

BAD EFFECTS OF VACCINATION.

DR. N. ALI, B. H. M. S., CALCUTTA.

I have great pleasure to report a wonderful cure of an infant 9 months old suffering from the ill effects of vaccination.

The father of the child, Kazi Fateh Ahniad got him vaccinated having a great belief in vaccination to be the most effective means of prevention from Small Pox. Now the child began to show signs of deteriorated health every day till it was reduced to a skeleton.

Now the father got anxious about the child's health and at last came to me and narrated the whole story.

I heard the full history of the case, examined the child and took down the following symptoms:—

1. Face, pale and earth coloured, head sweaty.
2. Weak.
3. Poor digestion.
4. Great tendency to catch cold.
5. Before this the child was quite healthy and strong.

From the history and the above symptoms, I concluded that the child had been suffering from the unhappy effects of vaccination and I put the little patient on Silicea 30 : 6 doses for 7 days. Silicea was indicated because it is a great nutritional remedy for the growing children of hydrogenoid constitution, and with above symptoms.

To my great surprise, I found that only after a few days the child commenced improvement and had been restored to its former health after a month. I for myself never believed that the child could regain its former health in so short a time. It was simply marvellous.

Every brother physician should know and learn what unhappy symptoms are likely to follow vaccination.

Thuja is its complimentary for the bad effects of vaccination and may be recommended for Diarrhœa after vaccination and Pox and also when the vaccination fever is very high.
