28 per cent. at the General Hospital, Vienna), is of itself sufficient to prove that the marked inferiority in the allopathic results cannot be in any way due to this complication. Let the reader also bear in mind that, while the allopathic mortality at Vienna was 28 per cent., the homœopathic was only 5 per cent.

Having stated these facts, we may next inquire whether Bright's disease of the kidney be not more frequent in London than in any of the places already mentioned. We shall find it to be so; and this fact must be carefully borne in mind when we shall have to state the results obtained at the London homœopathic hospitals—which results must not, for this very reason, be compared with any but the results of allopathic treatment as observed in London. It is as well, however, to state beforehand, that the influence of Bright's disease, even in London, has been greatly exaggerated in Dr. Routh's book.

As the basis of our calculation of the value to be assigned to Bright's disease, as one of the chief sources of the high ratio of mortality attending the allopathic treatment of pneumonia in London, we may take Dr. Hughes's paper in the Guy's Hospital Reports, already quoted.

In that paper, which embodies the principal facts observed in fifty-four cadaveric inspections of persons who had died of or with pneumonia, there are only six instances of kidney disease, namely, one-ninth of the whole. Three of these cases—

Hosted by Google

described as follows, "kidneys large, soft, and cream-coloured," "renal anasarca, kidneys large and white," "mottled kidneys" (Cases 1, 2, and 17)—are evidently cases of Bright's disease. But the other three leave us in doubt; they are thus described: "diseased kidneys," "suppurating points in kidneys," "diseased kidneys" (Cases 48, 50, and 54). Although most probably not cases of Bright's *granular* kidney, we shall take them as if they were certainly such, in order not to understate the gravity of the complication.

Now, in calculating the influence of Bright's disease upon the ratio of mortality in pneumonia, we must not put it down as one-ninth, for it must be recollected that these deaths represent a number of cases under treatment, which must be three or four times as great, according as the mortality was 30 or 25 per cent. Now, as Dr. Hughes observed about the same proportion of complicated cases as Drs. Taylor, Walshe, and Peacock, we may assume his mortality to have been equal to theirs, that is, 30 per cent. or less. Thus the fifty-four cadaveric inspections of Dr. Hughes represent the deaths resulting from the treatment of between 179 and 180 patients at least.

Taking the exact number, which is 179·82, and dividing it by 6 (the number of cases of kidney disease), we obtain as our result one case of kidney disease to 29·83 pneumonia cases, or 3·35 per cent.

Supposing, therefore, that in London all the pneumonia cases complicated with kidney disease were to end in death, under homœopathic treatment (which we cannot allow, excepting for the sake of argument), the increased mortality from this source would only amount to 3⅓ per cent.

If we now return to Dr. Routh's statement, as quoted above, that the mortality in the complicated cases observed by Drs. Taylor, Walshe, and Peacock was greatest among males, *owing to the greater number of cases* affected with Bright's disease among males than among females, we are led to inquire into the relative numbers of either sex affected with this disease. In Dr. Hughes's cases all were males. In Table XIII, of Dr. Peacock's Appendix to the Edinburgh Royal Infirmary Reports for 1842, already quoted, the case stands thus: granular disease of the kidneys, total admissions, 48; males, 30; females, 18. Adding Dr. Hughes's six cases to these, we have a total of 54 cases; males, 36; females, 18—proportion of the latter to the total of cases, one-third, or 33⅓ per cent.

Now, if the difference in the frequency of Bright's disease, as regards the sex of the patients, be requisite to explain the difference in the results of complicated cases of pneumonia in the practice of Drs. Taylor, Walshe, and Peacock, in reference to sex, it is evident that the cause is totally disproportionate to the effect. For Dr. Routh tells us that in the complicated cases the mortality in males was 1 in 1·9; in females, 1 in 2—giving a more favourable result in the females only in the proportion of 1·19. It is clear that if a difference of 66⅔ per cent. in the frequency of Bright's disease, depending upon the sex of the patient, is to be made to explain a difference of a little less than 5 per cent. in the results, the explanation is not the real one. It points out in fact, in the most forcible manner, that the influence of Bright's disease must be very small.

Hitherto the proportion of Bright's disease of the kidney, at Glasgow and at Edinburgh, has only been taken by calculating the ratio of deaths from Bright's disease to the total deaths, from all causes. Let us now see in what proportion the admissions for this disease stand with regard to the admissions from all causes.

At the Glasgow Infirmary there were admitted in the general wards, in the years 1846-47-48-49, 9351 cases (exclusive of accidents and of some thousands of fever cases in the fever-hospital). During these four years, 127 patients affected with *renal dropsy* and *kidney disease* were also admitted; proportion of the latter to the former, 1 in 73·62 cases, or 1·35 per cent.

In the Edinburgh Infirmary, in 1842, there were admitted 2290 patients into the medical wards (exclusive of 1240 admitted during the same time into the surgical wards). Of these the number affected with Bright's disease was 48; proportion 1 in 47·70 cases, or 2·09 per cent.

The proportion of cases in which, after death, the kidneys were found diseased by Dr. Hughes, to total cases under treatment, we have calculated to be at most 3·35 per cent.

If we take it for granted that in all the cases of diseased kidney observed by Dr. Hughes the affection was Bright's disease (which is doubtful), the difference is only 1·34 per cent. in excess of the Edinburgh cases.

It is evident therefore that the greater frequency of Bright's disease in London cases is greatly exaggerated by Dr. Routh. It may, it is true, account for the difference in the results of the treatment of pneumonia observed at the two Scotch Infirmaries, when compared with that observed in London (27 per cent., Glasgow; 24 per

Hosted by Google

cent., Edinburgh; 30 or 31 per cent., London); but it cannot in any way account for the marked difference between the allopathic and the homœopathic results as affirmed by Dr. Routh.

Endocarditis and Pericarditis. — The low place in the scale of frequency given to these complications, sufficiently attests their unimportance as a source of an increased per centage in the mortality of pneumonia.

We might therefore at once dismiss the subject; but in pursuance of our plan hitherto followed, we prefer leaving no quantity undetermined. So far therefore as materials can be found, we shall continue to adhere to it.

In the Appendix to the Report of the Royal Infirmary of Edinburgh for 1842, there is only one case of pericarditis, and none of endocarditis, in 2290 admissions into the medical wards. The proportion of admissions for organic disease of the heart is, however, high, being ninety-five for the year, or about four per cent. on admissions into the medical wards for all diseases.

In the Report of the Royal Infirmary of Glasgow, for 1846, there were admitted five cases of endocarditis and pericarditis into the general and fever wards; the total admissions for the year being 4554 patients, giving a proportion of these two forms of cardiac inflammation of a little more than one in a thousand admissions. Of these five patients one died. The admissions for pneumonia and pleuro-pneumonia in the same year were fifty-four; deaths seventeen. In the Reports of the three following years, the cases of endocarditis and pericarditis are not distinguished. I have not been able to procure the Report for 1850.

In 1851 there were admitted into the general and fever wards 3962 persons; of these, seven were affected with pericarditis and endocarditis — proportion, 1 in 566. Of these three died; the total deaths for the year amounted to 425 — proportion of deaths from pericarditis to total deaths, 1 in $141\frac{2}{3}$.

The same year there were admitted nine patients affected with *heart disease and dropsy;* of these three died — proportion of heart disease of all kinds to total admissions, 1 in $247\frac{10}{16}$. Deaths from heart disease, 6 — proportion to deaths from all causes, 1 in $70\frac{5}{6}$.

It is evident therefore that, in the first place, endocarditis and pericarditis cannot affect the mortality of pneumonia to any great extent; at the most 1 per cent. That, in the next place, organic heart disease, in general, being more frequent, may affect the mortality to the extent of between 1 and 2 per cent. *under allopathic treatment.*

In our next paper we shall see that from this cause the mortality of pneumonia, under homœopathic treatment, must be affected in a much smaller degree.

But this is not all. It seems probable that in allopathic institutions a degree of heart disease is taken into account, and looked upon as a serious complication, which under homœopathic treatment would be disregarded.

In his notice on the influenza of January and February, 1837, Dr. Clendinning reports the cases under treatment at the Marylebone Infirmary. These were 414 in number. Two-fifths were simple, and three-fifths complicated cases. These complications are valuable, as they give the proportion of heart disease in London. There were three cases of chronic disease of the heart, and one of pericarditis; being, together, in the proportion of less than 1 per cent. But the chief reason for alluding to this notice is to show what is understood by complication with heart disease.

In the "morbid appearances" observed in the Marylebone Infirmary in the winter of 1836-37, it is remarked, with reference to disease of the heart:—

"It may be thought singular that disease of the heart should have occurred so often, much oftener than phthisis, being eighteen times out of twenty-two (in the deaths, of course); and I should probably, some twelve months or more since, have been struck myself by such a statement.

But it is undoubtedly true, that disease of the heart *frequently escapes the observer who trusts to his eye as a means of admeasurement, when, as often happens, there is no pericarditis, nor any valvular disease; and when hypertrophy, if existing, is distributed pretty equally over the organs, there is a great chance of its escaping notice, unless very considerable;* more especially if the inspector have defective information respecting the health of the deceased. To guard against error from this quarter, I have for some time weighed every subject inspected on account of disease of the heart, entire in the first instance, and then, after careful examination of the pectoral viscera, weighed the heart separately, after washing, and in this way have satisfied myself that, amongst the labouring classes at least, hypertrophy of that organ is a still more common and fatal disorder than many or most physicians believe" (Quoted from Dr. Clendinning's observations, in "Annals of Influenza," p. 358. London, 1852.)

Hosted by Google

Is it not evident that with these views, and with a pair of delicate scales, it would be possible to account for every death not arising from *phthisis*, *bronchitis*, or *Bright's disease*, by the co-existence of hypertrophy of the heart with pneumonia?

ON INFLAMMATION.

(*Communicated.*)

The subject of inflammation has obtained no small amount of medical attention, probably owing to the universality of its nature, and the very short but rapid course it takes either for weal or woe.

When acute inflammation exists, it gives clear evidence of its existence; it is not likely to be mistaken, its signs are pretty certain, and by universal consent are readily made out. The treatment by non-homœopaths is also generally agreed upon, and how much soever they may differ among themselves in the treatment of other diseases, yet upon the subject of inflammation they are almost united. The rule laid down is nearly universally received among them, that so long as hardness in the pulse remains, blood may be drawn, aided by those remedies that lower the circulation; in a word, it is the non-stimulating plan.

It is much to be regretted that the term allopathy or homœopathy should ever be used by either party in taunt or ridicule; and when the terms do occur, I do not apply them in that spirit. The responsibilities of medical men are serious, too serious to be trifled with, and human life too sacred to be offered at the shrine of any medical sect or opinion; it is, therefore, no trifling matter in a disease like inflammation, so universal in its nature, and so fatal in its character, to adopt a treatment differing from that which, like the coin of the realm, has become current from a very early period to the present time; and nothing can justify departure from the rules laid down by allopathy, unless it can be shown and proved, incontestably proved, to friend and foe, that homœopathy loses a smaller per centage in acute diseases than any other mode of treatment yet known. It is not by a few isolated cases, treated by this or that system, that we can judge of its value; the only rock on which it can stand is its per centage of deaths.

Homœopathy has put forth this startling announcement, that in pneumonia, *i. e.*, inflammation of the lungs, allopathically treated, one in every four die; homœopathically treated, only one in every seventeen die. This announcement has never been met nor disproved; attempts have been made to fritter it away, but there it stands on public record, either true or false, there it is; if false, let its falsity be proved; if correct, nothing can justify, I repeat again, offering human life to the shrine of any medical sect or opinion. It is a sacred duty we owe to our fellow-men to adopt the best means in our power to prolong life, and if we are not acquainted with the best means, we are culpable for our apathy and negligence.

Let us for a few minutes glance at the character of inflammation. Ask a person how he felt a week or so before the attack came on, and you get something like the following answer. "Why, sir, I felt for some time very poorly before I was taken ill, weak, and out of sorts, off my appetite, and no spirits to go about my work." Does not this show debility at the bottom of inflammation? is it not its general forerunner, and may not this deficiency of nervous power be one of the exciting causes of inflammation? What though the circulating stream be like a torrent, jerking and bounding; with the rapidity of the current the strength is running out too. There may be excitement, strong excitement of the arterial system, but it is not superabundance of strength. Try him; ask the patient to get up and walk about. Can he do so? Those who defend bleeding should be prepared to show that it is the best mode of dealing with inflammation. The mere fact of the universality of its employment does not suffice. That it has received the sanction of the highest authority does not satisfy; it proves nothing more than its general reception. The only impartial evidence that can be received is the per centage of deaths. Let us reverse the order, and suppose homœopathy lost one out of every four, and allopathy one out of every seventeen, the homœopaths would then be deserving of the calumny and reproach now heaped upon them, and loudly calling for the strong arm of the law to interfere. But allopathy has the tide in its favour, and so long it will succeed; whilst at the same time an opposite under current of public opinion is running strongly too, and the weaker must give way to the stronger whichever that may be.

But it may be asked, and a very proper question for inquiry too, what better treatment has homœopathy to offer? It replies, by a non-reducing system; by saving the vital fluid—"the blood is the life;" by husbanding whatever strength is left at our disposal; and by selecting a remedy which is capable in health of setting up a train of symptoms similar to what is found in inflammation. Compare the action of inflammation and *Aconite* together.

Inflammation.	*Aconite.*
Quick, throbbing pulse.	Quick, throbbing pulse.
Oppressed breathing.	Oppressed breathing.
Acute pain.	Acute pain.
Moaning.	Plaintive cries.
Followed by alarming weakness.	Followed by alarming weakness.
Sinking of the pulse.	Sinking of the pulse.
Death.	Death.
Post-mortem appearances.	
Inflammatory patches.	Inflammatory patches.
Congestion of the venous system.	Congestion of the venous system.
etc. etc. etc.	etc. etc. etc.

Do they not correspond in a remarkable manner? and for this reason *Aconite* is homœopathic to acute inflammation, setting up a similar action. There are cases, however, of inflammation where *Aconite* is not the best remedy, and where a remedy bearing a greater resemblance to the kind of inflammation would be chosen. But of the power of *Aconite* over inflammation I will mention only one case out of a large number that could be given.

PLEURISY.

—Mrs. B. complained on the 19th January, 1846, of not feeling well the last four days, weary and languid, heats and chills, and upon rising this morning suffers from acute pain in the left side under the breast; cannot take a deep breath without much increase of pain; inspiration more hurried than expiration; pulse hard and accelerated; skin hot; tongue coated; and can only get relief by lying perfectly quiet on her back, without moving.

Prescription.—*Aconite* 3, eight drops in six onnces of water; one table-spoonful every hour, gradually lengthening the interval as the pain subsides.

21st. The patient sitting up in bed almost free from pain; can fetch a deep breath, and says she is almost well. This was her first trial of homœopathy, the patient remarking, "this must be a very valuable medicine." She subsequently took a little *Bryony*, and before the end of the week was quite well.

Five years previously I attended, allopathically (not then being acquainted with homœopathy), the same patient for a similar attack. She was bled, leeched, and blistered, and it was three weeks before the pain subsided, and she required to go out of town to regain her strength, which was not till the end of six weeks.

Of the power of *Aconite* over inflammation, cases could be furnished sufficient to fill a volume. Those of my medical brethren who have never witnessed its action are earnestly invited to do so; when properly administered, according to the homœopathic law, its soothing effects are beyond all praise. *Aconite* stands alone. I know of no medicine in the whole range of the Pharmacopœia possessing similar antiphlogistic powers; and I firmly believe if ninety-nine allopathic medical men were to use *Aconite* in the way Hahnemann has recommended it to be used, the whole ninety-nine, within a month, would become semi-homœpaths. Try it and reject afterwards, but don't reject before trying.

ACUTE INFLAMMATION OF THE EYE.

By Dr. Hastings, Cheltenham.

April 15th. Mr. C—, aged 40, has had inflammation of right eye for the last six days; the appearance of the eye is as follows; sclerotic and conjunctiva quite red; cornea dull; pupil contracted; great photophobia, so much so that he can only open the eye in the dark; continual watering of the eye; intolerable pain under the supra-orbital ridge; great pain on moving the eye; no sensation of sand in the eye; pain easier when walking about, but when lying down the pain under the supra-orbit is excruciating; both eyes agglutinated in the morning; exacerbation of all the symptoms about three o'clock a. m. General symptoms; pulse eighty; tongue white and flabby; skin dry and hard; bowels torpid; urine copious and natural; headache; tolerable appetite; no particular thirst; no sleep at night, for the last week; had an attack of inflammation in the same eye when a child; never had either syphilis or rheumatism; thought present attack caused by the prevailing east and north-east winds. Before I saw him he had taken repeated doses of *Blue Pill* and *Salts*, and had applied an astringent lotion of zinc, but derived no benefit. He is a strong, muscular and powerful man; neck short and face red; regular in all his habits, and temperate.

Prescription.—Two drops of *Aconite* 3, in six ounces of water, a dessert-spoonful every hour.

Eye to be frequently bathed with tepid water.

Evening, same day. Had taken six doses of medicine; only alteration, pulse lower.

Bell. 3, two globules, and to be repeated in two hours.

16th. Eye much worse; no sleep; great mental agitation; bowels not opened.

Evening. Bowels opened; eye no better.

Prescription.—Two drops of *Arsenicum*

Hosted by Google

3, in six ounces of water, a dessert-spoonful every four hours.

17th. Only took two doses of the medicine, as he said that it made him worse; but I considered him better, and therefore ordered the *Ars.* to be continued. To have tea and broth.

Evening. Eye easier and less injected. Continue *Ars.*, and poultice to the eye.

18th. Better; slept many hours last night; this is the first rest he has had since the attack. Complains of a "ticking, pulsating pain above the eye," in the orbit; great watering of the eye. Continue *Ars.*, a dose every six hours.

19th. Bowels opened; had some sleep; in all other respects in the same state as before.

Prescription.—Two grains of *Mercury* 3, in six ounces of water, a dessert-spoonful every six hours.

20th. Had a tolerably good day yesterday, and slept well last night, until four o'clock a. m., when a most violent attack of the ticking and pulsating pain in the orbit came on, which lasted for about two hours; no apparent change in the eye. Continue medicine; a dose every four hours.

21st. Passed a tolerable night; slight pain in the orbit about five o'clock a.m.; can see a little; just able to discern objects as through a dense mist, but can only keep the eye open for a moment; eye appears less injected, and can move it without pain.

Continue *Merc.*, a dose every five hours; poultice, etc., to the eye; and I left *Bell.* 3, two globules to be taken at three o'clock a. m., to prevent pain in orbit.

22nd. Took *Bell.* as directed; had no pain in orbit; slept well; eye less injected, and considerably better sight, with diminution of photophobia. Continue medicine.

23rd. Improving. Continue medicine, at longer intervals.

24th. No change.

25th. Eye very much injected, and great intolerance of light. *Sulph.*, a dose every six hours.

26th. Pain in orbit returned at four o'clock a. m.; bowels not opened. *Nux Vom.* 3, two globules, to be taken at night. Omit *Sulph.*

27th. Bowels slightly opened during the night; no pain in orbit; eye greatly injected, and excessively sensitive to the light. Prescribed *Ars.*, a dose every six hours, and cold water applied to the eye.

28th. No change. *Bell.*, a dose every six hours.

29th. During the whole of this month either north-east or east winds prevailed, which, I have no doubt, operated most injuriously; but this morning the wind veered round to the south, accompanied by delightful rains and balmy breezes, and upon visiting my patient this morning, I was agreeably surprised to find the dark screen off the window, he being able to bear the full glare of light, and the eye considerably less injected.

For the last five days the eye had made no progress; but now, as it were, all at once, it became well, and whether to attribute this marvellous transition to the *Bell.* administered on the 28th, the change in the wind, or both combined, I cannot say, though I accept the latter.

May 3rd. During this interval the progress was rapid; every day the bloodshot character of the eye subsided, and the sight became stronger. The *Bell.* was continued three times a day, and he is now quite well.

RHEUMATISM.

G. M—, Esq., aged 50, a gentleman from the country, sent for me to visit him at the George Hotel. He told me that he had a most acute attack of rheumatic fever about two months ago, from the effects of which he had not yet recovered, and though he had had the continual attendance of a physician, he found himself getting worse every day, and now considered himself past cure. "But," said he, "I thought I would come and put myself under your care as a last resource."

I had attended this gentleman, allopathically, about twelve months previously. He was so much changed for the worse since I saw him, that I certainly should not have recognised him. His countenance had assumed a peculiar haggard appearance; cheeks sunken and flushed; malar bones projecting; eyes much bloodshot; anxious look; voice scarcely audible; tongue coated white; thirst; no appetite; cannot sleep at night; skin hard and hasky, with eruptions on several parts; bowels never moved without strong opening medicine; urine scanty and high coloured; can neither move his arms nor legs, nor get up from his chair without assistance, nor even turn his head round, he is such a martyr to rheumatism; reduced much in flesh; complains of severe pains all over him, but especially in the back, loins, and epigastrium; pulse eighty, small and weak. I could not ascertain the medicine which he had used, as he had not the prescription with him; but he said that "he had swallowed gallons of medicine, and was completely tired of it." I

Hosted by Google

was glad to hear him express himself thus, and I replied, "Well, sir, you will not have to take any nasty medicine from me, as I must candidly tell you that I have completely given up the old system of medicine and embraced homœopathy." Of this he was not aware when he sent for me. Upon hearing this, his face brightened up, and he said, "I am glad to hear that, and though I know little of homœopathy, let me have anything rather than the old medicine." I rejoiced at this, as I had apprehended he would not allow me to treat him homœopathically. I then ordered him a nutritive diet—his former medical attendant had been keeping him on milk and water—and prescribed for him *Sulph.* 30, two globules.

Following day, much better; had slept tolerably well during the night, and had had a nice moisture on the skin; tongue rather cleaner, and rheumatism easier.

Prescription.—Two drops of *Tincture of Sulphur* 3, in an ounce of water, a teaspoonful night and morning.

Next day, still improving; bowels not opened; urine more abundant, and clear; rheumatic pains nearly gone; can rise up from his chair without aid; walk about, go up stairs and undress, and get into bed himself, things he has not been able to do for the last six weeks; appetite much improved, and his mind now quite cheerful; feeling convinced that he is going on better.

Two days afterward, on going in to see him, I met him at the outer door of the hotel, looking quite cheerful, and able to walk well. The rheumatic pains were almost gone; the bloodshot appearance of his eye much better; the cutaneous eruptions disappearing; the bowels regular; appetite good; and, in fact, to use his own expression, "he was as well as ever he was." He continued to progress most favourably, taking a dose of *Sulphur* every night, and in a few days from the last report he was so much better, that his cure seemed to him something very astonishing.

THE
HOMŒOPATHIC TIMES.

SATURDAY, JULY 3RD, 1852.

"THE dogmatist," says WATTS, "is sure of everything, and the sceptic believes nothing." Now, it is well known that the allopathic practitioners who are most dogmatic, are those who rush at consequences like the Malay at his victim—with a species of insane fury. The wiser of them, those who have been taught by reflection and experience, are sceptical about medicine: their supposed faith in the practice they use consists in their good works, and these good works consist in doing nothing, or as next to nothing, as they can contrive. To say that the orthodox are all evil-doers would be unjust, for many of them really persuade themselves they are doing the best in their power; and to say that the sceptics are all dishonest would be still more unjust, for they look at nature with a broader range than the others. The seeming acquiescence of the latter, and the often real acquiescence of the former in *received* opinions, is the real bane of medicine.

Science is progressive, and those who pretend to regard medicine as a science should hope and strive for its *progression.* The doctrine of HAHNEMANN offers the mode and the means of the progression. Why do the allopathists not inquire into its truth?

While the inquiry is pending, till what is now *heterodox* becomes *orthodox*, let us be tolerant to each other.

> "Embracing those whom Europe holds,
> The Doctor Catalogue unfolds
> About a hundred different sects:
> And due indulgence it should teach
> To every follower of each:
> If for a moment he reflects,
> The chances are against his own
> Just as one hundred are to one."

We do not admit this, however; for, believing that our medical sect has the advantage of the natural law of healing—*i. e.*, of a law of nature for our guidance—we invite all *other* sectarians to examine it.

Which of the medical sects restores most to health? He who can restore the sense of health to even one person who has lost it has not lived in vain. "Every recovery," says RICHTER, "is a *palingenesia*, and bringing back of our youth, making us love the earth, and those that

Hosted by Google

are on it, with a new love." Happy man he who is honoured as the instrument of this *redintegration* of any human being.

We think allopathy at this time is like the caterpillar in its cocoon; and we long to see it bursting out into the vigorous life of homœopathy. "With patience and perseverance, the leaf of the mulberry-tree becomes satin," according to the Arabian proverb, and so we have patience with our allopathic *co-rivals*.

We are ephemerals, and in our weekly articles we are the shadows of a name. But yet in our *anonymousness* we may be allowed to exhort our homœopathic brethren. Comparing ourselves with the mighty Cause we advocate, the best of our body must plead guilty to the charge of defects and short-comings. All have to learn so long as they labour and live.

All men have diversities of gifts. What is naturally deficient in the intellectual organization may be compensated for, in no small degree, by industry. "Mother," said the Spartan boy, going to battle, "my sword is too short." "Add a step to it," was the Spartan mother's reply.

We want our medical allies, colleagues, brethren, who profess the same faith as we do, to *do their best*: and when they go to battle with the allopaths, *to add a step to their sword*—to exhibit undaunted energy, the best foot foremost—with heart and mind in the assault, and with indomitable resolution in defence of the right.

Review.

What is Homœopathy? By Wm. Sharp, F.R.S. Rugby: Cropley and Billington, 1852.

An Enquiry into the Truth of Homœopathy. By Wm. Sharp, F.R.S. London: Davy and Son. *Price Sixpence.*

We have a sincere respect for our excellent colleague, Mr. Sharp. We heard a man of science say of him that he was "running over with science." The Royal Society must think so too, for he is a fellow of that illustrious corporation; and yet with all his science, like Whately and Bunsen, and many others of that high order of intellect, he is persuaded of the truth and reality of homœopathy.

In addition to science and practical skill, the fitting conclusion to the character of a medical man, is to be a Christian gentleman, who knows and practises the obligation, of Divine sanction, to do unto others as he would himself be done by.

It is to us a matter of felicitation that such men as Henderson and Ransford and Sharp, distinguished allopaths in former times, should have acknowledged the truth and reality of homœopathy. Some of the most eminent of the Senate, of the Church, and of the Bar are among our staunch supporters. We have, in our number, men of the highest science, of the largest intellect, of the most undoubted piety. This being the case, we may well afford to laugh to scorn the ribaldry and the insensate folly of our gainsayers; but knowing what poor human nature is, it is more becoming to *pity* them.

There can be no doubt that our far-spreading Reform is beginning to make itself felt in the high places of the Medical Profession. Some treat it with a good-natured affectation of indifference; some profess to know nothing about it; while the mass of our opponents still revile it, and vituperate the homœopathic practitioners.

Science, knowledge, and practical skill, it must be confessed, distinguish some of our body. But it is not the less incumbent on each follower of Hahnemann, whether so gifted or not, of whatever degree or standing he may be, to *do his best* to promote and advance the cause he professes to have at heart.

It is well known that we do not think the best means have been yet taken to benefit the poor. All who know what dispensary practice is are well aware how slovenly that practice is, of whatever school the medical men may be: all who are aware how defective in point of resources, and so in point of real usefulness, our three British homœopathic hospitals are, know very well that anything like a real and substantive benefit to any great number of in-patients is out of the question.

It is, therefore, that the testimony of men who were formerly distinguished allopaths to the truth of homœopathy is so valuable.

In the first of the two papers we have cited, "What is homœopathy?" Mr. Sharp establishes the following propositions.

1. Homœopathy *is not a novelty.*
2. Homœopathy *is not quackery.*
3. Homœopathy *is not an uncertainty.*
4. Homœopathy *is not an infinitesimal dose.*

Hosted by Google

5. Homœopathy *is not a "humbug."*

6. Homœopathy is a GENERAL FACT, *a principle, a law of nature.*

7. Homœopathy *is a practical fact.*

8. Homœopathy *stands upon its comparative merits.*

9. *The old method is unsatisfactory.*

10. Homœopathy *is simple and intelligible.*

11. Homœopathy *gains by comparison.*

12. Homœopathy *is medical treatment.*

13. Homœopathy *is a practical guide,*

14. Homœopathy *is a guide in the choice of the medicine, not merely of the dose.*

15. Homœopathy *aims at eradicating or permanently curing the disease.*

16. Homœopathy *economises the vital powers.*

17. Homœopathy *is gentle and agreeable.*

18. Homœopathy *administers one medicine at a time.*

19. The homœopathic physician *learns the properties of drugs by experiments on himself, not upon his patients.*

20. Homœopathy *is applicable to acute as well as to chronic disease.*

21. Homœopathy *is prepared for any new form of disease,* far better than the old method.

22. Homœopathy *carries into detail what all medicine is in the general.*

23. Homœopathy *relates only to the administration of remedies,* and detracts nothing from the value of the collateral branches of the science of medicine.

How, and how well Mr. Sharp has established these propositions, the homœopathic public should ascertain for themselves, by obtaining and reading his pamphlet.

The "Enquiry into the Truth of Homœopathy" is a reprint from the *British Journal of Homœopathy.* We refer our readers to this pamphlet also; both of them may be obtained from any homœopathic chemist or publisher, and we content ourselves at present, with extracting one case.

"CROUP.

"I have tried the new treatment in three cases of croup. One comparatively slight, because attended to immediately, though the difficulty of breathing and distress were very considerable, and the cough thoroughly characteristic. This was speedily cured by a few doses of *Aconite* and *Hepar Sulphuris.* The second was a more severe attack, and consequently resisted the treatment longer, but it also yielded during the night to *Aconite, Spongia,* and *Hepar Sulphuris.* My notes of the third case are as follow.

"Dec. 1, 1850; Sunday. This was as bad a case of croup as I ever saw recover. The patient, a little boy three-years and five months old, was very fat, and tall for his age; a fine child. He began, as usual, in the night (Saturday), but I was not sent for to see him till to-day at noon. His mother has given him *Antimonial Wine,* etc., and he has vomited several times, both before and after taking the *Antimony.* When I saw him his face was very hot and flushed, and, when he coughed, almost purple; his breathing very short, and the peculiar sound of croup accompanied both the breathing and the cough; his pulse above 180; occasionally he struggled violently for breath, as if he would be suffocated. I gave him *Tinct. Aconit.* 3, and *Tinct. Spongia* 5, in alternate doses every quarter of an hour.

"6 p. m. He has not yet been much relieved. Has taken six doses of each of the medicines. *Tinct. Hepar Sulph.* 5; I gave him half a drop. He seemed to breathe rather better after this, and in another quarter of an hour I repeated the dose. Fifteen minutes later I gave the *Aconite* again. His pulse was now 160; his fits of coughing not so frequent. For the night he had *Tinct. Aconit.* 2; *Tinct. Spongia* 3; *Tinct. Hepar Sulph.* 5; to take in turns, half an hour between each dose. As yet he was to have no food.

"Monday morning, 9 a. m. He continued very ill, and between twelve and one o'clock his parents thought he would die; but he then began to breathe better, and is now greatly recovered. His countenance looks natural; his breathing much slower and without noise; his cough has lost its croupy character, and is much less frequent, his pulse 140. He had begged for a little tea, and had taken it with a morsel of bread and butter, before I saw him. To continue the medicines at intervals of an hour.

"6 p. m. The most troublesome symptom during the day has been vomiting. The breathing and cough better; pulse 140. To discontinue the medicines, and to take *Tinct. Ipecac.* 3, a dose every two hours.

"Tuesday. He is much better to-day; and in a few days he was well."

Correspondence.

To the Editor of the Homœopathic Times.

Malvern, June, 185?.

DEAR SIR,—My last letter was directed from Cheltenham, this I direct from Malvern, where I am now sunning myself on the Herefordshire Beacon, and laughing most heartily at Dr. Bushnan, who has pretended to know all about homœopathy and the homœopathists; but I think he knows more about California, and would like to know more about its gold and diggings, than any other subject, scientific or literary. I know his writings well, and also a book, which he has reviewed in *his own Medical Times,* called "Cholera and its Cures," a compilation from the *Lancet* and *Medical Times,* etc. I find in page 17 of this book, a case of cholera reported as cured by the great Hippocrates with *Hellebore,* which caused vomiting, and

Hosted by Google

the patient "regained his strength and recovered." I think this is a homœopathic remedy for cholera, but the Editor of the *Medical Times and Gazette* could not see it was. This same work concludes with the strongest recommendation of the "saline treatment," which causes copious evacuations, and is homœopathic to some of the symptoms of cholera, and a very good remedy. I wonder if Dr. Bushnan believes in this treatment, for it, too, seems to be homœopathic. But to go on: he writes, in conclusion, "remembering that the advocates of truth have too often to contend with the machinations of self-interest, prejudice, and ignorance..... The result too bears its own moral: the young aspirant to professional honours may hereby be forewarned of the jealousies and hostilities against which he may have to contend; and he may, moreover, discover beacons, which would warn him from the shoals and sunken rocks upon which his fair fame may otherwise be wrecked." Dr. Bushnan is no *young* aspirant, but an *old one*, and, therefore, he aspires to the royal kitchen, and dedicates his work to the physician to the household; he is lucky in this dedication, which is not infinitesimal, but is homœopathic to his symptoms. Excuse me, I can hardly be serious with the author's aspirations, knowing their meaning. I shall, however, take another line from "Cholera and its Cures," which are many, and in his own words tell Dr. Bushnan that "a fact of the most vital importance has, by misrepresentation, been confounded with falsehood, and many thousand lives, in consequence, been blindly sacrificed; and to test the value of this assertion to disengage truth from the chaos of calumnies into which it has been plunged—to arrest the hand of death, and disseminate life-giving knowledge, are acts worthy of an enlightened and beneficent Government." Government ought, therefore, to make an investigation into the merits of homœopathy, and order a ward in every hospital over which it has control, and appoint a homœopathic physician to take every other case, and thus investigate this *life-preserving* doctrine, and not leave it in the hands of such men as the Editors of the *Medical Times* and *Lancet*. I should, therefore, propose that the Government of this country be appealed to for a fair investigation of this important subject; and further, that the physicians by them appointed be properly remunerated for their knowledge, and for the trouble and difficulty they may have in carrying out this inquiry. The Editors of the *Medical Times* and the *Lancet* are not the persons with whom to leave this matter; party men must work, and do work for their party, otherwise they would be turned off. Those Editors write against mesmerism, and of this subject they know nothing yet; they write against everything but lancets, pills, and boluses.

From my heart, I wish homœopathy to be investigated, and I wish to see this "battle of the doctors" over, or with John Abernethy I shall say, "let all the patients live on sixpence a day and earn it."

I have the honour to be, your obedient servant,

A CONVERT.

P. S.—Travelling has prevented my being able to get subscriptions for the portraits of eminent homœopaths; indeed, down here such things are not required, as I see the medical reformers in this place as large as life in the windows. By the way, the water here has been so strong and so scarce before the last showers, that many of the hydropathic patients could not drink it; it tasted to me as if saturated with herbs, and one of my little boys said it was "nasty physic." I hope the hydropaths will not read this, as it may displease them.

[This must be a very rare occurrence, for we have always understood that the springs of Malvern were inexhaustible, and the water to be the purest spring-water in the country.—ED.]

To the Editor of the Homœopathic Times.

SIR,—Numbers of the enlightened population of this country (to leave out other lands, where its progress has been even greater) are daily seeing the objections to the old system, and the advantages of the homœopathic. Such being undeniably the case, it is strange that any class of men should *blindly* refuse to inquire into the startling facts daily offering themselves, and still more strange that they should oppose and strive to put down with a strong hand a vastly spreading system, of which they know little or nothing. The following circumstances, which have just come under my attention, have determined me to trouble you with this communication, thinking them worth a place in your columns.

I am, Sir,

Your obedient servant,

London, June 9, 1852. SCRUTATOR.

ALLOPATHY *v.* HOMŒOPATHY.

A few days since I made a proposal to a city office, for the purpose of effecting an assurance on my life, filling in answers to their several questions fully and faithfully, among others, answering that requiring the name of my medical attendant, "William Batchelour, Esq., M.D., Finsbury Place South."

In reply, I received a letter requesting my attendance at the office, for the purpose of seeing the medical officer of the Society. I went accordingly, and, after waiting for a considerable time, was shown to his room, when the following conversation, *or examination*, took place; of course I only give it in substance, not *verbatim*.

He first asked me when I had a spitting of blood, which I had named in my proposal.

I answered, some time since, it might be two years, but that it was so slight as barely to be noticed, and had not been thought of until the question was asked, when, in my idea of fairness, I had named it.

He next asked if I was at present under medical treatment, or when I had been.

I answered, I was not at present, nor had I consulted my medical man for a considerable period, it might be about eighteen months.

He then asked me the name of my medical attendant.

Hosted by Google

I answered, "Dr. Batchelour, of Finsbury Place."

He then said, "Oh, he is a homœopathist, is he not?"

"Yes."

He then said, "I fear, sir, it is no use going any further. Being under homœopathy and in delicate health, you will not do for (or suit) us."

I said, "Very well; there ends the matter."

He, however, rang the bell, and asked for the Medical Directory, to which he turned, and not finding the name of Dr. Batchelour, stated "*my evidence to be incomplete*," as there was nothing to show him to be a medical man at all.

I stated that I knew Dr. Batchelour to be a medical man of some standing (or something to that effect).

He said, "But is he not a homœopathist?"

I answered, "Yes; I have been under that system for some years."

He then found, on turning over the leaves of the Directory, a list of persons practising, but who had not sent in their degrees, or whose names could not be found on the books of the College of Surgeons; among these appeared Wm. Batchelour's name. He said, "Strange! and yet," turning to Dr. Batchelour's report on my health to another office, that declined me, "he signs, M.D., M.R.C.S."*

I then said, that I thought the officers should have made all that out before giving me the trouble to come there, and detaining me so long.

He said, "But your evidence is not complete."

I answered, "The question asked was the name and address of my medical attendant, which I gave fully; anything further about him was your business, not mine. I filled up that paper some days since, and you certainly have had time to make inquiries. I understood it was usual to send forms to be filled up by the referees before troubling the proposer."

He said, "What college does Dr. Batchelour take his degrees from?"

Answer. "I don't know; had it been stated to me, in the letter requesting my attendance, that you required the pedigree and every particular concerning my doctor, I might have been prepared with them."

He said, "We don't want his pedigree; we only want to know if he is really a medical man."

I asked, "Are you a medical man?"

He answered, "Yes."

I said, "Then, sir, do all your patients know whether or no you are really a medical man, and can they all tell at what college you took your degrees?"

He then said, "Well, sir, considering all things, I don't think it worth while troubling you any further."

I rose and took my hat, saying, "I don't think it is; at the same time I cannot but again say that I think you should have inquired into all this matter before bringing me here."

* I have since seen Dr. Batchelour, and his degrees are M.R.C.S.E., M.L.A.C.L.

DOMESTIC BOOKS.

To the Editor of the Homœopathic Times.

SIR,—What is the greatest enemy homœopathy has to fear? Is it a foreign or a bosom foe? In other words, allopath or homœopath?

In my humble opinion, it is not the allopath; as his most bitter and determined opposition only makes us gird on our panoply more firmly, and eventually strengthens our cause.

But I opine, that in our own camp and in our own ranks lurk the most deadly foes to homœopathy. I allude to the numerous "domestic" works on its principles and practice. My opinion is, and in this I am not singular, that unless a check is put upon these, and that soon, homœopathy, and all who profess it, will be brought into contempt. "What is the use," say the public, "to consult a homœopathic doctor? All that we have to do is to buy a twelve-shilling case of globules, so and so's "domestic"—and set to work ourselves." And so they do, and blunder away, playing at globules, laughing when they make a *hit*, and becoming frightened when they make a *miss*, and, consequently, send off for an allopath, believing that there is no efficacy in the globules; and for why? Because they did not administer the proper medicine. Many evils result from this, among which are the following—namely, the public are led to fancy homœopathy to be a very childish and simple thing; homœopathy suffers by their blundering prescribing, and hence homœopaths are ousted of their rights.

From what I am in the habit of seeing daily of these injurious proceedings, I am convinced that unless the publications of these "domestics" are curbed, homœopathy must be content to drag a slow and tardy march for the next fifty years, instead of becoming, as it is entitled as a *science* to do, the legitimate and universal medical practice.

Let works on the practice of homœopathy abound, by all means, but let them be written for the profession, and not for the parlour and the nursery-maid's use.

Why should homœopathy be so popularised? Is it a thing to be thus played with? By adopting a wiser plan, the profession, homœopathy, and the public will be benefited, more especially the latter, as a dangerous instrument will be taken out of their hands.

M.D.

June 25, 1852.

[We agree with our correspondent that playing at physic, though it may be a pleasant is hardly a safe pastime. We cannot prevent the publication of domestic books: the supply is generally a very correct criterion of the demand for any article. The plan is that medical men should (in such cases as make it necessary or expedient, as when families live at a distance from any homœopathic practitioner) recommend only the best of these domestic books—but discourage the abuse of them as much as they can. Our correspondent is well aware that there is no end of allopathic medical chests, with domestic books, guides, etc.

This is a free country, and free people will do

Hosted by Google

as they please, after all. Our medical men should do, what they have not yet done, use their influence to get our respectable periodicals into large circulation, and to promote the sale of the healthier homœopathic literature.—ED.]

HOMŒOPATHIST *versus* ALLOPATHIST

To the Editor of the Homœopathic Times.

SIR,—Perhaps my subject, and the inexperience which must be evident in my treatment of it, will preclude the possibility of its appearance in your columns; nevertheless, what seems to me to be a duty towards those participators in our opinions who are in any way likely to be intimidated by the invectives so liberally poured forth by our antagonists—who, it must be confessed, are greatly to be pitied, considering the rapid increase of the popularity and adoption of our system—shall be performed.

I am personally acquainted with many unfortunate individuals who have rejected homœopathy when on the point of its adoption, because their medical friend (or, still worse, adviser) has terrified their imaginations with fearful stories of patients lost, or starved, or poisoned under its treatment; some asserting our medicines to be virulent poisons, others that they are no medicines at all, and midst these contradictory statements the terrified patient remains under the tender care of his licensed annihilator till, when all human aid is of no avail, a homœopathic physician is applied to, and in a few days or weeks the death of the unlucky patient adds, *of course*, one more decisive proof to the inefficacy of our devoted system.

There is another fashionable fallacy to which I would call the attention of the inexperienced. I have often heard the remark, "But, surely, medical men must have the best means of judging of the effects of this and every other medical system." And permit me to say, this holds true, if self-interest is the best pair of spectacles a man can wear to discern clearly the merits of a cause decidedly opposed to that instinct; but I will ask those who hold this opinion, whether the merits of law reform would receive a due appreciation from an attorney, or if a regulation of the church revenues (of which we have of late heard so much) would be wisely intrusted to a bishop. Now I think the simple deduction from this "rule of two" will be, that an allopathic practitioner is not the most fit person of all others to judge of the merits of our system. I would also observe, that my experience has invariably shown me that those professional members of the old system to whom their practice is of no pecuniary importance, or has retired from them or they from it, are never decidedly opposed to the doctrine or the disciples of the man who will at some future period be universally acknowledged as the medical benefactor of his race. Meanwhile, why cannot our persecutors follow the charitable counsel of Gamaliel? fully persuaded, as they are, that if our system is what they believe it to be—a pitiful deception, a mockery habited in the garb of science—it will, it *must* fall; it must decrease. The public mind, though it may not be, nor is it, well stored with medical *learning*, as are these worthy gentlemen, is still not so devoid of common sense and common perception as to be long deceived by a shadow, by a nothing wearing the *show* of reality. But if, as we know, it is far otherwise, let them remember that little indeed can envy, hatred, and malice do to retard the progress of a great truth; and let us ever remember that when reason fails, ridicule and calumny are the broken reeds resorted to; they are, as it were, the last death-struggles of an expiring cause, the last flickering of a decaying light, flaring with increased brilliancy immediately previous to its fatal extinction.

My advice is that we be neither importunate nor uncharitable towards those who will some day find it convenient to change their opinions. We can *afford* to be otherwise; we have on our side what none can take from us—*truth*. Let us then willingly and cheerfully leave to them the enjoyment of that ridicule and satire so freely bestowed on us, and in charity attribute the unhealthy susceptibility of their minds to the poisonous *effluvia* of their own laboratories, proving, by our own dignified reserve, that homœopathy is as beneficial to the moral as to the physical condition of mankind.

I remain, Sir, your obedient servant,

A LAY HOMŒOPATH.

SMALL-POX AND VACCINATION.

(*From the Family Herald.*)

LITTLE more than fourscore years ago, a youth, yet in his teens, an apprentice to a surgeon near Bristol, heard a young woman, who had called on his master for advice, remark, on the subject of small-pox being mentioned, "I cannot take that disease, for I have had the cow-pox." This observation forcibly struck young Jenner, and was probably the first step in the path of induction which led to his rescuing from rural tradition a vague belief among the peasantry of Gloucestershire that a disease of the nipples of their cows, communicable to milkers, protected them ever afterwards from attacks of small-pox. About thirty years subsequent to this incident, and after much patient and precise observation and experimentation, amid discouragement from his friends and medical associates, and difficulties inherent in the inquiry itself, he published a thin unpretending quarto, in which he gave to the world his brilliant discovery, that immunity could be secured against one of the most loathsome and fatal diseases, and that by very simple means, if mankind were wise enough to adopt them—the defacing, maiming, blinding, and destroying small-pox could be extirpated from the face of the earth.

We of the present generation have little conception of the ravages of the small-pox down to the period when Jenner, in 1798, announced his discovery. For forty-years previously, notwithstanding the practice of inoculation, which had been tested during half a century, the deaths in

Hosted by Google

London averaged two thousand yearly, when London contained not a third of its present numbers. In every fourteen who died from all causes, one fell a victim to small-pox. Three out of every four patients admitted to the London Asylum for the Indigent Blind the small-pox had made sightless. The total deaths throughout England from this scourge were estimated at forty-five thousand yearly. It once swept away in the Russian Empire two millions in a single year. He whose beneficent genius should stay this plague, may well take rank among the most illustrious benefactors of mankind.

More than half a century has passed away since Jenner, speaking of vaccination, declared that "the annihilation of small-pox, the most dreadful scourge of the human species, must be the final result of this practice." Yet the inexorable Registrar-General still numbers small-pox among the causes of mortality, and for the past few years his returns prove that this malady is spreading; that deaths from it have been more frequent; and there are indications that, unless vigorous preventive measures are taken, small-pox, with somewhat of its ancient rigour, may revisit us, to blind, disfigure, and destroy, and so punish us for neglecting the means of protection provided by the great Jenner. In 1842, 2715 persons died of small-pox; 4227 in 1847; and 6903 in 1848; nothwithstanding the operation of the Vaccination Act, which came in force in 1840. On inquiry at Somerset House, we learn no abstracts have been made of the mortality from small-pox in the intermediate years, nor since 1848; but those who find it necessary to inspect the Registrar-General's reports must have been struck with the frequent references by most of the district registrars to the prevalence of small-pox in their respective localities. In the very last quarterly report we are told, "Small-pox has prevailed very extensively; and the provision of gratuitous vaccination for the people by the legislature appears to be insufficient to stem its terrible progress."

How happens this in the very country of Jenner? From its first introduction vaccination has had to contend against ignorance, apathy, negligence, prejudice, and misrepresentation. An old and popular notion prevalent among the ignorant classes is, that small-pox is the expulsion of some morbid principle from the system, which can only be got rid of in this way. The objections to vaccination, founded on this notion, are now deprived of all force by the investigations of Mr. Ceely, of Aylesbury, who has demonstrated that small-pox and cow-pox are essentially the same disease. He introduced into the cow small-pox matter taken from man, and produced pustules which supplied lymph, and with this lymph he vaccinated children successfully. Cow-pox, then, is small-pox in a mild form; and granting, for argument's sake, that small-pox does remove morbid matter from the system, cow-pox will do it as effectually, without the risk of disfigurement or death. These objectors are to be argued with; but what are we to say to such perverse persons as the woman (who represents not a small class) who told the registrar of Nottingham that "she would rather lose half a dozen children by small-pox than fly in the face of Providence in having one vaccinated?"

Another class of objectors refrain from having their children vaccinated, believing that the process engenders scrofula and obstinate cutaneous diseases. They have observed, probably, eruptions manifest themselves *after* vaccination, and have been unable to perceive that this circumstance might occur, even had the patient not been vaccinated. What medical man is there who has not heard it urged that, because "neighbour Smith's child had scrofula after vaccination, she, as a mother, would take good care her child should not be vaccinated." Now, a smart attack of small-pox often developes scrofula, but cow-pox never. Moreover, cow-pox sometimes cures an obstinate cutaneous affection, although, as a general rule, it is undesirable in such a case that vaccination should be performed.

A good deal of distrust of vaccination has lately been excited by a wrong-headed physician, somewhat eminent as an observer and recorder of medical phenomena, but not gifted with the power of wielding statistical data, nor remarkably potent in the logical faculty. He has attempted to prove that vaccination is but feebly preventive, and urges the expediency of reverting to the practice of inoculation. From time to time, in consequence of his pertinacity in proclaiming his mistakes, paragraphs have been inserted in the papers calculated to throw discredit upon vaccination, and causing thereby much needless anxiety. The misapplied industry of this gentleman has done much mischief, in weakening the public faith in the only real preventive of small-pox; and surely he incurs no slight responsibility who, without sufficient grounds, unsettles the general reliance upon the protective powers of vaccination.

In addition to some information as to the circumstances under which vaccination should be performed, and how far re-vaccination is advisable, we hope in an early number to show that cow-pox is a defence as effective against an attack of small-pox as the occurrence of small-pox itself is a protection against a second attack of it.

THE RIGHT MOTIVES FOR PRACTISING MEDICINE.—"The legend which made the religionists of the olden time practise the healing art without price, and on which account they were supposed to be endowed with superior powers,—is it not true to this day? Honest, disinterested motives in the exercise of any profession, presuppose a clear, generous, open mind, which will also see clearer than other minds."—*Neidhard.*

ELEPHANTIASIS, OR ARABIAN LEPROSY.

(From Aretæus.)

The period at which Aretæus flourished is not exactly known; but the most probable conjecture is, that he lived in the era between Nero and Trajan. He is quoted by writers of the fourth century. He seems to have belonged to the medical sect of the Pneumatics, who acknowledged five elementary principles, or influences on the human health—heat, cold, moisture, dryness, and *spirit;* that is, the *spirit* of the Pneumatic sect, what has been called the *vis medicatrix Naturæ*—the *principle of life*—*vital power*—the *nervous force*—the *Archæus* or dominant principle of Stahl.

"Spiritus intus alit, totamque infusa per artus
Mens agitat molem, et magno se corpore miscet."
Æneid. vi. 267.

These elements, their conflicts and disorders, are variously assigned by Aretæus as causes of disease.

His graphic descriptions of disease are even now very interesting. We quote the latter part of his description of elephantiasis, for the sake of two cases he gives on report, the latter of which is a good illustration of a homœopathic cure.

"When the disease bursts forth from the internal parts, and appears on the extremities, scabby eruptions attack the ends of the fingers, the knees itch, and the patients, to ease themselves, are constantly scratching; the eruption sometimes involves the chin all round; the cheeks become red, with a slight protuberance; the eyes dull, of a brassy hue; the eyebrows prominent, thick, devoid of hair, scowling, forming a lump, from the interval between them being knit together; the complexion is livid or black; the skin of the forehead is violently drawn, so as to cover the eyes, as a lion does in his rage, and hence the disease is called Leontium, and it is like not merely to the lion and the elephant, but is

"gloomy as night in aspect;"

the nose is rugged, with black lumps; the lips are thick and prominent, the lower one livid; the teeth are not white, but have a blackish look; the ears are red, inclined to be black, and closed like those of the elephant, they seem larger than ordinary; there are ulcers in their bottom, which discharge an irritating sanious ichor; the body is wrinkled all over, full of deep clefts in the skin, which look like black furrows, and hence the disease obtains the name of Elephas; there are cracks in the soles and heels, as far as the middle of the toes. As the malady gets worse, the tubercles on the cheeks, chin, fingers, and knees become covered with fetid and incurable ulcers, fresh ones keep springing up in some places, while in others they are dying away; the different members, the nose, fingers, feet, and the whole of the hands, die and fall off while the patient still lives; and the malady does not consign him to death, and release him from an existence which is loathsome, and from his excruciating sufferings, before it severs him piecemeal, for existence is long dragged out, and again, he is in this respect like the elephant. When any recent pain attacks his limbs, it smites them heavily, wandering hither and thither; the appetite for food is not altogether extinguished, but the taste is vapid, neither eating nor drinking produces any pleasure, but they are disgusted with everything from their distress; there is atrophy; lassitude overcomes them, a feeling of weight in every limb, for even the small limbs give pain; the body is distressed with everything, and the man neither receives comfort from using or omitting the bath, whether he take food, fast, move about, or keep at rest, for the disease rules paramount everywhere. There is little sleep, and that little is worse than none, from the phantoms it presents; there is great difficulty of breathing, and a suffocation as if they were choked; and this is the way that many have turned the goal of life, and slept the never-to-be-wakened sleep of death.

"In such a state, who would not flee from these miserable wretches? who would not shun them? aye, should he be a son, a father, or e'en perchance his own born brother; for there is an alarm that the disease is infectious; and hence many have turned on the desert and mountain those who were dearest, some relieving their hunger for a long time, and others as little as possible, wishing them to perish.

"There is a reported case, that a man who had reached the desert, seeing a viper crawl out of the ground, was so driven by hunger and borne down by the disease, that, wishing to exchange one evil for another, he devoured the beast alive, and did not terminate his existence until all his limbs rotted and fell off. It is said, also, that another man saw a viper crawling into a cask of must, drinking his fill, and then disgorging and pouring forth his venom copiously into the liquid, that as soon as the animal was choked, the man drank greedily and profusely of the must, in hopes of being released from his life and suffering; when he had drunk to satiety

Hosted by Google

he lay on the ground in a state of intoxication, like one dying; after he aroused himself from his drunken stupor, his hair first all came off, then the nails and fingers, and all parts in succession melted away. Since there was, however, still power in the vital forces, nature remodelled the man anew, as from his birth; she reared him fresh hair, new nails, clean flesh, and stript off his former skin, as the serpent doffs its old age, and the man was recalled, by the fresh sprouting up of life, as it were another being.

"Such is the reported case; in troth, one we cannot altogether rely upon, but still not to be utterly discredited; for to believe that evil can be subdued by evil, and that nature should raise up a man from the embers of life that remained, is not so incredible as to constitute a miracle."

AN ESSAY ON HOMŒOPATHIC STATISTICS;

Together with a Critical Analysis of Dr. Routh's Work, entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

By John Ozanne, M.D.

(*Continued from page* 701.)

XVI.

V. *Meningitis.*—As this complication stands fifth in order of frequency, we naturally infer that it is rare in Drs. Taylor, Walshe, and Peacock's cases. That this must be so for London cases generally, we are led to believe, from the fact, that in Dr. Hughes's post-mortem examinations of fifty-four fatal cases, in which every kind of complication, however trivial it may be, is entered (I may point to Cases 18 and 40 in proof of what I here advance), no mention whatever is made of any appearance of meningitis, or of any other form of head-inflammation; we may therefore look upon this complication as possessing a very small share of influence upon the mortality in the cases of pneumonia recorded by these London observers.

But, in order to ascertain its frequency in other places, we may for a few moments fix our attention upon a series of facts observed by Grisolle at Paris, and noticed in his work on Pneumonia. The importance of the subject will be felt, if we consider that a part of our statistical information with regard to pneumonia is derived from observations of that disease treated homœopathically at Paris.

In 27 out of 304 pneumonia cases observed by Grisolle, and treated allopathically, delirium was one of the predominant phenomena. This gives a high proportion of cases with delirium, namely, 8·84 per cent.; of these one-fourth, or 2·205 per cent. recovered, leaving a mortality from this complication of 6·635 per cent. In addition to these cases there were five in which *mania*, and four in which *subsultus tendinum* were the complications, amounting together to 2·96 per cent., of these two, or 0·65 per cent., recovered; leaving a mortality of 2·31 per cent. from these two forms of disease. The total mortality from cerebral complications of all kinds being 8·945 in every 100 admissions, in round numbers, nearly 9 per cent.

We should expect the proportion of such cases to be very small in Dr. Fleischmann's Hospital at Vienna, for the chief cause of this complication is by Dr. Grisolle considered to be the abuse of alcoholic drinks. "L'abus des liqueurs alcooliques, l'habitude de l'ivrognerie, me parait devoir être regardée comme une des causes qui provoquent le plus souvent le délire dans le cours des inflammations pulmonaires" (p. 387). Now, as the Viennese are said to be a very temperate people (*vide* Wilde's Austria, *passim*), and as it is well known that brandy-drinking to excess is by no means rare among that class of the population of Paris which supplies the largest proportion of the inmates of hospitals, we may fairly conclude that although cases treated homœopathically at Paris are unfavourably circumstanced in respect of this complication (giving, under allopathic treatment, a mortality of nearly nine in every 100 cases), yet it cannot influence the homœopathic mortality at Vienna in nearly the same proportion of cases; therefore we may assign to it, as regards the Vienna homœopathic statistics, the same place that it occupies in Dr. Routh's statement of the cases of Drs. Taylor, Walshe, and Peacock.

It has already been said that complications generally have not the same influence upon the mortality of pneumonia under homœopathic treatment as they have upon this disease, if under allopathic medication; this will be proved by facts in the sequel. But in the present stage of our inquiry we cannot lose sight of this difference; for it is to be remembered, that the *delirium* prevailing in 11·51 per cent. of Grisolle's cases was not, in general, due to any inflammatory disease of the brain or of its membranes. Three-fourths of his patients affected with this complication died. In eight cases, traces of inflammation were found by Grisolle. In the other patients of whom post-mortem inspections were made, "no morbid condition, sufficiently serious to account for the disorder (of the nervous system, the delirium, etc.) observed

Hosted by Google

during the course of the disease, could be discovered."*

We may therefore, without in the least trespassing beyond the limits of legitimate induction, conclude, or, for greater safety, we may for the present simply *suppose* that, under a properly-conducted course of homœopathic treatment those of these patients who presented after death no traces of inflammatory or other lesions would have recovered. This would at once reduce Grisolle's mortality by three-fourths. Thus from 8·84 per cent., the mortality would be reduced to 2·205 per cent.

That such a supposition is not a mere speculation, without due foundation in fact, we shall in the sequel find abundant cause to believe. Indeed, it is remarkable that by every test the difference between the mortality under either system is about in the above ratio. Why should this complication be an exception?

The reader is here requested to remark the distinction constantly kept in view, in the consideration of the complications of pneumonia, between those cases in which the disease, either from its nature (incurable organic disease, meningeal inflammation with serous, sero-purulent effusions, or other morbid products) or from its extent (as in tuberculosis of the lungs, in which a distinction is drawn between those cases in which the tubercular deposition occupies a large portion of the pulmonary tissue, and those in which only a small portion of this tissue is rendered unable to aid in the performance of the respiratory function), renders recovery either impossible in all cases, or possible only in a very small per centage of cases. We now come to the last complication—to the termination of that preliminary inquiry, without which it would have been impossible to proceed one step further in our essay; unless, indeed, we were satisfied with mere guesses as to the value of the indeterminate quantities, or with an arbitrary valuation of them—a process which might perhaps suit the taste of the mere advocate of a cause, but down to which the author of these papers would never condescend to bend for assistance in his laborious task.

VI. *Erysipelas.*—This is so rare a complication of pneumonia, that we have no facts before us by the aid of which we might determine its importance.

In Dr. Hughes's fifty-four fatal cases, there is only one mentioned as complicated with erysipelas. If this were the correct proportion, namely, one case to 180 or 200 admissions, it would give a mortality from this complication of less than two-thirds per cent. But with a single case in so large a series, we are led, with reason, to doubt whether this was not a mere coincidence rather than a result of the general laws, which, although unknown to us, we know, by their results, do govern disease.

Be this as it may, we can do without observations of this complication; for if we ascertain the relative mortality of erysipelas under the old and under the new modes of treatment, we shall be able to form correct conclusions respecting its influence upon the mortality of pneumonia under either system.

In the years 1847, 1848, and 1849* there were admitted into the Royal Infirmary of Glasgow 157 cases of erysipelas. Of these 19 died, one death in $8\frac{2}{19}$, or 12·10 per cent.

In the course of nine years (1835 to 1843) there were admitted into the homœopathic hospital of Vienna 177 cases of erysipelas of the face, which, together with four cases previously in the hospital, and deducting one case which remained in hospital at the close of this period, make up a total of 180 cases: of these two died. Besides these there were thiry-one cases of erysipelas of the foot. All the patients recovered. This gives an aggregate of 211 cases, with two deaths, less than one per cent., the allopathic mortality being 12·10 per cent.

In Dr. Hughes's cases one death arose from this complication, the erysipelas having become gangrenous. Supposing his fifty-four fatal cases to represent 180 admissions, and taking the homœopathic mortality from erysipelas at one-twelfth of the allopathic, this would give a mortality under the homœopathic treatment of pneumonia of one death in 2,160 cases from the complication of pneumonia with erysipelas.

Secondary Pneumonia.†—Dr. Routh tells

* As this is rather a free translation, I transcribe the original *verbatim*. "Chez tous les autres (à l'exception de 2, dont l'autopsie ne put être faite) on ne constata dans le cerveau ou les meninges aucune altération assez grave pour expliquer les troubles observés pendant la vie" (p. 391) It may be necessary to explain that there were twenty-seven cases in all, of these three-fourths died; one-fourth only recovered. Of the twenty or twenty-one who died, all, excepting two, were examined.

* In most of the preceding calculations, the series of four consecutive years (1846 to 1849) has been taken, because it is the only *unbroken* series I could obtain. In the present calculation, the reason for omitting 1846 is, that in that year the *erythemæ* cases are mixed up with the *erysipelas*—not because it forms any exception. The entry in the tables is as follows:—erysipela and erythema, total 42; cured, 36; relieved, etc., 3; died, 3; proportion of deaths to cures, 1 in 12.

† *Erratum.*—In the last paper, p. 669, col. 2, line 12, instead of "1·19," read "one-nineteenth."

This erratum is not to be regretted, as it gives us an opportunity of restating an argument, the point of which was through it entirely lost. Dr. Routh accounts for the difference in the mortality of males

Hosted by Google

us that in the practice of Drs. Taylor, Walshe, and Peacock there were 17 cases of pneumonia, secondary "chiefly to fever," of these 10 died; mortality 58 per cent. (p. 53).

Much importance is here attached to secondary pneumonia, as unfavourably influencing the mortality of pneumonia, and perhaps rightly so; for it cannot be doubted that the slightest complication of, or the slightest acute disease preceding its development, must, with a method of treatment such as that of the old system, greatly tend to turn the balance against a favourable issue.

But, at the same time, we cannot help expressing our conviction that the influence of a previous disease upon the mortality of pneumonia has, like that of its complications, been greatly exaggerated.

Indeed, Dr. Routh has been very unfortunate in this case. He has overstated his argument in a manner which, were it not for the gravity of the questions under discussion, would require its fair meed of *ridicule*.

He tells us reproachfully that we are not accurate, perhaps not honest; for we do not include a sufficient number of secondary and complicated cases in our statistics of pneumonia! "The majority of cases of pneumonia recorded by homœopaths are *idiopathic* or *simple*, not *complicated* or *secondary*."

And "in the Glasgow Infirmary, out of 248 cases of pneumonia, 107 were complicated with fever, or 43 per cent." (page 50.)

In reply to this accusation, we declare that we record our cases *such as we meet them*; taking care, however, not to exaggerate the influence of complications.

and females in the complicated cases, 1 in 1·9 in the former against 1 in 2·0 in the latter, by the assertion that it is "owing to the greater number of cases affected with Bright's disease among the former." In our verification of this assertion we came to the conclusion that either thecause was disproportionate to the effect (to explain a difference of a little more than 5 per cent. in the results by a difference of 66·6 per cent. in the frequency of the disease), and hence not the true cause; or else that the influence of Bright's disease upon the per-centage mortality is much smaller than Dr. Routh makes it out.

Since the last paper was written we have carried out the analysis of this point (rather a knotty one, it must be allowed) to its ultimate consequences. The results are sufficiently interesting to make it worth the reader's pains to follow, one by one, each step of the reasoning.

This question may be viewed in two ways, thus giving rise to two hypotheses, the only two possible. Each will be taken in turn and fully analysed. *First hypothesis.*—It may be assumed that in the practice of Drs. Taylor, Walshe, and Peacock, both sexes were met with in the *usual proportions*, and that in each sex the proportion of cases of Bright's disease was exactly that which exists, not only in the cases in an hospital, but throughout the whole population of a town or district.

Upon this hypothesis the facts stand thus. In the cases of these three gentlemen there were 43 deaths; divided by 9, the proportion of kidney cases observed by Dr. Hughes in his 54 cadaveric inspections, these 43 death give 4·77 cases of kidney disease. The complicated cases, which comprise of course these 4·77 deaths, consist of males 39, deaths 21; females 23, deaths 11.

Our simplest mode of proceeding in order to attain the per centage in both sexes, exclusive of Bright's disease as a complication, will be to eliminate the value of Bright's disease in both sexes in succession.

4·77 cases of Bright's disease, being in the ratio in females of 33·3 to 66·6 in males, give for the former 1·59259 cases; for the latter, 3·18518.

The cases of Bright's disease being eliminated by deducting these numbers from the actual deaths met with by Drs. Taylor, Walshe, and Peacock, in their complicated cases, and the per-centage mortality on the total of complicated cases being calculated, we find that, excluding the mortality from Bright's disease, the per centage of deaths is in males 45·66; in females, 40·90; giving a difference of nearly 5 per cent. in favour of the female sex, the very reverse of what we should expect from the observations of Grisolle and Bruguet. This gentleman found the mortality in females nearly double that occurring in males. But this was in chief part due to the higher age of the females, most of whom were in fact old. This latter circumstance does not exist in Taylor, Walshe, and Peacock's cases, their female patients being younger than the average of Grisolle's. But Grisolle found, on the other hand, that with equal ages the mortality was somewhat greater in women than in men. Here, again, the discrepancy points out to the fact that this hypothesis cannot be the true one.

Second hypothesis.—It may be assumed that the proportion of females to males in Drs. Taylor, Walshe, and Peacock's cases does not represent that which exists in a whole population—whether of a town or of a district. That this is the case, the fact that their proportion of females is below the usual hospital average fully testifies.

In our *calculations* upon this hypothesis, it will therefore be necessary to ascertain the *ratio* in which one of the sexes, as met with in the cases of these gentlemen, stands to the others; next to divide the presumed number (4·77) of cases of kidney disease by the quantity found; and, finally, to divide this by the quantity found, as expressing the ratio of frequency of kidney disease in that sex, as compared with the other.

Let us first eliminate the value of kidney disease in the females. Deaths from complications, 21 males, 11 females; ratio of former to latter as 1·9090 is to 1. Dividing the presumed number of deaths from kidney disease, 4·77, by the above number, we obtain the result 2·5 to 1, expressing the ratio in which Bright's disease would stand in males to females, if its frequency were the same in both sexes. If now we divide the former number by 3, we obtain 0·833, the quantity expressing the number, taking Dr. Hughes as our basis, presumed to have been found in females. Taking the difference between this and the total of kidney cases for both sexes, we find the proportion to be in males 3·944.

Assuming the latter hypothesis to be the correct one, which I believe is the case, we should expect, on eliminating the mortality from Bright's disease, to find, if Drs. Taylor, Walshe, and Peacock's be correctly reported as regards this complication, a tolerably close correspondence between the mortality calculated in both sexes.

Now, what are the facts? The results so calculated give a mortality (excluding deaths from kidney complications) of 43·733 for males, and 44·204 for females; difference only 0·471 per cent.

Considering the favourable age of these females, we may put down this 0·471 per cent. as due to the influence of sex alone (as found by Grisolle).

But the principal conclusions to which we would point as gained by this analysis, is the fact that *Bright's disease of the kidney did not occur more frequently in Drs. Taylor, Walshe, and Peacock's cases than in Dr. Hughes's*; therefore, *our assumption of the facts observed by the latter as the basis of our calculation was perfectly right and proper.* And that, as an immediate deduction from this fact, the influence of this complication has been greatly exaggerated by Dr. Routh

Hosted by Google

gerate the influence of complications, the more especially, as we find that these complications have *very little influence*, under our treatment, upon the results of the disease. (*Vide* the series of papers entitled "Homœopathy in Paris," *Homœopathic Times*, 1850.)

But let us return to the Glasgow Reports. In the four years 1846—49, there were admitted into the *General Wards* of the Royal Infirmary 122 cases of pneumonia and pleuro-pneumonia. During the same period of four years, sixty-eight cases were admitted into the *Fever Wards*, being, as Dr Routh tells us, secondary to or complicated with fever; proportion of the latter to the former 42·62 per cent., very near the proportion (43 per cent.) stated by Dr Routh for a different series of years. But what were the results of treatment?

In the General Hospital the cases could not be *all* of a very acute character, for we find that nineteen patients, or 15·57 per cent. of the whole cases admitted, were dismissed uncured, probably to die elsewhere!

In the Fever Hospital none were removed or discharged but as dead or recovered.

The reader may perhaps—considering the gravity of cases complicated with fever, or secondary to it, and that none of the cases were dismissed otherwise than dead or cured, and considering that "the majority of cases recorded by homœopaths" are neither secondary nor complicated, according to Dr. Routh—conjecture that the mortality was *much greater* in the Fever than in the General Hospital of Glasgow. Not in the least! These are the facts.

General Hospital.—Pneumonia admissions 122, dead 38; proportion of the latter 31·14 per cent.

Fever Hospital.—Pneumonia admissions 68, dead 24; proportion of the latter 35·29.

So that the deaths calculated upon the *admissions* are more frequent by nearly four per cent. in the Fever Hospital. So far Dr. Routh's assertion *seems* fairly supported. But this is not the *true* mortality.

It will be better shown by taking the following:

General Hospital.—Cured 65, dead 38; proportion of the latter to the former, 58·46 per cent.

Fever Hospital.—Cured 44, dead 24; proportion of the latter to the former 54·77 per cent.

So that in the Fever Hospital the deaths bear a smaller proportion by nearly four per cent to the cures than in the General Hospital!

The same results are shown by the following calculation.

General Hospital.—Admissions 122, cured 65; proportion of recoveries to admissions 53·27 per cent.

Fever Hospital.—Admitted 68, cured 44; proportion of recoveries to admissions 64·70. So that in the complicated or secondary cases, of those admitted, above 10 per cent. more recover than of those entered as uncomplicated.

Do not these facts prove, in the most forcible manner, that, although right in his statement that *complicated or secondary cases* are more serious than *simple cases*, Dr. Routh has greatly exaggerated the influence of the former upon the mortality of pneumonia?

(*To be continued.*)

SPECIMEN OF ALLOPATHIC PRACTICE.

THE following very interesting case shows that the allopathic treatment in its heroic forms is, indeed, a very terrible affair. Observe the immense amount of depletion. The bleedings, the cuppings, the blisterings, the shavings of the head, the setons, the leeches, constitute such an awful picture of allopathic misdoing, that we really have not heart to comment on the treatment. But the publication of such cases cannot fail to benefit our Cause, by contrasting the two modes of therapeutics.

Those who use such practice seem to be altogether unaware that what they call "depletion," and even some of our own body do not seem to be aware, that "starvation" can bring about the state of things described in the report of the *post-mortem* examination. We are satisfied that such cases as this ought to be published; and from time to time we mean to give such cases, to let our readers know what allopathic practice is. We are indebted to the "Chrono-Thermalist" for this extract, and for that in a late number about the DUKE OF KENT.

"The case of Elizabeth Wilson, second daughter of William Carus Wilson, Esq., born at Casterton Hall, near Kirkby-Lonsdale, Westmoreland, on 22nd June, 1800.

"She was strong and healthy till frightened at church, 9th December, 1818; bled, 16th December, 1818, then took her bed, and there remained for eleven years, subjected to the treatment detailed below; during which time she was never able to take any breakfast; her dinner consisted of a little fish, or something else of a light nature; but frequently she

Hosted by Google

never tasted anything till the afternoon, and then only a little tea. Her nights were uniformly restless and sleepless. The throbbing and noise in her head were incessant, and the palpitations at her heart almost equally so. Sometimes distracted with pain in her teeth, and very often the whole of her mouth and throat was ulcerated or inflamed in the most excruciating manner, rendering her unable to speak or to eat" (p. 68).

"*Appearances forty-six hours after death, from post-mortem examination. The Head.*—On removing the skull-cap, the substance of the bones was found to be very irregular. The natural depression and prominences were peculiarly strongly marked. The dura mater was more adherent in the course of the longitudinal sinus than usual, and the vessels on the surface were highly injected with blood; those over the anterior portion of the hemispheres of the brain evidencing recent inflammation, and those on the posterior part very great congestion. The second membrane of the brain, the tunica arachnoidea, was opaque in patches—also said to evidence recent inflammation—and gelatine was effused under it. Indeed, under the membrane a considerable quantity of serum was effused. The ventricles of the brain presented nothing unusual. The substance of the *brain was much loaded with blood.* Upon removing the brain, the base of the skull presented the same strongly-marked character of its usual depressions and prominences as the skull-cap; indeed in some parts the prominences appeared like masses of adventitious bone—like so many points of unusual ossification. The petrous portions of the temporal bones in which the organ of hearing is developed, deviated considerably from the usual structure; inasmuch as they were remarkably attenuated and cellular, and easily fractured.

"*The Chest.*—Nothing remarkable but the heart, which was not more than half the usual size; its structure, however, was proportionate.

"*The Abdomen.*—Nothing remarkable presented itself here, beyond its contents partaking of the *general emaciation.*"*

*The foregoing case is taken from a work entitled "Memoir of a Beloved and Long-afflicted Sister." By William Carus Wilson, M.A., rector of Whittington. 8vo, second edition. Seeley. London: 1842.

VIEW OF PROFESSIONAL LIBERALITY AT THE MIDDLE OF THE NINETEENTH CENTURY.

ALTERED FROM A PAPER OF HAHNEMANN'S, "MUTATIS MUTANDIS," FIRST PUBLISHED IN 1801.*

(Communicated.)

WE do not here refer to that low, envious, trading spirit, for which the pressure of want is often the best excuse that can be made. We speak of the professional jealousy of medical men, sufficiently patent in the empire of Queen Victoria, which partakes of the character of the Arab, his hand against every man, and every man's hand against him. This insane jealousy has a most baneful influence on the noblest pursuit of man—the art of restoring health.

If this or that method of healing, this or that remedy, did not originate with this or that school, with this or that teacher—*war to the knife*, in the true PALAFOX style. *It did not originate with themselves*, and hence the hostility of puny sciolists.

The doctrine of HAHNEMANN was brought first before the profession in England in October, 1826, at a meeting of the MEDICAL SOCIETY, in Bolt Court, nearly twenty-six years ago, and is yet unrecognised by the bulk of our medical men. Permission has been refused to a homœopathic physician to examine the documents in proof of this fact. If HAHNEMANN had known England, he would not have complained of German intolerance.

An egotistical professional jealousy manifestly hinders the progress of true medicine, which is yet only in the bud. Surely England, the practical, should be able to bring this bud to blossom, and to fruit.

How spitefully was Harvey assailed when he taught the true doctrine, now recognised, of the "circulation of the blood!" How scandalously was Lady Mary Wortley Montague attacked when she imported from Turkey the practice of *inoculation*, to render more safe and mild, and to prevent future attacks of, small-pox!

Because she was the instrument of saving myriads of lives, she was charged with having a son by the Grand Turk!

How was Jenner treated? the man who introduced vaccination.

Gloomy enough are the prospects of the development of true medicine even now; for the worst feature is, that professional jealousy is as rife *within* the small band of medical reformers as among those *without the camp.*

* Hahnemann's Lesser Writings. Dudgeon's Translation. Wm. Headland, publisher.

There should be no *sectarian name*; there should be no *sectarian animosity*; for thereby the explosive spirit is roused to a fierce volcanic flame. We demand a calm, sober, and scientific investigation. Truth and a love for mankind beseem true medical reformers. Where all are minnows, in comparison with HAHNEMANN, why should there be such rivalry for the TRITONSHIP? Would it not be better for each of our body to say to each of the allopathic body, "Dear colleague, let us together investigate and observe the phenomena of disease, and the means of the different schools now in use for the treatment of such disease, and let us unite in laying before the world the results of our observations and of our experience?"

The spirit that is now in England, in the profession of medicine, is distinctly adverse and hostile to the investigation of therapeutical truth *for its own sake, and on its own merits.* This is not as it should be. How is the *plague-spot* to be removed?

The mutual detractions of medical men can have no other result than the depreciation and hindrance of their art, which is, in itself and in the best hands, obscure enough.

The homœopathists, following HAHNEMANN, show a mode of treating disease that directs us *almost unmistakably* to the appropriate remedy for every case—that points out to us how to discover, from the positive nature of medicinal agents, the diseases for which they are suitable. But because this method differs so much from that in ordinary use, because it is so simple, though difficult in the *mastery* of it, so unartificial and so free from the jargon of the schools, it makes little impression on the allopathic medical men, it is not studied by them, and they seek to *quietly shelve it.* We tell them, for their pains, they may as well attempt to transplant Paris to Salisbury Plain.

Here and there, this writer and that has claimed credit for recommending *Belladonna* as a *prophylactic* for *scarlet fever*; and no mention of HAHNEMANN, who proposed it more than half a century ago! *Aconite*, *Arnica*, *Calendula*, and other homœopathic remedies are coming into use among the allopaths; but they never mention the source from which they adopted them. So much for the liberality of our *sophists.*

Here are striking features of the professional liberality among the physicians of our time! Here is a fine specimen of a zealous endeavour to clear up the truth, of warm interest in promoting the welfare of mankind!

Hosted by Google

"The furtherance of every means, be it ever so small, that can save human life, and bring health and security to any family, should be a sacred object to the true physician. Away, then, with all grovelling passions at the altar of this sublime faith, whose priests we are.

"We all strive after a holy object, or should do so, but it is not of easy attainment. It is only by joining hand-in-hand, only by a brotherly union of our powers, only by a mutual intercommunication, and a dispassionate development of our knowledge, one to another, of our views, discoveries, inventions, and observations, that this high aim can be obtained—*the perfecting of the medical art.*"

Physicians and surgeons of Great Britain and Ireland, be brothers—be fair, be just. We have quoted to you some of the words of the MASTER, how do you receive them? how do you act one to another? do you compare notes? does the allopath say to the homœopath I have seen lately fifty cases of this or that epidemic, my results have not been favourable? Does the homœopathic practitioner answer him fairly or candidly? Is there any communication between these rivals of different sects? Ought there to be any rivalry, excepting as to who shall benefit the greatest given number of patients?

Our readers are well aware how the very reformers are divided—how this or that person proclaims the merit of this or that chieftain; as if a Medical Reform for mankind was to be made a thing of partisanship! fie! fie! fie! They also know how very unscrupulously our adversaries deal with us, and say we kill those they cannot cure.

A Countess dies—the allopathic journals proclaim she is killed by homœopathy; her body is examined, and it is found she has an incurable lesion of the brain; these very journals publish the *post-mortem* examination, but do not say the case was incurable, and *therefore* homœopathy could have had nothing to do with the death.

A child has *tubular pneumonia* during the progress of whooping-cough, the allopaths have the treatment of the pneumonia from the very first day, attend him during eight days; the patient succumbs, and the death is said to be due exclusively to the homœopathic practitioner who attended him for the whooping-cough.

A man dies of renal disease, after having been sounded by a homœopathic surgeon for calculus; there is no evidence that any false passage was made, though there was a *post-mortem* examination, and yet these allopaths assume that a renal disease of long duration was brought on by the sound of the homœopathic practitioner.

A man of very advanced age dies of apoplexy, having been attended by a homœopathist, it was he killed the patient. Another dies of Asiatic cholera; it is proved that the homœopathic attendant was soon discharged, and an allopath attended the patient the greater portion of the time—an attempt is made to crush the homœopathic practitioner.

Are such injurious charges to be justified? Cannot homœopaths agree among themselves? and cannot allopath and homœopath meet on a neutral ground to discuss the merits of their different systems?

To give and to take—to bear and to forbear—are very important lessons. Why cannot they be learned? We appeal to those who have common sense and common humanity. To expect reasoning from the unreasonable is the most unreasonable of all things, and so we address our remarks to those that have understanding.

This is a nation remarkable for practical sense, and the people in the article of their health will overrule and master the class-interests that oppress them.

Let our people be once convinced that homœopathy cures more than allopathy, that the cure takes a much less time, and is far more permanent, and in proportion as they learn the value of life, of health, and of time, they will avail themselves of homœopathy.

There is a Homœopathic Hospital at Manchester; another will soon be opened at Doncaster, under the auspices and at the personal risk of Dr. Dunn, who ought to be liberally supported; there are already two in London, and soon there will be a third—the Homœopathic Hospital for the Diseases of Children.

These hospitals show that homœopathy has *taken root* in England. Edinburgh and Glasgow, in Scotland, and Dublin, in Ireland, are still without their hospitals. Why should this be so?

If the medical men were liberal towards each other, the homœopathic public would be abundantly liberal to all the public charities for the relief of the poor by homœopathic practice.

THE
HOMŒOPATHIC TIMES.

SATURDAY, JULY 10TH, 1852.

THE progress of science is confirming, day after day, the homœopathic doctrine. As

science becomes popularised, the public mind must become more and more familiar with the claims of homœopathy.

The following passage from the *Leader* of June 26, is one of the many instances we might quote.

"When iron is in mass, it has but a slight tendency to become oxidized; but the same mass of iron, if *minutely divided*, cannot be brought into contact even with atmospheric air at a low temperature without becoming red hot, and at the same time becoming converted into an oxide. Cobalt, nickel, and uranium possess the same qualities (Mulder). What is the explanation of this curious fact—which, by the way, is at the service of homœopathists as an argument for triturated medicines? Not that the particles of iron acquire a new force by division, but that these molecules, when accumulated into a mass, are prevented from acting in *that* direction, and their force is what we call 'latent.'"

We know very well that certain substances, inert in their crude forms, become energised, and acquire medicinal force by trituration and repeated subdivisions. Whether this be *magnetic*, or the development, by friction or succussion, of *latent* properties, matters not—experience teaches us they act medicinally; and this is, after all, the true test of any real therapeutical method.

The Indians of South America have a root, the expressed juice of which acts immediately in curing inflammation of the eye. They have also an herb, the leaf or the seed of which is curative of diarrhœa and dysentery. This is experience. The yellow fever is at present raging in some parts of that continent, and the European practitioners give five-grain doses of *Calomel* every two hours. The vast majority of their patients die; and yet it has been authenticated that the homœopathic treatment of this fearful tropical disease has been eminently successful in the Brazilian empire. But the allopathic doctors shut their eyes and close their ears, and will neither see nor hear; they reject all the evidence that is offered them. There is, then, such a thing as *rejecting experience*.

The citadel of life, however, is a sacred thing, and should be defended with all the muniments in our power. Those, especially, whose office it is to minister to the ailing and to those oppressed with disease, are bound to inquire into every proposed method of diminishing the sum of physical suffering.

We inhabit a body of death—one doomed to dissolution—but it should be our aim to maintain it in health so long as we can. Furthermore, sound health of body is necessary to complete soundness of mind; and the virtuous and pious who enjoy comfortable health are happy, and their happiness is admitted by all thinking persons.

There is no reason, humanly speaking, that the following description of a dying person should be often seen, and yet that it is no uncommon thing appears from the fact that the wonderful observer SHAKESPEARE is the describer.

"It is too late; the life of all his blood
Is touched corruptibly; and his pure brain
(Which some suppose the soul's frail dwelling-house)
Doth, by the idle comments that it makes,
Foretell the ending of mortality."

In the same drama, a little further on—it is the description of the death of King John—the same marvellous poet says:

"O vanity of sickness! fierce extremes,
In their continuance, will not feel themselves.
Death, having preyed upon the outward parts,
Leaves them insensible: and his siege is now
Against the mind, the which he pricks and wounds
With many legions of strange fantasies;
Which, in their throng and press to that last hold,
Confound themselves."

The narcotised death-bed is surely not a thing to be desired or envied.

The EUTHANASIA of the heathen of old did not consist in this; let any one read the Phædo of PLATO, and see how SOCRATES departed.

We hold that Homœopathy holds out a fair prospect of eliminating what are called hereditary diseases, of gradually extinguishing them, and that it affords the best means yet known of preserving a healthy mind in a healthy body, and of increasing

Hosted by Google

the mesh of human life. It is therefore a Reform that claims the attention of the sage, the statesman, and the philanthropist, as well as of the physician.

We confidently oppose this NEW PHYSIC to what has been so happily called VETULISM by the writer of "Stray Notes."

EXTRACTS FROM MR. SHARP'S ENQUIRY INTO THE TRUTH OF HOMŒOPATHY.*

We are indebted to Hahnemann, a German of the last generation, for powerfully and perseveringly calling our attention to the latter principle or general fact, namely, that "*likes are cured by likes*," or, in other words, that the true properties of drugs can be discovered only by experiments on the healthy body of man, and that whatever symptoms of disease are thus produced are the true guides to the use of the remedy; for that it must be given only in such natural diseases as are attended with symptoms like those produced by the drug in the healthy person.

This proposition has now been put forth in such a strong and urgent manner, as to demand an investigation by every medical man who is conscientiously desirous of doing all the good he can to his suffering fellow-creatures. It does not seem to have anything in itself which must necessarily excite disgust or opposition; it is no theory of disease; it does not pretend to explain the *modus operandi* of medicines; it professes to be a *fact* upon which a method of cure may be founded. But it comes to us associated with another professed fact, of a much more startling character; namely, that the properly-chosen remedy acts with sufficient power, in the cure of diseases, in inconceivably small doses. It is this second proposition which excites ridicule, affronts propriety, rouses indignation, and provokes rejection. The two statements are not necessarily connected—one might be true and the other false—but they actually come presented to our minds in such a state of union, that they must be investigated together, and in all probability must stand or fall together.

Conceiving it to be my duty to inquire into the truth or falsehood of these statements, I have done so, in all sincerity and diligence, for nearly two years. Having been satisfied by this inquiry of their value, it has appeared to be also my duty to embrace them practically, in the hope of being thereby enabled to afford additional relief to my patients. Having gone so far as this, it seems due to my former friends and associates to present to them the grounds of so serious a change. I beg therefore respectfully to lay before them the following cases, as a selection from those I have treated after the new manner, and which, along with many others, have induced me to persevere with this treatment.

* An Enquiry into the Truth of Homœopathy. By William Sharp, F.R.S., Fellow of the Royal Medico-Chirurgical Society, Member of the Royal College of Surgeons, and late Senior Surgeon of the Bradford (Yorkshire) Infirmary. Second Edition. London: W. Davy and Son, Gilbert Street, Oxford Street.

PAROTITIS.

Every one knows that the first effect of *Mercury* is to act upon the salivary glands; if, therefore, there be any truth in the law of "similia," *Mercury* ought to be a cure for mumps. I have had a great many opportunities of putting the law in question to this test, and I can with truth affirm that in every instance the result has been satisfactory. I gave nothing but *Mercurius* in various dilutions, and in every case the cure was rapid and perfect. It must be remembered that not the slightest local application of any kind was permitted in any one of the cases. The pain was amazingly mitigated, and there was no metastasis or sympathetic affection of any sort. In my former practice I had come to the conclusion that a *Mercurial* plaster, containing a little *Hydriodate of Potash*, was the most successful treatment.

CYNANCHE.

Miss —, of a nervous temperament, suffered from headache and sore-throat yesterday; to-day has vomiting of mucus and bile, and diarrhœa; pain like a cord drawn round the body.

Tinct. Bell. 3.

Evening. The vomiting and purging ceased immediately. Now feverish, with headache and sore-throat.

Tinct. Aconit. 3.

2nd day. No fever; tongue clean and moist; has had no sleep on account of severe compressive pain on the top of the head.

Ignatia 12, three powders, containing two pellets each.

In the evening she reported that "the pressure was relieved after the first powder, and the pain very much less after the second; the third entirely removed it."

3rd. Has slept well; is down stairs. Well, except an ulcer remaining in the left tonsil, and weakness.

Having exerted herself too much, this was followed by a bad night and return of headache.

Merc. 5.

5th. Better, but complains of weakness and depression.

China 6.

I afterwards found that my patient was agitated by various mental anxieties, which

Hosted by Google

interfered with the recovery of her strength, and she went from home a short time. She returned well.

Other cases of cynanche have yielded beautifully to *Belladonna*, and one or two to *Nux Vomica*, where that remedy seemed better adapted to the constitution.

Aug. 7th, 1851. Thos. Rogers, aged sixteen. Severe cynanche tonsillaris; right tonsil very large, apparently suppurating, and must burst. I felt a strong inclination to thrust a lancet into it. He has had quinsy before, when the abscess burst. He is quite unable to swallow.

Tinct. Hepar Sulph. 5.

8th. Can swallow rather better; abscess has not burst. Continue the medicine.

11th. Throat not so well; more painful.

Tinct. Bell. 1.

12th. Throat no better.

Lach. 6.

13th. Throat much better; swelling subsiding. Repeat *Lach.*

15th. Well.

INFLAMMATORY CONGESTION OF THE LUNGS.

In February, 1850, I attended J. R—, a servant, for a violent attack of inflammation of the lungs, and not feeling myself at that time sufficiently master of the homœopathic treatment of so dangerous a disease, I prescribed for her in accordance with my former experience. Three weeks elapsed before she became convalescent, and it required some time to be spent in the country before she could return to her employment.

In the evening of the 25th of October, I was sent for by her mistress, to see her again. She had continued well all the summer, but having been out the previous evening in the wet, she was taken ill again in the same manner as before. She was exceedingly hot; her face flushed; her breathing rapid and difficult; she complained of violent pain in the chest and head; had a short, hacking cough; and her pulse 140, full and hard. The nature of the case was sufficiently manifest. I ordered her to take *Tinct. Acon.* 3, *Tinct. Bell.* 3, in half-drop doses every half-hour, alternately.

The next morning I was highly gratified to find that the flushed face and pain in the head were gone; that the pain in the chest was very much less, the breathing greatly relieved, and the pulse 115. She complained now only of pain in the back.

Tinct. Acon. 3, *Tinct. Bryon.* 2, to be taken as before. She had no other medicine, and recovered in a few days.

PLEURO-PNEUMONIA.

March 23rd, 1851. Mrs. W—'s nephew, a thin, unhealthy-looking young man of about 18. Has been ill some days from checked perspiration. He now looks deathly pale, is shivering, has headache, and his pulse is too rapid to be counted.

Tinct. Nux Vom. 3.

24th. Headache gone; nature of the case now more evident. The pain in the side, dyspnœa, short, dry cough, and the stethoscope plainly indicating pleuritis, and the inflammation extending to the lungs. Pulse 120; urine high coloured and very acid; the tongue has a dry stripe along the centre, and is furred on the sides.

Tinct. Bryon. 3.

25th. Symptoms much the same.

Tinct. Acon. 2, *Tinct. Bryon.* 2, alternately.

In the evening. Respirations from 40 to 48 in the minute; pulse 120; cough frequent. Expectoration now coming on, of a pale pink (tinged with blood); pain very severe in the right side and across the diaphragm. No relief from the *Bryonia.*

Tinct. Acon. 3, *Tinct. Bell.* 3, alternately.

26th, 8 a.m. Somewhat relieved, has had a little sleep; pain less; pulse still 120, but softer; breathing still frequent and short.

Evening. Very little pain, except when moving; pulse 110; respirations 32; sputa not tinged; air enters the right lung better.

Tinct. Aconit. 2, *Tinct. Bell.* 2, alternately.

27th. Has had a restless night; complains of pains externally in the chest and abdomen, sore to the touch; breathing nearly 40 times in the minute; pulse 108; has perspired freely on the body and chest; cough troublesome; has not expectorated much; mouth and breath disagreeable; tongue moist; urine less high coloured.

Tinct. Rhus Tox. 3, half a drop every two hours.

Evening. Looks ill; lies only on his back; pulse and breathing the same; no expectoration; no pain, except on moving or coughing.

Tinct. Phosph. 2, every two hours.

28th. Has had a good night, after a bad fit of coughing in the evening, and a difficult motion; looks rather better; is free from pain; pulse 103; respiration not so frequent; urine still rather high coloured.

29th. Saw him asleep; pulse 100; respirations 40; cough not so troublesome; much depressed in spirits.

Phosphorus 6, nine pellets in four ounces of water, a tablespoonful every three hours.

30th. Has slept all night; no pain; pulse 68; tongue still furred and breath fœtid; respiration rapid.

Mercurius 6, twelve pellets in four ounces of water, as before.

31st. Better; no pain; pulse 64; breathing still short and imperfect. Repeat *Mercurius.*

April 1st. In the act of dressing when I saw him. Breathing still frequent; other symptoms as before.

Tinct. Bryon. 3.

2nd. Feels better; pulse 70; expectorates freely; breathing rather better.

3rd. Improving rapidly. Repeat *Bryonia.*

4th. Has had a violent attack of pain in the muscles of the thigh and leg, which were beginning to swell, this continued for some days. The pain and swelling subsided under the use of *Aconite* and *Sulphur*, and the cough, expectoration, and difficulty of breathing entirely disappeared. I have since examined his lungs, and they have regained their healthy condition. He has had no return of the symp-

Hosted by Google

toms, and is now pursuing his avocation, which is a trying one for such a constitution.

It is evident that this young man very nearly died. Experienced homœopathists will see that the treatment might have been better; doubtless the *Phosphorus* ought to have been given in the first instance instead of the *Bryonia*. Had this plan been adopted, I have no doubt that the recovery would have commenced earlier; but with all its defects the treatment was ultimately successful, not only in affording palliative relief but in effecting a radical cure. I feel a moral certainty that had he been treated with bleeding and blistering, purgatives, salines, and antimonials, he would have died, if not immediately (which I believe would have been the case), at any rate from the chronic disease which by this method would have been left behind. The time seemed long during which my anxiety continued, but after all it did not extend to a fortnight, and it must not be forgotten that the disease had been allowed to gather strength for nearly a week before anything was done to check it. I feel justified by the result in considering this case as a striking proof of the efficacy of the new remedies in such an acute and highly dangerous disease as pneumonia is universally considered.

Correspondence.

HOMŒOPATHIC CONGRESS.

To the Editor of the Homœopathic Times.

SIR,—In reference to Dr. Fearon's letter, which appeared in the last number of the *Homœopathic Times*, allow me to observe that the time for meeting was never formally fixed, although the end of July was proposed; that on a remonstrance being received from London, where the great bulk of homœopathic practitioners reside, that this would be an inconvenient time for them, whereas September would be an inconvenient time for nobody, it was considered that to insist upon the former period would be improper and discourteous in the highest degree. The only reason given by Dr. Fearon for preferring July to September is, that we should have thus an opportunity of publicly braving the Medical Faculty of the University. Now, as the energetic measures taken in reference to Dr. Pope's rejection have been followed by perfect success, and as it is now tacitly agreed that no more students are to be rejected on a similar ground, it seems to us, and we are sure the majority of our colleagues will agree with us, that it would be highly impolitic wantonly to irritate a body of men who have still the power of doing much mischief to the Cause we have espoused, and the best thing that can happen is that this false step should be forgotten by all parties, if it be not repeated. Nor can we think that it would be of any consequence to get some two or three students, who may be favourably inclined to homœopathy, to join in our convivialities. There seems to us no need of any excuse for fixing on Edinburgh as our place of meeting; independently of its general claims as a metropolis and university town, and as the most beautiful city in Europe—for which reasons we presume it was selected by the British Association as one of the first places to hold its meetings—it has special claims of interest to a very large number of homœopathic practitioners as the place of their medical studies, with which they have doubtless many pleasant associations, which it will be agreeable to revive; and for those who have not yet been here, there could not be found a more healthy or delightful sojourn during the brief annual holiday which every one should allow himself.

J. RUTHERFURD RUSSELL, } Secretaries.
D. WIELOBYCKI, }

[Edinburgh was the place chosen at the Annual Meeting last year for holding the Homœopathic Congress this year, and therefore we need say nothing in addition to what the secretaries, Drs. Russell and Wielobycki, have observed on this point. We also believe with them that September will suit the convenience of the London homœopathists much more than the present month; and that many more would go at the later than could go at the earlier period.—ED.]

To the Editor of the Homœopathic Times.

SIR,—In your number of June 12 I perceive an attempt made by Professor Georgii to extend the charges against which I appealed on behalf of myself and Mr. De Betou. I confess I am grieved to find that the whole tenour of M. Georgii's reply goes to show that, in the opinion of some people, Ling's system is to be esteemed as a medical *mystery* rather than as a valuable branch of medical *art*.

But I should be averse from these and like remarks did not Professor Georgii, pursuing as he evidently is an uncalled-for attack, seek to disparage my attempts in the eyes of my professional brethren, and with arguments which, I feel convinced, they will be loath either to appreciate or recognise. The unpleasant conviction is forced upon me, both from this and the circumstance that he is the only Swedish practitioner now resident in London, that he himself is more intimately acquainted with the kind of information furnished your reviewer than he is willing openly to support. With less good taste than I should have expected, Professor Georgii voluntarily comes forward to give his testimony *against* Mr. De Betou's already published declaration. The character of this testimony is self-evident. After admitting that Mr. De Betou "well applied the degree of knowledge he possessed," he throws doubts upon the statements of that gentleman, although he does not actually deny the facts, making use of the expressions "as far as I know," "I believe," etc. I take it, however, that between the present *doubts* of M. Georgii and the *lâches* of his memory in this particular, the remark contained in the review, that Mr. De Betou's system had "about the same relation to Ling's movements as the processes of Mr. Harrup, of Brighton, or those of Mr. Beveridge, of Edinburgh, or of divers others of that class of

Hosted by Google

gymnosophists," falls to the ground. Being satisfied, therefore, that M. Georgii has rescued the character of my predecessor from the danger threatened, in a far more efficient manner than I could hope to have done, I have merely a few words to say on my own behalf.

The explanation given in my last note as to the source whence I derived Branting's "formulæ" I need not repeat—save that, had I known the fact, he should have had the full credit of them, especially as he has hitherto published so little either for the guidance or instruction of others. The remarks of M. Georgii on the latter head can scarcely be satisfactory to any one at all interested in the treatment. I leave it to the profession to say whether these formulæ, if worth anything at all, are not as much *public professional property* as any formulæ of the schools. M. Georgii says distinctly they are not. I regret, then, to perceive the Swedish authorities on this subject assuming a position derogatory to the genius and character of our profession, and am compelled so to consider it. Whatever Professor Georgii's future opinion of the professional *status* of myself or others in this branch of therapeutics may be, I shall not seek to inquire; but this I honestly declare, that if I am only to comprehend the mysteries of these jealous formulæ "in the course of years," I will not only decline the ordeal, but abandon them altogether, convinced that the labyrinth would only darken as I proceeded.

Furthermore, Professor Georgii tells us that Ling "established a science containing a definite prescription for every movement of the human body, whether voluntary or inducted;" and again, "that Ling's science, as a living and practical art, can be no more traced out, in all its practical bearings, in a book, than can be the science of sounds and harmonies." If this be so, I have always admitted it; what just ground, I ask, is there to call in question the qualities or capabilities of any practitioner who may use his own common sense in applying these movements? And this, despite that excessive refinement of a very rational and simple treatment sought to be established to the prejudice of its promoters in this country. The importance of the subject must again plead my apology for occupying your valuable space.

I remain, Sir,

Your obedient servant,

J. W. F. BLUNDELL, M.D.

32, Finsbury Circus,
June 16, 1852.

[We regret that press of matter has prevented our publishing Dr. Blundell's letter sooner. We assure him that next to our interest in homœopathy, though *longo intervallo*, is our interest in such hygienic means as the water-treatment, the movement-cure, magnetism, etc.—ED.

Miscellaneous.

THIRST RELIEVED BY WHAT PROVOKES THIRST.—The late Anthony White, Esq., one of the worthy examiners of the London Royal College of Surgeons, was called to see an old bachelor dying of dropsy, and who complained of incessant thirst; he advised his patient to drink but little. He related to me the following anecdote of his own life. Being from home for a few days, sporting with some friends, he remarked—"On my return, I was overpowered with thirst, nothing quenched it, nothing that I drank in any way appeased it; it was insufferable. One of the sportsmen, better acquainted with the fatigues of the field, recommended my taking some hot spiced soup which was then ready; at once the distressing thirst was assuaged in a way I could not have believed." *Similia similibus curantur.*

[We are indebted to Dr. Clarke of Islington for this anecdote.—ED.]

WHALE-FISHING BY ELECTRICITY.—The *New Bedford* (U.S.) *Mercury* gives an account of some interesting experiments, illustrating the effect of electricity to facilitate the capture of the whale. The most prominent features of this new method are thus described: "Every whale at the moment of being struck by the harpoon is rendered powerless, as by a stroke of lightning, and therefore his subsequent escape or loss, except by sinking, is wholly impracticable; and the process of lancing and securing him is entirely unattended with danger. The arduous labour involved in a long chase in the capture of a whale is superseded, and consequently the inconvenience and danger of the boats losing sight of or becoming separated from the ship is avoided. One or two boats only would be required to be lowered at a time, and, therefore, a less number both of officers and seamen than heretofore employed would be ample for the purposes of the voyage. The electricity is conveyed to the body of the whale from an electro-galvanic battery contained in the boat, by means of metallic wire attached to the harpoon, and so arranged as to re-conduct the electric current from the whale through the sea to the machine. The machine itself is simple and compact in construction, enclosed in a strong chest weighing about 360lbs., and occupying a space in the boat of about three and a half feet long by two in width, and the same in height. It is capable of throwing into the body of the whale eight tremendous strokes of electricity in a second, paralysing in an instant the muscles of the whale, and depriving it of all power of motion, if not actually of life."—*The Age.*

[We should like to know if the electricity that victimises the whale has been *weighed*, or if its *amount* has been ascertained. If not, and we know that as yet there are no means for gauging this subtle agent, we demand why our opponents should sneer at the small doses of the homœopathists.

We know that medicinal forces reside in dilutions or subdivisions so minute as to defy the appreciation of the chemist or the mechanician; but so does the amount of electricity that stuns or kills the whale.—ED.]

THE DOG-DAYS.—HOMŒOPATHIC TREATMENT FOR THE ILL EFFECTS OF EXCESSIVE HEAT.

(Communicated.)

Of the intensity of the heat we have lately had, the following are important illustrations:—

"Fire caused by the Rays of the Sun.—The weather on Sunday, July 4th, was intensely hot. The thermometer in the shade, towards the middle of the day, stood as high as blood-heat. About half-past twelve o'clock the rays of the sun became concentrated upon a small timber building, and the heat was so great that the premises immediately afterwards became ignited, when the flames shot forth in a great body."

"Multiplicity of Deaths from Coup de Soleil.—On Friday, July 2, Mr. G. S. Brent held an inquest at Harrow on a labourer, aged 40. On Tuesday deceased, while hay-making, staggered and fell. His fellow-labourers, upon raising him up, found him in the agonies of death, and he only survived four hours. Mr. Heulett made a *post-mortem* examination, and found that death resulted from a *coup de soleil*. Mr. Brent held a second inquest, at Notting-hill, upon a nursery-maid, aged fourteen. Deceased wheeled the children to Kensal-green, a distance of two miles. Upon returning home she complained of headache, and laid herself outside the bed, from which she fell to the floor, in four hours afterwards, a lifeless corpse, and quite black. Dr. Frost, who performed a *post-mortem* examination, gave it as his opinion that death resulted from a *coup de soleil*. The coroner remarked that the number of deaths that resulted from the same cause within the week was truly frightful. Mr. Wakley had held two inquests in similar cases. It therefore was really necessary that medical men should meet and decide upon some specific against such dreadful calamities. Dr. Frost suggested the throwing of water from a height upon the head of the sufferer, a treatment successfully adopted in India. Before the coroner concluded the second inquest information reached him that a cheesemonger, residing in Tottenham-court-road, while speaking to a lady, fell dead to the ground from a *coup de soleil*, and communications have reached London from several districts announcing numerous fatal catastrophes from the same cause."

It may not only be interesting but useful to those who use the homœopathic treatment for themselves and families, to have some advice how to proceed at this time, or hereafter, on the recurrence of such tropical heat.

During very hot weather, it is more refreshing and cooling to use tepid water for ablutions and baths than cold water; as in cold weather, where there is reaction, it is better to use cold water. This is a matter of experience, and harmonises with the general truth of the homœopathic law.

No persons should, except in cases of absolute necessity, expose themselves to the fierce solar heat during the hottest parts of the day. The clothing should be adapted to the season. Children should only go out for exercise during the cool of the morning and evening.

One of the many beautiful illustrations of the Divine goodness and tenderness for the human family, to be found in Holy Writ, is in the fact that in Palestine, where the nights and days are nearly equal, the temple-service, the morning and evening sacrifice, was at six a.m. and six p.m.

The medicines that have been recommended for the injurious effects of exposure to heat are, chiefly, *Aconite, Antimonium crudum, Belladonna, Bryony, Camphor, Carbo veg., Opium, Silicea, Thuja,* and *Zinc.*

The choice of the remedy will here, as in all other cases, depend on the symptoms of the sufferer.

Aconite, for the effects of a sun-stroke, especially if there should be dry heat of the skin, apprehension, and fear of death; giddiness, especially on rising; stupifying pain in the head; weight and fulness in the forehead and temples, with pressing outward, as if the contents of the skull were forcing themselves out; strokes and pulsations in the head; heat and redness in the face. This remedy, when there are the above and other *Aconite* symptoms, is especially indicated for haymakers or others, who have foolishly *slept* in the sun.

Antimonium crudum, for those who suffer *mal-aise* from the heat of the summer, even when not exposed to the direct influence of the sun; if fatigue is easily excited by the slightest exertion; if there is drowsiness, and disturbance of the stomach, with nausea or diarrhœa, or other signs

Hosted by Google

of gastric derangement; when there is much perspiration, especially at night. This medicine, the symptoms indicating them, may be beneficially followed (if needful) by *Pulsatilla* and *Mercury*. The proper *Antimony* symptoms are aggravated by heat, and in the heat of the sun, which shows its applicability, when the symptoms indicate it, for those who suffer from heat. The writer of this paper is now in attendance on a child suffering from gastric fever, with great cerebral excitement; constant nausea, frequent vomiting, drowsiness, with delirium, irregular pulse, red and hot face, involuntary wetting the bed, were the principal symptoms. *Antimonium crudum* was given with great benefit. The other symptoms suitable, the medicine was given on account of the aggravation of the child's sufferings from the intense heat. In some cases of those suffering from *mal-aise*, fatigue, and lassitude, with nausea, *Antimonii sulphuretum rubrum*, the *Golden Antimony*, has been (experimentally) given with benefit. The child above mentioned, six years old, had been usually bathed with cold water, but cried out for warm water, and she was always refreshed by being sponged with tepid water. This is an instance of natural instinct in disease.

Belladonna is a medicine that may be very useful in the cases of those who suffer from the effects of heat of any kind, of a sun-stroke, etc.: headache, with fulness and expansive pressure in the forehead; heat of the forehead, sense of a band across it; the sufferings increased on any movement and by moral emotions; fear for *present* objects; cries and tears; aching pains in the eyes, extending to the head; the head hot, the rest of the body cool, cold feet; great agitation; delirium, frenzy, and rage; dartings into the head as from knives; pulsations in the head; throbbings in the head; bending the head backward, and so on.

Bryony is cognate to *Antimony* for these sufferings; *nausea, vomiting*, and *diarrhœa*; inability to digest milk, which immediately produces nausea and vomiting; anger easily provoked; *fear respecting the future.*—*Bryony* would be indicated especially when any of its proper symptoms are present, such as pains in the limbs, increased on movement, on touch, etc.

Camphor is recommended by Noack and Trinks for a sun-stroke; constrictive headache, especially at the back part of the head and above the root of the nose, with loss of consciousness or delirium, or with spasms that draw the head to one side.

Carbo vegetabilis, for the headache that follows the being *over-heated*; sensation of cramp-like tightness in the brain, as if the scalp was contracted; the constrictive pain accompanied by nausea; pressure and burning pain in the eyes; obstruction or running of the nose.

Opium, when there is lethargy with snoring; face red and puffed; excessive desire to sleep, with utter inability to sleep: sleeplessness, with anxiety and tossing; delirium, with frightful visions; head bewildered; loss of consciousness; slow, stertorous respiration; apoplexy seems threatened; great weight of the head; eyes half-closed; cloudiness of the sight; convulsive twitches of the face; retention of urine.

Silicea is sometimes indicated after *Antimony* and *Bryony*, when heat causes nausea and other signs of gastric disturbance.

Thuja, itching of the skin, especially in the evening and during the night; pimples; cutaneous sufferings mitigated by the touch. Heat in the evening, especially in the face; pain, as if a nail were driven in at the crown of the head; painful tenderness of the left side of the head. Heat in the face; digging pain in the face and cheek-bones.

Zincum, violent beatings in the whole body; jerks through the whole body during sleep; pricking and itching of the skin; itching *rash* in the bends of the knees and elbows. Small boils between the shoulder-blades, on the back, and in other parts of the body; frequent aching in the forehead; tearing pains in the temples, with stitches behind the ears.

These brief jottings are of course meant only for those who cannot immediately have the attendance of a homœopathic practitioner, in case of dangerous or severe sufferings from heat, and little more has been done than merely to point out the remedies, of which the three or four first-mentioned are the most important (inclusive, however, of *Opium*, under circumstances that indicate this drug).

For the *eczema solare*, heat-rash, a very weak lotion of *Arnica* has been recommended—five or six drops of the tincture to a pint of water; but it is best not to interfere with it, except there be constitutional symptoms, when the appropriate remedy should be chosen.

Muriatic Acid, it has been said, however, has a specific action for this affection, when it is so distressing as to require relief. The *Muriatic Acid* symptoms—stinging, itching, in various parts of the body, relieved by scratching; pricking over the whole body; vesicles on the skin. We give a case recorded by Dr. Neidhard.

Hosted by Google

"Miss—, is afflicted with *eczema solare* every summer, by exposure to the sun. This affection is characterised by numerous red pimples on the forehead, but particularly on the cheeks, and around the mouth, with itching. The whole face is so red, at times, that she is induced to shun society. *Muriatic Acid* 18, one drop was given every other day, from June 25th, 1838, to July 9th, and from that period to September, 1838, *Muriatic Acid* 6, removed it completely."

HYDROPHOBIA.

THERE are well-authenticated cases of homœopathic cure of this terrible disease. We add another, from the *Times* of July 9, quoted from an American paper.

"CURE OF HYDROPHOBIA IN THE UNITED STATES.—The son of Mr. Waite, of Cincinnati, was recently seized with hydrophobia. We learn by the *Cincinnati Gazette*, that since then, by judicious treatment, he has entirely recovered, though a running wound is intended to be kept up where the lad was bitten, in order to prevent the possibility of a return of the symptoms. The vesicles which formed under the tongue rapidly disappeared under the administration of Lachesis, a medicine prepared from the virus of the lance-headed adder, which was given as an antidote to the poison, and the spasms were prevented by the use of Belladonna and other remedies."

Now, considering that "legitimate medicine," as the allopaths delight to designate their method of practice, can do *absolutely nothing* for the mitigation and cure of this terrible calamity, we put it to the common sense of Englishmen, if these very allopaths are not bound, in common honesty and humanity, to try the homœopathic remedies. If the dog-day heat continues, there will probably be cases of hydrophobia in England, as there have been in France. We subjoin, as it may be interesting to our readers, a paper by Hahnemann, written and published *before* he discovered the homœopathic law, as one of general applicability in the treatment of disease.

THE BITE OF MAD DOGS.

(*From the Friend of Health, by Samuel Hahnemann. Published at Frankfort-on-the-Main, in* 1792.)*

The disease that results from the bite of rabid animals, most frequently of mad dogs, is of such an extraordinary and terrible character, that we are struck with horror on beholding a patient affected by it, and the mere description of his sufferings causes us to shudder. Among a thousand persons affected by real hydrophobia, often not one is saved. The most vigorous constitution, the best physician, the most recondite remedies, and the most implicit obedience of the patient and his friends, are in most cases all of no avail; in the possession of perfect consciousness the unfortunate being is usually, amid the most fearful symptoms, hurried off in a few days to an untimely end.

The patient feels an accession of pain in the bitten part, which may either be perfectly healed or still an open wound, it becomes surrounded by a blue border; a creeping sensation proceeds from it up to the throat, which feels as if contracted. The patient has pain in the head and stomach, and sometimes bilious vomiting. His sleep is disturbed by frightful dreams, he becomes restless; the hands, feet, and tip of the nose grow cold, the features distorted. He thinks he sees fiery sparks dancing before his eyes. He feels neither hunger nor usually thirst; the tongue is moist, but covered with viscid mucus; stools and urine suppressed, or he passes them of natural colour, but with pain. The pulse is weak and jerking, but not inflammatory. He cannot bear the approach of any liquid without trembling all over, with wild, anxious, sad expression. In like manner he cannot bear anything glittering, bright or white, anything approached suddenly towards him, loud talking, a draught of air, etc. In the lucid intervals he speaks rationally, but in a more timid, rapid, and nervous manner than usual; a hacking cough, sometimes combined with hiccough, interrupts his speech. His face becomes always paler and more distorted; the anxiety that dominates over all his actions is expressed also by the cold clammy sweat on his face and hands; his eyes are tearful and the pupils dilated. He tosses convulsively about in his bed. He seeks to run away. At length he hides his face, becomes quieter, and expires.

The *post-mortem* examination exhibits usually nothing abnormal. The extreme tension and excessive irritability of the nervous system and the sense of self-preservation shown in the anxious dread of approaching dissolution, these are the sole characteristics of this fearful disease.

I shall not here enter into a description of the countless remedies that have been proposed for it; their enormous quantity is of itself to a certain extent a proof that no sure mode of cure is yet known, otherwise that would be adhered to. I shall merely endeavour to remove some erroneous notions prevalent on the subject, and thus, if possible, endeavour to render this disease of less frequent occurrence.

The *first* and most prejudicial of these is the great confidence reposed in certain remedies said to be infallible, among which I allude chiefly to internal remedies. Some persons are bitten by a dog supposed to be mad. They use with all speed the renowned specific, and none of them takes the hydrophobia; all recover from their wounds without any serious consequences following; and in all the

Hosted by Google

country round nothing is talked of but the wondrous curative virtues of, it may be, the may-worm electuary,* or whatever else these patients used. It follows, of course, that in similar cases occurring in this district nothing more will be done than to give the bitten individuals the may-worm electuary. One of these, however, dies of hydrophobia, but the vaunters of the nostrum can furnish reasons for its inutility in this case; at all events, this single unfortunate case is regarded as the exception, against the many successful ones. Should it happen a third time that some one or other in the neighbourhood is inoculated with the poison of a mad dog, so that in the course of nature he must be affected by the hydrophobia, the electuary is at once confidently administered to the unfortunate individual, and it is only by the sad termination of this case that the remedy falls into disrepute.

Had the first cases of reported success been more carefully investigated, it would have been found that these first patients had received no true virus of rabies into their wounds, and that consequently the electuary had no difficulty in curing, as there was nothing to cure. The subsequent unfortunate cases might then have been prevented, had not such implicit confidence been placed in this internal remedy, but the far more trustworthy external preventive remedies been employed.

But what are the best external preventive remedies, and how can we confidently pronounce on the madness of an animal? These questions shall be answered farther on.

Thus much is certain, that the commencement of the malady is at first merely local. The poisonous saliva of the animal lies at first inactive in the bitten wound. The wound heals, and not the slightest inconvenience is experienced, until, after a longer or shorter period, symptoms of irritation of the nervous system, and along with them the fatal hydrophobia, make their appearance. Could we at first extract the poisonous saliva from the wound as completely as we can a splinter or a bullet, it would be impossible that rabies could result from such a bite. But if it be already present, we know *no* remedy whereby it may be certainly cured. Hence all trusting to such specifics is unsafe and injurious, if we have not already frequently tested their efficacy on fully-developed hydrophobia.

The second error which may prove injurious, is the belief that a dog has communicated the poison by its bite if he die within a few days of rabies, and has not communicated it if he continue alive; consequently that a dog that soon dies with the symptoms of this disease, which fear magnifies excessively, was mad, but that one that recovers could not have been mad. In the former case (and who can deny it, as we know as yet so little of the maladies of the domestic animals?) it might have been quite a different disease that the dog had which inflicted the bites, and the remedies employed for these bites thus falsely acquire a reputation as specifics for hydrophobia. In the latter case, in spite of all the danger, none is apprehended; the only useful remedies for the parts infected by the virus are neglected, and the fatal disease is in all certainty allowed to break out.

We find in the records of medicine many instances* in which the severe bite of a dog that afterwards died with all the signs of rabies, infected some persons but not others, without the latter employing anything, and on the other hand, there are undeniable instances showing that dogs of whose bite persons have died of hydrophobia have remained alive.

To refer to but one case of the latter sort, I may mention that Martin Lister, in the 13th vol. of the *Philosophical Transactions*, relates the case of a robust young man, who, six weeks after being bitten, became affected by hydrophobia, of which he died fourteen days thereafter. At the same time, the same dog bit a little dog, which died the day following of rabies; but the large dog itself recovered, and was quite well eight weeks after it had been mad.

A similar instance of a rabid dog which recovered, some children, at the risk of their lives, diligently washing its wounds, is to be found in the 20th volume of this instructive collection, where we also meet with the cases of two young men, related by Dr. Kennedy, *who recovered from the hydrophobia without employing any means*. Had any of the renowned specifics been used in these cases, would not the cure have been infallibly ascribed to it? Can a medicine be extolled as infallible for this disease, or even as very useful, that has not cured at least ten cases of developed hydrophobia?—Where is there such a medicine?†

The third error is the delusion entertained even by physicians, that the virus of mad dogs can only cause infection when introduced into the wound caused by a bite, or some other open wound.

As a proof of the incorrectness of this, cases are not rare where mad dogs have merely licked the external skin, and yet have communicated the disease. Two boys, as we learn from De la Prime, in the 20th volume of the *Philosophical Transactions*, frequently cleaned with their hands the wounds of a dog that had been bitten by a mad dog; many months afterwards, *without ever having been wounded*, they both were attacked simultaneously by hydrophobia, which lasted a week, when the eldest recovered, and said timidly to his father, "I am well." The same happened to the other. They remained well three or four days, then again had violent attacks of hydrophobia for a

* A nostrum for the hydrophobia purchased at an extravagant price by the Prussian Government.

* Vaughan saw from twenty to thirty persons bitten by a mad dog, of whom only one among them, a boy, died of hydrophobia, the rest escaping unaffected.

† Unless it be perhaps the root of *Belladonna*. Might not a very strong extract of *Black Henbane*, prepared *without heat*, administered in sufficient quantity in the form of pills, be able to cure this disease? A number of *theoretic* reasons lead us to have strong hopes that it might. But the extract must be so strong that two grains of it are sufficient to cause in a healthy individual troublesome symptoms, stupefaction, etc.

Hosted by Google

week, and thereafter recovered without relapsing. Likewise in the 23rd volume we find the history of two servants, who frequently inserted their fingers into the throat of a dog (that had been bitten by another rabid dog, and did not die for three weeks afterwards), in order to feel if there was anything the matter with it. Both were affected by hydrophobia without having been wounded; the stronger of the two recovered without using any medicine, but the younger died of hydrophobia on the third day.

I myself knew a boy whose face was licked by a dog that was going mad, and who died of hydrophobia.*

It is in general the safest plan to consider the bite of an unirritated dog as that of a mad dog, and to treat it accordingly. This is the surest way to guard against hydrophobia.

The wound should be immediately washed out with water in which a quantity of potash has been mixed, and this should be repeated frequently, and until the surgeon arrives, who should bring with him a piece of caustic potash, and touch the open wound therewith until a slough the thickness of the back of a knife is formed, whilst the moisture that exudes should be removed by blotting-paper. The pain is not very severe, the slough falls off in a few days, and the clean wound soon heals. If this is done first of all and very quickly, we may feel quite at ease, and do all in our power to comfort and console the patient,† and tranquillize his circulation. A moderate blood-letting in plethoric individuals, or a glass of wine given to persons of an opposite constitution, will suffice for this purpose. If this frightful disease can by any means be prevented, it is by such means; but *not by any internal medicine* hitherto known.

The part of the skin which, although not broken, may have been wetted by the saliva of a dog which has become suspicious from having bitten others, must be diligently rubbed with potash, and washed continually for an hour with a solution of the alkali. If a blister be afterwards applied to the spot, then all danger will be more than warded off.

No dog should be trusted that bites people unirritated, and has a gloomy wild expression. It is far better to kill too many of these often useless beasts, than to allow one actually rabid to roam at large; man's life is too precious, and should be held paramount to every other consideration. Merely to shut up for a few days dogs bitten by a mad one is always dangerous, as examples are not awanting where they only became mad several weeks after being bitten. They must either be killed, or be kept in safe custody for at least four weeks, before they are trusted; the former must absolutely be done in case the dog that inflicted the bite was very suspicious.

A dog may be suspected of commencing rabies when it ceases to be friendly, will scarcely wag its tail on being patted by those it likes best, appears very tired and lazy, is cross and dejected, dreads the light, and creeps into dark corners, where it lies down without sleeping. It never barks, not even when there is the greatest cause for it doing so; it merely growls at anything approaching it suddenly, and springs out at it. The eyes are dim, the tail and ears hang down. At this stage the bite commences to be dangerous.

This state lasts but half a day, or a whole day, and then the second stage of rabies breaks out. The animal no longer knows its own master, eats and drinks no more, becomes restless, growls with a hoarse whine, without ever barking, goes about threateningly with dependent head, red watery eyes, having a sad expression, and directed towards the ground. It involuntarily moves the lower jaw in a mumbling manner; its leaden-coloured tongue, dripping with saliva, hangs out of the mouth; the tail is stuck betwixt the legs; the hairs of the whole body stand out in a disorderly manner. It tries to run away, snaps at everything before it, and runs along, irrespective of the road, without apparent object, straight and crooked, at a quick, usually unsteady pace. Other dogs run away from it.

* Cœlius Aurelianus, Palmarius, Van Hilden, Callisen, Odhelius, Gruner, and Morando have recorded similar cases.

† A clergyman was affected by chronic hydrophobia merely from imagining that a dog that had bitten him was mad. He would have died had not a physician pointed out to him the erroneous nature of his idea. He soon recovered after the physician had succeeded in convincing him, and without taking any medicine.

AN ESSAY ON HOMŒOPATHIC STATISTICS;

Together with a Critical Analysis of Dr. Routh's Work, entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

By John Ozanne, M.D.

(*Continued from page* 715.)

XVII.

Simple or Primary Pneumonia.—We have seen how much importance is attached by Dr. Routh to the complications of pneumonia, and how much he insists upon the necessity of carefully separating the *complicated* and *secondary* forms of this disease from the *simple* and *primary*, if we would obtain statistics, both trustworthy and useful. So far Dr. Routh is perfectly right; but where he is wrong is in ascribing too great an influence upon the mortality in pneumonia to the various complications which he enumerates.

His apparent object in so doing is twofold. He first casts a doubt upon the validity of homœopathic statistics, by attempting to show that simple primary pneumonia cases constitute a larger proportion of the cases recorded in the homœo-

Hosted by Google

pathic than in the allopathic statistics. Thus he says, "another important fact in connection with these statistical returns is the following: the majority of cases of pneumonia recorded by homœopaths are idiopathic or simple, not complicated or secondary" (p. 50).

And, secondly, by attempting to show that in the allopathic returns—*e. g.*, those of Drs. Taylor, Walshe, and Peacock, whose complicated cases, as reported by Dr. Routh, amounted to 55 per cent. of the whole—whilst the mortality in the complicated and secondary forms together amounted to 53·1 per cent., it was only 3·2 per cent. in the simple and primary cases.

In the course of our analysis of the various statements made by Dr. Routh, with reference to the complications of pneumonia cases observed in London, we have found—by calculating the mortality per-centage likely to arise from each of the complications enumerated by him, taking as our basis observations made in London and elsewhere by allopathic physicians, whose opinions are of the greatest weight in medical science—that the influence of these complications has been greatly exaggerated by Dr. Routh.

From this demonstration the following corollary may be deduced. Since the influence of the complications on the mortality, in a given series of cases, has been exaggerated, the per-centage mortality in the simple or primary cases must have, by some corresponding process, been decreased.

Dr. Routh, in a spirit which we certainly shall take care to avoid, has been so unfortunate as to pen these lines:—"It is hence manifest that, by diminishing the number of complicated cases, the cipher of mortality may be diminished; a mode of stating a result not likely to be detected, if the fatal cases are carried under a generally-admitted fatal complication—phthisis, for instance, or œdema of the lungs, of which disease twelve out of thirteen died in Fleischmann's Hospital between 1835 and 1843" (pp. 50, 51).

This suggestion has already been fully commented upon in preceding parts of this essay. It would not, therefore, be again brought forward, were it not to show that allopathists are fully alive to the advantage of resorting to a mode of concealing their ill success, which they charitably impute to homœopathists.

There are, I am sorry to say, facts which prove that, paraphrased as follows—the alteration being italicised—this suggestion is fully applicable to the advocates of the old system:—

"It is hence manifest that, by *increasing* the number of complications,* the cipher of mortality *of the uncomplicated cases* may be diminished; a mode of stating a result not likely to be detected, if the fatal cases are carried under a generally-admitted fatal complication—phthisis, for instance, *or Bright's disease, the frequency and influence of both of which we have found to be so greatly exaggerated in Dr. Routh's treatise.*"

It is far, very far from being our purpose to lower a question of vital importance to society at large, such as this is, to the low level of discussions of mere personalities. Much rather would we divest it of all personal or party considerations or interests, and view it in a purely philosophical and philanthropical spirit. Such has been our effort throughout; but sometimes, as in the present case, when our adversaries have stepped beyond the bounds of legitimate discussion, it has been necessary to show them the evil tendency of their proceedings. That nothing could show it to them in a more vivid light than by turning occasionally their own arguments against themselves, every one will readily admit. Let us, therefore, all strive to deal with scientific questions with that calm spirit and singleness of purpose which can alone lead us to the truth. Is not the field of labour of each of us large enough, and are not the duties which we have to accomplish sufficiently arduous to claim all our energies of body and of mind, without allowing us time to scan invidiously or too suspiciously the course of others? Whether we follow the banner of *authority* in medicine, or follow that of *reform*, are we not—provided we proceed cautiously, and yet with faith that ours is the right path—are we not all labouring for the elucidation of truth and the ulterior welfare of our fellow-creatures?

We have seen that, by his method of classification, Dr. Routh has made it appear that in Drs. Taylor, Walshe, and Peacock's cases of pneumonia the majority were complicated, and that whilst the general mortality was 30 per cent., that occurring in the idiopathic or simple forms

* My attention to this process, and hence to the complications in Drs. Taylor, Walshe, and Peacock's cases, was first and most forcibly called by the fact that in his classification of Dr. Tessier's cases, treated homœopathically, Dr. Routh places the three deaths which occurred in the practice of that gentleman *among the complicated cases.* (*Vide* Routh's Appendix, p. 78). Had he not done so, the singular fact would have appeared, *that in the complicated cases treated homœopathically not one single death occurred.* This was really the case, and Dr. Routh's classification is wrong. These patients died, not of complications, but because they were brought into the hospital at a too advanced stage of the disease.

Hosted by Google

was only 3·2 per cent.; the difference between these two results being ascribed by Dr. Routh to the number of complicated and of secondary cases, the mortality in which amounted to 53·1 per cent.

But having, from Dr. Routh's mode of classifying Dr. Tessier's (homœopathic) cases, seen reason to doubt the soundness of the basis of his classification, we have entered into a full analysis of his complications and into a careful appreciation of the value to be ascribed to each, in calculating the per centage of mortality. We have thus found that the influence of the complications has been considerably exaggerated.

In endeavouring to ascertain the per-centage mortality in *simple* or *primary* cases, as the heading of this section requires us to do, we might obtain the desired result by eliminating the first quantity, namely, the value assigned to the complication, and thus reach our conclusion with but little time or trouble. But sound conclusions in science are never to be obtained without the expense of both time and trouble; therefore we think it better to ascertain this per centage by another method—a more direct method—and by means of a new set of facts. The advantage to be gained by this will be twofold. In the first place, the results will either affirm or condemn our previous conclusions; in the next place, the results obtained will be possessed of a value not relative, but absolute, and will hence be available for a subsequent stage of our inquiry.

We have often alluded to the statistics of the Glasgow Royal Infirmary, deservedly commended by Dr. Routh. But they cannot be of any use to us at present; for beyond the distribution of the cases into the *general* and into the *fever* wards, which Dr. Routh tells us indicates that the latter were *complicated with* or *secondary to fever*, we are not told the number or the nature of the complications.

Allusion has also frequently been made to the Appendix to the *Reports of the Edinburgh Royal Infirmary*, by Dr. T. B. Peacock. In this Appendix the results obtained are admirably arranged in a series of tables, exhibiting them under various forms. Unfortunately, I have only been able to procure the Reports for 1842. It so happens also, that in that year the mortality was not in accordance with the usual average. It was as follows: admissions (exclusive of a case of gangrene of the lungs) 42; deaths 16; ratio of the latter to the former, 38 per cent.

This mortality, somewhat higher than the average observed at that Institution, which is, according to the editors of the "Introduction to the Study of Homœopathy," who quote from the Reports of the Edinburgh Infirmary from July, 1839, to October, 80 to 222 admissions, or 36 per cent., differs too little (by only 2 per cent.) from it to invalidate the conclusions to be drawn from the year 1842.

But if this difference is to be considered in its effects, we may at once declare that it can only affect our conclusions by *adding to* instead of *taking from* the number of complications observed. Now, the reader is by this time too well schooled by Dr. Routh's teaching, to doubt that if the mortality be high, it is *of course due to the number of complications!* But what are the facts?

There were 42 admissions (*exclusive of the case of gangrene*); there were 16 deaths. These deaths are accounted for in Table XIX. (p. 21), in which "the cause of death" in those cases "in which examination of the body took place" is given. Of these 16 deaths, 5 were *due to complications*, stated as follows: *pneumonia with miliary tubercles in the lungs*, 1; *with tubercle in the mesenteric glands*, 1; *with pericarditis*, 1; *with organic disease of the stomach*, 1: 4 in all. Deaths from *simple pneumonia*, 12: 4 deaths from complications to 12 without, and yet a mortality of 38 per cent.!

But let us calculate the per-centage mortality of the uncomplicated. To do so will be an easy task.

Pneumonia admissions 42, deaths 16 (excluding from the number of admissions and of deaths the case of gangrene of the lungs). If we eliminate the four deaths, which, as already stated, were the consequences of complications with tubercles in the lungs and in the mesenteric glands, with pericarditis, and with organic disease of the stomach, we obtain a residue of 38 uncomplicated cases, 12 of which terminated in death; giving a mortality of rather less than 1 in 3, or 31·57 per cent.

As already stated, the mortality in 1842 was rather higher than that observed during the twenty-seven previous months. In the Report of the Edinburgh Infirmary, embracing the period from July 1, 1839, to October 1, 1841, prepared by Professor Reid, there are recorded 222 cases of pneumonia, 80 of which ended in death. From October 1, 1841, to October 1, 1842, there were 42 admissions, and 16 deaths. Mortality in the former period 36·03 per cent.; in the latter 38·09: difference 2·06. The latter period, the only one for which we

Hosted by Google

could obtain the Report, may therefore fairly be taken, in order to ascertain the proportion of deaths in uncomplicated cases.

If we assumed Dr. Routh's views regarding the statistics of pneumonia, namely, that all the deaths excepting 3·2 per cent. are due to complications, to be correct, we should expect to find in the Report for 1842 a much larger proportion of complicated cases. For that reason it is not to be regretted that we have only the Report which gives the higher mortality, as it shows in a very forcible manner how much the influence of complications has been exaggerated by the antagonists of homœopathy. It shows also how little reliance can be placed upon the other value, that given to simple and primary pneumonia. The value obtained at Edinburgh (31·57 per cent.) is nearly ten times as great as that (3·2 per cent.) declared by Dr. Routh to be the value found in London.

Let us now ascertain the mortality in uncomplicated cases in Dr. Hughes's practice. To do so is not so simple a task as the reader might expect, for Dr. Hughes's papers were not written with the view of giving the statistics of pneumonia in general, or of any of its forms; however, with a little attention, we can attain the end in view without much difficulty. The facts upon which our calculations shall be based are the following.

In a *note*, at the foot of page 12, we find these words:—"Since writing the above I have, by collating the cases in my note-book, been enabled to calculate the ratio of mortality of dextral, sinistral, and double pneumonia, so far as it can be estimated from only 24 fatal cases observed during life, and examined after death. The result is, in some respects, opposed to the conclusion which would, at first sight, appear to be deducible from the numbers stated above, and is as follows:—

	Per cent.
Pneumonia of right side, fatal in the ratio of	27
,, left side ,,	10
Double pneumonia ,,	37

"In respect to the acknowledgedly high rate of mortality, it should be recollected that they were hospital cases, and that *in five instances* the disease was *complicated with phthisis*, and *in seven others with empyema, aneurism, hæmaturia, epilepsy, delirium tremens, pericarditis*, and *emphysema respectively*."

We thus have two points ascertained: 1st, the number of complications in the number of living patients represented by these 24 deaths; 2nd, the ratio of mortality, according as the pneumonia is single and sinistral, or dextral, or else double. But we require a third point, namely, 3rd, the number of cases in which each of these forms was observed.

This third point is given in the preceding page. In a table, the number of cases of dextral, sinistral, and double pneumonia observed in 100 cases is given thus: the column is headed "living cases in former paper." The side affected with pneumonia—of the right side alone the cases were 52; of the left, 29; both sides were affected in 19; the side not mentioned, 1. Total, 101. As the last case is in every respect null and void, being in fact a case not properly observed, it should be eliminated. We thus have a series of 100 cases with the ratio of frequency of double and of single pneumonia, whether sinistral or dextral, obtained by *observation*; the ratio of mortality of each form was obtained by *observation also*. If we *calculate* the mortality upon this basis, *i. e.*, the *observed facts*, we shall obtain the number of living cases which the 24 deaths represent. To ascertain, subsequently, the mortality of the uncomplicated cases, after excluding the complications, as enumerated by Dr. Hughes, will be an easy task.

The Side affected with Pneumonia.	Number of Cases observed.	Observed Ratio of Mortality per cent.	Calculated Mortality per cent.
Right side alone	52	27	14·04
Left ,, ,,	29	10	2 90
Both sides	19	37	7·03
	100		23·97

This gives us a mortality of nearly 24 per cent. in Dr. Hughes's cases.

But it may be objected that 23·97 cannot be made to represent 24 deaths, there being a difference of 13 thousandths. In order to be accurate, we shall therefore not take 100 cases with 23·97 deaths, but we shall take the 24 deaths, which at the same ratio we find to represent 100·125 living. The difference is very small, and might have been neglected. But our business is not to deal with *approximations*, but as far as possible with exact quantities. Here the necessity for accuracy is all the greater, since we are dealing not with hypothetical or imaginary quantities, but with calculations based upon facts also observed by a very accurate physician.

THE
HOMŒOPATHIC TIMES.

SATURDAY, JULY 17TH, 1852.

THE CASE OF MR. PASCOE.

THE HOME SECRETARY has declared the sentence of transportation is to be carried out, and that Mr. PASCOE is to be banished as a felon.

The following extracts from the *Times* were lately given in the columns of the *Medical Times and Gazette.*

"Mr. Crowder rose to ask the Secretary of State for the Home Department whether he had received any applications in favour of William Hamblyn Pascoe, a medical practitioner, sentenced to ten years' transportation at the last Cornwall assizes, for administering savine with intent to procure abortion; and whether he was aware that the opinion of the only medical witness for the prosecution, that no medical man of competent skill would use savine unless his object were abortion, had been shown to be erroneous by a large body of the Medical Profession, and had been admitted by the witness himself, since the trial, to have been expressed in ignorance of the fact that savine was in use in the profession for legitimate purposes; and whether it was the intention of Her Majesty's Government to advise a pardon, or any mitigation of the sentence.

"Mr. Walpole replied, that several applications had been received by him with respect to the case of Mr. Pascoe, and that the greatest attention had been paid to them, in consequence of the respectability of the quarters whence they came. It was quite true, that the only competent medical witness on the trial had since expressed his ignorance of the fact at the time that savine was used for legitimate purposes, but the hon. and learned gentleman would draw a very wrong inference from that fact if he imagined the circumstances were not sufficient to support the verdict of the jury (hear, hear); and as the case had made a great stir among the Medical Profession, he might as well state that, after the most careful and minute investigation, he had no hesitation in his own mind that this person was really guilty of the charge; for he examined the woman three or four times—he gave her large doses of savine for nineteen consecutive days—he took her to his own house, where the child was born—he conveyed the body in a bundle at dusk to the sexton; and it was buried at night. (Hear.) Under these circumstances, he was not prepared to say the intention of the Government was to advise Her Majesty to mitigate the sentence. (Hear.) He might add, that these were cases of great anxiety to any one who filled the office in which he was placed. (Cheers.) He had given this particular case the greatest attention, and he hoped the House would bear with him, and not press such questions upon him. (Cheers.)"

The evidence of the *malus animus* against Mr. PASCOE is altogether unsatisfactory. In fact, the clear inference to be drawn from the whole evidence is that he gave savine, not knowing that the woman was *enceinte.*

But the medical testimony clearly shows the uncertainty of allopathic practice. Savine is the Βράθυ of DIOSCORIDES, who flourished in the first century of the Christian era, and its use in medicine is therefore of great antiquity; and in different ages very different medical properties have been assigned to it, and consequently it has been used (allopathically) in various disorders.

Mr. PASCOE believed the patient suffered from disorder of the heart and liver, and in one of his student-day books of medical authority (he became a licentiate of the Society of Apothecaries in 1823) he had seen savine recommended in such cases—so he gave it.

"Savine is a powerful stimulant," says one of the allopathic authorities (Dr. ANTHONY TODD THOMPSON), "possessing diaphoretic, emmenagogue, and anthelmintic properties. It has certainly a considerable effect on the uterine system; but on account of its stimulating properties, is suited to those cases of amenorrhœa only which are *unattended by fever*, and in which the circulation is languid. In plethoric habits its use should be preceded by *repeated bleedings* (HOME, Clinical Experiments, p. 387), and at all times its internal exhibition requires caution. It has been given in gout, and in worm cases also. The dose of the powdered leaves is from grs. v. to grs. xv., administered two or three times a day."

Mr. MOORMAN (M.R.C.S. Eng. 1829, L.S.A. 1828) gave an opinion at the trial that "Mr. PASCOE, if a man of competent skill, must have known this prescription would only answer the purpose of procuring abortion." We have shown, on Dr. TODD THOMPSON's authority, that savine has been used in various disorders. It

Hosted by Google

must be remembered that he was one of the three greatest pharmaceutical authorities of Great Britain. Mr. PASCOE sees a patient with certain symptoms as detailed by herself; he consults a book formerly of great authority, prescribes savine for her in moderate doses (according to the measure of the allopathic school), and abortion taking place, he is condemned as a felon, and sentenced to transportation.

The only competent medical witness on the trial, "according to Mr. WALPOLE, had since expressed his ignorance of the fact at the time that savine was used for legitimate purposes." But that medical witness decided jury and judge.

"Take away this opinion, and what becomes of the circumstantial evidence? Leave out all about the savine, and put the rest of the evidence together. A young woman goes to a surgeon, and asks for advice; the surgeon gives a medicine which, according to the hypothesis, is innocent. The patient gets no better, returns to the surgeon, begs his servant to let her remain in the house, is there confined of a dead child, which the surgeon, unfortunately for himself, has buried by the parish sexton. As we said before, take away the savine, and nothing remains on which even a charge can be founded. Was Mr. Pascoe to blame because he allowed this young person to remain in his house? Was he to blame because the body was buried in public by the sexton and not in secret by himself? Yes, he was to blame, certainly, for indiscretion, but not to be condemned for guilt. No; it was felt by the judge that these circumstances proved nothing, and that without the evidence that savine would be administered only for a felonious purpose no jury could have convicted.

"Mr. Walpole did not state the facts of the case correctly. Mr. Pascoe first administered savine in moderate, not in large doses; the patient then discontinued the medicine, and, several days afterwards, went to Mr. Pascoe's house. She was not taken there by Mr. Pascoe, as asserted. While in the house, according to the woman's own statement, she never told Mr. Pascoe that anything more was the matter with her than 'disease of the heart and liver.' Mr. Pascoe examined her—that is, her heart; it nowhere appears that he examined her in reference to her pregnancy. She took only salts; and, although, according to Mr. Walpole's mode of putting the case, the woman was taken to the house in order that abortion might be produced, it is certain that, while there, no means whatever to effect this purpose were used; and the indictment was not for any action at this period, but for using savine some weeks before.

"To read Mr. Walpole's statement, one would think that Mr. Pascoe took her to his house, examined her repeatedly, and gave her large doses of savine.

"We should be quite satisfied if the case were put to the judge in these words:—The administration of savine being in most cases legitimate and good practice, were the other circumstances of the case sufficient to prove that, in this instance, it was given *malâ fide?* If Judge Erle will say that they were, we will submit to the decision. If he will not, Mr. Pascoe ought not to be transported. Nothing more will be said in the House of Commons, and our hopes are therefore but small. But we will not surrender the matter without a last attempt to gain another hearing.

"Mr. Pascoe is a licentiate of the Society of Apothecaries. We are convinced that in no better way could the Society show its zeal for the interests of those connected with it, than by examining into the merits of the case, and by obtaining from Mr. Walpole, even now, a reconsideration of the sentence. Let any member of the Court place himself in Mr. Pascoe's position, and then let him ask himself whether he would not feel that all his brother medical men were bound by the highest obligations of Christian morality to afford him help in a conjuncture so terrible."—*Medical Times and Gazette.*

We not only feel sympathy for poor Mr. PASCOE, but we wish our readers to observe the vacillation and discrepancy of allopathic practitioners on this subject of the medical properties of their own drugs, and also to notice the *see-saw* mode of practice. Savine is *stimulating*, therefore in the case of plethoric persons its use is to be preceded by repeated bleedings.

We sincerely hope the generous part taken by Mr. HINGSTON, of Liskeard, Mr. HARRIS, of Redruth, by the Ethical Society of Manchester, and by the Editor of the *Medical Times and Gazette*, may be rewarded by Mr. WALPOLE'S favourable reconsideration of Mr. PASCOE'S case.

WHAT IS HOMŒOPATHY?

BY WM. SHARP, F.R.S.

WE propose to give some extracts from this paper, because we think the testimony of a man of acknowledged science and character, who was formerly a distinguished allopathic practitioner, is of great advantage to our Cause. Mr. SHARP is not only a scientific and a practical man, but he is also a cautious one. He is well acquainted with the inductive philosophy, is a conscientious and pains-taking experimenter, and would be satisfied with nothing less than complete conviction on any subject of his investigation, before he declared his opinions.

"Among the many important topics of the

Hosted by Google

day,' none, having reference to this life only, can possess higher claims to calm inquiry and earnest attention than the various resources which are available to mankind, when suffering from bodily disease—a trial which few, if any, at all times escape.

"In the present age of discovery and invention it would be remarkable if, while all around are sailing onward, the physician alone was becalmed; while every branch of art and science is progressively and rapidly improving, the resources of medicine remained stationary. But this has not happened; the onward wave has reached the surgeon's barque, and he also is afloat upon the mighty waters of natural science.

"There are indeed many who would stoutly stand upon the 'old paths,' but in this case we have no inspired prophets and apostles, as happily we have in an affair of higher moment, upon whom to rest as upon a firm foundation. The opinions of mere men, however venerable by age, are but a sandy base. The people of the present times are—

'Nullius addicti jurare in verba magistri.'

Nature's laws and nature's facts alone are able to stand the rigid scrutiny to which the sentiments of men, in physical science, are now so unreservedly exposed.

"Some men's minds, under such an apparently unsettled and disorderly state of things, will become sceptical and faithless. This arises from indolence; they will not give themselves the necessary trouble to investigate, and thus they throw truth and falsehood overboard together, and vainly try to rest upon a negative. But to the more active and industrious mind the same condition is stimulative to exertion. Truth is sought after with earnestness, and when found, is embraced with satisfaction and delight.

"Among the medical inquiries of the day, homœopathy, in the judgment of many, is the most important which has yet appeared, while in the opinion of many more it is 'the biggest humbug that ever was!' It is proposed to consider, in a few words, what homœopathy is not, and what it really is."

In his first proposition, *Homœopathy is not a novelty*, Mr. SHARP quotes from HIPPOCRATES. The Roman historian, SUETONIUS, in his account of the Emperor AUGUSTUS, gives a like testimony. Many passages might be quoted, not only from SHAKESPEARE, but from all *first-class* poets, in recognition of our law. Mr. SHARP gives the following passage from the Second Part of SHAKESPEARE's Henry IV.

"In poison there is physick; and these news
Having been well, that would have made me sick,
Being sick, have in some measure made me well."

The fact is, that the homœopathic law being a law of NATURE, all true thinkers, however unconsciously, must, in some way or other, have borne testimony to it.

Mr. SHARP's second proposition is, that *Homœopathy is not quackery*. He says:

"The essence of quackery is secrecy. The individual practising it pretends to the possession of some valuable remedy—a nostrum—which he sells for his own private gain, but which he will not disclose for the public good. Homœopathy has no secrets—no nostrum—it courts inquiry, it entreats medical men to investigate it. This is not quackery.

"Homœopathy, in its present form, was discovered by a regular physician (Hahnemann), and was first published in the leading medical journal of Europe (Hufeland's), in 1796. It has been studied and adopted by several thousands of regularly educated and qualified practitioners, some of them professors in universities, and others, leading men in their profession, who urgently call upon their colleagues to follow their example. They offer every facility in the way of instruction, by hospitals and dispensaries, and by private information which it is in their power to give. This is not quackery.

"Homœopathy is no field for the St. John Longs and the Morisons—the patent medicine vendors. The unsettled, unsatisfactory, and unsuccessful course of the educated physician leads his patients to try quacks and quackery, whose means, it must be acknowledged, are very similar to his own, and sometimes more successful. Nothing would so effectually drive away all real charlatanry as the adoption by the profession of a recognised law of healing, and the carrying this out fully and fairly, so as to derive from it all the success which can in reason be looked for."

We come now to his third proposition—*Homœopathy is not an uncertainty*; and we here, too, give his statement *in extenso*.

"It is surprising how the opponents of homœopathy, and even some of its friends, bewilder both themselves and others, when they endeavour to explain what homœopathy is. The impression is thus produced that the new doctrine is nothing more than a wild theory, very vague, and very worthless. The most common mistake is thus stated:—'A medicine or a poison which will produce a disease will cure *it*.' 'If I am fatigued with a long walk I must take a short one!' This is the same curing the same—not *like curing like*. *Similis* is not *idem*. Greek scholars ought not to fall into such an error as to confound ὁμός with ὅμοιος; they may be reminded of the controversy between Athanasius and Arius, in the fourth century, and the difference between ὁμοούσιος and ὁμοιούσιος.

"Let me try to set this matter in a clear light. 'Give,' says Hippocrates, in a particular case of insanity, 'a draught from the root of mandrake, in a smaller dose than will induce mania,' that is, if taken in health. In both cases there is an alienation of mind, the symptoms are similar, but the causes are different, and the cases are not identical.

"The preparation of mercury called corrosive sublimate is one of the most violent poisons; two or three grains are sufficient to destroy life, as has happened when it has been given by mistake for calomel. The symptoms it produces are well known to be those of inflammation of

Hosted by Google

the stomach and bowels, accompanied by diarrhœa with bloody stools;—in the words of Taylor,* symptoms 'like those of dysentery,—tenesmus and mucous discharges mixed with blood being very frequently observed.' In March, 1852, I saw J. C., a tall spare man about thirty, suffering from a severe attack of dysentery; his countenance much distressed; a great many stools for three days, consisting of blood and jelly-like mucus, with considerable pain in the abdomen, increased by pressure, and a quick pulse. I dissolved one grain of corrosive sublimate in half an ounce of water, put four drops of this solution into two drachms of dilute alcohol, and gave him six drops of this tincture in four ounces of water, directing him to take a dessert-spoonful every three hours till the symptoms abated. He had no other treatment, and in three days he was quite well. Here the symptoms of the dysentery were like those which this preparation of mercury produces, but they had not been occasioned by corrosive sublimate, *therefore* it was a proper remedy on the principle of *similia*,—that like cures like.

"Every one knows that the Spanish fly, cantharides, even when only applied externally in the form of a blister, very often acts injuriously upon the bladder, causing strangury and other painful symptoms connected with that organ. I hold in my hand a little book with the following title, 'Tutus Cantharidum in Medicinâ Usus Internus, per Joannem Groenevelt, M.D., e Coll. Med. Lond. Editio Secunda, 1703.' This book is full of interesting cases of strangury and other affections of the bladder very successfully treated by the internal use of cantharides. Here is a special case of homœopathy—of like curing like—or, in the words of the old translator of Hippocrates already quoted, 'Velut urinæ stillicidium idem facit *si non sit*, et *si sit* idem sedat.' The drug produces the complaint *if not there*, but *if it be there*, it cures it. For this method of treatment, the author tells us in his preface, *he was committed to Newgate*, on the warrant of the president of his own college—the Royal College of Physicians of London. 'Chartâ quadam manibus propriis signatâ, sigilloque firmatâ, me sceleratorum carceri (*Newgate* vulgo dicto), malæ praxeos, reum asseverantes tradiderunt!' This happened in 1694—just a century before Hahnemann. It is worthy of remark, before quitting Dr. Greenfield, that the dose of cantharides which he gave was such as to oblige him to give camphor along with it, as an antidote to correct the otherwise aggravating effect of the fly. The present method of reducing the dose, which we owe to Hahnemann, has enabled me to cure similar cases of diseased bladder without the addition of the camphor, and without fear of aggravating the symptoms.

"One instance more. Belladonna, when swallowed as a poison, produces a scarlet rash, a sore throat, fever, headache, etc., all which symptoms appear in scarlet fever. Belladonna, as was first discovered by Hahnemann, not only generally cures, but often preserves from scarlet fever. *Belladonna does not produce or cause scarlet fever, but it does produce symptoms similar to those of scarlet fever.* Whoever will carefully study these examples will no longer charge the doctrine of homœopathy with vagueness and uncertainty."

* Medical Jurisprudence. Article Corr. Subl.

With his fourth proposition we should be inclined to break a lance with him, but this is an *open question*, and *a matter of experience*. *Homœopathy is not an infinitesimal dose.* It is certain that HAHNEMANN, in the first instance, used the ordinary doses, and gradually reduced them, from finding that *such* doses of any medicine which were homœopathic to any case produced unnecessary and sometimes perilous *aggravations* of the disease. By gradual *reduction*, by cautious *induction*, by multiplied *experimentations*, and after an *experience* of many years, he arrived at his *infinitesimal* doses. It is certain that the *smallest* dose of the highest dilution, or dynamisation, call it what you will, that is capable of producing the curative effect is the *best*. This, however, we state, is entirely *a matter of experience*. We now let Mr. SHARP speak for himself.

"This is another popular mistake, diligently, though perhaps ignorantly, fostered by the opponents of homœopathy. Like curing like—*similia similibus curantur*—says nothing about the dose. All that is essential to the carrying out of this principle—all that the general fact or law of nature requires for its fulfilment is announced by Hippocrates: give the poison in a *smaller dose* as a remedy in the natural disease, than would be sufficient to produce similar symptoms in a healthy person. A smaller dose—how much smaller is a matter of experience. If twenty grains of ipecacuanha will make a healthy person sick, the twentieth part of a grain may be required to cure a similar sickness. If twenty grains of rhubarb will act as a purgative, one grain may cure a similar diarrhœa. If two grains of arsenic or corrosive sublimate might bring on fatal inflammation of the stomach or bowels, the thousandth or the ten-thousandth part of a grain may be sufficient to cure,—not that inflammation brought on by itself,—but a similar inflammation arising from other causes.

"It should not be forgotten that homœopathy, as a principle, was discovered by experiments made with ordinary doses, and he is a true homœopathist who may never prescribe any other. The nature and effects of the so-called infinitesimal doses are separate questions; those who make use of them find that they are (from whatever cause) efficacious and generally sufficient, but no man is pledged to use them exclusively, though many do, being satisfied from their experience that they are the safest and best mode of administering medicine. No one will deny that they are the pleasantest, and if success follow their use, why should they not be used? Because, it is said, they appear absurd, and their action cannot be explained.

Hosted by Google

But if a fraction of a grain will cure a disease, is it not more absurd to give a poisonous dose? And who can explain the mode of action of the large dose any more than of the small one? If diseases disappear of themselves under suitable diet and regimen, or if the small doses afford all the aid required, why should patients be 'encumbered with assistance,' or their recovery be retarded or jeopardised by the unwieldy and often injurious interference of large doses of poisonous drugs? Why has it so often been said that 'the remedy proved worse than the disease?'

We propose, with the author's permission, to go through the remainder of this paper; and we again recommend to the *homœopathic public* the perusal of this essay, and of Mr. SHARP'S "Inquiry into the Truth of Homœopathy."*

Correspondence.

THE ANNUAL HOMŒOPATHIC CONGRESS.

To the Editor of the Homœopathic Times.

SIR,—As the letter of the Secretaries of the Congress published by you, on the 10th, places me in an unfair position, I must request your insertion of a few lines in reply.

My reason for preferring July to September was not, as they assert, "only that we should have thus an opportunity of publicly braving the Medical Faculty of Edinburgh." I merely stated, what others who were present at last year's Congress can bear me out in, that Edinburgh was fixed upon (Leamington having been previously proposed), by way of reply to the attacks that had been made upon us there.

I certainly think that our meeting would have possessed a greater degree of moral weight and dignity by its taking place before the University is closed and the town half-empty, than it will now have. Nor would there have been necessarily any greater degree of "braving" in that case, since allopathy and allopaths are not likely to be much attacked at the Congress. The discussions at it are more likely to be occupied by some members finding fault with each other for giving too large or too small doses, too seldom or too frequently repeating them, and giving too high or too low dilutions.

I entirely dissent from your correspondents in believing that the Medical Faculty are a body of men who have still much power to injure our Cause. Doubtless they may be able to cause a little annoyance to some of the Edinburgh homœopathists, but they have now learnt, from the outcry raised on account of Dr. Pope's case, that in resorting to violent or unjust measures they would be only injuring themselves, not us, and have therefore wisely resolved to be quiet; nor could they be very easily roused into action again.

The danger we have to fear, and against which no remedy has yet been provided, is that individual professors may mark those students who become favourable to homœopathy, and contrive their rejection as if on account of ignorance. This could be quietly done without raising any stir.

To prove that the Medical Faculty in Edinburgh are as hostile as ever, we have only to call as witnesses Drs. Russell and Wielobycki; the former having found it necessary to write, not long since, to the papers complaining of the conduct of certain surgeons, and the latter having been meanly attacked in a journal conducted by four Professors, the attack being followed by the comical scene reported to have taken place between Professor Syme and Dr. Wielobycki, in which the Professor was left standing, as a modern imitation of Jupiter, enveloped in a shower not of gold, but of one-pound notes.

Wishing to avoid giving rise to any unpleasantness, I shall waive further observations, which the tone and matter of your correspondents' letter are calculated to suggest, and am,

Your obedient servant,

Birmingham, July 13, 1852. GEORGE FEARON, M.D.

QUEEN'S HOSPITAL BIRMINGHAM.

To the Editor of Aris's Birmingham Gazette.

SIR,—In your publication of the 7th, a correspondent signing himself "*Philomedici*," and who may be either a half-convert, or, as some suppose, an enemy in disguise, suggests that a ward in each hospital should be for two years placed under the care of a homœopathic physician, for the purpose of fully testing the system. The chief objection to such a proposition is that there is no mention made of sufficient accommodation being allowed for our own nurses and house-surgeon. We could not trust to the ordinary nurses of the hospital to administer the medicines in our absence, as their prejudices would be likely to interfere with the proper performance of that duty, while we should also require a house-surgeon who had some knowledge of homœopathy to be at hand, in case of emergencies arising during the night or at any other time.

Some months ago, when it was sought to establish an hospital for consumption here, the committee of the Queen's Hospital, by way of putting a stop to the project, put forth an advertisement, in which they stated that they had ample accommodation for receiving consumptive patients, but want of funds prevented them making use of the spare space. Now, what I would propose is, that they should place at the disposal of the homœopathists—and we would, if they desired, pay a reasonable rent for it—some of this spare space sufficient for the reception of at least fifty patients, and for not less than a year.

The medical officers of the hospital would of course be allowed to watch the treatment of the cases, and if it was considered necessary, only such patients should be received into those

* What is Homœopathy? By Wm. Sharp, F.R.S. "Inquiry into the Truth of Homœopathy," by the same author. William Headland, 15, Princes Street, Hanover Square.

Hosted by Google

wards as came expressly for homœopathic treatment.

Whatever the result of the trial, the hospital would be the gainer by it, for if homœopathy was proved to be false, it would have obtained the character of being conducted in a fair and unbigoted spirit, while it would have at the same time the merit of being the first British allopathic hospital in which a practical and thorough trial of the system had been made. On the other hand, if the trial proved favourable to homœopathy, as I have every reason to believe it would, the greater part of the friends of homœopathy here would in future have a feeling of sympathy towards the Queen's Hospital, and would be under a moral obligation to support it; and as all acknowledge that they are a rapidly-increasing body, such a support would be very valuable to an institution not overburdened with funds, while it would have been easily obtained. The hospital, too, would afterwards have an historical interest attached to it, and its fame would extend wherever the keenly-contested struggle between the old and the new modes of practice was known. Then, as to its medical officers, the one or two—if there are indeed as many, for on that point I am very sceptical—who really believe homœopathy to be a delusion, would, we may naturally suppose, be delighted with so good an occasion of overthrowing it, while if it proved to be true, the whole of them would have an excellent means of studying it, and would be enabled to make use of it in their practice without that risk of damaging themselves which they would otherwise incur.*

As this is a question which concerns the public even more than it does the members of the medical profession, is it too much to ask of the Editors of the Birmingham papers that they should employ their pens in advocating a trial such as I have proposed? Hoping that you, Sir, will at any rate take the matter up,

I am, Sir, your obedient servant,

GEORGE FEARON, M.D.

To the Editor of the Homœopathic Times.

DEAR SIR,—Last year I attended the Congress at London, and after Edinburgh had been proposed for the Congress of 1852, I suggested Dublin for the meeting in 1853, so that we should take the metropolis of England, of Scotland, and of Ireland in succession. In the month of May next, Dublin will contain an Industrial Exhibition, that is likely to mark the year 1853 with no less glory in the annals of industry than any that have preceded it. The organization for its execution is now complete; the project has passed from the region of vague rumour, and taken a form and substance that leaves no room for doubt.

Let us therefore have our meeting in 1853 in Dublin, and to it let us draw our continental reformers, Liedbeck, Bönninghausen, and others, and from their lips let us learn their medical experience. Perhaps we could induce Fleischmann, Tessier, and their colleagues to visit the Irish Crystal Palace and the Irish Homœopathic Congress of 1853. We should make our therapeutics generally known, and to that meeting we ought to invite Crampton, Cusack, March, Graves, and Stokes; men worthy of an invitation—men who could appreciate the philosophic teaching of Hahnemann.

Let us weep over the animosities of scattered discord in the camp of young physic, let the pure and holy elements of peace be with us; and when we meet at Edinburgh, in September, let it not be said that this leader or that leader is absent, and let not those men at this side and that side of young physic think or imagine that they are leaders—for we require no leaders; we shall press on with the law of cure of the great and good leader Hahnemann. Let a man worthy of the chair of that Congress be invited—let Henderson be there, and then who can be absent? Our meeting shall then be fully reported. Our editors shall not forget their duties, and as their articles are written for the public as well as for the profession, let them, in mercy's sake, keep back their spleen, and hide such utter worthlessness, that our impure state may not appear while bearing the banner of reform; and with the eloquence of St. Basil, and in the words of Pope, I shall transcribe those lines of the poet, that may lead us in our advance to the "Temple of Fame."

"As on the smooth expanse of crystal lakes
The sinking stone at first a circle makes,
The trembling surface, by the motion stirred,
Spreads in a second circle, then a third;
Wide and more wide the floating rings advance,
Fill all the watery plain, and to the margin dance."

I am, Sir,

THE PILOT THAT WEATHERED THE STORM.

RELIEF OF THIRST DURING THE PREVALENCE OF GREAT HEAT.

To the Editor of the Homœopathic Times.

SIR,—My attention has been drawn to the case, *Thirst relieved, etc.*, among the miscellanies of your last number, which has put me in mind of a *preventive* to thirst, well known in the parched and drear walks of India, especially in military marchings, and which I have myself applied most successfully, not only in India but in Egypt likewise, and which also is within the reach of every traveller, namely, that of keeping constantly, while it lasts, one or two smooth pebbles, the size of beans, or a little less, in the mouth; this soon creates or excites *saliva*, which relieves the sufferer under thirst.

AN OLD INDIAN OFFICER ON THE SHELF.

---

* Perhaps my former antagonist in your columns will use whatever influence he may possess as one of the physicians of the Queen's Hospital, in promoting this trial; it would be a graceful act on his part, and would be an evidence that at the time he attacked us so strongly, he really was under the delusion that homœopathy was a delusion.

AN ESSAY ON HOMŒOPATHIC STATISTICS;

Together with a Critical Analysis of Dr. Routh's Work, entitled "The Fallacies of Homœopathy, and the Imperfect Statistical Inquiries on which the Results of that Practice are estimated."

By John Ozanne, M.D.

(*Continued from page* 732.)

XVIII.

Dr. Hughes's statement of the number of complications found in the "24 fatal cases observed during life and examined after death," is not worded with sufficient scientific precision to allow of its being made the basis of our calculations, in the present stage of our inquiry, without being first carefully scrutinized, and the different interpretations which may be put upon it fully weighed.

Simple as it appears when first read, this statement may be interpreted in three different ways. Let us take each of these interpretations in turn, and see to what result it would lead us, before we decide upon the superiority of its claims to our confidence. These different ways of explaining the statement give rise to the following hypotheses:—

First Hypothesis.—The 12 complications were not all fatal cases.

If so, we must take the *ratio* of mortality in complicated cases given to us by Dr. Routh, and calculate the number of deaths which must have occurred among the complicated cases. This number of deaths deducted from the total number (which is 24) will give the deaths occurring, according to this hypothesis, in the uncomplicated cases.

	Living Cases.	Calculated Number of Deaths.	Ratio of Mortality.
Complicated	12	6·12	51·00 per cent.
Simple.....	88·125*	17·88	20 16 per cent.
	100·125	24·00	

Second Hypothesis.—These 12 deaths from complications (if by that number of complications Dr. Hughes meant that they were all deaths) represent a larger number of complications observed in the living patients, among whom the 24, or total of deaths occurred. Taking Dr. Routh's ratio of mortality in complicated cases, we calculate the number of living patients these 12 deaths represent, we deduct this number from the total of living patients, and thus obtain the number of the uncomplicated cases among which the other 12 deaths occurred. Thus:—

	Deaths.	Living Cases.	Ratio of Mortality.
Complicated.	12	23·529	51 00 per cent.
Simple.....	12	76·596	15 53 per cent.
	24	100·125	

Third Hypothesis.—These 12 deaths comprised *all* the complications. On this hypothesis the results would be as follows:

	Deaths.	Living Cases.	Ratio of Mortality.
Complicated	12	12·000	100 00 per cent.
Simple	12	88·125	13·61 per cent.
	24	100·125	

The results, as exhibited in the above tables, are simply these. If we admit that, first, Dr. Hughes meant 12 complicated cases and not 12 deaths from complications, the ratio of mortality in the simple cases was 20·16 per cent.; second, if Dr. Hughes meant 12 deaths among complicated cases, the mortality in simple cases was 15·53 per cent.; third, if, lastly, he meant that the 12 cases he mentioned were deaths from complications, and at the same time the only complications observed, then his mortality in simple cases was in the ratio of 13·61 per cent. In other words, the mortality was respectively, according to these hypotheses, the only three possible, 20·16, 15·53, or 13·61 per cent., in simple pneumonia. Dr. Routh gives for simple pneumonia a ratio of mortality, in Drs. Taylor, Walshe, and Peacock's cases, of 3·2 per cent. The marked degree in which Dr. Routh's statements of the results of practice of these gentlemen differ from the results obtained at the Edinburgh Royal Infirmary and by Dr. Hughes in London, as regards the ratio of mortality in simple or primary pneumonia, leads us to doubt, with perfect propriety,

* It has already been stated that Dr. Hughes's mortality, calculated at 23·97 per cent., gives for 24 deaths a number of *living cases* equivalent to 100 125.

Hosted by Google

the accuracy of his classification of the cases of Drs. Taylor, Walshe, and Peacock. The fact that, with a general mortality of 30 per cent., whilst the general mortality at Edinburgh was 38 per cent., and in Dr. Hughes's cases 24 per cent. (calculated mortality)—the fact that, with a general mortality *intermediate* to these, Drs. Taylor, Walshe, and Peacock should have found a mortality in simple uncomplicated pneumonia of only 3·2 per cent. against 31·57 per cent. at Edinburgh, and 13·15 or 20 per cent. in Dr. Hughes's practice, is sufficiently anomalous to justify the suspicion that Dr. Routh has not correctly classified the observations of Drs. Taylor, Walshe, and Peacock.

It is obvious, from his mode of classifying Dr. Tessier's cases (under homœopathic treatment), whereby the three deaths are made to appear as the results of complications, whereas they were in reality due to the circumstance that the treatment was commenced too late,—it is obvious that Dr. Routh does not follow the same mode of classification which other observers follow; therefore we can have but little confidence in his statement of the small mortality in uncomplicated pneumonia.

It may be objected, however, that this explanation of the discrepancy between the results of treatment in Drs. Taylor, Walshe, and Peacock, as stated by Dr. Routh, and those obtained at Edinburgh by Dr. Hughes, cannot be fully satisfactory, for no classification can be so vicious as to give results so totally opposed to all that is observed elsewhere; and because, on the other hand, as the treatment of the cases of Drs. Taylor, Walshe, and Peacock must have been of the same kind as that adopted in the two other series of cases, compared with theirs, and cannot be supposed to have been more judiciously carried out. I readily grant that this objection is not without some weight, and that we cannot ascribe the full amount of the discrepancy in the observations to the vicious mode of classifying one of the series alone. There is another circumstance which may account for superior results in the latter series—the examination of the influence of *age* and of *sex* on the results of pneumonia, in our next section, will naturally lead us to it—I allude to the circumstance that the ages of the patients reported by Dr. Routh were unusually favourable.

Influence of Age.—Dr. Routh has, with perfect propriety, considered the influence, favourable or otherwise, exercised by the age of the patient upon the issue of pneumonia.

He has, moreover, given us a table from Grisolle's work on Pneumonia, in which the proportion of deaths is shown to increase as the age of the patient advances.

But Dr. Routh, like many a moralist, ever willing to caution us upon the rectitude of our ways, and ever prepared to read us a lesson upon supposed errors of conduct—to use no worse term—seldom, if ever, applies the moral to himself. This question of age, like all other questions respecting the influence of various circumstances upon the results of disease, is made to play its part.

As mentioned above, Dr. Routh has given us a table from Grisolle, in which the proportion of deaths per cent. is stated for each decennial period of life. This table can be of no use to us in examining Drs. Taylor, Walshe, and Peacock's cases, for it does not give the actual number observed for each age, and because in Drs. Taylor, Walshe, and Peacock's cases, although the ages are given in some sort, it is only in an imperfect manner; for only the numbers *above* or under forty years of age are mentioned.

Fortunately, there is a table in Grisolle (p. 520), taken from a large series of facts collected in a work by M. Leroux. This table is as follows:—

Ages.	Cases.	Deaths.
From 13 to 30 years	182	17
„ 30 „ 40 „	58	15
„ 40 „ 50 „	47	16
„ 50 „ 60 „	55	23
„ 60 „ 70 „	16	9
„ 70 „ 75 „	6	5
	364	85

The influence of age cannot be better shown than by comparing the last two periods with the first two. Or again, by taking the first three periods, for each of which it will be observed there is a mortality as near as possible to the average (15) of the three. Taking this number as the fixed point or standard of comparison, we find that for the same number of deaths there are under treatment, between forty and fifty years of age, 47 persons; between thirty and forty, 58 persons; between thirteen and thirty, 182 persons affected with pneumonia.

It is obvious, that if, in any series of cases, the number of cases between thirteen and thirty years of age should greatly preponderate over those above forty years of age, the per-centage mortality will be lessened in proportion.

Dr. Routh applies the fact to us in general terms, but strange to say, when he comes to the facts he does not show cause for its application—in truth, because he

Hosted by Google

cannot do so. For instance, after stating the ages in Dr. Tessier's cases, he says, "here there is no room for complaint. The number under forty is correct—that above about twice as large as it should be." This mode of dismissing a series of cases, such as Dr. Tessier's, is characteristic of the manner in which facts are usually dealt with by Dr. Routh. Had Dr. Tessier's cases happened to be under the average age, they would have been called "*selections*," but being considerably above the average age, and hence very unfavourably situated, they are dismissed with this simple observation, "here there is no room for complaint!" Had Dr. Routh's aim in writing his book been at all above that of a mere partisan—had his sole purpose been the discovery or the elucidation of truth, he would have seen cause to study Dr. Tessier's cases more closely, and to give a fairer report of them. As he has not seen fit to do so, it will be our business to show how far Dr. Tessier's cases were unfavourably circumstanced as regards *age*.

To do so, we shall simply take the ages in Tessier's cases, and in Dr. Routh, also, Grisolle's ratio of mortality observed for each decennial period of life, and calculate what Tessier's mortality would have been if his cases had been under allopathic treatment.

Ages.	Mortality, one in	No. of Tessier's Cases.	Calculated Mortality.
13 to 30 ..	12·3 ..	10 ..	0·81
30 ,, 40 ..	5 4 ..	11 ..	2·03
40 ,, 50 ..	4·4 ..	6 ..	1·36
50 ,, 60 ..	3·6 ..	6 ..	1·66
60 ,, 70 ..	3·8 ..	4 ..	1·05
Above 70 ..	0·8* ..	2 ..	2·00
			8·91

In calculating this table upon Dr. Routh's basis, we have been guided by the wish to exhibit Dr. Tessier's results upon Dr. Routh's own statements, but *these are not correct;* therefore the result is not very accurate. We have also had to make a little change in Dr. Routh's statement. He reports Tessier's cases above sixty years of age to be six in number; in the other table, the proportions above sixty and above seventy are given separately. We have therefore given the *actual* numbers observed in each of these decennial periods, namely, four and two. Such as it is, and although very inaccurate, this table shows the relation in which the homœopathic practice atands to the allopathic, as regards their respective results. It shows a mortality, calculated upon Dr. Routh's data, of 8·91, against an actual mortality of 3 only. In other words, the homœopathic mortality was only one-third of what the allopathic would have been under like circumstances.

But here is the same calculation upon correct numbers. Grisolle gives the following proportions of deaths to cases under treatment as the result of his observations. It will be seen, on comparing this statement with the report given of it by Dr. Routh in his work, how little we can depend upon the accuracy of the facts in the treatise on the "Fallacies of Homœopathy" (Grisolle, p. 519; Routh, p. 49). In the following table the statements as found in Grisolle, and as reported by Dr. Routh, are placed in apposition.

Ages.	Proportion of Deaths to Admissions, as found by Dr. Grisolle.	The same as reported by Dr. Routh.
16 to 30..nearly 1 in 14	1 in 12·8 or	8·1 ℘ Ct.
30 ,, 40..rather less than 1 in 7..	,, 5·4 ,,	18·5 ,,
40 ,, 50..1 in 6	,, 4·4 ,,	22·7 ,,
50 ,, 60..1 in 5	,, 3 6 ,,	27·7 ,,
60 ,, 70..less than 1 in 6	,, 3·8 ,,	26·3 ,,
Above 70..8 in 10	,, 0 8 ,,	125·0 ,,

The report given by Dr. Routh of Grisolle's statements is so different from the original, that one might suspect that by some unaccountable mistake another table had been substituted for that in which the influence of age upon the mortality was exhibited. The singular mistake, however, in the last age in the table, by which a mortality of eight-tenths is transformed into one death in 0·8, or 125 per cent., that is, 125 deaths to every 100 cases under treatment, renders this supposition improbable. The fact is, that Dr. Routh has both committed a blunder, and given proof of gross carelessness. We can excuse a blunder, for who can say that he never makes mistakes—*humanum est errare!* But we cannot excuse carelessness in such a question as this.

It will be observed that Grisolle does not give the *exact* proportions. He has made the calculations with accuracy; and who would doubt Grisolle's accuracy? But in giving us the proportions we require, he tells us it is "*negligeant les petites fractions.*" Our object in this essay is not merely to give a general idea of the facts, but as minutely accurate a statement of them as their nature will allow, therefore we cannot neglect small fractions; it is for this reason that we give generally three decimal fractions; never less than two.

The general reader may, perhaps, not understand how we can bring within a

* This is an absurdity! "One death in 0·8 cases, or 125 deaths per cent.," is a statement which could only emanate from the pen of one who is fit to give lessons in statistics, or to pass judgment on homœopathists!

Hosted by Google

sufficient degree of exactness, numbers qualified by such expressions as "less than," or "rather less than." But every person in the least acquainted with mathematics will perceive, at once, that we may, by a very simple process of *limitation*, so narrow the uncertain value as to render it almost insignificant, or ascertain the exact fraction by which it may be expressed. Thus it is obvious, that by the expression "rather less than one-seventh" Grisolle means to denote a value between one-seventh and two-fifteenths, or, in other words, a mortality intermediate to 1 in 7, and 1 in 7·5. Had he meant to denote a smaller proportion than the latter, he would have said "rather more than 1 in 8." We may therefore look upon the proportions 1 in 7 and 1 in 7·5 as the higher and lower *limits*; we are sure to find the real value—the value sought—somewhere between them both. With this explanation, the following table will be easily understood.

In this table, and in the two to be given afterwards, M. Tessier's cases will be classed according to ages; each period of life being placed in apposition to the corresponding period in the tables of MM. Grisolle, Leroux, and Chomel. The ratio of mortality found for each period by these observers will be stated; and the mortality which would have occurred in M. Tessier's practice, had his patients been treated allopathically, will be calculated for the number of his patients at each age.

Ages.	Proportions of Deaths to Admissions as given by Grisolle.	The same, but more exact.		No. of Tessier's Cases for each Age.	Calculated No. of Deaths.	
		Highest Limit.	Lowest Limit.		Highest Limit.	Lowest Limit.
16 to 30	1 in 14·50*			10	0·689	0·689
30 „ 40	less than 1 „ 7·00	1 in 7·00	7·50	12	1·714	1·600
40 „ 50	1 „ 6·00			7	1·166	1·166
50 „ 60	1 „ 5·00			7	1·400	1·400
60 „ 70	less than 1 „ 6·00	1 in 6·00	6·50	4	0·666	0·615
Above 70	8 „ 10·00			1	0·800	0·800
				41	6·435	6·270

The result obtained is that calculated for each age; in accordance with Grisolle's ratio of mortality, M. Tessier's cases would have presented a number of deaths somewhere between 6·435 and 6·270, instead of 3, the number of deaths met with under homœopathic treatment. The homœopathic mortality is, therefore, to the allopathic, as 3 is to 6·270 or 6·435.

(To be continued.)

* Grisolle says "à peine un quatorzième." But as he gives us the actual numbers, 116 cases, of which 8 terminated fatally, I have calculated the proportion as above.

SUGGESTIONS TO THE HOMŒOPATHIC SCHOOL.

(*From the American Journal of Homœopathy*, vol. vii. No. 1.)

We now enter upon the editorial labour of the seventh year of this Journal. The doctrine we have advocated has been approved by those of our colleagues whose judgment, learning, experience, and integrity not only command our respect, but also that of the people among whom they reside. In the main, our course has been commended by those competent to judge of the matter. Being thus encouraged it is our purpose to be more diligent, and make the *American Journal of Homœopathy* still more worthy the consideration of those who believe the immutable principles developed by the immortal Hahnemann. We announce at the very outset of this seventh volume, that we shall continue to the utmost of our ability to advocate homœopathy as taught by the great master, and show less favour than we have ever yet done to mongrelism, eclectism, and allopathy.

Hahnemannian homœopathy, which by the bye is the only homœopathy yet promulgated, although much is propagated in her name which is in fact but allopathy, has never disappointed our reasonable expectations, and we will answer for it, nor those of any other practitioner. We avow most distinctly that we shall not cease to advocate the "*small doses*," the attenuated drugs, from the 3rd to the 30th, and higher.

The evidence of the efficacy of these attenuations is too convincing to leave a doubt in our mind that they are the most safe and certain in the cure of diseases. Our colleagues will pardon us, we know, for we have avoided heretofore speaking of our own practice in the columns of this Journal, but for this once we will say, that for years past we have rarely employed drugs in the treatment of diseases in less than the 30th attenuations, and we do know that (we speak it for the honour of homœopathy) our success has exceeded that practice in our neighbourhood in which the

Hosted by Google

mother-tinctures and low attenuations were relied on. We shall, of course, have occasion again and again to refer to the subject of doses, and will not extend our remarks in this article.

With the means at our command, we have had an eye to the practice of physicians of our school in this country, and we are happy in being able to state that genuine homœopathic practice is gradually working its way among practitioners, and as a consequence among the people. We are also able to state, that in numerous instances, where practitioners like a barber undertook to shave both sides, that is, practise homœopathy and allopathy as customers might designate, the practice itself was unsuccessful, and of course failed to secure the confidence of the people, and was treated by them with not only neglect but contempt.

We shall continue to urge the study of Hahnemann's Organon of homœopathic medicine—a work not yet thoroughly understood; and the same may be said of his work on Chronic Diseases.

We believe the period is at hand when it will be found politic, nay more, absolutely necessary, for a line of distinction to be drawn between those who practise in all cases pure homœopathy, and those who do not. In our humble opinion, it cannot be otherwise than pernicious for genuine homœopaths to mix themselves before the public with those who are not. We cannot reconcile it with discretion, nor with wisdom, nor with honesty, for those who, after mature reflection and experience, are thoroughly convinced that the doctrine and practice of Hahnemann are true, to give countenance in any way to mongrelism and eclectism, which are allopathic. Our course in this respect seems to us perfectly consistent with a true spirit of liberality. It deprives no man of his just rights. It places every man before the public in his real professional character. It should not cause any unholy feeling among practitioners personally. It leaves every man free to follow the convictious of his own mind, and advocate and practise what he believes to be true; and it protects the public from imposition. The sum of the whole matter is this; we think the period has arrived when pure homœopathists should be careful not to place themselves in such relations as will, to the public, indorse mongrels, eclectics, and allopaths as genuine homœopathic practitioners.

Now, if such practitioners are honest and wise, and sufficiently intelligent to be actuated by a love of truth in the science and art of medicine, they cannot object to these views, but on the contrary approve them. For if they hold the truth in medicine, genuine homœopaths do not, and therefore the latter are but an unprofitable incumbrance to the former; and *vice versa*. Hence a separation is desirable for both. We shall not apologize for this bold declaration of our views.

We see no necessity in this day for pure homœopathists to adopt a policy inconsistent with their principles; they have fixed principles upon which they can rely, and the only true policy for them is to strictly adhere to those principles in all circumstances. We contend that, to the present time, no one understands homœopathy as well as did Hahnemann, and probably for years to come his Organon and his Materia Medica Pura must be the acknowledged standards of the homœopathic school. He has given to the world a complete system, made up of principles that are immutable. The homœopathic school can and ought to claim that she is constituted by a complete science for the art of healing. Now what we contend for is, that in the *art* of healing there should be the most strict observance of those established laws of nature which constitute the science of medicine as promulgated by Hahnemann. In this way, and in this way only, can the art of healing be improved.

How is it possible for any one who doubts the principles which constitute the science of medicine, to habitually make those principles a guide in his practice? It may be possible, yet we think it rarely the case. We assert for a fact, capable of being established, as much so as its nature admits of, that the pure homœopathists are the only practitioners who are habitually guided by fixed principles in the treatment of diseases. They never rely upon experience apart from the law; if they do, they are out at sea without a rudder or a compass, and are carried about by every wind of doctrine. Thus it is with mongrels, and with eclectics, and with allopaths.

In one thing the allopathic school is consistent. It seeks to separate itself from the homœopathic, in its societies and associations. This to our mind is reasonable, and there should be no complaining of the course of that school in this respect. We look upon that school as honest in its purposes; for no one doubts but men sincerely sustain error. So it is with allopaths, and they believe it to be their duty to exclude homœopaths from their communion, who they think hold pernicious doctrines.

It is the custom of the times, and for aught we know always has been so, for those who agree in certain principles on any subject to associate together, and if any member habitually does anything inconsistent with the admitted principles by which the association is united, he voluntarily withdraws, or he is expelled, or he loses caste among his fellows. This course of conduct among men is so natural in every man's views and feelings, that it exists even in the loosened organizations of political parties. Therefore, so far as our own views and feelings govern us, we are for union of form, as it is already in fact, of pure homœopathists, in a way that shall, by precept and example, exhibit to the world that the science of medicine is complete, and that the art of medicine is not that uncertain guesswork that many now suppose. Our readers will now, we trust, understand our position, which is the same we have tried to hold from the commencement of this Journal.

THE
HOMŒOPATHIC TIMES.

SATURDAY, JULY 24TH, 1852.

THERE has been no greater mischief in this world than an abuse of authority—the submission to mere names in matters of opinion. By that alone were the Covenanters of Scotland slain like beasts of prey, and the fires of Smithfield were kindled. Mere names should never be made the measure of facts. A truth must be decided on its own merits, not on the authority of those who maintain or gainsay it.

The law of England at this day is a deadweight from its *precedents*. The practice of medicine has, over-riding it like an incubus, the assumed authority of the schools. "The woods," says LOCKE, "are fitter to give rules than cities, where those that call themselves civil and rational go out of their way by the authority of example."

We deny that any corporate medical body has any right to decree peremptorily any mode of medical practice. The change in their own practice should teach them modesty. How any body of men should deem themselves authorized to assume such authority as to confine medical practice within their own limits is passing strange.

Hear what one of our English Bishops, Dr. HOADLY, says: "Authority is the greatest and most irreconcilable enemy to truth that this world ever furnished out. All the sophistry, all the colour of plausibility, all the cunning of the subtlest disputer in the world, may be laid open and turned to the advantage of that very truth which they designed to hide or to depress; but against authority there is no defence. It was authority which would have prevented all reformation where it is, and which has put a barrier against it wherever it is not."

Precisely so; it was a blind and arrogant authority that decided HARVEY was an intolerable quack, when he taught the circulation of the blood; that decreed the greatest of astronomers, KEPLER, to be a madman; that shut up another great astronomer in the prisons of the Inquisition, and there confined

"The starry Galileo and his woes;"

that heaped with the most base and unmanly reproach Lady MARY WORTLEY MONTAGUE for having introduced inoculation from Turkey; that declared JENNER to be a sort of incarnate fiend for having proposed vaccination as a *prophylactic* against small-pox; that now attempts to down-tread and extinguish the doctrine and practice of HAHNEMANN.

It is well: a blind and brutal intolerance always comes to the ground—is always quenched by experience and the influence of time.

We know how all reforms that have ever merited the gratitude of mankind have been received in the first instance. The truth of the matter is that men do not much over-like their benefactors—the necessity of acknowledging previous defect and shortcomings and failures is to the unenlightened a serious grievance. It is not enough that HUFELAND and others of his stamp—the first men of their day—acknowledged the transcendent merits of HAHNEMANN—the small sciolists of to-day sneer at him—call him quack, adventurer, medical theorist, and so forth.

But we his vowed followers and champions, how do we defend his cause? Is it to be done by a premature school, where there are lecturers with scant audience—by hospitals so small as to afford no statistics—by divisions among ourselves, and rivalry, and distinctions without a difference?

Where in England is the work absolutely done in defence of HAHNEMANN and his doctrines? Domestic books hardly answer that purpose. Where is the experience recorded of our pioneers? Are they asleep? are they on a journey? are they in a cataleptic condition?

We know right well that in our three years of existence we have done something to defend, to promote, to advance, and to establish homœopathy. We should have been able to do much more, had we been cordially supported by the bulk of our medical colleagues. But where is the support we have a right to

Hosted by Google

calculate on? Where are the reports of hospitals and dispensaries? Where are the cases of individual practitioners?

This is not the way that a great battle is to be fought against a blind and arrogant authority, such as allopathy boasts of having in schools and colleges and universities.

There has, in this world, been many a Pharaoh who knew not Joseph.

There has been many a writer for the benefit of mankind, who may truly have said of himself, "when these fingers are cold and rigid—and when this bounding heart is still—and when this active brain is at rest—there will be some to grieve that it is so; but meanwhile the service of fingers and heart and brain is not acknowledged by those for whose benefit it is performed—at least not as it should be."

Let us all unite against the blind and brutal intolerance of allopathic authority. Let us all be prepared with a reason for the medical faith we profess.

Our adversaries are unscrupulous; they are determined to achieve our ruin, if they can, *per fas vel nefas*. Let us be determined to vanquish them in fair fight.

WHAT IS HOMŒOPATHY?*

We give the remainder of Mr. Sharp's paper, trusting, however, that our readers will obtain the pamphlet from the publisher, and distribute it largely.

5. Homœopathy is not a "*humbug*." Neither are those who profess it "knaves or fools, swindlers or donkeys." Were the matter a piece of deceit, it is not likely to have had the steady success which its opponents are constrained to acknowledge attends its practice. A short time, at any rate, would expose its fallacy. An ingenious and plausible advocate might make an *hypothesis* popular, but he could never obtain extensive belief in the statement of a supposed *fact* which every day's observation proved to be untrue. As to the hard names, they are no arguments, and therefore must remain unanswered, except by the observation that they generally betray a weak cause on the side of those who use them. Men conscious of integrity can afford to despise them. We are forbidden, and feel no inclination to return railing for railing; what we wish is that our medical brethren would study our science, and instead of abusing *us*, help us to improve *it*, for the benefit of our own and of future generations. When any one speaks disrespectfully of things of which he is ignorant, he may be very fitly rebuked, as Dr. Halley was by Sir Isaac Newton:—"I have studied these things—you have not."

* What is Homœopathy? By W. Sharp, F.R.S. London: W. Headland, Princes Street, Hanover Square.

6. Homœopathy is a General Fact,—*a principle,—a law of nature*. All nature is exquisitely arranged and governed by perfect laws,—the result of infinite wisdom and almighty power. The discovery of these general facts has marked epochs in the annals of mankind. What consequences have followed the discovery that a magnetised steel bar, when free to move horizontally, always turns one of its extremities towards the north pole of the earth? And what will follow from the further fact, so recently discovered by Œrsted, that when this bar is surrounded by a current of electricity, its direction is altered, at will, to the right hand or to the left, as is seen in the electric telegraph? Who attempts to *explain* or to *ridicule* these things? They are FACTS. Newton discovered that the force of gravity is in direct proportion to the mass of matter in the attracting bodies, and in inverse proportion to the square of their distances. Doubtless many other proportions are *possible*, but this is the one fixed upon by the wisdom of the Great God. Dalton discovered that the elements of matter, when combining chemically with each other, always do so in certain fixed proportions; for example, oxygen combines with hydrogen in the proportion of eight parts by weight to one. This is an interesring particular fact; but it becomes much more important when it is known to be a general fact that oxygen will combine in the same proportion of eight parts by weight with a fixed weight of every other element; as with six of carbon, sixteen of sulphur, fifteen of phosphorus, thirty-five of chlorine, twenty-seven of iron, thirty-one of copper, etc., and these likewise with each other in the same proportions in which they combine with oxygen; as thirty-five of chlorine with one of hydrogen, twenty-seven of iron, thirty-one of copper, etc., etc. Here is a law of nature, absolutely unalterable by us, and yet it is most evident that these proportions of combination *might* have been very different;—they are so arranged by infinite wisdom—we cannot explain why—*shall we ridicule the arrangement?* So we can imagine many laws of healing, but our business is to discover, if possible, the actual one. The evidence in favour of *similia similibus curantur* is already great, and is increasing daily. It claims to be received as a *general fact*, unless it can be set aside by good *evidence* to the contrary. Let it be borne in mind that ordinary medicine is without a rule, and even, as contended for by the present President of the Royal College of Physicians, "incapable" of receiving one. It is, consequently, in the condition of ships before the discovery of the mariner's compass. If then a rule be found, how great must be its value! It is not possible to overrate the value of a well-founded principle in any branch of science, for "principles built upon the unerring foundation of observations and experiments must necessarily stand good, till the dissolution of nature itself." (Emerson, in Newton's Principia, vol. iii. p. 86.)

7. Homœopathy *is a practical fact*. It is not a speculative theory to be reasoned upon in

Hosted by Google

the closet, but a fact to be observed at the bedside; it is no metaphysical subject, to be logically shown by *à priori* reasoning to be absurd; it is no piece of presumption and impudence to be put down "by authority," as the Council of our Royal College of Surgeons happily acknowledges; it is a fact to be examined, like the statement of any other fact, *upon evidence*. We are not called upon to sit down and imagine its possibility or its impossibility, but we are urgently pressed to observe whether it be true or not. Hundreds of credible witnesses tell us that all curable diseases are, for the most part, readily cured by the new method. This is asserted as a fact. Is it true? This is the question. Try the medicines—why should you not? The interests of humanity require it. If they succeed, it is a great blessing; if they fail, publish the failures. This is the only fair and honest way to oppose homœopathy, and in no other way is it likely to be opposed with success.

8. Homœopathy *stands upon its comparative merits*. This must be the test of all methods of treating disease. There is no absolute preservation from suffering in a sinful world, nor any deliverance from death. "There is no discharge in that war." And as all generations have died under the old method, so, should the new one prevail, all generations will continue to die under it. This consideration should render disputants on both sides sober-minded. Medical men are engaged in an unequal contest—the great enemy will always conquer at last; but the question is a fair and a rational one, from which class of means do we actually obtain the greatest amount of relief from bodily suffering, and by which is the apparent approach of death most frequently warded off? This reduces the whole matter to what would seem to be its proper shape—a practical question—what will do me most good when I am ill?

9. *The old method is unsatisfactory*. This is admitted by almost all medical authorities. It is not necessary to bring forward quotations in support of this statement, they might be had in abundance; but the fact is so notorious, that the differing of doctors has become a proverb; in short, there is no opposition of sentiment or of practice too great not to be frequently met with. I well remember the reply made to me by an eminent and old practitioner when I was a pupil, who saw the distress I was in on perceiving the uncertain condition of medical knowledge, "If there be nothing true in medicine, there is in surgery, so you must give your mind to *that!*" The old medicine is in the condition that astronomy was in before Newton, and in a worse condition than chemistry was in before Dalton; many valuable isolated facts known, but no golden thread, no law of nature discovered, by which a host of conflicting conjectures might be dissipated, and facts reduced to an intelligible order.

10. Homœopathy *is simple and intelligible*. However absurd the rule may appear to some, it is, practically, a plain one, and becomes, to those who follow it, more easy and more satisfactory every day. It is not pretended that it can be carried out without serious labour. The law of gravity is abundantly plain and simple, but there are plenty of difficulties, notwithstanding, in working out the inequalities of the moon's motions.

11. Homœopathy *gains by comparison*. It is more successful than the old system. This comparison can be instituted in two ways—by the statistics of public institutions, and by those converts from the old practice who have tried it long enough to be able to compare with each other the results, in their own hands, of the two methods. As an illustration of the former mode of comparison, the following abstract drawn from Dr. Routh's statistics, (in the "Fallacies of Homœopathy") is given by his reviewer, "by which the relative success of the new and the old modes of treatment can be seen at a glance."

	Homœopathic Treatment. Deaths per cent.	Allopathic Treatment. Deaths per cent.
Pneumonia	5·7	24·
Pleuritis	3·	13·
Peritonitis	4·	13·
Dysentery	3·	22·
All Diseases	4·4	8·5

When, in 1836, the Asiatic cholera attacked, as an awful scourge, the city of Vienna, all the hospitals were fitted up to receive cases indiscriminately, as they occurred; one was a homœopathic hospital, but under the inspection of two allopathic physicians. The authorized report, when the epidemic had done its work of death, was this:—

Mortality in the Hom. Hospital.	*Mortality in the Allo. Hospital.*
Under 33 per cent.	66 per cent.

Two-thirds recovered in the one, and two-thirds died in the other. See the well-known book, "Austria and its Institutions," by Mr. W. R. Wilde, M.R.I.A.

The results of the treatment of Asiatic cholera in this country have been similarly successful. When it visited Liverpool, in 1849, it was of a virulent character. During the week ending on the 18th of August, the number of deaths amounted to 572. The total number of deaths in Liverpool from cholera, from May 20th to October 6th, was 5,098. The population of the town at that time was 360,000. The mortality by cholera was therefore about 1·4 per cent. of the entire population. The mortality out of the cases of cholera was 46 per cent. as reported by Dr. Duncan, the medical officer of health: the mortality among those treated homœopathically was 25 per cent.

Many other statistics might be added leading to the same conclusion. The second mode of comparison rests in the bosom of each private practitioner. Thus much, however, may be stated, so far as I am at present informed; every practitioner who has, with sufficient care and perseverance, studied homœopathy, has

Hosted by Google

embraced it, and I have not yet heard of one who has deserted its ranks because he has been disappointed as to the efficacy and superiority of this mode of treatment. For myself, I may be permitted to say that, having practised the old method for many years with success, and having now devoted myself for some time to the new mode, while I at once acknowledge that the study is laborious, and not without its difficulties, I am persuaded that it is a change for the better, and I venture to engage that if my medical brethren will try such plants as the following, prepared as we now use them, in the cases for which they are indicated by the law of *similia*, they will be greatly surprised and gratified by their beneficial effects :—

Aconitum Napellus,	Atropa Belladonna,
Bryonia Alba,	Arnica Montana,
Matricaria Chamomilla,	Pulsatilla Pratensis,
Ipecacuanha,	Nux Vomica, etc. etc.

12. Homœopathy *is medical treatment.* It is not the do-nothing system which it is represented to be by opponents. who thus only betray their ignorance. When fever and dysentery were desolating many parts of Ireland in 1847, one of the places which suffered most was Bantry, near Skibbereen, in the county of Cork. During ten weeks one hundred and ninety-two cases were treated homœopathically by Mr. Kidd, at their own homes, amid all the wretchedness of famine; the mortality from fever was less than two per cent., and from dysentery fourteen per cent. During the same period many were treated on the old method in the Bantry Union Hospital, with the advantages of proper ventilation, attendance, nourishment, etc., and from the report of Dr. Tuckey, the physician, the mortality from fever was more than thirteen per cent., and from dysentery thirty-six per cent.

At the same time another Fever Hospital was opened for similar cases occurring among the emigrants from Ireland to this country, in which the medical man tells us he abstained from all interference, and remained passively watching the cases, ordering them free ventilation, cleanliness, and confinement to bed; water or milk and water being given as drinks. He congratulates himself upon the success attendant upon thus allowing the cases to take their natural course, undisturbed by medicine; the deaths from fever in this hospital were ten per cent. We have here, therefore, an opportunity of comparing together the results of the three methods—the ordinary system of medicine, no medicine at all, and the homœopathic medicine. The deaths from fever are thus reported:—under ordinary medicine, above thirteen per cent.; under no medicine at all, ten per cent.; under homœopathic medicine less than two per cent. A sufficient proof that *that* is doing something and gaining by it; while, by the same comparison, giving large doses of medicine is doing something indeed, but losing by it.

13. Homœopathy *is a practical guide.* It is not, like hydropathy, a single remedy to be applied in the treatment of every disease; it is a guide or rule to direct us in the use of all remedies. The medical practitioner who for years has felt and mourned over the bewildered condition of his professional knowledge, the contradictions of his theories, and the uncertainty of his facts, is the only person who can fully appreciate the value of any principle capable of affording him a light to guide his path. Few intelligent persons, however, can have failed to discover, from their intercourse with physicians, that ordinary medicine is in an unsettled and benighted condition. It has many valuable facts, it has many excellent remedies; but the facts are isolated, or connected only by false hypotheses, and the remedies are made use of in such a vague manner, and in such destructive doses, that the value of the one and the excellence of the other are either greatly impaired or converted into injuries.

14. Homœopathy *is a guide in the choice of the medicine, not of the dose.* The dose is, as yet, a question of experience. The law of *similia* is an admirable guide in the selection of an appropriate remedy in any case of disease; but the only information it affords in the choice of the dose is this, that it must be a *smaller* one than would be sufficient to produce similar symptoms in health. *How small* a dose this is must be ascertained by trial, until some general fact or law can happily be discovered which shall constitute a guide to the dose, as the law of *similia* does to the medicine. I venture to entertain a sanguine hope that this will be accomplished.

15. Homœopathy *aims at eradicating, or permanently curing the disease*, wherever this is possible, not merely at affording palliative relief. This constitutes another great feature of the new method, and again points out, in a striking manner, its superiority over the old mode. If the symptoms of an ailment are cured by the operation of the remedy upon the constitution, the cause of those symptoms, or the pathological condition, is, in all probability, permanently removed. In seeking to effect this, no other mischief is occasioned. How often has not this case occurred: a patient is suffering from cough, medicines called expectorants are prescribed. At the next visit the cough is somewhat relieved, but the expectorants have unfortunately produced nausea, and the appetite is gone; mineral acids are ordered to improve the tone of the stomach, and to restore appetite. At the following visit, the appetite is better, but the acid has irritated the mucous membrane of the bowels, and has produced diarrhœa; to check this, astringents must be given, which have occasioned, by the time of the next visit, a return or aggravation of the cough, and thus the round has to be recommenced. Who does not see that there is room for improvement in such a system? But the greatest of all difficulties of the old mode of treatment is this,—to decide the point whether depleting and lowering measures, antiphlogistics, as they are called, are indicated, or the opposite remedies, stimulants and tonics. The most eminent and experienced practitioners not unfrequently differ in their opinions upon this important point, even when humanly speaking, the life of the patient hangs

Hosted by Google

upon the decision. Now this acknowledged and grave difficulty is greatly mitigated, if not entirely removed, under the new method; the group of symptoms has to be taken, and a similar group found, belonging to any remedy;—*that* is the remedy most likely to be useful, by whatever name it has been usual to designate it.

16. Homœopathy *economises the vital powers*. It does not, like bleeding, and purging, and salivating, and sweating, draw largely upon the remaining strength of the patient, already perhaps greatly reduced by his sufferings. Homœopathy lets well alone. Its medicines act only upon the diseased organ. If the head be sick, it does not add to this sickness a complaint in the intestines, which strong purgatives must do; if the lungs be inflamed, it does not also bring on an inflammation in the skin, which a blister does. The beneficial consequence of this method is conspicuous in the speedy return of the patient to his accustomed health and occupation. When the acute disease is removed, which it often is in an unusually short space of time, the patient is well; he has no tedious convalescence, requiring wine and bark.

17. Homœopathy *is gentle and agreeable*. If the new mode of treatment be found on trial to be *only as efficacious* as the old one, it ought to be preferred on account of its gentleness and pleasantness; how much more if it succeed *better*. The action of the medicines, in point of fact, is found to be such as to supersede the necessity for the severe measures and nauseous doses hitherto had recourse to. The medicines are tasteless, or nearly so, themselves, and they do not need the aid of such formidable adjuncts, as bleeding, and blistering, and setons, and issues, and cauterisations and moxas. Already, indeed, the beneficial influence of homœopathy in this respect upon general practice has been generally felt. In the year 1827, I attended the hospital in Paris which was in charge of Baron Larrey, Senior Surgeon to the Army of Napoleon. At every morning's visit, he had, among his numerous attendants, two "internes" or dressers, as they are called at the London hospitals, accoutred in this manner:—one carried a small chafing-dish with fire in it, the other a box, containing a number of actual cauteries (irons like small pokers) and a pair of bellows. As we passed from bed to bed, one or more of the suffering occupants was sure to be ordered the cautery, when one of the irons was immediately placed in the chafing-dish, the bellows were applied, and as soon as the instrument was brilliantly red hot, the Baron would take it in his hand, and deliberately draw two or three lines on the flesh of the patient, very like the marks with which most of us are familiar, made by the ordnance surveyors, on our houses and pavements, during their labours in all parts of the country. Now, surely, to see banished for ever not only such painful methods as this, but everything which approaches to it, must be a consummation to be wished for.

18. Homœopathy *administers one medicine at a time*. This is another great improvement. How was it possible ever to attain to a satisfactory knowledge of the powers and properties of any drug, so long as several were always combined together when given to a patient? In the days of Sydenham, the father of English medicine, sixty or eighty medicines were mixed together in the favourite prescriptions; this number has been greatly reduced since the time of Sydenham, but so long as only two medicines are given together, it is impossible to ascertain with accuracy the effects of either.

19. The homœopathic physician *learns the properties of drugs by experiments upon himself, not upon his patients*. That the contrary has been the plan hitherto adopted is notorious. How many poor people have been deterred from availing themselves of the aid of our hospitals, lest they should have "experiences" tried upon them!

The only certain way of learning the real effects of drugs upon man's health is to administer them experimentally to *healthy* persons. None have thought of this method, so far as appears, except the illustrious Haller and Hahnemann;—none have attempted to carry it out except Hahnemann and his disciples.

It is evident that the properties of medicinal substances must be ascertained by some kind of experiment; the question in dispute is this,—is it best to try these experiments upon sick persons or upon healthy ones? Shall the physician get his knowledge by experimenting *upon his patients or upon himself?* The practitioners of the old school pursue the former method, those of the new one the latter. What does the *patient* say?

20. Homœopathy *is applicable to acute as well as to chronic diseases*. When the discovery was first announced to the world by Hahnemann, he did not carry its application further than to chronic diseases,—to ailments continuing for a long time. And the impression is still general that such treatment may possibly avail where there is abundance of *time*, but what is to be done in cases of emergency? Acute disease with immediate danger,—how can you trust to homœopathy *then?* The answer to this grave question which manifold experience gives, as indeed may be partly gathered from the statistics of cholera and other acute diseases, given in the preceding pages, is this,—that it is able to grapple with the most dangerous and sudden attacks of disease *more successfully than any other known method of treatment*.

21. Homœopathy *is prepared for any new form of disease* far better than the old method. This fact was very strikingly exhibited on the appearance of Asiatic cholera in Europe. The various Colleges of Physicians were quite at a loss to know how to deal with the formidable stranger; and when called upon, in their respective countries, to issue advice and directions, nothing could be more painful than the visible inconsistencies and unsatisfactoriness of their multiform recommendations.

On the other hand, the homœopathic practitioners, whether in Russia or in Austria, in France or in England, found the true remedies without co-operation and without difficulty, and they proved wonderfully successful. Hahne-

Hosted by Google

mann himself published a tract pointing out the proper treatment, from the description he had read of the disease before he had seen a case.

This point was with Sydenham a great source of perplexity. "This, at least," says he, "I am convinced of, viz., that epidemic diseases differ from one another like north and south, and that the remedy which would cure a patient at the beginning of a year will kill him perhaps at the close. Again, that when once by good fortune I have hit upon the true and proper line of practice that this or that fever requires, I can (with the assistance of the Almighty), by taking my aim in the same direction, generally succeed in my results. This lasts until the first form of epidemic becomes extinct, and until a fresh one sets in. *Then I am again in a quandary*, and am puzzled to think how I can give relief. . . . . It is more than I can do to avoid risking the lives of one or two of the first who apply to me as patients."* This is the confession of a man entitled, for his truthfulness and his genius, to the highest admiration. The difficulty, though not perhaps always so frankly acknowledged, has been always felt until now;—it is *not* a difficulty in homœopathy.

22. Homœopathy *carries into detail what all medicine is in the general.* Medicines are not food, but poisons;—not materials which of themselves can preserve or produce health. They are all naturally inimical to the human body, but when that body is in a state of disease, they are found, as a matter of experience, sometimes to assist in restoring it to health.

Medicine, *in the general*, is poison to the healthy frame of man, and a remedy to that frame when sick; this is admitted by all, and this is homœopathy in the general; why not then have homœopathy in detail? Why not first ascertain what symptoms each poison produces, when taken in health, and why not give it as a remedy for similar symptoms in natural disease? Medical men have been experimenting in the treatment of disease for many centuries, why not try *this* experiment? Our opponents admit in general what they ridicule and oppose when carried out in particulars.

23. Finally, homœopathy *relates only to the administration of remedies*, and detracts nothing from the value of the collateral branches of the science of medicine. It leaves anatomy, physiology, chemistry, etc., unaffected. The homœopathic physician ought to be as accomplished in this and other departments of knowledge as his fellow-practitioner of the old school; and he is more likely than the other to turn all such knowledge to the beneficial account of his patient.

24. This is a brief exposition of the leading features of homœopathy. They would admit of being much more copiously enlarged upon, but the aim has been to make a few points so clear that it may not be doubtful what we are contending for. We should be glad to be fairly met with facts and arguments, but in the place of these we have ridicule and abuse. In time, perhaps, the tables will turn, and then, no doubt, *Punch* will find it more easy to satirise the face contorted at the sight of the "black draught" about to be swallowed, or the barber's pole and bandage for bleeding, which he will very likely graphically illustrate as one of the last relics of *barber*-ism, than he has hitherto done any of the facts belonging to homœopathy.

But surely any proposal, such as is explained in the foregoing pages, even if there be but a chance that it may be instrumental in diminishing the sufferings of our fellow-men, deserves to be received with something more decorous than ridicule. "Those who reject it, or who cast it out of the way, as unworthy of inquiry, must do so on their own responsibility." If they decline "to search all things that may present even the shadow of a chance of bringing them more nearly acquainted with the laws which the Creator has instituted for the government of the world, and especially with those upon which He has caused the preservation of health to depend, let them recognise that it will be vain for them, in any after hour of hopelessness, when it may be too late to avert their own premature death, or the death of a relative or friend, to rely on the hackneyed consolation, that the calamity is to be regarded as a new instance of the inscrutable ways of Providence, and not as the penalty of having wilfully blinded themselves to any light beneficently set before them, the reception of which might have ensured their preservation."*

* Works of Sydenham, vol. i. p. 33, Sydenham Society's edition.

* Truths and their Reception, by M. B. Sampson, p. 87.

SHORT ABSTRACT OF A FEW OF THE CASES TREATED AT THE NEW YORK HOMŒOPATHIC DISPENSARY.

Dr. Bolles.—Mrs. D., æt. 47. Chronic constipation, scybalæ, with pain and straining. *Nux* 6, *Sulph.* 30. Bowels regular while taking the medicine.

James C., æt. 3. Dry cough, more or less, all winter. *Phos.* 30. In a week, cough almost gone.

Mrs. C. Pain in back for seven months, scanty urine and dropsy of feet. *Colch.* 3, *Iod. Pot.* 1. Urine increased and dropsy disappeared in a week. *Ledum* 30. Pain in back ceased in a week more.

Miss Mary P. Salt rheum in face for more than a year. *Rhus* 30. Improvement in a week; almost well in two months.

Mrs. Mary P., æt. 44. Pain in stomach and dyspepsia for two years, with bloating of face. *Ars.* and *Cham.*, *Nux* 6, *Rhus* 24. Was perfectly well in two weeks, and remained so, at last accounts, three months after.

Hannah D., æt. 45. Painful diarrhœa for a week. *Phos.* 30, *Secale* 30. Ceased immediately on taking medicine.

Miss D. Suppression of menses for a year. *Kreos.* 30. Menses reappeared after three doses.

Bridget C. Permanent swelling and dropsy

Hosted by Google

of feet, after being frozen. *Agar.* 3. Almost well in two weeks.

Mary M. Inflammation of breast for a week, with swelling of glands of armpit. *Bry.* 3, *Merc.* 3. Well in two weeks.

Catharine G., æt. 36. Chronic headache, with burning on top of head; dizziness, heat and redness of face. *Bell.* 30, *Carbo veg.* 30, relieved her from May 8 to August 28.

Mrs. B. Chronic rheumatism, of four years' standing. *Ledum* 30, and *Merc. viv.* 3, produced marked relief from July 3 to October 2.

Mrs. Catharine R. Chronic headache for years on left side of face and head, after salivation for cholera in 1832. *Nitr. ac.* 3, relieved from July 24 to December 11 and after.

Wm. D., æt. 15. Rheumatism for three days; had a similar attack two years ago, that, under allopathic treatment, confined him to the house for six weeks. Well in a week.

Patrick H., æt. 3½ years. Ill for five weeks with daily paroxysms of fever, at noon, consisting of heat followed by warm perspiration. *Acon.* 3, *Arsen.* 3. No fever after first day of taking the medicine.

Dr. Kirby.—John McE., æt. 44. Costiveness; without relief four, five, or seven days. *Nux* 30, without benefit—then *Opium* 3. Reported himself regular for four weeks, during which he used it.

Sarah J., æt. 22. Expectoration of blood and thick yellow phlegm, fever and night sweats, hacking cough. *Phos* 30. Was nearly well in three weeks.

Mary O., æt. 33. Burning in stomach, pain after eating, waterbrash and costiveness, pain in region of womb, with yellow leucorrhœa. *Nux* 30, and *Bell.* 30. Three weeks after, the majority of symptoms were removed.

Chester S., æt. 43. Dysentery, with ten or fifteen bloody passages per day. *Merc. viv.* 3. Nine days after, reported he had only a little soreness in lower bowel, with a passage from bowels only every two or three days.

John C. æt. 68. Dyspeptic for two years, bitter eructations and heartburn. *Arsen.* and *Nux.* In three weeks reported himself cured.

Dr. Stewart.—Catherine Jane V., æt. 10. St. Vitus's dance, for three years under old-school treatment. Treated unsuccessfully at this dispensary for four months, when left arm became partially paralysed. *Plumb. acet.* 1, with almost immediate relief; in three weeks was better than for three years, slight returns of the disease being readily relieved by same remedy, and remained well, according to last report, nine months after.

Josephine H., æt. 22. Profuse menstruation, lasting nine or ten days. *Sabina* 3. In three months, menstruation lasted only two or three days instead of eight or nine.

Alice S., æt. 13. Chronic eczema, or salt rheum of ears and face for eight years. *Merc. cor.* 3. Almost well in seven weeks.

Marcus S., brother of above, æt. 3. Same disease for one month; almost well in three weeks, under same treatment.

Mary M., æt. 7. Eight or ten pustules upon the eye; severe acute eczema or salt rheum of ears and nose; one pustule opened into anterior chamber of eye, with effusion of blood and matter into eye. *Ars.* 1, *Bell.* 1, *Baryta mur.* 1, *Tart. emet.* 1. In two months was much improved. In three months all active disease had subsided, but eyes were very dim from specks and scars. In five months there was only very slight dimness left. In six months eye perfectly clean and well, without any external application whatever.

Dr Curtis. — Barney McE., æt. 13. Catarrh of chest of two years' duration; cough from exercise, cold air, talking, laughing; morning paroxysms of cough which sometimes last an hour, but little expectoration. *Phos.* 3. In two weeks cough all gone, but some difficulty of breathing remaining.

Elizabeth W., æt. 32. Indolent varicose ulcers of both legs, much improved by *Lycopod.* 3.

Dr. Peters.—Mary A, æt. 43. Frequent and profuse menstruation, never goes over three weeks, often only two, and lasts at least eight days, profusely. *Sabina* 3. Next period not so profuse, and two days' shorter continuance. Three months after reported that menstruation lessened each period, and lasted only four days, and not so profusely.

Helena K., æt. 24. Catamenia suppressed for five months, with frequent diarrhœa. *Puls.* 3, *Verat.* 3. During next week had no diarrhœa; catamenia returned; afterwards had returns of diarrhœa, but remained regular.

John H. Constipation. *Nux* 3. Next week reported that bowels had been moved twice a day, which was quite unusual; week after, that bowels were much more regular than they had been for some time. Afterwards had bleeding piles. *Aloes* 3, in two weeks piles almost gone.

Eliza K., æt. 68. Costive for thirty years, and pain in side for six months. *Nux* and *Bryon.* without benefit; *Plumb. acet.* 3. A month after, reported that she had been better for a long time; pain in the side better; bowels more regular than for several years. Repeat *Plumb. acet.* In another month reported costiveness as still much better. An attack of drowsiness and return of costiveness relieved by *Opium* 3.

Eliza M., æt. 40. Chronic costiveness; without relief three and four days. *Plumb. acet.* Next week much better, and remained so for three weeks more.

Ann G., æt. 24. Diarrhœa for a month; latterly, dysentery with straining every ten or fifteen minutes, passing blood and slime. *Merc. cor.* 2, *Arsen.* 2. Next visit reported dysentery gone, but slight diarrhœa remaining.

Susan K., æt. 43. Liver complaint and jaundice for nine months; headache, sleeplessness, nausea, white stools, urine thick and dark like ox-gall. *Cuprum acet.* 1. In two weeks reported her passages as bilious, yellow and brown, for first time in nine months. In a month well.

Jane J., æt. 20. Obstinate constipation, often goes a week without relief. *Plumb. acet.* 1, without benefit. *Nux* 3. Next visit reported bowels regular, rather loose.

Hosted by Google

Dr. Bartlett.—Michael F., æt. 50. Partial blindness for three years, dyspeptic, acid stomach, constipation. *Sulph.* 3, *Hepar sulph.* 1. In two months reported that constipation and acidity had been and were still relieved. *Bell.* every third morning. In a month more, reported that dyspepsia was relieved, and eyes also.

Laura W., æt. 14. Enlatgement and palpitation of heart; was thirteen weeks under treatment, improving all the time under *Spigelia* 1, and *Bry.* 3.

Isabella McC., æt. 35. Dyspepsia, with nausea and constipation. *Sulph.* and *Nux.* Cured in three weeks.

Mary McJ., æt. 50. Sick seven weeks; frequent desire to pass water, scanty discharge of urine, pain in back, acrid urine, smarting badly, mouth dry, thirst. *Canth.* 3, *Nux* 3. In a week was so greatly improved as to be almost well.

Margaret W., æt. 41. Neuralgia from carious teeth. *Mezereum* and *Spigelia*, with much relief.

Ann L. S., sick a year; distress after eating, vomiting of food, pain in stomach and bowels, frequent cold chills and paleness, followed by flushes of heat and great redness of face. In two weeks vomiting was cured, and pain in stomach relieved.

Dr. Fulgh.—Mary S., æt. 30. Pain in back and head, vomiting and constipation. *Nux* and *Ipec.* In two weeks much improved and bowels quite regular.

Jane K., æt. 50. Change of life, headache, chills, flushes of heat, etc. *Puls.* 3. Remained much better for three weeks. Slight returns, relieved by same remedy.

Hannah B., æt 28. Scrofulous swellings and ulcers for several years, suppressed menstruation. Under *Ferr.*, *Calc.*, *Silic.*, and *Iod.* was almost well in six months.

Hugh G., æt. 5. Dropsy of the belly after an attack of measles. *Arsen.* Almost well in fourteen days.

Dr. Allen.—Mary D. Dyspepsia from childhood, costiveness, etc. Under *Nux* and *Sulph.* Bowels became regular.

Mary D., æt. 25. Fever and ague from February to August 5, before she came under homœopathictreatment. *Nux* and *Arsen.* Improved the first week, was cured in the second week.

William B., æt. 64. Pain in the right side for two years, difficult breathing, cough, with thick white expectoration, and obstinate constipation. *Nux* 6, *Sulph.* 4, and *Plumb. acet.* Almost well in nine weeks.

Thomas B. Chronic discharge from ear. *Puls.* 6, *Merc.* 6, *Calc.*, *Sulph.*, *Silex*, and *Hepar.* Almost well in four weeks.

Mr. Reisig.—John M., æt. 14. Scrofulous ulcers and enlarged glands of neck. *Calc. car.* Almost well in three weeks.

Alfred S., æt. 3½. Rickets. *Calc. car.* Almost cured in ten months.

John M., æt. 8. Angular projection of spine; much relieved by *Calc.*, *China*, *Hepar*, *Rhus*, and *Asafœtida* in three months.

Sarah R., æt. 56. Dyspepsia, pain, vomiting, and constipation. *Nux.* Almost well in four months.

Ellen S, æt. 2. Dysentery for four days. *Merc. sol.* 2. Well in less than a week.

The cases from the records of the New York Homœopathic Dispensary reported above, are taken from a report of that Institution dated April 9th, 1852, and ordered by the trustees to be published. We shall make further extracts at a future time.—*American Journal of Homœopathy.*

THE MIDDLESEX ELECTION.

(*From the Medical Times and Gazette.*)

It is not our province to discuss politics, neither are these pages the arena in which to fight the battles of party. We cannot help going out of our way for once, however, to remind our readers, that on this day (Saturday) Lord Robert Grosvenor seeks the suffrages of the electors of the county of Middlesex. After the many insults this weak and vacillating nobleman has heaped upon our Profession, we hope and trust that no medical man will be found to record a vote in his favour. A day of reckoning comes, sooner or later, to every man; and the great patron of all quacks must find out that from Regular Medicine he has nothing to expect but the most contemptuous and determined hostility. It would be, indeed, a bitter reproach to all of us if it were found that the votes of medical men had returned the most determined, although impotent, enemy of their science into Parliament during a contested election. In all probability, the new Senate will contain no member of the Medical Profession; it is, therefore, imperative upon us that we do all that we can to keep out of Parliament a man who has flirted with every kind of quackery, and has taken to his arms the most rampant of them all—homœopathy.

[We submit for the gratification of our readers this amiable outpouring of the sentiments of our contemporary. Happily his aspirations for the defeat of Lord Robert Grosvenor have failed of success; and he will again have the opportunity of defending homœopathy as a senator. We heartily trust that the Noble Lord may have a vast array of supporters in the House of Commons, whenever the subject of our Medical Reform is brought before that august assembly. —Ed.]

FIRST REPORT OF THE YORK HOMŒOPATHIC DISPENSARY.

One hundred and sixteen cases of disease have been treated at the Institution during the past twelve months, and it may be gratifying to believers in the superiority of the homœopathic practice to be informed, that the number of applicants for relief increases every week; but from the want of an efficient assistant, it is impossible to attend to all the requests for gratuitous attendance upon the poor at their own dwellings. So soon as the funds of the Institution may admit, its benefits shall be extended as widely as in other homœopathic dispensaries; in

Hosted by Google

the mean time, the attention of honorary subscribers is directed to the recently adopted Rule, No. 5, by which arrangement a class of persons hitherto unprovided for will be able, without difficulty, to obtain professional attendance and medicines at their own houses.

Summary of Diseases prescribed for during the year ending May, 1852.

Name of Disease.	No. of Cases.
Abscess	2
Amaurosis	3
Amenorrhœa	3
Asthma	4
Bladder, Irritability of	1
Caries	1
Catarrh	3

Total number	116
Of whom were discharged—Cured	57
Improved	22
Unaltered	9
Lost sight of, results unknown	5
Remaining under treatment	23
	116

The following cases will show the efficacy of homœopathic treatment.

OPHTHALMIA.

Charlotte R—, aged three years, recommended by Mrs. Clifford, admitted June 3rd, 1851; has had inflammation of the conjunctivæ for two months; the pain is very acute, she cannot bear the light, the eyelids adhere by the secretion of matter; she has also a papular eruption on the forehead, arms, and legs. Two globules of *Aconite* 3, were ordered to be given every morning, and the same of *Sulphur* 6, every night. In four days a marked improvement had taken place, and on the 5th of July she was discharged cured.

Eliza J—n, aged four years, admitted March 18th, 1852; has been the subject of ophthalmia since August, 1851, which appears to have been caused by the drying up of an eruption with external applications. She has been for many weeks under allopathic treatment, without benefit. The light affects her so painfully that she always keeps her eyes shut. Two globules of *Belladonna* were ordered to be taken twice in the day, and cold water compresses to be applied to the eyes. Within four days the relief afforded was so great, that she was able to keep her eyes open, and the improvement since that time has rapidly progressed.

Anne R—, aged one month, recommended by Mrs. Clifford, admitted Oct. 20th, 1851; has been affected with purulent ophthalmia since her birth. A solution of lunar caustic had been used without benefit. *Aconite*, *Pulsatilla*, *Calcarea carbon.*, and *Sulphur* were the only remedies used, and she rapidly recovered.

CHOREA.

Louisa S—, aged ten years, recommended by Mr. Browne, Blake-street, admitted Oct. 4th; of delicate constitution; has been affected with St. Vitus's dance for six months; the disease came on after an attack of small-pox; her legs and arms are in perpetual motion, with constant twitchings of the muscles of the face. *Cuprum*, in doses of three globules night and morning, cured her in three months.

RHEUMATISM AND AFFECTION OF THE HEART.

Joseph T—, aged nine years, recommended by Miss Cholmeley, Brandsby Hall, admitted March 9th, 1852; has been ill with acute rheumatism for two months; at present he sleeps badly; the muscles of the neck are rigid and painful, especially when in bed, so that he screams out: has some pain in the region of the heart, accompanied by palpitation. *Aconite*, *Belladonna*, and *Nux Vomica*, followed by *Calcarea*, were the only medicines used. He left the Dispensary in three weeks cured.

CHRONIC PLEURISY.

George C—, aged 34, recommended by W. R. Ward, Esq., admitted Nov. 6th, 1851; complains of pain in the region of the heart and under the right breast; has been ill for a month; coughs a little, with expectoration; cannot take a full inspiration without pain. He was treated with *Bryonia*, *Pulsatilla*, and *Phosphorus*. He reported himself cured at the expiration of twenty-two days.

"RESPICE, ASPICE, PROSPICE."—St. Bernard.

No. 157. Vol. III. SATURDAY, JULY 31, 1852.

NORTHERN HOMŒOPATHIC MEDICAL ASSOCIATION.

(*From the Huddersfield Chronicle.*)

The third meeting of this Association was held at Dr. Ramsbotham's, in this town, on the 2nd inst., when there were present Drs. Drysdale, Liverpool; Irvine, Leeds; Craig, Leeds; Ransford, York; Ramsbotham and Cameron, Huddersfield; Wright, Halifax; Tuckey, Preston; Norton, Chester; and Atkin, Hull; Messrs. Phillips, Manchester; Scholefield, Bolton; Booth, Leeds; Holland, Rochdale; Moore, Liverpool; Brady, Huddersfield; and Smith, Sheffield. Visitors—Stirling Howard, Esq., and C. Dickson, Esq., Sheffield; Messrs. Turner, Manchester; and Haycock, Huddersfield. Mr. Phillips, the late president, having taken the chair, Dr. Ramsbotham was unanimously elected president, and took the chair. The minutes of the last meeting were read and approved. Applications from two gentlemen desirous of becoming members of the Association were read and referred to the next meeting.

The secretary presented an abstract of Dr. Craig's proving of *Cotyledon Umbilicus*.

Dr. Irvine made a communication on mesmerism, illustrated with experiments, for which the thanks of the Association were given by the president.

The next meeting was fixed to be held in Manchester, on the second week in January, and Mr. Phillips was appointed local secretary. The Association then adjourned.

At six o'clock nearly one hundred members and friends sat down to a most sumptuous dinner, provided with great liberality by Mr. and Mrs. Reid, of the Rose and Crown Hotel. The dinner was served up in the recently-erected Masonic Hall attached to the house, which was tastefully decorated with evergreens for the occasion. James Stansfeld, Esq., of Halifax, presided, and was supported on his right and left by the Rev. R. Collins, vicar of Kirkburton; the Rev. A. H. Frost, incumbent of Meltham Mills; the Rev. D. Meredith, incumbent of Elland; and the Rev. Mr. Hutchinson. The vice-chair was occupied by Dr. Ramsbotham, and, in addition to the gentlemen present at the morning meeting, we observed amongst the company, Messrs. Sydney Morehouse, Joseph Norton, Thomas Varley, W. Barker, E. Eastwood, Jos. Shaw, H. B. Taylor, S. Howell, John Whitacre, Charles Dixon, H. Huntriss, J. Labrey, R. Jackson, S. Routledge, J. Hannah, W. Moore, W. Hardy, and others. A party of amateur glee-singers, accompanied by Mr. J. Wood on the piano, were present, and contributed very agreeably to the pleasures of the evening.

On the cloth being withdrawn, and the dessert placed on the table,

The Chairman gave "the Queen," and "Prince Albert, and the Royal Family," which were drunk with the honours, followed by the National Anthem.

Dr. Ramsbotham then read a number of letters from clergymen and other gentlemen, expressive of their regret at being unable to be present, but wishing every success to homœopathy. The several communications having been read,

The Vice-Chairman again rose to give the toast, "The Memory of Hahnemann." He observed that he could, with great truth and sincerity, say that this was one of the happiest days of his life. If anybody had told him four or five years ago that within such a period he should have been seated at the bottom of a table surrounded by so many supporters and friends of homœopathy, he could not have believed it. (Hear.) He felt that this day was a day of great solemnity to those who, like himself, had launched themselves in the bark of homœopathy. It was the anniversary of the death of their great master, and he was sure they would feel that a festival was no inappropriate thing even on the anniversary of his death. (Hear, hear.) For if it was true that a good name was better than precious ointment, and the day of one's death than the day of one's birth, it was never more so than in the case of Dr. Hahnemann. He was quite convinced that from the time of Æsculapius or Hippocrates to the present, there had never shone such a light in medicine as the illustrious Hahnemann. What was medicine before his time? It was a mass, no doubt, of valuable facts and learning, but of misapplied knowledge. (Hear.) Great men had arisen—great discoveries had been made—but there had never been a law of healing—a universal law applicable to all cases, by which a man could be guided in his treatment of disease. (Hear.) They were accused by their opponents of casting behind their backs the facts and accumulated knowledge of ages. They did no such thing. They accepted everything that was valuable in the old school of medicine; they read their works and were taught in their schools, but what Hahnemann had done was to give them a law which enabled them to arrange these facts and accumulations of experience, so that they could find a remedy for all curable diseases. (Hear.) He was a sincere convert to the doctrine of Hahnemann,

Hosted by Google

and by this doctrine he was determined to stand or fall. (Applause.) He should like to tell them what homœopathy was. It was not in itself a system of small doses, but was a law of nature discovered by Hahnemann, expressed in the words, *like cures like*. He found that medicines, which have been known for ages as *specifics*, have the power of producing symptoms similar to those of the diseases which they cure. Struck with this fact, he proceeded in a course of long-continued and painful experiments on his own person and on those of his family and friends, whom he could induce to take the drugs, to ascertain their effects or symptoms on healthy bodies. He then went on to try the medicines in natural diseases, the symptoms of which were like those produced by the drugs on healthy persons; he was successful in curing the diseases, but found that the ordinary dose in most cases caused painful aggravations before the cure was effected. This led him to reduce the dose, and hence arose that practice of infinitesimal doses which had been the stumbling-block of the profession. Homœopathists, therefore, believed that medicines cure diseases, not by disturbing the healthy parts of the body, but by acting simply on those that are suffering in a manner similar to the disease itself. Take as an illustration a case of vomiting. There were few of them who had arrived at the age of manhood but had experienced this affection, or taken emetics. The most common emetic was Ipecacuanha, Twenty grains were sufficient to make a man vomit, and if any number of people were to take it, they would all be more or less affected with sickness. The law of healing says that we must apply such remedies as produced similar effects to the disease itself, and, therefore, if a person was found suffering from sickness, not caused by the medicine, the remedy would be Ipecacuanha; but every one would see that if under such circumstances twenty grains were given, matters would be made much worse. Such would be the fact, and therefore they gave a smaller dose—but the quantity was a matter of experience. *The small dose* was not homœopathy, but it was the application of *like to like*. They were guided by the law laid down by Hahnemann, that *like cures like*—not as their opponents, the *Medical Times* and the *Lancet*, said—the *same to the same*—so that a drowning man must be drowned a little more, and a man who had been hung, hanged a little more. That was not homœopathy. (Hear.) Homœopathy gave *like to like*, but they must give it in minute doses, or they would make bad worse. The smallness of the dose was the consequence of the application of the law, but not the law itself. The quantity to be given was not settled, and whether one professional man gave decimal tinctures, and another centesimal tinctures, and a third globules, all were equally homœopathists. (Hear.) Unfortunately these infinitesmal doses had been laid hold of, and much ridicule and vituperation cast upon them by those who had not investigated the science. A Dr. Simmons had published a lecture delivered by him at the Chatham-street School of Medicine, Manchester, in which he stated that there had recently sprung up a dangerous and pernicious sect (homœopathists), whose object was not the advancement of science, but who sought to ignore the experience of the past. Now, he (Dr. Ramsbotham) had already told them that homœopathists did not reject the accumulated wisdom of ages; and as to the charge of being "the knaves, the pariahs, and the prostitutes of a noble profession," it was fully answered by the meeting which he saw before him. They were not knaves, etc; their characters had been before the world long prior to their conversion to homœopathy. Dr. Ramsbotham then read extracts from the works of Sydenham (the English Hippocrates), from Van Helmont, Silvius, and others, to show that the allopathists rejected much of the accumulated experience of ages In his "Processus Integri, or Practice of Physic," Sydenham said:—"Pleurisy consists of a preternatural fermentation of the blood extravasated; in which fermentation, the sharp particles do by their points or acrimony vellicate the membraceous parts, and being intimately fixed in the nervous fibres, they make a concussion therein, which because it is continued to the origination of the nerves, a sad sensation of pain does arise, which is various, dull, pungent, rending, throbbing, distending, corroding, etc., according to the nature of the part affected, quality of the spirits, and concurrent particles of the blood and humours." In regard to its treatment, Sydenham went on to say on the next page:—"Bleed on the affected side three or four times, and take away ten ounces of blood. The juice expressed out of *horse-dung*, with water drawn from *ox*, *calves*, *sheep*, or *hog's blood*, is commended as an excellent thing, because it imbibes the pleuritic acid." Helmont rejected bleeding "as an accursed remedy; because a pleurisy cured by bleeding often leaves a consumption behind it, and that they who use bleeding much do often fall into this disease: he commends powder of *stag's tail*, which may be drank to a drachm at a time, and also *goat's blood* taken liquid, and warm, or dried and given in powder to a drachm or more. Powder of *bull's tail* is also good, and of a *boar's tooth*. Or take *powder of goat's blood and of stag's tail, of each one scruple; red poppy water, an ounce and a half, mix for a dose Or take flowers of red poppies and of daisies, leaves of wild chicory, of each a handful; horse-dung, an ounce and a half, boiled in barley-water, a sufficient quantity*, strain and *sweeten with syrup of red poppies*, of which let the sick take a draught now and then." (Laughter.) What enlightened allopath would now acknowledge either the theory or the treatment he had read? Alterations and improvements in the practice of medicine had taken place from time to time. Why then, he asked, not go a step further, and investigate facts which they could not gainsay? why not test the science according to the law, and if they found it true, receive it thankfully, as he had done? Homœopathists were not afraid of exposure. Homœopathy was not quackery.

Hosted by Google

Quackery hid itself in secret places. From the time he had become convinced of the soundness of the principles of Hahnemann, he had called upon his brethren to look into the subject for themselves. Homœopathy courted investigation, and they would be glad to introduce it into their hospitals and infirmaries—to walk side by side with their brethren of the old school, so that the poor might choose that in which they had the most confidence. (Hear.) But this was not permitted, and they were cast out and repudiated as brethren. If, however, the friends of homœopathy chose at any time to establish other institutions, he was sure that Dr. Wright, Dr. Cameron, Mr. Brady, and himself, would be most happy to devote their time to their management. Whether they did this or not, their brethren of the old school must either investigate homœopathy or allow it to be practised in their infirmaries, or otherwise confess that they dare not face the light. (Hear.) He could say that if the governors of the Huddersfield or Halifax Infirmaries would, by a vote, permit the practice of homœopathy in those institutions, they (the homœopathists) would so comport themselves that the other medical officers should at no time have any ground of complaint. But if they were not admitted, and the friends of homœopathy chose to establish separate institutions, upon the heads of their opponents be the blame. They had offered their services, and were prepared to work amicably alongside of their professional brethren of the old school, without interfering with their practice; but if these offers were rejected and rival institutions should rise up, and if in the course of time the existing institutions should languish for want of support, again, he said, upon the heads of their opponents be the blame. (Hear, hear.) He appealed to facts, which, though again and again denied, had never been disproved. They had been charged by Dr. Routh with picking and choosing their cases, and with cooking their statistics, but he appealed to the experience of those before him whether this charge was true. (Hear, hear.) The results of the practice of homœopathy in cases of Asiatic cholera, in Huddersfield, were well known. Their statistics had been denied, and an endeavour had been made to upset them; and here, perhaps, they would pardon him for digressing a little from his subject. Far be it from him to cast one single reflection on the memory of those who were passed from amongst them. It was a somewhat singular circumstance that their meeting should take place this day, when one, much esteemed, and standing extremely and, he doubted not, deservedly high in the estimation of his friends, had been carried to his last resting-place. He should be extremely sorry to be guilty of anything like reflecting on his memory, but truth was truth and must be spoken. He was there on the defensive in that which concerned him very nearly—the truth of the statistics which had been published in reference to the treatment of Asiatic cholera in this town. An endeavour had been made to upset those statistics, but no man had come forward with evidence to disprove a single fact. The application of homœopathy was extremely successful in those cases. He rejoiced in it, because he was persuaded that the same success would at all times attend the efforts of all who rightly applied the law of *similia similibus curantur*. Before sitting down he must say a few words about Hahnemann himself. It was nine years ago that day since Hahnemann, full of years and of honours, ceased to live. He died on the 2nd of July, 1843, in the 89th year of his age. Long before his great discovery, he was known as one of the most learned physicians of his age. It was in 1790, whilst translating Cullen's "Materia Medica," that the first ray of homœopathic light beamed into his mind. He then commenced that course of patient experiment which only ended with his life. In 1796 he communicated his discovery in a letter published in Hufeland's celebrated Journal. In 1806 he published his "Medicine founded on Experience," and in 1810 he gave to the world the first edition of his immortal work, the "Organon of the Healing Art.". In 1821 his "Materia Medica," in six volumes, was completed, and in 1830 his "Chronic Diseases," in five volumes. These works contained the provings of a great number of medicines on persons in health, and were an invaluable guide in the choice of remedies in natural disease. At the time of his death he left a great treasury of facts in manuscript, which he (Dr. Ramsbotham) trusted would one day in their integrity become the property of his disciples. The promulgation of his discovery brought down on Hahnemann a storm of untiring persecution. The apothecaries brought forward some obsolete law, by which physicians were not permitted in Germany to prepare their own medicines. It was impossible for Hahnemann to submit the delicate preparation of his medicines to his avowed enemies; he was, therefore, driven from city to city, until in 1820 he was invited by the enlightened sovereign of Anhalt-Coethen to accept an asylum in his dominions. Here he resided until he went to Paris in 1835, where he lived, sought and followed by the highest in rank and science, and received the full acknowledgment of his merits. The seven years he lived in Paris were passed in almost uninterrupted happiness. He left his disciples a science so near perfection, that it was a great source of satisfaction to them that not one of those who had adopted the system had been disappointed: and when he (Dr. Ramsbotham) looked at America, England, and the continent of Europe, and found that there were 3,000 homœopathic practitioners—gentlemen who had been educated in the same schools as their brethren, and received the same diplomas,—he could not but feel that the day of Hahnemann's death was better than his birth, and that the memory of his name was better than precious ointment. (Hear, hear.) Let them drink then, in solemn silence, to the memory of their great master, and be glad that such a light had been permitted by the Almighty to shine upon them. (Applause.)

The toast was drunk in silence, and after a glee,

Hosted by Google

The Rev. R. COLLINS rose and said, he had been requested to propose a toast which he was sure would meet with the cordial approbation of all present. Homœopathy, he might observe, must stand or fall by facts, and he thought the facts so numerous and well attested, that it would be a very difficult thing to overturn them. These facts were accumulating daily, and in the full persuasion that in proportion as homœopathy was tested these facts would become more numerous, he rejoiced that they were there that day. There were three advantages which homœopathic medicine possessed. In the first place, it was a very pleasant kind of medicine, and never caused any wry faces; second, it was a very expeditious mode of treatment; and in the last place, it was an effectual mode of treatment. (Hear.) He believed it would go on prospering, and in conclusion he had great pleasure in proposing "Success to the Northern Homœopathic Association." (Applause.)

The toast was drunk with honours.

Dr. ATKIN acknowledged the toast, and said, that the reason why they had established this Association was simple and cogent. The practitioners of homœopathy were few and scattered, and they felt that their isolated position prevented them from enjoying that support of their colleagues, and of conversing and consulting with them on professional matters, which was desirable. The Institution had been established in the early part of the present year, and had been most successful. He thanked them for their presence that evening, indicating as it did the interest they felt in the movement, and he was sure that they would each return to their respective homes more determined than ever to make still further exertions towards advancing the science of homœopathy, and in that way the best interests of their patients. (Hear) He again thanked them in the name of his colleagues for the kind manner in which they had given this toast. (Hear, hear.)

The CHAIRMAN, in calling upon the next speaker, said he trusted the time was not far distant when homœopathic practitioners would be permitted to practise in the infirmaries of Huddersfield and Halifax, or else in institutions of their own He trusted, in unison if it could be done, but if not in unison, then in institutions of their own. (Hear, hear.)

Dr. RANSFORD, of York, in proposing "Success to Homœopathic Hospitals and Dispensaries," said he could not boast of much experience in such institutions, but at the same time he felt it his duty, whenever one was erected in the city where he might be residing, to give it his hearty support. The Institution at York was in such an infant state that he could not refer to it as an illustration of success, but he might say that the result hitherto was most encouraging. (Hear, hear.) He was delighted to be surrounded by so many friends of homœopathy, and he was sure they would return home encouraged to pursue their practice with increased energy. He knew well the resources of allopathy, having practised it for many years, and had often trembled at the danger in which it involved him; but now he stood on better ground, and he would say that if their enemies could show them a still better path, they would immediately adopt it, as their object was simply to benefit their patients. Those alone knew the value of homœopathy who had tested it under trying circumstances, and for himself he must say that it had surpassed his most sanguine expectations. (Applause.) He had great pleasure in proposing the toast intrusted to him.

The VICE-CHAIRMAN then gave "The Health of the Chairman," which was received with cheers. In giving this toast he could not forbear mentioning one little fact that was interesting, but pre-eminently so to himself. It was to the brother of their most worthy chairman that he was indebted for the first ray of light which broke upon his mind in reference to this subject. He was travelling to London from Leeds some six years ago, when he met with Mr. Hatton Stansfeld. That gentleman kept him awake the whole night by relating fact upon fact, illustrative of the success of homœopathy, until the subject forced itself upon his mind, and made him think that there might be something in that which he had so long despised. From that time he gave the science his consideration, and became a convert. (Hear, hear.) He had great pleasure in proposing the health of their excellent chairman. (Hear, hear.)

The CHAIRMAN, in responding to the toast, said he felt deeply his inadequacy to do justice to the great and important Cause they had met to advocate. He had felt some diffidence on this ground in acceding to the invitation to preside on this occasion; but, on the other hand, he should have been ungrateful to have refused, knowing the benefit which he, in common with many others, had derived from this system. (Hear, hear) There were two or three circumstances which, in the first instance, led him to think favourably of homœopathy. There was the indisputable evidence of facts which he could not gainsay, accompanied with the opportunity of seeing results produced which could not be produced by any other science. These things impelled him to inquiry, and having made that small progress, he could not read without being further convinced of its truth. (Hear.) The statistical details referred to had not been cooked —they were too numerous and too severely criticised to be cooked. (Hear, hear.) Without referring to Asiatic cholera, he would allude to the effects of homœopathic treatment in Ireland during the prevalence of the famine fever in that country. The relative proportion of deaths under the two modes of treatment was, homœopathy two, allopathy thirteen. It was said that homœopathy did nothing, and that the result was the effect of nature. The experiment had been tried on Irish emigrants, and the result gave the relative proportion as homœopathy two, no medicine and left to nature ten—(laughter)—a still more convincing proof to his mind of its efficiency. (Hear, hear.) He was fully persuaded that it was as much entitled to be called a science as any other branch of philosophy—a term to which he was bound to say

the old system had no claim. There was a vast amount of facts and of valuable information collected in allopathy, but they were isolated and never could be connected with the system; there was no fact which, when established, necessarily led to another; whilst homœopathic medicine was really a science—every step was a step in advance, and added to the grand fabric which was rising, and which, in time, would envelope the whole science of medicine. (Hear, hear.) Last of all there was the result of personal experience. Three and a half years ago he was afflicted with the gout, when he was homœopathically, and successfully, treated, and he was thankful to say he had never since had the slightest return of the symptoms. (Hear, hear.) Prior to that period he had effected an insurance upon his life. Up to that time he had received regular notice when the premium upon his policy was due, but on that occasion he did not do so, and the time when he should have paid unfortunately passed by. The circumstance of having the gout, however, reminded him of it, and he immediately wrote to the head office, expressing his surprise that no communication had been made to him as usual, giving at the same time a statement of his health and stating his willingness to pay any fine which might be demanded. He accordingly underwent a medical examination, which being unsatisfactory, he went to the fountain-head, and was examined by two or three leading physicians in London—amongst others by Dr. Paris, the president of the Royal College of Physicians. That gentleman treated him in a very supercilious manner, laughed at his treatment, and the result was that the Society refused to re-insure him. (Expressions of disapprobation.) After, however, very great pressure, they consented to return him half the policy he had paid in. He had, therefore, very good cause for remembering his homœopathic treatment. He was grateful, however, to the bridge which had carried him over, and he could not but mark the conduct of those who had treated him in this way. He felt that the making known of facts would tend to the promotion and dissemination of a knowledge of that system which had freed so many from the narrow prejudices to which professional gentlemen of the old school were exposed. (Hear, hear.) He concluded by again expressing his approval of homœopathy, and by acknowledging the manner in which his health had been drunk.

Dr. NORTON briefly proposed "The Health of the Ladies," which was duly honoured.

Dr. F. R. LEES said they had done him the honour of appointing him to propose the last toast, and it was one in which he was sure all present would heartily join. They were better aware than himself of the obligations under which their common cause lay to their vice-chairman. (Hear, hear.) He had not only advocated homœopathy, but risked much public opprobrium in practising their principles. (Hear, hear.) With regard to his own views on this great question, he could only say that he concurred in the remarks previously made, that the foundation of the system was that of facts—and the broader their foundation of facts, the greater their triumph. They might sometimes be at a loss to account for facts—they might be in want of a theory, but whilst human theories were changing from day to day, the great facts of God would endure for ever. (Applause.) It had been said by one of the gentlemen present that homœopathy was one of the greatest blessings to humanity—and so it was. With what was Jenner's name associated but with homœopathy—the application of that which realized a similar disease to prevent its recurrence in a more virulent form? And what was the result?—the mitigation and almost annihilation of one of the greatest scourges to humanity. (Hear, hear.) They would not fail, as homœopathic practitioners became more numerous, to strike at the very fountain of disease, and promote the cause of human happiness. (Hear.) Hahnemann did not live to see the triumph of his discovery, but his shade should yet look down upon the successful progress of the truth with which his name was associated. (Hear, hear.) They might not live to see it, but their children would. (Applause.)

The toast was drunk with cheers.

The VICE-CHAIRMAN, in responding to the toast, said he wished he could express in burning words of eloquence, such as they had just listened to, his feelings on this occasion. He did feel that the triumph of this great, this noble, this blessed Cause was secure; he felt that another generation would wonder when they heard and read how their forefathers had been treated during illness. It was but a short time since that he stood alone in Huddersfield, the laughing-stock of the town. If in any company conversation flagged, they needed but to mention his name or introduce the subject of homœopathy to set it agoing again. Then, everybody had a tale to tell of this half-cracked individual. (Laughter.) He rejoiced that these days were gone, and that whatever his faults might be, upon this subject he was free from selfishness. He had been railed against and misrepresented by his medical brethren, but notwithstanding these things, he would offer them the right hand of fellowship, saying, "Come with us, and we will do you and your patients good." (Hear, hear.) This was not vain boasting, for they well knew the success of homœopathy in Huddersfield, Halifax, Leeds, Hull, and Sheffield. It had been planted in those places successfully, and he was confident it would everywhere prevail. (Hear.) He thanked them for the toast they had just drunk. (Applause.)

The CHAIRMAN, accompanied by several other gentlemen, then retired, the vice-chairman and a large portion of the company remaining to a later hour.

After the retirement of the chairman and other friends,

Dr. RAMSBOTHAM proposed the health of Mr. Moore, in connection with the lay supporters of homœopathy, to which Mr. Moore responded in an able speech, and before sitting down took occasion to propose the health of Mr. Brady, which was drunk with acclamation.

Mr. BRADY briefly returned thanks.

The health of Dr. Cameron was next proposed, in his absence, by Mr. Phillips, and in the course of his address Mr. Phillips paid a handsome tribute to Dr. Cameron's scholarship and general abilities.

The company was afterwards addressed by Mr. Edmund Eastwood, Mr. C. Dixon, of Sheffield, and Mr. James Brook; after which the party soon separated, all highly gratified and evidently deeply interested by the proceedings of the evening.

[We have deemed it our duty to place on full record in our pages the GATHERING of the "Northern Homœopathic Medical Association," as one of the best proofs that our *Cause* advances apace.

Our provincial colleagues happily seem to be united, and not distracted by any dissensions. We cordially wish our energetic friends every success, and while we would suggest a caution to avoid, as a means of argument for our doctrine, everything obsolete that might savour of claptrap ridicule, so disingenuously employed by the allopaths, we think Dr. Ramsbotham very happily held up to public gaze some of the remedial means advocated by the great Sydenham, whom our self-styled "regulars" of the present day look upon as one of their most gifted orthodox pioneers. Sydenham's works have been recently translated, and largely circulated by the Sydenham Society, and are held in high repute as models worthy of imitation.—ED.]

Miscellaneous.

HOT SUMMERS.—The excessive heat which prevails at present gives some interest to the following account of remarkably hot summers:—"In 1132 the earth opened, and the rivers and springs disappeared, in Alsace. The Rhine was dried up. In 1152 the heat was so great that eggs were cooked in the sand. In 1160, at the battle of Bela, a great number of soldiers died from the heat. In 1276 and 1277, in France, an absolute failure of the crops of grass and oats occurred. In 1303 and 1304, the Seine, the Loire, the Rhine, and the Danube were passed over dry-footed. In 1393 and 1394 great numbers of animals fell dead, and the crops were scorched up. In 1440 the heat was excessive. In 1538, 1539, 1540, 1541, the rivers were almost entirely dried up. In 1556 there was a great drought over all Europe. In 1615 and 1616 the heat was overwhelming in France, Italy, and the Netherlands. In 1646 there were fifty-eight consecutive days of excessive heat. In 1678 excessive heat. The same was the case in the first three years of the eighteenth century. In 1718 it did not rain once from the month of April to the month of October. The crops were burnt up, the rivers were dried up, and the theatres were closed by decree of the Lieutenant of Police. The thermometer marked 36 degrees Réaumur (113 of Fahrenheit). In gardens which were watered fruit-trees flowered twice. In 1723 and 1724 the heat was extreme. In 1746, summer very hot and very dry, which absolutely calcined the crops. During several months no rain fell. In 1748, 1754, 1760, 1767, 1778, and 1788, the heat was excessive. In 1811, the year of the celebrated comet, the summer was very warm and the wine delicious, even at Suresnes. In 1818 the theatres remained closed for nearly a month, owing to the heat. The maximum heat was 35 degrees (110 75 Fahrenheit). In 1830, while fighting was going on on the 27th, 28th, and 29th of July, the thermometer marked 36 degrees Centigrade (97 75 Fahrenheit). In 1832, in the insurrection of the 5th and 6th of June, the thermometer marked 35 degrees Centigrade. In 1835 the Seine was almost dried up. In 1850, in the month of June, on the second appearance of the cholera, the thermometer marked 34 degrees Centigrade. The highest temperature which man can support for a certain time varies from 40 to 45 degrees (104 to 113 of Fahrenheit). Frequent accidents, however, occur at a less elevated temperature."—*Galignani's Messenger.*

CURE FOR WARTS.—A correspondent of the *Cottage Gardener* says:—"There is a very useful property belonging to the *Ranunculus arvens*, or common crowfoot, which I do not think is generally known, and which I should like to see recorded in our valuable publication. On breaking the stock of the growing plant in two, a drop of the milky juice will be observed to hang on the upper part of the stem; if this is allowed to drop on the wart, so that it be well saturated with the juice, in about three or four dressings the wart will die, and may be picked off with the fingers. It is the most certain remedy I ever saw, as I have seen people whose hands were covered with them cured in a few weeks. I have also removed them by the above means from the teats of cows, where they are also very troublesome, and prevent them standing quietly to be milked." A simpler method is to rub the wart with the inside of the common bean shell.

[The *Ranunculus bulbosus* and *Ranunculus sceleratus* have been *proved* as homœopathic remedies; and both have a powerful action on the skin. Besides these, the *Ranunculus acris*, the *Ranunculus flammula*, and *Ranunculus repens* have been tried experimentally. We know nothing of the domestic remedy for warts, as above quoted, but we give it—for as much as it may be worth.—ED.]

END OF VOL. III.

LONDON: Printed by THOMAS HARRILD, of Albany Cottage, Sydenham, in the County of Kent, at his Printing Office, 1, and 1½, Dudley Court, in the Parish of St. Olave, Silver Street, in the City of London; and Published by HENRY RENSHAW, at the Office, 356 Strand, in the County of Middlesex.—*Saturday, July* 31, 1852.
